In 1853, Lord-Advocate Moncrieff appointed Mr. Burton as commissioner to inquire into the working of the system, as well as the methods adopted to evade the Truck Act. Mr. Burton made a tour through most of the counties south of Aberdeen, and the result was the above Report, which places a mass of information before the reader, which we do not believe is to be got elsewhere. The contents of this Report, which ought to be more generally known than it is, are calculated to excite discussion of a very interesting and subtle nature among all those who pay attention to our social organization, and on which it is peculiarly difficult to come to any decision with which one would be inclined to be satisfied, that he had arrived at certain conclusions.

CABANILLAS, N.

Recherches pour substituer le papier-monnaie au numéraire. Le Mans, 1848.

CABANIS, PIERRE JEAN GEORGES.

Born at Cosmac, in 1757, was eminent as a physician, a philosopher, and a writer. He was a member of the Council of 500, and after the 18th Brumaire was appointed a member of the Conservative Senate. He was a member of the Institute. He died 6th May, 1808.

Essai sur les secours publics. Paris, 1793.

CABARRUS, FRANÇOIS, COMTE DE, was born at Bayonne, in 1752. Being destined for commerce, he was sent to Saragossa to learn Spanish. He established himself near Madrid, and became acquainted with Campomanès, d'Olivadès, and other Spanish economists. Upon his advice the minister of finance created government notes bearing interest, which had a good effect in restoring credit. This having succeeded, the Bank of St. Charles at Madrid was founded, and placed under his direction, but he was disgraced in 1788, on the death of Charles III. Some years afterwards he was appointed ambassador to France and Holland. In 1809, Ferdinand VII. appointed him minister of finance. He died 27th April, 1810.

Castas sobre los obstaculos que la naturaleza, la opinion, y las leyes oponen a la felicidad publica. Madrid, 1780.

CABET, ETIENNE, was born 1st January, 1788, at Dijon. One of the most notorious socialists of the day. He is the son of a cooper, and was intended for that trade himself, till 12 years of age. His father, however, gave him a good education, and he studied medicine and law, and became an advocate at Dijon. He was obliged to leave there in consequence of the ardor he displayed in defending General Veaux, in 1816, on a charge of conspiracy against the Bourbons. He then went to Paris to pursue his profession. He took an active part in the revolution of 1830, and he was soon afterwards appointed avocat-général of Corsica. But he was soon recalled on account of the violent democratic opinions he avowed. The department of the Côte-d'or returned him to the Chamber of Deputies, in which he maintained the most violent doctrines. He established a newspaper, *Le Populaire*, on the same principles, which in February, 1834, having contained some violent attacks on the king, he was tried and condemned to two years imprisonment. He escaped to England, and lived there till 1839.

In 1841, he began to put forth his peculiar Socialistic doctrines. These are reduced to a regular treatise in his *Voyage en Icarie*, published in 1842. (SOCIALISM). This became very popular, and in 1847 he came to London to obtain a grant of land in Texas to carry out his scheme. Having succeeded in this, a party of his disciples started for the settlement, against his advice, as was said. They suffered much, which becoming known at Paris, made a great outcry against him. Cabet, however, set out with a new band of disciples at the end of the year. The Mormons had been obliged to leave Nauvoo, and in May, 1850, Cabet was allowed to establish his colony there, where it is said still to exist. Cabet is sole judge and ruler. The number is said to be about 200. Besides a great number of pamphlets on his doctrines, Cabet has published,—

CAIRNES, JOHN E. Whately professor of Political Economy at Trinity College, Dublin, and professor of Jurisprudence and Political Economy in Galway College.

The Character and Logical Method of Political Economy. London, 1857.

The object of this course of lectures is to discuss the nature, objects, and limits of economic science, and the method of investigation proper to it as a subject of scientific study.

At p. 3, Professor Cairnes enters a protest, in which we are happy to concur, against the excessive authority which statistics are assuming over Political Economy. In former times men studied principles, but now they seem exclusively to collect statistics, and even to consider Political Economy as having no other aim than to explain statistics. Now there is no science in which statistics are not of immense value, when properly used, but sciences depend upon certain fundamental conceptions, and not upon statistics. Statistics are of great use in mechanics, but the fundamental conceptions of mechanics are not formed from statistics: so statistics may be of great use in medical science, but the treatment of a fever does not depend upon statistics. So in Political Economy, statistics are also of great use, but its fundamental conceptions and principles in no way depend upon them. Thus statistics must be the handmaiden and not the mistress of Political Economy.

Professor Cairnes says, p. 3, "The technical terms of Political Economy are often taken from popular language, and inevitably partake, in a greater or less degree, of the looseness of colloquial usage. It is not, therefore, to be expected that economic discussions should be carried on with the same singleness of purpose, or severity of expression and argumentation—consequently with the same success—as if they treated of the ideas of number and extension, or of the properties of the material universe."

To this doctrine we must enter our decided protest. It is the very cause of the science being in so controverted a state at the present day, that economists have not really examined and settled the meaning of the words they use. (PRELIMINARY

DISCOURSE; AXIOMS AND DEFINITIONS). The technical terms of many of the other sciences are taken from common discourse, but they are carefully appropriated to certain meanings in those sciences, and always used in that single sense.

The consequences of Professor Cairnes's loose phraseology, are very soon apparent. At p. 7 he says, "I shall, therefore, take it for granted that 'wealth,' the subject matter of Political Economy, is susceptible of scientific treatment." Now what is *wealth*? Does Professor Cairnes include incorporeal elements as well as material ones under that title? A question of the most vital importance in Political Economy. After bringing forward definitions of this science that have been propounded by various writers in which he substantially agrees, he proposes his own, either this,—“Political Economy is the science, which, accepting as ultimate facts the principles of human nature and the physical laws of the external world, investigate the laws of the production and distribution of wealth, which result from their combined operation;” or this—“Political Economy is the science which traces the phenomena of the production and distribution of wealth up to their causes, in the principles of human nature and the laws and events of the external world.” Now let us observe that assuming the “principles of human nature” and “laws and events of the external world” to be all known and accepted as facts, still, neither from the definitions offered, nor from his whole treatise, can we discover what he means by *wealth*, or *production*, or *distribution*, each of them words of a fundamental importance. We have asked above what the Professor means by *Wealth*; We now ask what he means by *Production*? For as it stands we have nothing to inform us whether the whole science of agriculture and manufactures is included in it. One of the fundamental differences between the school of Quesnay and Adam Smith lay in the different meanings given to *Production* and *Productive labor*, and different theories of *taxation* have been founded on the meanings given to it. We can only say that this definition of Political Economy leaves us in total darkness as to its “nature, objects and limits.”

Professor Cairnes then quotes a passage from Mr. Mill, in which we do not think he has very clearly expressed the connection between Science and Art. The true connection is well expressed by Bacon, *Nov. Org.* 1. 3. “Quod in contemplatione instar causæ est, id in operatione instar regulæ est.”—“That which is a principle in Science is the Rule in Art.” However, we shall reserve some discussion on this till further on in these remarks.

Professor Cairnes then discusses whether Political Economy is an exact, a positive, or an hypothetical Science; as we have so fully considered this question in the *PRELIMINARY DISCOURSE*, we shall not repeat here what is there stated.

Professor Cairnes then classes Political Economy with Mechanics, Astronomy, Optics, Chemistry, Electricity, and the Physical Sciences, which have reached the deductive stage (p. 38), and truly says (p. 58), that the course of inquiry in them will be analogous. As an example of an economic law, he takes the “very fundamental law in Political Economy that ‘cost of

production regulates the value of freely produced commodities," which he maintains to be true. Not that every particular instance of exchange will be governed by the law of cost of production; but he says that it is the constant and unfailing tendency of things to do so. How far this can be accepted as a scientific truth we have fully examined elsewhere. (COST OF PRODUCTION; PRICES, THEORY OF; CONTINUITY, LAW OF).

Professor Cairnes then considers "the solution of an economic problem and the degree of perfection of which it is susceptible," in which he again maintains that Political Economy is not an exact science.

He then devotes a lecture to support the Malthusian doctrine of population, in which we do not think he has been successful, as we think that Malthus has not correctly stated the circumstances of the problem (CAPITAL; POPULATION). Professor Cairnes then adopts the doctrine of Malthus, "that there is in human beings a tendency to multiply faster than subsistence is capable of being increased." (p. 112).

In his last lecture, Professor Cairnes attempts to restore the Ricardian Theory of Rent. We shall not discuss the matter as it is fully done under RENT. But we shall only observe how the adoption of it agrees with Professor Cairnes's doctrine, that Political Economy is to be treated in a manner analogous to the Physical Sciences. He notices the theory first brought forward by Dr. Anderson in 1777 (ANDERSON), and further developed by Ricardo. How entirely inadequate this theory is, we have shewn in RENT. However, Professor Cairnes implicitly adopts it. He then says, p. 152, "This is the theory of Rent, as expounded by Ricardo. It explains the existence of Rent in the case of all those lands on which agricultural produce is raised at less than the greatest cost at which it can be profitably produced; but it explains it in this case only. It has accordingly been objected to this theory, &c., &c. It must be admitted that, assuming the facts to be as the objection implies, the theory of Ricardo fails to account for them; and beyond question, the facts are as the objection implies. This, however, is no reason for rejecting the theory, which, as I have just shewn you, is based on facts quite as certain as those which are urged against it." *

"I have mentioned two cases of Rent in which the phenomenon is not explicable on the theory of Ricardo. I shall now mention another." We have quoted these passages for the purpose of seeing how far Professor Cairnes observes his own doctrine, that Political Economy is to be treated in the same manner as the Physical Sciences. How is a theory which is only capable of explaining *one* single class of cases, and is acknowledged to be utterly incapable of explaining *three* other classes of cases, analogous to any theory received in Physical Science? And Professor Cairnes resolutely adheres to it, because it can explain *one* class of facts! Would this be permitted in any Physical Science whatever? If this is to be permitted, why was the Ptolemaic Astronomy overthrown? It was fully capable of explaining a very large class of cases, and yet, because there were others it could not explain, it was rejected. If this mode of reasoning is to be allowed in Political Economy, why was the cor-

puscular theory of light overthrown? It fully explained a very large number of cases, and yet being found incapable of explaining others, it was rejected. The Ptolemaic Astronomy and the emission theory of light were equally based on certain "facts," or phenomena, as the Ricardian Theory of Rent. Why was the Phlogiston Theory of Chemistry overthrown? It was based on certain facts.

Now, Physicists having tried each of the above theories, and finding them incapable of explaining other facts different from those they were based upon, have unanimously rejected them in favor of general theories, which have explained *all* cases. No Physicist ever thought of writing a work on astronomy, in which one set of phenomena were explained on the Ptolemaic system, and another on the Copernican system. No Physicist ever wrote a treatise on optics in which the emission theory was maintained in one part, and the wave theory in another part. But that is what Professor Cairnes does in supporting the Ricardian Theory of Rent. And on a greater scale, this is the very objection which applies to the whole Ricardian system of Political Economy. It is based on *three*, if not *four*, contradictory theories of value. And how any man educated in physical science can fail to see that, or how seeing that, he can continue to maintain it, is beyond us to imagine.

Now, let us not be mistaken. We fully admit the immense practical benefits Adam Smith, Ricardo, and the early Economists have conferred upon the world. To them be all due honor. But after all, the character of their work was purely *destructive*. They were engaged in a glorious combat to liberate mankind from the shackles which accumulated error, perverse ingenuity, and selfish sophistry had imposed upon them. Their principal efforts were, therefore, to overthrow, and to do that, no very great nicety of expression was necessary. The accomplishment and the triumph of their work was the establishment of Free Trade.

Many persons think that the establishment of Free Trade is the end-all and the be-all of Political Economy. But that is a most grievous delusion. It is only one of the magnificent services it is capable of rendering to mankind, and is indeed only the basis of the Science. It is only clearing the ground of rubbish, and laying the foundation upon which the edifice of the Science is to be reared.

The rough work has been done, but the finer work has yet to be done. In the discussions raised since the days of Adam Smith, vast masses of truth have been ascertained. But they are still in a crude, fragmentary, and unconnected state. They are merely a mass of raw materials, which have yet to be reduced into harmony and order, and consolidated into a great systematic edifice of science, and that so far from being done, has scarcely yet been even attempted. And it can only be done by patient and continuous thought, and by endeavouring to discover those great conceptions and axioms which will connect these disjointed and fragmentary masses of ascertained truths. That this is the only method that can ever succeed, no one conversant with the history of physical science can deny, and yet so far from having been attempted by the chief writers on

Political Economy, it has been positively discountenanced by them. But that is manifestly the duty of future Economists.

In an Appendix, Professor Cairnes has done us the honor to single us out for special attack, and from the challenge he has thrown out to us we shall see how far he has really understood the doctrine of the Economist, whose champion he has declared himself.

After three pages of verbal cavilling, of which he is welcome to make the most, he says, p. 176, "But a word with regard to Mr. Macleod's capacity of understanding the authors whose writings he treats so contemptuously. A large portion of his introduction to his second vol. (i. e., *Theory and Practice of Banking*), is devoted to an attempt to controvert the received doctrine which attributes to 'cost of production' a governing influence on the value of certain classes of commodities. 'Political Economy,' he says, 'can never advance a step until this arch-heresy be utterly routed out.' Well, what is his contradiction of the 'arch-heresy?' Here it is given in capitals. 'VALUE DOES NOT SPRING FROM THE LABOR OF THE PRODUCER, BUT FROM THE DESIRE OF THE CONSUMER. To allege that value springs from the labor of the producer, is exactly an analogous error in Political Economy to the doctrine of the fixity of the earth in Astronomy.'

"Granting that the analogy is perfect (though I confess I am unable to perceive it), will Mr. Macleod inform us who has said that 'Value springs from the labor of the producer?'"

Is Professor Cairnes in jest or in earnest? Has he ever read Ricardo and the Economists of his school? We only take a few passages from them.

Thus Ricardo says, *Principles of Political Economy and Taxation*, 3rd ed., p. 13—

"In speaking, however, of labor as being the foundation of ALL value, &c."

At page 19—

"To convince ourselves that this (i. e., labor) is the foundation of exchangeable value, &c."

At page 320—

"Value then essentially differs from riches, for value depends not on abundance, but on the difficulty or facility of production. The labor of a million of men in manufactures will always produce the same value, but not always the same riches. By the invention of machinery, by improvements in skill, by a better division of labor, or by the discovery of new markets, where more advantageous exchanges may be made, a million of men may produce double or treble the amount of riches, of 'necessaries, conveniences, and amusements,' in one state of society, that they could produce in another, but they will not, on that account, add anything to value; for everything rises or falls in value in proportion to the facility or difficulty of producing it, or, in other words, in proportion to the quantity of labor employed on its production."

At page 323—

"That commodity is alone invariable, which at all times requires the same sacrifice of toil and labor to produce it."

These passages seem to us pretty plainly to declare that value springs from the labor of the producer; but let us see what some of the disciples of the Ricardian school say.

Thus Mr. McCulloch, in his *Introductory Discourse to the Wealth of Nations*, says, p. xxxii—"Locke has here all but established the fundamental principle which lies at the bottom of the science of Wealth. Had he carried his analysis a little further, he could hardly have failed to perceive that water, leaves, skins, and other spontaneous productions of nature, have no value, except what they owe to the labor required for their appropriation. * * * An object which may be appropriated or adapted to our use, without any voluntary labor on our part, may be of the very highest utility; but as it is the free gift of nature, it is quite impossible it can have the smallest value."

And Note II., p. 438—

"When, however, it is said that the labor of man is either immediately and directly, or remotely and indirectly the chief source and limiting principle of exchangeable value,"

Did Professor Cairnes ever read Mr. McCulloch's *Theory of Absenteeism*, and what is his opinion of it?

Did Professor Cairnes ever read *The Templar's Dialogues*, by De Quincey, which have always been considered as the very quintessence of the doctrines of the Ricardian School? (DE QUINCEY).

These passages, among numbers that might be cited, seem to us plainly to declare, that value springs from the labor of the producer. But let us see what impression the doctrines of Ricardo have made on other writers. Let us take Malthus first.

Malthus says, *Definitions in Political Economy*, p. 183—

"Mr. Ricardo, therefore, quite consistently with his own hypothesis, considers a commodity, the producing labor of which has doubled, as having increased to double its former value. It has increased in relation to a standard which, according to him, is the sole cause of value."

Mr. Jennings, *Social Delusions*, p. 12, says—

"To whatever degree of opulence the society might advance, it cannot be conceived that he would consent to abandon these principles in favor of any of our popular dogmas derived from the great fundamental fallacy, that all value is derived from human labor."

Also, p. 66—

"We have already seen that as one school formerly taught that all value is centred in money, and another that it is centred in land, so at the present day the school of Adam Smith, Ricardo, and McCulloch teaches us that it is entirely centred in labor, &c."

Let us also see what impression Ricardo's doctrine makes on an eminent foreign writer. Bastiat, *Harmonies Economiques, De la Valeur*. p. 131. Edit. 1855, says—

"Ainsi le principe de la valeur est pour Smith dans la matérialité et la durée, pour Say dans l'utilité, pour Ricardo dans le TRAVAIL, &c."

We think we have now sufficiently answered Professor Cairnes's question, "who has said that value springs from the labor of the producer?" And perhaps he may now see the analogy we draw between that doctrine and the doctrine of the fixity of the earth.

That doctrine maintains that diamonds are valuable because a great deal of labor has been bestowed in searching for them. We maintain that a great deal of labor is bestowed upon

searching for them, because they are valuable. The Ricardian school affirms that *Labor is the cause of Value*; we maintain that *Value is the cause of Labor*, which is the reversal of the whole Ricardian system of Political Economy. It appears to us that this is as great a revolution in Political Economy as it was in Astronomy, when the doctrine, that the *Sun goes round the Earth*, was changed into the *Earth goes round the Sun*.

Does Professor Cairnes now see any analogy?

The Professor then says, "Mr. Macleod's refutation of the doctrine that 'cost of production regulates value' is therefore simply a refutation of his own extravagant misconception of it. * * *

When a writer thus shews an entire inability to comprehend the meaning of authors of such remarkable perspicuity and power of expression as Mr. Ricardo and Mr. J. S. Mill (for I will not suppose that he intentionally misrepresents them), his competency for the task which he has undertaken, of reconstructing the science of Political Economy, may be imagined. It is, of course, unnecessary to notice his 'arguments' in refutation of the doctrine in question. It will be time enough to do so when he shews that he understands the principles he assails."

It appears to us that Professor Cairnes has yet something to learn of the nature of the doctrine he has undertaken to maintain, as well as something of the method of treating Political Economy in the spirit of Inductive Science. At all events, we have, we think, done enough to obtain a notice from Professor Cairnes of our "arguments" in refutation of the doctrine, which he may see under *COST OF PRODUCTION*.

Professor Cairnes calls us "sciolists and smatterers, who may always be expected to wrangle." It may be so; but our opinions in Political Economy coincide with those of Socrates, Aristotle, Burke, Samuel Bailey, Whately, Bastiat, and Chevalier, and that must console us for being under the censure of Professor Cairnes.

CALONNE, CHARLES ALEXANDRE DE,

was the son of the President of the Parliament of Douay, and was born there on the 20th January, 1734. His father destined him for the same profession as that in which he had acquired considerable distinction. He was early advanced to the office of *avocat-général* before the principal court

of Artois, and soon afterwards to that of *procureur-général* before the Parliament of Douay. In 1763, he was made master of requests before that Parliament, and in 1768 intendant of Metz. His talents for administration procured him advancement to the more important province of Lille. He was possessed, to a very eminent degree, both of the solid capacity for business, and of the dazzling brilliancy of conversation and manner, which were peculiarly suited to gain him influence with women, who were then so powerful at Paris. By this means he enlisted in his favor the interest which procured him his next appointment.

Turgot and Necker had successively endeavoured to stem the growing deficiency in the finances. But their measures of reform were distasteful to the greedy and selfish courtiers, and they had been driven from power. Necker had retired in 1781, and two short ministries succeeded him. At last, in October, 1783, matters became serious, and the women raised a cry, that Calonne was the only man who could save the country. M. D'Harvelay, the banker to the Court, whose wife was the *very* intimate friend of Calonne, strongly urged his nomination on the king. Calonne was distasteful to the king and queen from his character, and he was very unpopular with the public from some unfair conduct he had been guilty of with regard to some other officials. But the influence of the ladies was irresistible, and he was appointed *Contrôleur Général*, or Prime Minister, on the 3rd October, 1783.

The former ministers had fallen from the unpopularity they created by their attempted retrenchments. Calonne tried the opposite course. When he came into office things were certainly desperate. The whole sum in the treasury was £48. His credit with the financiers enabled him to raise loans, though at heavy interest. While Turgot and Necker had endeavoured to reduce the expenditure, and thus raised themselves hosts of enemies, Calonne determined that every one should be gratified. A succession of public fêtes pleased the populace, and public works were set agoing to employ the workmen; though as one of them was a custom-house wall round Paris, the citizens were not particularly well pleased. The great docks at Cherbourg were commenced, which roused the jealous vigilance of Burke, and which have only just been completed in our own day. The least consideration will shew that this expenditure was of the most mischievous nature, as it was all unproductive, and should only have been incurred out of an overflowing income, and not out of a deficient one. The king and queen were conciliated by the purchase of a palace for each. And when the latter expressed a wish to him, he gallantly replied, "If it is possible, it is done; if it is impossible, it shall be done." To his lady friends he sent *bons-bons* wrapped up in Bank notes. For some time every one was dazzled with the lavish expenditure, which was, in fact, only hurrying the State faster into the abyss.

Nevertheless Calonne never concealed the reality from himself, nor from the King. He frankly told the King that the State was only supported by trickery, and borrowing 100 millions a year. The financiers, of course, were not so easily blinded as the people, and loans

became increasingly difficult to raise. Calonne saw that the bubble must soon burst, and he laid a paper before the King in 1785, containing a scheme of the most startling audacity. He proposed an entire reform of the monarchy. He proposed that all the provinces should be assimilated, in their laws; that all custom-houses between them should be abolished; that each should have a representative assembly; that all exemptions from taxation should be abolished; that the *taille* and the *gabelle* should be diminished, the price of salt lowered, and the *corvée* abolished. To carry out this *revolution*, the *Notables* were to be summoned. The state of affairs was to be laid before them without concealment or disguise, and they were to be invited to make a sacrifice of their exclusive privileges, and surrender their exemption from taxation, for the public good. By these means, Calonne proposed to make an entire reform of the taxation, and he calculated that the income would be made to equal the expenditure, and the State brought out of all its difficulties.

We are at a loss to conceive whether this was the last struggle of a desperate gamester, or the counsel of a profound statesman. It seems clear that the plan proposed would have extricated the State from its embarrassments, and would have saved the Monarchy. But with the examples of Turgot and Necker before him, was he so ignorant of the intense selfishness of the aristocracy as to suppose that they would ever agree to such proposals? Even if the *Notables* did agree to them, how could they give the force of law to such a fundamental change in the laws of the kingdom?

The impending proposals were secretly discussed between the king and only two or three of the ministry during 1786. The Queen even was kept in the dark. At last, on the 29th December, 1786, the public were taken by surprise by a decree summoning the *Notables* to meet at Versailles on the 29th January, 1787.

When the day came, the *Notables* met at Versailles, but there were no preparations made to receive them. This irritated them. At last, on the 22nd of February, a meeting was held. The measure being adopted, it must be allowed that Calonne carried it out with unflinching courage. The state of the kingdom was laid before them in all its appalling danger. He gave them a history of the finances for the preceding 40 years. The false disguise of prosperity in which they had been wrapped by successive ministries was stripped off. In 1764, the annual deficit was already 40 millions; in 1781, it had increased to 56 millions, at the time when Necker had published a statement shewing a surplus of 10 millions. During this time, loans had been continually contracted, and no provision had been made for paying them off. Between 1776 and 1786, loans had been contracted to the amount of 1,250 millions, which no provision had been made to redeem. In the current year the deficiency was not less than 125 millions. Calonne having thus laid the critical circumstances of the country before the assembly, brought forward his plans of reform.

If a volcano had suddenly opened in the centre of Paris, it could scarcely have caused greater terror and consternation, than the *exposé* of Calonne. The financial statements countersigned by so many ministers for so many years, were

now shewn to be so many impostures. The *notables* were furious at the demand upon them to give up their privileges. A universal storm burst out, headed by Necker's friends. Calonne was driven from power. The last chance of saving the country was thrown away, and thenceforth France rushed headlong into the revolution, which soon swept away king, *notables*, aristocracy, church, privileges and all.

In August, 1787, the Parliament ordered their *Procureur-Général* to institute a prosecution against the fallen minister for malversation in office. But gay and jesting to the last, he leisurely retired through the provinces, first to Flanders, and then to England.

He still continued in the confidence of the king, and in 1791 he drew up a plan for the invasion of France by the united powers of Europe, to deliver the Royal Family from the thralldom in which they were kept by the republican party. He strongly opposed the flight of the king, which could only destroy the royalist and constitutional party.

In 1792, the situation of the king became daily more painful, and Calonne warmly urged on the advance of the allied armies to Paris, to deliver him. In July, he, with the Marquis Lemon, drew up that fatal proclamation which was published by the Duke of Brunswick, which gave so great an advantage to the most violent party by making them appear the most patriotic, and which undoubtedly hurried on the destruction of the king.

Calonne lived in England till 1802, and published several pamphlets, which are of great use in explaining the financial condition of France. Napoleon permitted him to return to France, where he died one month afterwards, on the 30th October, 1802.

Besides several memoirs addressed to the king, of great historical interest, Calonne published—

Correspondence de Necker et de Calonne. 1787.

Requête au Roi. London, 1787.

Réponse de Calonne à l'écrit de Necker. London, 1788.

Lettre de Calonne au Roi. 1789.

Seconde lettre de Calonne au Roi. 1789.

Observations sur les finances. London, 1790.

Esquisse de l'état de la France. 1791.

Des finances publiques de la France. London, 1797.

CALVERT, JOHN W.

The merits and tendencies of Free Trade and Protection respectively investigated, and measures of amendment suggested. London, 1850.

CALVERT, ROBERT. M.D.

An exposition of the laws of Social Economy. London, 1831.

CALVIN, JEAN. This celebrated divine may be cited as one of the first persons, if not the first, who saw through the folly of the universal prejudice against the imaginary crime of usury. He was born at Noyon, in Picardy, on the 10th July, 1509, and died on the 27th of May, 1564.

The question of the lawfulness of usury was

submitted to his judgment, and we give an abstract of his reply, as it is the first instance we know of common sense having been brought to bear on the question, and it will be seen how he anticipated Bentham's line of argument. (*Epistole, Responsa. Geneva, 1575, p. 355*).

On the question of the lawfulness of usury being submitted to him, he replies that it is not entirely condemned in any part of Scripture. The sense of the precept of Christ (Luke vi.) had been perverted. The law of Moses was political, and not to be stretched beyond what men and equity would bear. There were, indeed, certain passages of Scripture in which the Holy Spirit inveighs against usury. As in Psalm lv., 12, he describes a wicked city, where usury was practised in public. But, in fact, the Hebrew word meant *fraud* in general, and could not be applied to usury. It is true that usury was mentioned by name, by the writer, but that was because fraud and cruelty so often accompanied it. Ezekiel, it is true, goes further (xxii., 12), and specifies usury as one of the crimes which had kindled the wrath of God against Israel; but he uses two words, one of which means usury, and is derived from the same root as signifies to *devour*, and the other means increase or addition.

He shews that the Jewish laws and polity were adapted to the Jews only, and that modern society in no way resembles the condition of the Jews, to whom usury was forbidden.

He treats the reasons of St. Ambrose and Chrysostom as of very slight weight, and then says:—

“Money does not beget money! What does the sea? What does a house, for the letting of which I receive a rent? Does money truly grow from the roof and walls? But the land also produces, and something is brought from the sea which afterwards produces (or draws forth; *PRODUCTION*) money, and the convenience of a house may be bought or exchanged for a certain sum of money. If, therefore, more profit can be made by trading, than from the produce of any farm, is he who has let some barren farm to an agriculturist to be allowed to receive rent and profit, and another man not to be allowed to receive profit from money? And if any one buys a farm with money, does not that money generate money every year? You would allow that the profit of the merchant comes from his diligence and industry. Who doubts that unemployed money is useless? Or that he who asks a loan from me does not intend to keep it idle when he has got it? Now, in truth, that profit does not arise from the money, but from the produce. These reasons, therefore, are somewhat subtle, and have some plausibility; but when they are fully weighed, they fail. I therefore conclude that we are not to judge of usury by any particular passage of Scripture, but only by the law of equity. This will be clearer by an example. Let us suppose some wealthy man with large possessions in farms and rents, but not much money. Suppose another man, not so rich, nor of such large possessions as the first, but yet having more ready money. The latter being about to buy a farm with his own money, is asked for a loan by the wealthier man. He who makes the loan may stipulate for a rent for his money, and that the farm shall be mortgaged to him until the principal is repaid; but until it is repaid, he will be content with the profit or

usury. Why, then, shall the first contract without a mortgage, but only for the profit of the money, be condemned, when the much harsher one of the annual rent, with a mortgage of the farm, is approved? And what else is it than to treat God like a child when we judge of things by mere words, and not from the nature of the thing itself? As if virtue and crimes could be perceived from the form of the words!”

No one can but admire the daring good sense of this argument in the mouth of a divine, in defence of what was then considered one of the worst crimes men could be guilty of, and be amazed that these arguments made scarcely any impression, even in Protestant England, for upwards of 200 years!

CAMBACERES, JULES.

De la corvée, et de la prestation en nature. Paris, 1848.

CAMBON, JOSEPH, born at Montpellier, the 17th June, 1756. He was a merchant there, when the revolution broke out. He adopted its principles warmly, and in 1791 caused the republic to be proclaimed in his native town. He was sent as its representative to the legislative assembly in September, 1791. He devoted himself specially to the finances. In August, 1793, he was elected President of the Assembly; and in 1794 he addressed to it his report on the finances, and brought forward the plan for the great book of the public debt. He was minister of finance during the period of the Assignats (*ASSIGNATS*). He escaped with difficulty with his life during the reign of terror, and retired for a while from public life in 1795. In 1815 he was elected a member of the Chamber of Representatives; but, being excluded from the amnesty of 1816, he took refuge in Belgium, and died near Brussels, 15th February, 1820. His writings are very numerous.

Sur les Assignats. Paris, 1793.

Rapport à la convention nationale sur le projet de la formation du grand livre. Paris, 1795.

Lettres à ses concitoyens sur les finances. Paris, 1796.

CAMBRELENG. A member of the House of Representatives in the United States.

An examination of the new tariff proposed by the Hon. Henry Baldwin, by one of the people. New York, 1821.

Report of a committee of the House of Representatives, on the 8th of February, 1830, on commerce and navigation. New York, 1830.

CAMPANELLA, TOMMASO. One of the great leaders of the revolt of the human mind against the despotism of Aristotle and the schoolmen, was born the 5th September, 1568, at Stilo, a small town in Calabria. He was early distinguished for extraordinary precocity, and at 14 entered a convent of the Dominicans. He was devoted by the love of study, and in a marvellously short space of time mastered Thomas Aquinas, Albertus Magnus, and the other commentators on Aristotle. Having thus learnt all they had to say, he was profoundly convinced of the utterly unsatisfactory nature of the School philosophy, and immediately began to proclaim

war against it. His master having undertaken to maintain a public discussion at Cosenza, was taken ill, and the monks of the convent invited Campanella to take his place. Campanella declared that philosophy was not to be learnt from authority or from books, but from nature alone. His audience were astonished, and declared that he had imbibed the spirit of the great Telesio. Not having previously heard of that philosopher, he obtained his work, and became a disciple of his doctrine. In 1591, in his 24th year, he published his first work, *Philosophia sensibus demonstrata*, at Naples. This created such a fury among the partisans of the schoolmen and Aristotle, that an old man accused him of magic, and he was obliged to fly. He visited Rome, Florence, where he refused an offer of a Professorship in the University of Pisa, from the Grand Duke Ferdinand, and settled for several years at Padua, in the Venetian territory. Everywhere he denounced the doctrine of Aristotle, and published several works against him. After some years he returned to Stilo. In 1599, an immense conspiracy was formed against the abominable Spanish government of Naples. Hundreds of monks and country gentlemen were involved in it, and Campanella was denounced as one of the chiefs. He was siezed and carried to Naples, where he was thrown into prison, and kept there 27 years, notwithstanding several efforts made by the Pope for his release. He was put to the torture seven times. At length in 1626, after the death of Phillip III, he was released on the earnest request of Pope Urban VIII, who claimed him as a prisoner to the Inquisition, on a charge of heresy. He was removed to Rome, and kept there in a nominal custody. He acquired great influence with the Pope, but the inveterate hostility of the Spanish agents, and the schoolmen still pursued him, and made it unsafe for him to continue there any longer.

In 1634, he escaped in disguise from Rome, in the suite of the Comte de Noailles, the Ambassador of Louis XIII, who was his intimate friend. He fled to France, and visited Peiresc and Gassendi. Richelieu protected him, and Louis XIII conferred on him a pension of 2,000 livres a year. Broken down with his long sufferings, he retired to a convent of his order in the Rue St. Honoré, afterwards the celebrated Jacobins, and after returning from a visit to Descartes in Holland, he died 21st May, 1639.

Campanella, like many other ingenious philosophers, devised a scheme for an Utopian Republic framed on the most extreme communistic principles, it is called *Civitas Solis poetica. Idea Reipublicæ Philosophicæ*. This work describes an imaginary republic; we have given some account of it under **SOCIALISM**.

CAMPBELL, D. FORBES.

Translation of Remarks on the Production of the precious metals. By Michael Chevalier. London, 1853.

CAMPBELL, JOHN, born at Edinburgh in 1708; died at London in 1775.

The true interest and political maxims of the Republic of Holland. By John De Witt. London, 1746.

Candid and impartial consideration of the nature of the Sugar Trade. London, 1764.

A political survey of Britain; being a series of reflections on the situation, lands, inhabitants, revenues, colonies, and commerce of this island. London, 1774.

CAMPOMANES, DON PEDRO RODRIGUEZ, one of the most celebrated men whom Spain produced in the last century, was born in the Asturias, in 1723. He was famous for the most varied accomplishments, and for the extraordinary number of languages with which he was familiar, comprising most of the European ones, and Arabic. He raised himself to the highest offices in the State by his own merit. He had acquired the reputation of being the ablest and most upright lawyer in Spain, when Charles III. appointed him his advocate before the Royal Supreme Court of Castille. His works gained him the highest celebrity in Europe; but what most concerns us, that he was a most ardent and enlightened Economist. He pointed out the fatal dependence of Spain on the mines of Mexico and Peru. He maintained that the true power of Spain was in herself, in Europe. He earnestly advised that all burdens on industry should be removed, that foreign and domestic commerce should be managed in a liberal and enlarged spirit. He pointed out the immense evils to the State of so much land falling into the hands of the clergy, and being kept inalienable in mortmain. He advocated the entire freedom of trade in corn, and the suppression of mendicity.

All this was done many years before the *Wealth of Nations* was published.

He was appointed President of the Cortes, Director of the Royal Academy of History, and Minister of State. But when Count Florida Blanca was appointed minister, he was deprived of all his offices. He died in 1802.

Discurso preliminar sobre la marina, navegacion, comercio, y expediciones de la republica de Cartagena. Madrid, 1756.

Respuesta fiscal, sobre abolir la tasa y establecer el comercio de granos. Madrid, 1764.

CAPEFIGUE, BAPTISTE HONORE RAYMOND.

Histoire des grandes opérations financières, banques, bourses, emprunts, &c. Paris, 1855.

CAPITAL.—This word is one of the great fundamental conceptions, upon the true settlement of which, a permanent Science of Political Economy is built.

2. It has been the too common practice hitherto in Political Economy for writers to treat the notion of arriving at scientific conceptions with neglect, if not with positive contempt. And it has been very common with them, either to begin with no definitions at all, or with such as are merely arbitrary, and not subjected to the laws of Inductive Logic.

3. But this is a very grievous error. Conceptions are not arbitrary, but they are founded in nature. There is nothing more admirable in Bacon than the earnestness and emphasis with which he enforces the doctrine that conceptions, notions, or definitions, are to be settled and ascertained by the very same process of induction that axioms, or general principles, *axiomata*, are.

4. And every great philosopher since has enforced the same doctrine. Thus the book in Locke's essay, which is generally admitted to be the most useful, is devoted to the very purpose of maintaining the necessity of accurate conceptions. Locke is fully of opinion that other sciences besides the mathematical, may be raised to the rank of exact sciences, by following the same course as has been pursued in them, namely, by an accurate investigation and settlement of their fundamental conceptions, and always using them in the same sense. Moreover he has remarked that it is not possible to arrive at general laws without a proper settlement of conceptions.

5. This truth is fully acknowledged by the cultivators of every Physical Science, and any one who is conversant with their history knows perfectly well that their early stages were full of vehement controversies about definitions, or conceptions. And it is just because their cultivators recognized this, and devoted all their energies to obtain true conceptions, that they have since made such wonderful progress, and that those who cultivate them are all agreed about them, and consequently their united efforts advance the science.

6. But Economists alone of all the cultivators of any science, have systematically despised this indispensable labor. And the result is just what might have been expected. Instead of being unanimous, and all employed in advancing the Science, they are at present very much employed in combatting one another; and we believe we may say with perfect truth, that there is not a single fundamental conception in Political Economy about which its cultivators have come to a unanimous agreement. And consequently, if they cannot agree about the meanings of terms, how is

it possible that they can ever agree in any general proposition whatever? True Conceptions are the foundation of true general laws.

7. In treating of the word Capital we shall not commence by laying down any arbitrary definition of it. We shall endeavour to make the conception the result of the investigation. The business before us is to discover the origin of the term, and the meaning attributed to it by those who used it first, and then to follow the current of usage down to the present time.

8. But we are by no means bound to adopt all that these writers may have said about it. Because it may possibly happen that some of them may have had no very clearly defined conception of it themselves. They may have mixed up accidental circumstances with essential ones, and have given the former undue prominence, so as to have obscured the fundamental idea.

9. Our business is, therefore, to consider what things the originators of the term applied it to, and why they applied it to them, to eliminate all accidental ideas, and to discover that *one* fundamental idea, which alone it is permitted to generalize.

10. And here let us lay down two Canons, which will be found to be of very extensive utility in the formation of Economical Conceptions and Axioms.

I. The fundamental Conceptions and Axioms of any Science must be perfectly general.

II. No general Conception, and no general Axiom, must contain any element involving more than *one* fundamental idea.

The truth of this is manifest, because if any element involves two or more ideas, it is qualified, and therefore it limits the generality of the conception, or the axiom, which is contrary to the first canon.

11. To exemplify the truth of this, let us take the definition or conception of force in Mechanics.

Force is any cause which produces, or tends to produce, motion.

This definition is perfectly general. It does not say force is any material, or corporeal, cause, but *any* cause, corporeal or incorporeal, and it is perfectly well known that an immense part of mechanical force is incorporeal, which can neither be seen, nor handled, but yet may be MEASURED.

So in Algebra, a quantity is anything that may be MEASURED, whatever its nature.

Now as an example of a conception of similar generality in Political Economy, let us take Aristotle's definition of Wealth (ARISTOTLE).

"We call wealth all (things) whose value is measured in money." In this we see that the term "wealth" fully answers the canon above stated. It is perfectly general. It does not say something corporeal, but anything.

But even this definition may be shortened, for the words "in money" are superfluous. Money, indeed, is the usual measure of value among civilized nations, but yet the value of things may be measured in other things, without money. Hence we may define Wealth thus,

Wealth is everything whose value may be measured.

By this means we obtain a conception of the same generality as those of physical science. And this is the standard to which all conceptions in Political Economy must be brought, before they

can be received as satisfactory, or fitted to form the basis of a science. Nor will any one familiar with the conceptions of Physical Science accept any of a less degree of generality.

12. But this degree of generality is only to be obtained by bestowing the same care, and by proceeding in the same manner, as is done to obtain general laws, or axioms. And the formation of conceptions is governed by exactly the same laws of Inductive Logic, as the formation of axioms. Moreover, having obtained the conception inductively, we must then proceed deductively, and discover all the classes of cases to which it is applicable. By this means only can the limits and the extent of the subject be defined.

13. We shall now trace the word Capital from its origin, through different languages, till we come to our own.

The words Principal, and Capital, come to us from the Greek *ἀρχαίον*, and *κεφάλαιον*, which both mean the same thing, namely, a principal, or capital, sum of money placed out at interest.

Thus Plato *de Legg* : v. 742—

Μὴ ἀποδιδόναι τῷ δανεισαμένῳ μήτε τόκον μήτε κεφάλαιον.

Not to return to the lender either the interest or the capital.

So *Æschines* against *Ctesiphon*, lxviii. 26,—

Καὶ τόκον ἤνεγκαν Δημοσθέει τοῦ δωροδοκῆματος δραχμὴν τοῦ μηνὸς τῆς μνᾶς, ἕως τὸ κεφάλαιον ἀπέδοσαν.

And they brought the interest of the bribe, namely, a drachma by the month for every mina, until they paid the capital.

So *Demosthenes*, p. 834, 5,—

Τῆς δέμου οὐσίας ὅλον τὸ κεφάλαιον ἀνηρήκασιν. They took away all the capital of my property.

So *Plutarch*, *Fabius*, c. 4,—

Τοῦτο τὸ κεφάλαιόν ἐστιν, ὅκτω μυριάδες δραχμῶν.

This is the capital, 80,000 drachmas.

So *Acts* xxii. 28,—

Ἐγὼ πολλοῦ κεφαλαίου τὴν πολιτείαν ταύτην ἐκτησάμην.

I bought this freedom for a great sum.

So *Chrysostom* says,—

Καὶ τὸ κεφάλαιον σὺν τόκῳ ἀνήλωσα.

And I spent the capital and the interest.

So, *Artemidorus*, l. 18. *Τὰ χρήματα κεφάλαια καλεῖται.* Money is called capital.

So, *Suidas* says, *Κεφάλαια, τὰ χρήματα.* Capital, money.

And in *Byzantium's* modern Greek Dictionary. *Κεφάλαιον; ἡ τοκισμένη ποσότης.* *Ἰταλ. τὸ καπιτάλε.* Capital, a quantity of money put out to interest. *Italian, capital—οἱ τόκοι υπερβαίνουν τὸ κεφάλαιον.* The interest exceeds the capital. —*ἔδικλίσασε τὰ κεφάλαια του.* He has doubled his capital.

Thus we see that in all these passages the word *κεφάλαιον* is applied to a sum of money, usually put out to interest, or invested for profit.

And *Stephens*, in his *Thesaurus*, defines the word thus—*κεφάλαιον*, caput, unde fructus, et reditus, manat. Capital, the source whence any profit, or rent, flows.

Now, a sum of money put out to interest is a special application of the general idea; and if we want to generalize it, we may say that it is an Economical Element applied to the purposes of profit.

14. We have not found any passage in which the word *κεφάλαιον* is used metaphorically in Greek for a source or fountain in general. But in Latin the word *caput* is constantly used, not only as a sum of money put out to interest, but as the source, or fountain, whence things spring.

Thus in Livy, VI. 15. "*De capite deducite, quod usuris pernumeratur.*"—"Take away from the Capital what is counted as interest."

Also VI. 36. "*Promulgare legem de ære alieno, ut deducto eo de capite, quod usuris pernumeratur esset.*"—"They published a law of debt, that all that was reckoned as interest should be deducted from the capital."

So, Horace, *Sat. I. 2, 14.* "*Quinas hic capiti mercedes exsecat.*"—"He squeezes out five times the usual interest for his capital."

In these places *caput* is used strictly as applied to money put out to interest, for which sors is often used.

But it is also constantly used as the source or origin of anything. Thus, in Plautus, *Curculio*, II. 1. 19; *Pseudolus*, I. 5. 31; *Rudens*, IV. 4. 34. "*Scelerum caput.*"—"O source, or fountain, of crimes"

Rudens, IV. 4. 55. "*Perjuri caput.*"—"O fountain of perjury."

Cicero, *Pro Plancio*, c. 23. "*Neque ego, si fontem maledicti reperietis, aut aut negligetis, aut dissimuletur, unquam postulabo; si quid sine capite manabit, aut si quid, &c.*"—"Nor will I, if ever you can discover the source of a calumny, ever ask you to neglect, or conceal it, if any spring up without an origin, &c."

And this metaphorical use of *caput* is common among the writers of *re rusticæ*, as the source, or root, of a plant. Thus, Cato, c. 51. "*Hæc omnia a capite propagari eximique oportet.*"—"All these must be taken and propagated from a root."

Also, c. 36. "*Capita majora.*"—"The greater roots."

Also, c. 33. "*Capita vitium per sementim ablaqueato.*"—"Dig about the roots of the vines at seedtime."

In Columella, *caput* is used for capital generally. Thus, XI. 1. 28. "*Ut et jacturam capitis amissi restituat.*"—"So as to restore the waste of lost capital"

A very common use of *caput* is the source or fountain whence a stream or river flows.

Thus, Palladius, *Aug. 8. 7.* "*Puteum fodies, et aquæ caput requies.*"—"Dig a well, and seek a spring of water."

15. In classical Latin we do not find that the word *capitale* was used in this sense, but it is in mediæval Latin. Thus we read in Ducange—

CAPITALE.—*Debitæ pecuniæ caput.* Papias, *capitale, caput pecuniæ*; and it is said to be equivalent to *sortes*, a usual Latin word for the capital of a sum lent, and he quotes several instances in which the word is used by mediæval writers in this sense.

In process of time this word was shortened into *capitale*, which was particularly applied to flocks and herds, because that was the principal

wealth. Hence by corruption, come our words *cattle*, applied to beasts, and *chattels* applied to things.

16. In Italian we find in the Dictionary of the *Accademici della Crusca*,

"*Capitale; la sorte principale, il fondo, e ancora quella quantità di danari, che pongono i mercatanti in su i traffichi, che si dice anche corpo.*"

"Capital; the principal sum, the fund, and also that quantity of money which merchants place in their business, which is also called *corpo*."

Thus in Latin, in mediæval Latin, and in Italian, the word *Capital* was originally applied to money put out at interest, or invested for profit, and it was then metaphorically applied to other things.

17. In French, the usage is the same. The Dictionary of the French Academy, 6th edition, 1835, says,—

Capital employé substantivement signifie le principal d'une dette, d'une rente. Il a payé les intérêts mais il doit encore le capital. Le capital d'une rente perpétuelle devient exigible en cas de faillite du débiteur.

Il se dit aussi d'un fond commercial des sommes que l'on fait valoir dans quelque entreprise.

Capitaliste; celui, ou celle, qui a des capitaux, des sommes d'argent considérable, et qui les fait valoir dans les entreprises de commerce, d'agriculture, de manufacture, ou de finance.

Hence the general idea is, that it is a source from which some profit springs.

18. Let us now see what the principal Economists say about the word.

Turgot, *Sur la formation et la distribution des Richesses*, § xxxi, introduces the word. "*Ce moyen consiste à vivre de son Capital, ou plutôt de l'intérêt qu'on en tire en le prêtant.*"

Where it evidently means money put out to interest. But at § lix, he gives rather a different meaning.

"*Quiconque, soit par le revenu de sa terre, soit par les salaires de son travail, ou de son industrie, reçoit chaque année plus de valeurs qu'il n'a besoin d'en dépenser, peut mettre en réserve ce superflu, et l'accumuler: ces valeurs accumulées sont ce qu'on appelle un capital.*"

He then shews how this capital in money may be invested in anything, such as an estate in land, "*il est absolument indifférent que cette somme de valeurs, ou ce capital, consiste en une masse de métal, ou en toute autre chose, puisque l'argent représente toute espèce de valeur, comme toute espèce de valeur représente l'argent. Le possesseur d'un capital peut donc d'abord l'employer à acheter des terres.*"

Thus Turgot introduced the notion of capital being the fruit of the accumulation of anterior labor. Primarily money, and then any other things, such as farms, or fonds de terre, or merchandise, and he says, &c., "*Nous avons vu que l'argent n'entre presque pour rien dans la somme totale des capitaux existants, mais il entre pour beaucoup dans la formation des capitaux. En effet, presque toutes les épargnes ne se font qu'en argent; c'est en argent que les revenus sont payés aux propriétaires, que les avances et les profits rentrent aux entrepreneurs en tout genre; c'est donc de l'argent qu'ils épargnent, et l'accroissement annuel des capitaux se fait en argent,*

mais tous les entrepreneurs n'en font d'autre usage que de le convertir sur-le-champ dans différentes natures d'effets, sur lesquels roule leur entreprise; ainsi cet argent rentre dans la circulation; et la plus grande partie des capitaux n'existent qu'en effets de différentes natures."

19. Adam Smith, *Wealth of Nations*. Book II, chap. I, says: "When the stock which a man possesses is no more than sufficient to maintain him for a few days, or a few weeks, he seldom thinks of deriving any revenue from it. He consumes it as sparingly as he can, and endeavours by his labor to acquire something, which may supply its place, before it be consumed altogether. His revenue is, in this case, derived from his labor only. This is the state of the greater part of the labouring poor in all countries."

"But when he possesses stock sufficient to maintain him for months, or years, he naturally endeavours to derive a revenue from the greater part of it, reserving only so much for his immediate consumption, as may maintain him till this revenue begins to come in. His whole stock, therefore, is divided into two parts. That part which he expects is to afford him this revenue is called his CAPITAL. The other is that which supplies his immediate consumption, and which consists either, first in that portion of his whole stock which was originally reserved for this purpose; or secondly, in his revenue from whatever source derived, as it gradually comes in; or thirdly in such things as had been purchased by either of these in former years, and which are yet not entirely consumed, such as a stock of clothes, household furniture, and the like."

Thus Adam Smith fully shews that he considers capital to be an economic element employed in a particular way, and his description certainly implies the necessity of anterior accumulation. We shall see further on what he includes under the title of capital.

20. We shall next take J. B. Say, who says, *Traité d'économie politique*, p. 68. Edit. Guillaumin.

"En continuant à observer les procédés de l'industrie, on ne tarde pas à s'apercevoir que seule, abandonnée à elle-même, elle ne suffit point pour créer de la valeur aux choses. Il faut de plus, que l'homme industrieux possède des produits déjà existans, sans lesquels son industrie, quelque habile qu'on la suppose, demeurerait dans l'inaction. Ces choses sont:—

"1. Les outils, les instruments des différens arts. Le cultivateur ne saurait rien faire sans sa pioche, ou sa bêche, le tisserand sans son métier, le navigateur sans son navire.

"2. Les produits qui doivent fournir à l'entretien de l'homme industrieux, jusqu'à ce qu'il ait achevé sa portion de travail dans l'œuvre de la production. Le produit dont il s'occupe, ou le prix qu'il en tirera, doit, à la vérité, rembourser cet entretien, mais il est obligé d'en faire continuellement l'avance.

"3. Les matières brutes que son industrie doit transformer en produits complets. Il est vrai que ces matières lui sont quelquefois données gratuitement par la nature; mais le plus souvent elles sont des produits déjà créés par l'industrie, comme des semences que l'agriculture a fournies, des métaux que l'on doit à l'industrie du mineur, et

du fondeur, des drogues que le commerçant apporte des extrémités du globe. L'homme industrieux que les travaux, est de même obligé de faire l'avance de leur valeur.

"La valeur de toutes ces choses compose ce qu'on appelle un *capital productif*."

"Il faut encore considérer comme un capital productif la valeur de toutes les constructions, de toutes les améliorations répandues sur un bien-fonds, et qui en augmentent le produit annuel, la valeur des bestiaux, des usines, qui sont des espèces de machines propres à l'industrie."

"Les monnaies sont encore un capital productif toutes les fois qu'elles servent aux échanges, sans lesquels la production ne pourrait avoir lieu. Semblables à l'huile qui adoucit les mouvemens d'une machine compliquée, les monnaies, répandues dans tous les rouages de l'industrie humaine, facilitent des mouvemens qui ne s'obtiendraient point sans elles."

21. J. B. Say was one of the first of modern Economists to maintain that immaterial products are within the domain of Political Economy. At page 123, he says,—

"Un médecin vient visiter un malade, observe les symptômes de son mal, lui prescrit un remède, et sort sans laisser aucun produit que le malade ou sa famille puissent transmettre à d'autres personnes, ni même conserver, pour la consommation d'un autre temps."

"L'industrie du médecin a-t-elle été improductive? Qui pourrait le penser? Le malade a été sauvé. Cette production était-elle incapable de devenir la matière d'un échange? Nullement, puisque le conseil du médecin a été échangé contre ses honoraires; mais le besoin de cet avis a cessé dès le moment qu'il a été donné. Sa production était de le dire; sa consommation, de l'entendre; il a été consommé en même temps que produit."

"C'est ce que je nomme un *produit immatériel*."

"L'industrie d'un musicien, d'un acteur, donne un produit du même genre; elle vous procure un divertissement, un plaisir, qu'il vous est impossible de conserver, de retenir, pour le consommer plus tard, ou pour l'échange de nouveau contre d'autres jouissances."

Say says, that Adam Smith denies the name of products to such things, and classes the labor employed in them as unproductive. Say dissents from this, and maintains it is truly productive. He says, "Je ne trouve pas raisonnable de prétendre que le talent du peintre soit productif, et que celui du musicien ne le soit pas."

However, though Say maintains the existence of these immaterial products, at p. 125 he denies them the name of Capital.

"De la nature des produits immatériels, il résulte qu'on ne saurait les accumuler, et qu'ils ne servent point à augmenter le capital national. Une nation où il se trouverait une foule de musiciens, de prêtres, d'employés, pourrait être une nation fort divertie, bien endocrinée, et admirablement bien administrée; mais voilà tout. Son capital recevrait de tout le travail de ces hommes industrieux aucun accroissement direct, parce que leurs produits seraient consommés à mesure qu'ils seraient créés."

And in the epitome at the end of the work, p. 569, he says,—

"CAPITAL. Somme des valeurs employées à

faire des avances à la production. Ces valeurs, qui sont originairement le fruit de l'industrie aidée de ses instrumens, ne se perpétuent, et ne forment un fonds *productif* permanent, qu'autant qu'elles sont consommées reproductivement. Du moment que, soit par l'amour des jouissances présentes, soit par l'impéritie de l'*entrepreneur*, qui les emploie, elles ne renaissent pas dans d'autres produits, le capital est dissipé, en tout ou en partie.

"Tont capital transmissible est composé de *produits matériels*; car rien ne peut passer d'une main dans une autre, sinon des matières visibles. Un crédit ouvert, des effets de commerce, ne sont que des signes des valeurs matérielles actuellement possédées par celui, qui les cède, pour un temps, ou pour toujours, à celui qui les accepte."

We must request the especial attention of our readers to these extracts; Say maintains that immaterial products are not capital because they are not capable of accumulation; and he says that all capital must be material, because nothing but something *material* can be transmitted from hand to hand.

22. In his *Cours complet d'économie politique*, Vol. I. p. 91, in again censuring Adam Smith for excluding immaterial products, he says, "La science et le talent d'un médecin, d'un chirurgien, d'un professeur, ne sont-ils pas des capitaux acquis et qui donnent un revenu? Les leçons orales qu'ils ont reçues, n'étaient cependant attachées à aucun produit matériel."

At p. 130, he says,—

"Or, Messieurs, les fonctions d'un capital sont de fournir la valeur de ces avances; de se laisser consommer pour renaître sous d'autres formes; de se laisser consommer de nouveau pour renaître encore; et ainsi de suite éternellement, pourvu que la même valeur capitale soit assez habilement employée pour renaître constamment, et pour être réemployée d'une matière productive. En moins de mots, un capital est un somme de valeurs consacrées à faire des avances à la production."

Now, how can this be a necessary duty of capital, when Say admits that money may be used as capital? Money is not destroyed, which he means by *consommer*.

At p. 137, he says,—

"La nature des capitaux, la nature de leurs fonctions, nous découvrent des vérités assez importantes. L'une d'elles est que les capitaux productifs ne consistent point en valeurs fictives et de convention, mais seulement en valeurs réelles et intrinsèques, que leurs possesseurs jugent à propos de consacrer à la production. En effet, on ne peut acheter des services productifs qu'avec des objets matériels, ayant une valeur intrinsèque; on ne peut amasser en capitaux et transmettre à une autre personne que des valeurs incorporées dans les objets matériels." And yet, in a note to this passage, he says, "Il y a des capitaux qui ne sont pas incorporées dans les choses matérielles, comme la clientèle d'un notaire, d'une entreprise commerciale; mais cette portion de capital est une valeur très réelle, et non pas seulement un signe comme ceux qui, selon certaines personnes, peuvent remplacer les capitaux."

And at page 531 of the same volume he says,—

"Il faut comprendre parmi les capitaux plu-

sieurs biens qui ont une valeur, quoiqu'ils ne soient pas matériels. Le cabinet d'un avocat, d'un notaire, la chalandise d'une boutique, la réputation d'une enseigne, le titre d'un ouvrage périodique, sont incontestablement des biens; on peut les vendre, les acquérir, en faire l'objet d'un contrat; et ce sont des biens capitaux parceque ce sont les fruits accumulés d'une industrie. Un avocat, par la sagesse de ses avis, par son assiduité et ses autres qualités, a fait concevoir au public une bonne opinion de son cabinet; cette bonne opinion lui donne droit à de plus forts honoraires; ce supplément de profit est le revenu d'un capital appelé *réputation*; et ce capital est le fruit des soins, et des peines, que l'avocat a pris pendant plusieurs années."

23. We must beg our readers to observe the astounding self-contradiction contained in these passages. In the former ones he denies that immaterial products are capital, or that anything but material products can be accumulated, and transmitted from hand to hand. In the latter, he maintains that these immaterial products are capital, that they are the fruit of accumulated industry, and that they may be transferred from hand to hand! Now, unfortunately, this is only one example among many of the self-contradictions of Economists; and then it is said that Political Economy cannot be made an exact science!

24. At page 154 he very justly says that education is capital.

"Une autre espèce d'épargne est celle qu'on fait en se procurant des talens, en élevant ses enfans, &c. Si ces talens sont lucratifs, ils représentent un capital dont la rente est dans les profits qu'ils pourront procurer. * * * Une famille même de simples manouvriers, qui a les moyens d'élever un enfant jusqu'à l'âge d'homme, mais qui n'a pas les moyens de lui donner aucun talent, n'en a pas moins accumulé un capital au profit de ce fils; car, par une suite de privations, et d'épargnes sur ses autres dépenses, elle en a fait un homme capable de gagner un salaire quelconque, qui est le revenu d'un capital appelé *homme*; car un homme fait, quel qu'il soit, est un *capital accumulé*."

At p. 163. "Or cette population-là, résultat des avances successivement faites pour la mettre à ce point, est elle même un capital accumulé. Les richesses des nations se réduisent donc à ces capitaux, et les capitaux ne s'acquerraient que par l'épargne. C'est elle seule qui a fait l'opulence de la Hollande, de l'Angleterre, qui a fait la nôtre, et qui la portera, j'espère, fort au-delà de ce que nous la voyons."

"C'est la fausse idée qu'on ne pouvait épargner que les produits matériels pour en faire des capitaux durables, qui a empêché Adam Smith, et après lui plusieurs écrivains Anglais, de regarder comme productif, les travaux qui ne logent de valeur dans aucune matière; comme ceux d'un instituteur, d'un avocat, d'un médecin."

"Ces auteurs ne se sont pas aperçus que, bien que de semblables travaux soient nécessairement consommés à mesure qu'ils sont exécutés, ils peuvent être consommés d'une manière reproductrice; d'une manière, conséquemment, qui perpétue la valeur qu'ils ont eu, et peut en faire un capital. Le capital d'un artiste est son talent; or son talent est né des leçons qu'ils a reçues. Les

leçons ont été consommées, mais il est né de cette consommation une contre-valeur, mise en réserve dans la tête d'élève et devenue un capital productif. Une nation où il y a beaucoup de talens acquis, soit dans les beaux arts, soit dans les arts industriels, est incontestablement plus riche qu'une autre nation où les mêmes talens n'existent pas. Elle obtient tous les ans, en raison de cette supériorité de talens, de plus gros profits, des revenus plus considérables."

J. B. Say in the preceding extract blames Adam Smith for excluding immaterial products from national wealth. If he had looked to his own previous treatise, he would have found some one else to blame, nearer than Adam Smith.

At p. 520, he says,—

"Sans une classification des choses possédées qui les embrasse toutes, en faisant un évaluation des biens d'une nation, d'une communauté, d'un particulier, nous ne serions jamais certains de la faire complète. * * *

"Nos propriétés se composant de nos biens, quels qu'ils soient, comprennent nos biens naturels en même temps que nos richesses sociales."

And after going through several descriptions of personal talents, he says,—

"Ce que je vous ai dit suffit, je pense, pour vous convaincre, messieurs, que les facultés industrielles sont des propriétés du même genre que toutes les autres, et que ce n'est qu'en les respectant à l'égard de toutes les autres qu'on obtient tous les avantages sociaux attachés au droit de propriété. Par la même raison cette espèce de propriété, quoiqu'elle puisse difficilement se traduire en chiffres, fait néanmoins partie des richesses générales d'une nation. Une nation où les capacités industrielles sont plus nombreuses, plus éminentes qu'ailleurs, est une nation plus riche."

Of the two treatises from which these extracts are taken, the latter was published very considerably later than the first, and consequently in the remarkable self contradiction displayed in them, we may fairly take the latter as the more matured opinion of the author.

26. We shall now see what Ricardo says.

At p. 16, *Principles of Political Economy*, 3rd edition, we meet with the following:—

"Even in that early state to which Adam Smith refers, some capital, though possibly made and accumulated by the hunter himself, would be necessary to enable him to kill his game." One would imagine, that on the first introduction of such an important word as Capital, some little explanation would have been given of it. By no means. The bewildered reader goes on, and on, and on, all the while wondering what this strange word can mean, till at last, at page 89, no less than 73 pages after it has been first introduced, he finds this paragraph,—

"Capital is that part of the Wealth of a country which is employed in production, and consists of food, clothing, tools, raw materials, machinery, &c., necessary to give effect to labor."

Here at length we might suppose that light had broken in upon us, but, on the contrary, it is darker than ever; for, instead of one unexplained word, we have two, *wealth* and *production*. What is *wealth*? and what is *production*? Of these we may gather that *wealth* means material things exclusively, but what *production* is we have not

been able to discover from the whole of Ricardo's work.

27. Malthus, *Definitions of Political Economy*, p. 237, defines capital to be,—

"That portion of the stock of a country which is kept or employed with a view to profit in the production or distribution of wealth;" and he defines stock to be accumulated wealth, either reserved by the consumer for his consumption, or kept or employed with a view to profit, and he defines wealth to consist entirely of material objects.

28. Mr. Senior, *Political Economy*, p. 59, says,—

"The term Capital has been so variously defined, that it may be doubtful whether it have any generally received meaning. We think, however, that in popular acceptation, and in that of Economists themselves, when they are not reminded of their definitions, that word signifies *an article of wealth, the result of human exertion, employed in the production or distribution of wealth*. We say the result of human exertion, in order to exclude those productive instruments to which we have given the name of natural agents, and which afford not profit, in the scientific sense of that word, but rent.

"It is evident that Capital, thus defined, is not a simple productive instrument; it is in most cases the result of all the three productive instruments combined. Some natural agent must have afforded the material, some delay of enjoyment must in general have reserved it from unproductive use, and some labor must in general have been employed to prepare and preserve it. *By the word abstinence we wish to express that agent, distinct from labor and the agency of nature, the concurrence of which is necessary to the existence of Capital, and which stands in the same relation to Profit as Labor does to Wages*. We are aware that we employ the word abstinence in a more extensive sense than is warranted by common usage. Attention is usually drawn to abstinence only when it is not united with labor. It is recognized instantly in the conduct of a man who allows a tree, or a domestic animal, to attain its full growth; but it is less obvious when he plants the sapling, or sows the seed corn. The observer's attention is occupied by the labor, and he omits to consider the additional sacrifice made when labor is undergone for a distant object * * *

"We have already defined Capital to be an article of wealth, the result of human exertion, employed in the production or distribution of wealth; and we have observed that each individual article of wealth is in general the result of a combination of all the three great instruments of production—labor, abstinence, and the agency of nature."

At p. 134, Mr. Senior includes intellectual capital,—

"Even in our present state of civilization, which, high as it appears by comparison, is far short of what may be easily conceived, or even of what may confidently be expected, the intellectual and moral capital of Great Britain far exceeds all her material capital, not only in importance, but even in productiveness. The families that receive mere wages probably do not form a fourth of the community; and the comparatively large amount of the wages even of these is principally owing to

the capital and skill with which their efforts are assisted and directed by the more educated members of the society. Those who receive mere rent, even using that word in its largest sense, are still fewer; and the amount of rent, like that of wages, principally depends on the knowledge by which the gifts of nature are directed and employed. The bulk of the national revenue is profit, and of that profit the portion which is mere interest on material capital, probably does not amount to one-third. The rest is the result of personal capital, or in other words of education.

"It is not on the accidents of soil or climate, or on the existing accumulation of the material instruments of production, but on the quantity and diffusion of this immaterial capital, that the wealth of a country depends. The climate, the soil, and the situation of Ireland have been described as superior, and certainly are not much inferior to our own. Her poverty has been attributed to the want of material capital; but were Ireland now to exchange her native population for seven millions of our English North countrymen, they would quickly create the capital that is wanted. And were England North of Trent, to be peopled exclusively by a million of families from the West of Ireland, Lancashire and Yorkshire would still more rapidly resemble Connaught. Ireland is physically poor because she is morally and intellectually poor, because she is morally and intellectually uneducated. And while she continues uneducated, while the ignorance and violence of her population render persons and property insecure, and prevent the accumulation and prohibit the introduction of capital, legislative measures, intended solely and directly to relieve her poverty, may not indeed be ineffectual, for they may aggravate the disease, the symptoms of which they are meant to palliate, but undoubtedly will be productive of no permanent benefit. Knowledge has been called power; it is far more certainly wealth. Asia Minor, Syria, Egypt, and the northern coast of Africa, were once among the richest, and are now among the most miserable countries in the world, simply because they have fallen into the hands of a people without a sufficiency of the immaterial sources of wealth to keep up the material ones."

It will be seen further on in this article how entirely we agree in Mr. Senior's opinions on this point.

29. Mr James Mill, *Elements of Political Economy*, 3rd. Edition, p. 16 says,—

"We have already observed that labor performs its operations, either simply, by the unaided powers of the human body; or with the use of instruments, which augment not only the quantity, but often also the accuracy and precision of its results.

"As examples of the earliest and simplest of the instruments, contrived for this purpose, we may mention the bow and arrow, and the sling, of the huntsman. The spade is an instrument easily invented for turning the soil; and a certain rude machine, to which the force of cattle may be applied, and which is the first form of a plough, suggests itself at an early stage of improvement.

"From these beginnings men proceed, inventing one instrument after another, the axe, the hammer, the saw, the wheel, the wheel-carriage, and so on, till they arrive at last at that copious

supply of complicated machinery by which labor is rendered productive in the most artificial states of society. The provision which is made of these instruments is called Capital.

"This, however, is not the whole of what is denominated Capital. Labor in its earliest stage is not employed upon any materials but such as nature presents, without any preparation at the hands of man. When the savage climbs the tree, to gather the fruit; when the huntsman tears down the branch to form his club or his bow, he operates upon materials which are prepared for him by the hands of nature. At a subsequent stage in the progress of industry, the materials upon which labor is employed, have generally been the result of previous labor. Thus the flax and the cotton, which are to be manufactured into cloth and muslin, have been the result of the labor of agriculture; the iron has been the result of the labors of the miner and smelter, and so of other things. The materials upon which labor is to be employed, when they have been the result of previous labor, are also denominated Capital.

"When we speak of labor as one of the instruments of production, and of capital as the other, these two constituents, namely, the instruments which aid labor, and the materials upon which it is employed, are all that can be correctly included in the idea of Capital. It is true that wages are in general included under that term. But in that sense labor is also included, and can no longer be spoken of as an instrument of production apart from capital.

"We have already seen, that whenever labor is spoken of as a separate, distinct instrument of production, the idea of the subsistence, or consumption of the laborer, for which wages is but another name, is included in the idea of the labor.

"Having thus endeavoured to annex precise ideas to the terms Capital and Labour, a matter of the utmost importance in the study of Political Economy, and to distinguish their respective departments in the business of production, it is only further necessary to advert to the origin of capital and the laws of its accumulation.

"It is easy to discover, that the source from which capital is ultimately derived is labor. Production of necessity begins with hands. There can be no instrument till it is made; and the first instrument had no previous instrument to be made with.

"The first portion of Capital, therefore, was the result of pure labour, without the co-operation of Capital."

30. No person familiar with the method of proceeding in Natural Philosophy can fail to see the utterly unscientific character of the preceding extract. It is a mere arbitrary enumeration of what Mr. Mill considers to be Capital; but there is no *general idea* given of it, which is what we want. It is perfectly easy to see the incorrectness of the assertion of the last paragraphs. Production does not begin with hands. Did the hands of man produce the first cattle, the first corn, the first fruit trees? It is perfectly clear that the first capital existed *before* labor, as we have shewn afterwards.

31. Mr. McCulloch has also introduced an arbitrary definition of Capital. *Principles of Political Economy*. 4th edit., p. 100.

"The Capital of a country consists of those

portions of the produce of industry existing in it, which may be DIRECTLY employed either to support human beings, or to facilitate production. . . ." The italics are the author's own. From this it evidently appears that Mr. McCulloch means by Capital, simply the quantity of things already existing upon which labor has been employed. He allows that this definition differs entirely from that of Adam Smith, and we believe from that of any other Economist whatever, and we have no hesitation in rejecting it.

32. Rossi entirely dissents from the definition of Mr. McCulloch. *Cours d'Economie Politique*, T. III. p. 279.

"L'œuvre de la production exige, outre le travail, le concours du capital. Nous avons souvent dit ce qu'on entend par capital. Dans le langage de la science, ce n'est pas une richesse quelconque, ce n'est pas une valeur quelconque, c'est uniquement cette partie des valeurs qui est appliquée à la production. Encore une fois, dans le langage commun, on appelle du nom de capital les pierres précieuses qu'une femme a dans son écrin, les tableaux qu'un amateur a dans sa galerie; mais le capital, instrument de la production, n'est autre chose que cette partie des valeurs qui est appliquée à la reproduction de la richesse.

"Ainsi, si en nous demande—'Les machines sont-elles un capital?' Il n'y a aucun doute. 'Les animaux appliqués au travail, sont-ils un capital?' Il n'y a aucun doute. 'Les hangars, boutiques, maisons servants au travail, sont-ils un capital?' Il n'y a encore aucun doute. 'L'argent monnayé est-il un capital?' La réponse est la même. Je le répète, c'est par la destination, et uniquement par la destination, qu'on sait si une partie quelconque des valeurs nationales est ou n'est pas un capital.

"Ainsi l'argent que l'avare enfouit dans son jardin, n'est pas un capital tant qu'il reste enfoui parce qu'il ne sert pas à la production, parce qu'il n'est pas disponible, parce qu'il n'est pas offert sur le marché comme instrument de la production. Mais l'argent qu'un fabricant peut emprunter, l'argent qu'un capitaliste est toujours disposé à prêter, pourvu qu'on lui offre des garanties, des sûretés suffisantes, cet argent-là est un capital."

33. Mr. John Stuart Mill, *Principles of Political Economy*, B.I.C. IV. says that there are three requisites to production, labor, natural agents, and a stock of the products of former labor previously accumulated. "This accumulated stock of the produce of labor is termed capital. * * *

"Capital, by persons wholly unused to reflect on the subject, is supposed to be synonymous with money. To expose this misapprehension would be to repeat what has been said in the introductory chapter. Money is no more synonymous with capital than it is with wealth. Money cannot in itself perform any part of the office of capital, since it can afford no assistance to production. To do this it must be exchanged for other things; and anything which is susceptible of being exchanged for other things, is capable of contributing to production in the same degree. What capital does for production, is to afford the shelter, protection, tools, and materials which the work requires, and to feed, and otherwise maintain the laborers during the process. Speaking of the manufacturer, he says, 'His money and finished goods, however, are not wholly capital,

for he does not wholly devote them to these purposes; he employs a part of the one, and of the proceeds of the other, in supplying his personal consumption and that of his family, or in hiring grooms and valets, or maintaining hunters and hounds, or in educating his children, or in paying taxes, or in charity. What then is his capital? Precisely that part of his possessions whatever it be, which he designs to employ in carrying on fresh production. It is of no consequence that a part or even the whole of it, is in a form in which it cannot directly supply the wants of laborers.

"Suppose, for instance, that our capitalist is an hardware manufacturer, and that his stock in trade, over and above his machinery, consists at present wholly in iron goods. Iron goods cannot feed laborers. Nevertheless by a mere change of the destination of these iron goods, he can cause laborers to be fed. Suppose that with a portion of the proceeds he intended to maintain a pack of hounds, or an establishment of servants; and that he changes his intention, and employs it in his business, paying it in wages to additional workpeople. These workpeople are enabled to buy and consume the food which would otherwise have been consumed by the hounds, or by the servants, and thus, without the employer's having seen or touched one particle of the food, his conduct has determined that so much more of the food existing in the country has been devoted to the use of productive laborers, and so much less consumed in a manner wholly unproductive.

* * * *The distinction then, between Capital and not-capital, does not lie in the kind of commodities, but in the mind of the capitalist—in his will to employ them for one purpose rather than for another; and all property, however ill adapted in itself for the use of laborers, is a part of capital as soon as it, or the value to be received from it, is set apart for productive employment. The sum of all the values so destined by their respective possessors, composes the capital of the country. Whether all those values are in a shape directly applicable to productive uses, makes no difference. Once appropriated to that end, they do not fail to find a way of transforming themselves into things fitted to be applied to it."*

Thus Mr. Mill fully agrees in the distinction that capital is not any particular thing, but that whether an article is capital or not, entirely depends on the method in which it is employed, and he also says that ANYTHING which can be exchanged may be Capital,—an admission we shall find hereafter, to be of the most important consequence.

34. M. Coquelin, in the *Dictionnaire d'Economie Politique*, art. Capital, says "on peut dire d'une manière générale que le capital est le fruit de l'accumulation. C'est l'ensemble des valeurs antérieurement soustraites à la consommation improductive, et que le passé a léguées au présent. * * * Sauf quelques écrivains qui ne font pas autorité dans la science, tous les économistes s'accordent à ne pas comprendre sous la dénomination de capital la terre, ni les instruments donnés par la nature, mais seulement les valeurs créées de main d'homme, et antérieurement accumulées."

35. On comparing the definitions of Capital, as used by these various writers, we may gather dis-

tinctly that, with few exceptions, they acknowledge that nothing is absolutely capital, but that whether it is so or not, depends upon the method of its use, or employment.

This would be perfectly satisfactory as a general definition, but it will be seen, they all clog this definition with the limitation that it is the fruit of past labor. Thus we think that the spirit of these definitions may be expressed thus,—

Capital is wealth accumulated from past human labor, and employed in a particular manner.

36. Upon looking at this definition it immediately strikes us that it violates the first canon laid down above; it is not general, it is limited, for it is not wealth in general, but wealth the fruit of past human labor.

The question is to consider whether this limitation is necessary and essential, or whether it may be rejected.

Now we observe that though a great portion of existing capital may be the result of human labor, it is perfectly manifest that the first capital men possessed, was *not* the result of human labor.

When man was first placed upon the earth, it is undoubtedly certain that he found the means of support already prepared for him. This is a conclusion that all agree in. The most ardent sticklers for the literal interpretation of the first chapter of Genesis, and the most sceptical of geologists, are unanimously of opinion, that however, or whenever, man appeared upon the earth, he found fruits, and corn, and cattle, and fish *already* on the earth prepared for his use. No one can allege that the first cattle, the first fruits, or the first corn, were the result of human labor.

Mankind therefore employing part of these for immediate use, and setting aside and reserving another portion for increase, for reproduction, for producing something for future use, immediately turned them into CAPITAL, which was not the result of human labor.

37. Moreover, though flocks and herds may be tended and appropriated, and may be kept for the purposes of increase, and that increase may be again applied to the purposes of increase, it is quite clear that it is a most violent abuse of language to say that cattle, a species of capital—in fact, a corruption of the word—are the fruits of accumulated human labor.

We may say the same of fruit-bearing trees; they are capital, but cannot properly, as we think, be called the fruits of human labor.

We may say the same of corn, though about that there is more human labor employed; it seems to us to be an incorrect use of language to call corn the result of human labor. Man, indeed, may plant and water, but is it man that makes the corn grow? Paul may plant, and Apollos may water, but it is God that giveth the increase.

38. Now, no doubt, it is undeniably true that a great quantity of capital is the result of accumulated human labor; but as we have shewn that all original capital, and a great portion of existing capital, is not the result of human labor, it manifestly follows that the limitation, "the accumulation of past human labour," is not the *essence*, but the *accident* of capital, and must be rejected from the general definition. It is a very strong instance of the great general law in Inductive Logic, that in framing conceptions and

axioms the *negative* instance is the stronger of the two.

In fact, it is quite clear that to insert that qualification, "the produce of past human labor," is to give a *description* of how it was got; and many authors content themselves with telling us the things they consider to be Capital. Now, we do not want a *description* of how capital is got, or an *enumeration* of what things are Capital, but we want a *CONCEPTION* or *DEFINITION* of what Capital is.

39. We conclude, therefore, that the definition of Capital must be disembarassed of the condition with which it is clogged, and we obtain our first generalisation, that Capital is any Economical Element appropriated to the purpose of profit, or increase.

40. In fact, this is in exact accordance with Mr. Senior's remark, p. 67. "But Economists are agreed that *WHATEVER* gives a profit is properly termed CAPITAL."

Now, why should Mr. Senior, having obtained this excellent definition, which fulfils the conditions of a true scientific conception, in another place limit capital "to be an article of Wealth, the result of human exertion?" It is perfectly clear that the very terms of the definition include labor itself as capital. A workman's labor gives him a profit, it is therefore his capital.

41. And so Mr. J. S. Mill, as we have seen above, lays down the general proposition, that *ANYTHING* that may be exchanged may be used as capital. Why, then, having obtained this general conception, does he proceed to clog it with limitations and conditions?

We shall see further on in this article, that there are abundance of things which produce a profit, and which may be exchanged, which are in no way whatever the result of human labor.

42. We apply to the word CAPITAL, as well as to PRODUCTION and CONSUMPTION, a similar remark to what Dr. Whately has applied to Value. *Lectures on Political Economy*, p. 166.

"It may be worth observing that, in examining, framing, or altering definitions on Political Economy, you will find in most persons a proneness (as in other subjects also) to introduce *accidental* along with, or instead of, *essential* circumstances: I mean that the notion they attach to each term, and the explanation they would give of it, shall embrace some circumstances, *generally, but not always*, connected with the thing they are speaking of; and which might accordingly (by the strict account of an accident), be absent or present, the essential character of the subject remaining the same. A definition framed from such circumstances, though of course incorrect, and likely at some time or other to mislead us, will not unfrequently obtain reception, from its answering the purpose of a correct one, at a particular time and place. * * * A specimen of that introduction of accidental circumstances, which I have been describing, may be found, I think, in the language of a great number of writers respecting Wealth and Value, who have usually made *labor* an essential ingredient in their definition. Now, it is true, *it so happens*, by the appointment of Providence, that valuable articles are, in *almost* all instances, obtained by Labor but still this is an *ACCIDENTAL*, and not an *ESSENTIAL* circumstance."

And this is the very cause which has had such a blighting effect on the progress of Political Economy. It is the want of the spirit of generalization. It is this spirit alone which can ever elevate Political Economy to the rank of an exact science, and it is the want of it, or indeed the general want of the perception of its necessity, that has kept the science in so controverted a state at the present day.

We return then to our general conception of the term Capital.

Capital is an Economical Element devoted to the purposes of profit.

Hence anything that is exchangeable, whatever its nature be, any Economical Element whatever, may be Capital.

And any source whatever which gives a profit is Capital.

43. But this opens the question.—What is an Economic Element; or an Economic Entity?

It is well known that a very wide division of opinion prevails among Economists, as to whether the word "Wealth" or Economic Elements, is to be restricted to *material* things, or includes incorporeal elements, which may be bought and sold.

We are now, therefore, to inquire whether incorporeal elements are to be admitted into Political Economy.

It is somewhat remarkable that the earliest existing treatise on an economical subject, is for the express purpose of proving that mental products are capable of being exchanged for meat, drink, clothing, &c., and that they are to be considered in all respects *wealth*, as much as material products. (*ÆSCHINES SOCRATICUS*).

The very same doctrine, too, may be deduced from Aristotle's definition. He calls everything whose value may be measured in money, *wealth*. This definition manifestly includes everything which is exchangeable, whatever its nature be, whether corporeal or incorporeal.

44. In modern times, when the science was revived by Turgot and Quesnay, the Physiocrats, whose doctrines have certainly been misunderstood on some points, would appear to have excluded immaterial wealth from Political Economy.

But Beccaria expressly included incorporeal elements. He says that Political Economy treats of the exchange of products with products, products with services, and services with services. He thus treats incorporeal elements exactly in the same light as material ones. He also marked out one part of his treatise for immaterial products, but he never completed it.

45. It has commonly been supposed, that Adam Smith excludes intellectual, or mental, products from Political Economy; but we think that upon examination, his doctrine in one part of his work will be found to be inconsistent with that in another. Thus, in speaking of Capital, he expressly includes in *Fixed Capital*, Book II., chap. I., "the acquired and useful abilities of all the inhabitants or members of the society. The acquisition of such talents by the maintenance of the acquirer during his education, study, or apprenticeship, always costs a real expense, which is a *capital fixed and realised*, as it were, in his person. These talents, as they make a part of his fortune, so do they likewise of that of the society to which he belongs. The improved dexterity of a workman may be considered in the same light as a

machine, or instrument of trade, which facilitates and abridges labor, and which, though it costs a certain expense, repays that expense with a profit."

In this passage, therefore, it is perfectly plain that Adam Smith includes intellectual or mental wealth, in the capital of the country, although such is not generally supposed to be his doctrine. Mr. McCulloch has well pointed out the inconsistency of this passage with his chapter on productive and unproductive labor, where he excludes all labor not employed in producing some vendible commodity from the title of productive.

46. J.B. Say has usually had the reputation of being the first great Economist who included intellectual wealth as part of the national capital, though, as we have seen, others preceded him. We have also shewn his astonishing self-contradiction. In one treatise he totally excludes mental wealth from national capital; in another he expressly includes it.

47. Ricardo, however, altogether excludes anything but material products from Political Economy. And in this he has been followed by James Mill, and Malthus.

48. Mr. Senior, as we have seen above, entirely adopts the view that immaterial wealth is capital. And Bastiat maintains the doctrine in its widest generality, that anything that can be exchanged is an economical element, and that any economical element may be capital (*BASTIAT*).

49. We have said enough to shew the remarkable differences of opinion that prevail among Economists on the subject. We have now to endeavour to discover whether we can have the guide of analogy from the physical sciences to enable us to decide among such a mass of conflicting opinion.

50. Now when we consider that Political Economy is the science of exchanges, or at least that according to all views, exchanges are one of the most important parts of it, it would certainly appear that there can be no rational ground for excluding anything which is the subject of exchange. It is undeniable that immaterial services form an immense proportion of the exchanges made. How then can they be excluded from the science? When we consider that in Mechanics there are incorporeal forces which can neither be seen nor handled, but yet may be *measured*, that in Chemistry there are also invisible elements which may be *measured*, we should conclude from analogy that in Political Economy there are elements which can neither be seen, nor handled, but which may be *measured and exchanged*.

When we consider that in Mechanics, which is the science of forces, from the very generality of the definition, a force may be either corporeal or incorporeal; that in Chemistry, which is the science of combinations, from the very generality of the definition, whatever will combine, is a chemical element, whether corporeal or incorporeal; it follows by the strictest analogy, from the generality of the definition, that in Political Economy, which is the science of exchanges, whatever can be exchanged is an economical element, whatever its nature be.

Nay, not only from the analogy of these sciences should we argue that incorporeal elements ought to be admitted, but if we are to have a science of Political Economy of the same generality as the

others, we should *a priori* expect that there would be incorporeal elements in it.

Such, we think, would be the obvious consideration which would strike any one who reflected on the analogy presented by the other sciences, and we must therefore examine what reasons these authors have alleged, who have opposed the admission of incorporeal elements into Political Economy.

51. Now, with respect to most of the authors above cited, we observe that they do not allege any reason at all for their opinions. They merely announce them. The first, we believe, who argued against their admission was Malthus; and, though somewhat long, we shall lay his reasons before our readers, and examine into their validity. Malthus begins his work by dwelling on the importance of the word *Wealth*, and its definition, and he very justly says, that it is a mistake to suppose that a writer is at liberty to define his terms as he pleases. He points out that the comparative merits of the system of the Economists, or Physiocrats, and that of Adam Smith, depend upon their different definitions of wealth, and of productive labor. Some writers have given too narrow a definition of wealth, others have extended it too far. Thus he says, p. 23,—

“Among the definitions which have extended the meaning of the term *Wealth* too far; Lord Lauderdale's may be taken as an example. He defines wealth to be ‘All that man desires as useful and delightful to him.’

“This definition obviously includes everything, whether material or intellectual, whether tangible or otherwise, which contributes to the advantage or pleasure of mankind, and of course includes the benefits and qualifications derived from religion, from morals, from political and civil liberty, from oratory, from instructive and agreeable conversation, from music, dancing, acting, and all personal qualities and services. It is certain, however, that an inquiry into the nature and causes of all these kinds of wealth would not only extend beyond the bounds of any single science, but would occasion so great a change in the use of common terms, as to introduce the utmost confusion into the language of Political Economists. It would be impossible to form any judgment of the state of a country from the use of the terms rich, or richer. A nation might be said to be increasing in wealth, when to all common eyes, and in all common language, it might be growing poorer. This would be the case, according to the definition, if a diminution of the manufacturing and mercantile products had been balanced in the opinions of some persons by the gratifications derived from the intellectual attainments, and the various personal qualities and services of the inhabitants. But how is this balance to be ascertained? How is it possible to estimate the degree of wealth derived from these sources? Yet it is quite obvious that we cannot practically apply any discussions respecting the relative increase in the wealth of different nations, without having some means, however rough, of estimating the amount of such increase.

“Some modern writers, who do not choose to adopt the language of Adam Smith, and yet see the confusion which would arise from including under the head of wealth every kind of benefit or qualification of which man is susceptible, have

confined the definition to those objects alone, whether material or immaterial, which have value in exchange.

“This definition is certainly preferable to the more comprehensive one just noticed, but by no means to the extent which might at first be supposed. When it is considered attentively, it will be found to be open to a very great portion of the objections to which the more general one is liable, and to draw the line of demarcation between what ought, and what ought not, to be considered as wealth, in the most indistinct and unsatisfactory manner.

“Passing over the incorrectness of introducing a term open to so much controversy as value into a definition of wealth, it may be observed—

“1st. That if by an object which has value in exchange, be understood its susceptibility of being purchased or hired, then there is scarcely any quality or accomplishment, of the mind or body, that would not come under the category of wealth. The possessor of the lowest species of literary knowledge, that of reading and writing, may be hired to teach others; and as all, or nearly all, who had acquired these useful arts are susceptible of such employment, an estimate of national wealth ought to include the value of these attainments, however various in degree and widely extended.

“2ndly. All the knowledge acquired by a superior education, and superior talents, on account of similar susceptibility, would have a greater claim to be included in the estimate. The possessors of religious and moral knowledge, though obtained without any view to the instruction of others for a pecuniary remuneration, would be ready to sell such instruction under a reverse of fortune. The same may be said of a knowledge of classical literature, mathematics, history, natural philosophy, chemistry, geology, mineralogy, botany, &c. &c. On the same principle, those who had learnt to dance, to sing, or to fence for their amusement, might, more or less, imperfectly teach dancing, singing, or fencing, for money.

“In short, if we include under the denomination of wealth, all the qualities of the mind and body, hired, we shall find that by the restriction of the term *wealth* to that which has exchangeable value, we have advanced but little towards removing the confusion and uncertainty attendant upon the former definition; and all idea of estimating the increase of wealth in any country, or making any moderate approaches to it, must be absolutely hopeless.

“On the other hand if we confine the definition of wealth to those objects which either have been exchanged, or are specifically intended to be exchanged, we shall attempt to draw a broad line of demarcation between things which in regard to their qualities are precisely similar; and further exclude from the category of wealth a great mass of articles which have been included, and most correctly so, by Adam Smith, and by almost every person who makes use of the term, either in writing or conversation.

“The various information acquired by private study, and destined for private use and enjoyment, may be exactly of the same kind as that which is intended to be let out, if anybody will hire it; yet the first in this classification is not to be called wealth, and the other is. The person who

buys instruction, buys an amount of wealth, which it must be presumed is equal in value to what he has paid for it, while the self taught person, who is in possession of much superior knowledge, has acquired no wealth. According to this definition wealth cannot be given; it can only be taught. The instructions of the schoolmaster are wealth; the same instructions given by a friend or father are not wealth. This is sufficiently inconsistent; but this is not all. By this definition of wealth, a very large and most important portion of material commodities is excluded from the denomination. In the business of agriculture a considerable share of the produce is always destined to be consumed on the spot without being exchanged. * * * Now this large mass of material commodities increased as it would be by the flax and wool raised, spun, and wove for home consumption, few it is conceived would venture to exclude from the denomination of wealth; and yet this produce has neither actually been exchanged for money or other goods, nor has it been raised with the intention of being so exchanged, and therefore, according to the last definition, it ought not to be considered as wealth.

"It must be allowed nevertheless, that it has exchangeable value; and here one of the great characteristic differences between material objects, and objects which are not material, appears in a striking point of view. Of the quantity and quality of the material commodities here noticed it would not be difficult to make an inventory. Many household books indeed furnish one; and knowing pretty nearly the quantity and quality of such articles, a fair approximation to their value might be attained by estimating them according to the market price of the district at the time. But in regard to immaterial objects, the difficulty seems to be insurmountable. Where is an inventory to be found, or how is one to be made of the quantity and quality of that large mass of knowledge, and talents, reserved for the use and consumption of the individual possessors, and their friends. Or supposing it were possible to form such an inventory how could we make any moderate approaches towards a valuation of the articles it contained.

"Consequently if by objects which have value in exchange we mean objects which are susceptible of being exchanged, we shall include such a mass of the mental and physical qualities of mankind, as to make the term wealth convey no tolerably distinct and useful meaning.

"And if by objects which have value in exchange, we mean only those objects which have actually been, or are specifically intended to be exchanged, we shall exclude from the denomination of wealth a large mass of material commodities which have always, and most justly, been classed under that head.

"To get rid of these obvious embarrassments, it has sometimes been the practice to consider the labor which is hired, as the wealth which is purchased without reference to its results. But it seems very strange and incorrect to consider mere labor as wealth. No one would give anything for it if he were sure that it would yield no gratifying result. It is in the expectation of this result alone that labor is employed. The sick man employs a physician, not because he is pleased with the trouble which he gives him, but because

he expects that his health may be benefitted by the advice which he receives. The lawyer is consulted and fees, only because his client expects to derive some advantage from the opinion to be given, or the cause to be pleaded. And even the menial servant is not hired on account of the desire to see a man work, but on account of the trouble, which he will save his master in performing certain offices for him, or the gratification afforded to his vanity by the show of having a person at his command.

"The natural consequences of these difficulties is, that the ablest writers who have deserted matter, in their definition of wealth, have fallen almost inevitably into contradictions and inconsistencies."

Malthus then goes on to shew most satisfactorily the astounding contradictions into which J. B. Say has fallen in his various works, and he says,—

"The fact really is, that if we once desert matter in the definition of wealth, there is no subsequent line of demarcation, which has any tolerable degree of distinctness, or can be maintained with any tolerable consistence, till we have included such a mass of immaterial objects as utterly to confuse the meaning of the term, and render it impossible to speak with any approach towards precision, either of the wealth of different individuals, or different nations."

52. We may also take what M. Baudrillart says, as he shares the objections of Malthus. At p. 53 (*Manuel d'Economie Politique*), after stating that some writers maintain that all sorts of work ought to rank equally in political economy, and that the work of the statesman, the jurist, the painter, the priest, and the professor, should rank equally with that of the agriculturist, the manufacturer, or the merchant; asks if they have succeeded in proving their case, and, in his opinion, says that they have not. He considers the case of the surgeon and doctor, and says that though they may contribute to heal a man who may produce wealth, still their services are not wealth in themselves. He continues, "*Les travaux du savant, du lettré, du professeur, du prêtre, de l'artiste, dans le cas plus ou moins fréquent où ils vont à leur but, qui est l'amélioration et développement de la nature humaine, sont donc productifs d'utilité, sans d'être de richesse. Ils ont une valeur, sans doute, c'est à dire qu'on les paye; mais cela signifie seulement qu'en échange de certains avantages intellectuels qu'on en espère, on sacrifie une partie des produits matériels que l'on possède, ou que l'on peut acheter. Avant à celui qui vend sa peine en vue de ces résultats, il ne crée pas de la richesse, il en consomme, sans qu'on puisse dire pour cela qu'il est plus oisif ou plus inutile que celui qui forge du fer ou qui fabrique de la toile; il peut même se livrer à un travail beau coup plus considérable et rendre des services encore supérieurs, quand même, ni directement ni indirectement, aucune création de richesse ne devait s'ensuivre. Il y a donc une distinction entre les travaux qui ont pour but d'être utiles ou agréables aux hommes, à un titre quelconque, et ceux qui ont pour objet d'enrichir les membres de la société.*"

"*Ses produits immatériels et les produits matériels présentent d'ailleurs des différences graves qui nous semblent devoir faire exclure les pre-*

miers du domaine de l'Economie Politique, tout en tenant le plus grand compte de l'effet indirect que les travaux qui y donnent lieu peuvent avoir sur le développement de la richesse ; car limiter une science ce n'est aucunement, nous ne saurions trop y insister, briser ses rapports naturels et indispensables avec les domaines qui l'avoisinent, pas plus que la division de l'humanité en divers corps de nations n'exclut entre celles-ci de perpétuelles relations de commerce et la réciprocité des bons offices.

"L'une de ces différences porte sur l'impossibilité absolue d'arriver à aucune *évaluation* précise de ces biens dits immatériels. Sans doute on a soutenu avec raison qu'il n'y a aucun moyen de parvenir à évaluer exactement le capital matériel d'une nation. Mais on peut le faire plus ou moins approximativement. L'idée seule au contraire de faire l'inventaire, un inventaire quelconque, si restreint qu'on le suppose, de l'instruction, de la beauté, de l'agilité, du goût, de la justice, de la bienveillance, et autres qualités naturelles ou acquises, a quelque chose de bizarre et de tout à fait choquant ; elle répugne au sens commun."

M. Baudrillard, after quoting Malthus, says :—

"Une autre différence, qui tient de près à la précédente porte sur la faculté d'être échangés. Nous ne nions pas à coup sûr ce fait qui frappe tout le monde, que les avocats, les médecins, les acteurs, les chanteurs, &c., rendent des services utiles ou agréables, qui s'échangent contre des produits, ou ce qui revient au même, contre un certain produit, c'est à-dire la monnaie, par l'intermédiaire de laquelle on obtient tout le reste. Le taux suivant lequel se règle le prix de ces services, leur salaire appréciable en monnaie, est essentiellement du ressort de l'économie politique, quand même ces travaux ne feraient qu'absorber et détruire de la richesse. Mais il importe de remarquer que cette circonstance ne fait pas que les produits, qu'on appelle immatériels, soient en eux-mêmes pourvus de la faculté d'être échangés. Nos qualités et nos vertus nous sont inhérentes. Dans certains cas, nous pouvons bien mettre un prix à la peine que nous prenons pour y faire participer les autres. En elles-mêmes, elles sont invendables, inaliénables, intransmissibles. Celui qui s'efforce, moyennant salaire, de faire naître chez les autres certaines modifications heureuses ne se dessaisit pas pour cela de sa science, de son goût, de ses vertus, comme celui qui échange une pièce d'étoffe s'en dessaisit pour obtenir une pièce de monnaie.

"C'est par abus de mots, ce nous semble, que l'on donne à tout travail utile le nom d'industrie, de même que c'est par abus que l'on applique le mot de richesse à tout service et à tout résultat utile."

53. We thus place before our readers what these able writers have said, in order that they may give what weight they please to their arguments. We shall not in this place take notice of all the arguments alleged against the admission of immaterial products into Political Economy, because it will be more convenient to reserve some for further discussion. But we shall only notice here one of the principal arguments alleged, that it is not possible to make a valuation, or inventory, of such products.

It appears to us that this argument is both

unfounded, and, even if it were well founded, it is incorrect.

In the first place, it is unfounded, because, if it were necessary to make a valuation of the immaterial products of a nation, it is not more difficult than to make a valuation of material capital. Take the incomes of all the persons who deal in immaterial products, capitalize them, and there is the value of the totality.

But, furthermore, the argument appears to us to shew a misapprehension of the nature of Political Economy. That science never yet attempted to make a valuation of all the Economical Elements in any country whatever. Is it necessary for Political Economy to take an inventory of all the pots and pans in a gentleman's kitchen, or his furniture, or the coats, waistcoats, &c., &c., in his wardrobe? It might possibly be done as a curious statistical table, and a very curious inventory it would be. But it would not be Political Economy. But if it is wholly useless to make an inventory of the things, it would be absolutely impossible to put a valuation on them, for it is manifestly utterly uncertain, and it would clearly depend on numerous circumstances, which it would be absolutely impossible to foresee.

To suppose that it is necessary for Political Economy to make an inventory of all economical elements, is as baseless as to suppose that it is necessary in mechanics to make an estimate of all the mechanical forces in the world ; or that it would be necessary to the science of medicine to make a catalogue of all the medical cases in the world ; or to the science of chemistry, to ascertain the total quantity of chemical elements in the world. Each of these may, perhaps, have its uses, but they are in no way necessary to mechanics, medicine, or chemistry. The business of mechanics is to deal with particular cases of forces ; of medicine, to deal with particular cases of fever, cholera, &c. ; of chemistry, to deal with particular cases of combinations : and so it is the business of Political Economy to deal with particular cases of exchange.

54. Mr. Cazenove, who restricts the term Wealth to material objects, thereby agreeing with Malthus, says (*Thoughts on a few subjects of Political Economy. Append: p. 71.*) "M. Say was, I believe, the first writer who ventured upon this innovation of the ordinary meaning of the term *Wealth*. But in his discussion on the subject of over-production, he avowedly discards the consideration of *immaterial* wealth, and confines himself exclusively to that which is *material*."

"Other authors, who have begun their treatises with giving the same extension to the term, have afterwards been obliged, in like manner, to restrict it to its ordinary meaning. Their reasonings would be for the most part false or unintelligible, unless they were understood as referring exclusively to *material* productions." And he commends Mr. Mill, who adopts that restriction.

We have shewn that Mr. Cazenove is in error in supposing that J. B. Say was the first to introduce immaterial products into Political Economy, although he has, certainly, usually the credit of doing so. Besides Socrates and Beccaria, we have shewn above that Adam Smith himself, in a passage that has been most strangely overlooked, enumerates intellectual abilities and

talents among the fixed capital of the country. We have ourselves shewn the extraordinary inconsistencies into which Adam Smith and J. B. Say have fallen. But what do these inconsistencies prove? Only this, that those writers who have fallen into them have never seized the fundamental conceptions of the science with that tenacity of grasp, and clearness of vision, so as to enable them to erect a durable science.

55. But we have no such flickering faith in our own convictions. On the contrary, we have the firmest belief in their truth, and we are fully prepared to follow them out to the remotest consequences which can be logically deduced from them. This is preeminently a case in which the prescient sagacity of Bacon is vindicated, when he earnestly warns us to look constantly to Natural Philosophy for our reasoning, and to refer questions in other sciences to that as the mother of them all. We believe the conceptions we adopt to be framed in the strictest analogy to the conceptions of Physical Science, and not only that they are true, but that they are the only true ones. Who that is familiar with the conception of incorporeal forces in mechanics, or of gaseous elements in chemistry, could hesitate for a moment in recognizing incorporeal elements in Political Economy? or rather, who that is familiar with these sciences would think for a moment of rejecting them? We have already endeavoured to shew that some of the arguments adduced for rejecting them are unfounded. At all events whatever inconvenience Economists may find in admitting them, is common to them with Physicists. But the fact is the study of Physical Science governs and rectifies men's thoughts, and gives precision and generality to their language, and men are compelled to expand their ideas to bring them into conformity with nature. And after several generations, physicists have brought their language into a wonderful state of refinement. And by this means, not only the study of nature, but language itself has become a mighty instrument of thought and discovery. The language of Science itself has become a very potent instrument to unlock the secrets of nature. And if Economists would only bestow the same care in polishing and purifying the language of Political Economy, it will be found—and not till then—that language itself is a potent instrument of discovery in Political Economy. By no other course whatever can Political Economy ever be raised to the rank of an exact science. It is only by polishing the language that we can ever attain those bold generalizations which are the essence of science. And those who wish to advance the science must especially aim at these generalizations. Science is not advanced by cautious timidity, but by cautious daring. And these generalizations must be subjected to the most rigorous tests of Inductive Logic. There is no one who is familiar with the conceptions in Physical Science, who cannot see in what a very crude state the conceptions of Political Economy still are. We scarcely know of one which has ever yet been tested by the laws of Inductive Logic. So little has this been done that we believe we are actually the first to apply one of the most powerful weapons of Inductive Logic—the LAW OF CONTINUITY—to the conceptions and axioms of Political Economy. (CONTINUITY, LAW OF.)

56. Now we adopt the principle that whatever can be exchanged, and therefore, whatever has value that may be measured, is an Economical Element, or an Economic Entity, in its widest generality, and we accept all the consequences of this doctrine. Whatever may be bought and sold is in our view an economical element, and under the dominion of Political Economy. And we rejoice to say that we have the approval of one of the highest living authorities for doing so. M. Michel Chevalier writes to us, "Vous définissez l'Economie Politique par ceci, qu'elle étend son domaine sur tout ce que se vend et s'achète. Dans mes cours au Collège de France, que j'ai cessé de faire depuis 1852 (tout en restant titulaire de la chaire), j'ai souvent exprimé la même idée, et j'ai eu occasion d'y revenir dans nos discussions de la Société d'Economie Politique de Paris, discussions mensuelles qui sont reproduites en abrégé dans le *Journal d'Economie Politique*. Je vous en fais l'observation non pas de tout pour vous disputer la priorité—une idée appartient à celui qui en fait tirer le bon parti, et vous avez fait un excellent usage de celle-là—mais bien pour me féliciter avec vous d'une coïncidence qui me flatte."

57. For these reasons it appears to us that all the arguments which have been urged against the admission of incorporeal elements into Political Economy entirely fail, and that, on the contrary, it is utterly in the teeth of all scientific analogy to reject them. Every one now is agreed that Political Economy treats about *wealth*. It may be called the Theory of Property; and how is it possible to frame a general definition of property, until we have surveyed all the different kinds of property? Now, we shall show a little further on, that those writers who have restricted wealth to material things have omitted an immense mass of property, which is recognised by the law, and treated in all respects in the same way as material property.

58. We are persuaded that the difficulty on this point has arisen from the fundamental misconception as to the nature of Value. For if we consider Value to be some quality inherent in a thing itself, most persons imagine that there must be some corporeal substance in which that quality must be embodied, and that it cannot be measured, except by something corporeal. But it would be just as erroneous to say in Mechanics that an incorporeal force cannot be measured, or that an invisible element in Chemistry cannot be measured.

59. And this, as every one knows who has studied the history of Science, was the very objection that was raised against the admission of gravity as a mechanical force. Its opponents could not imagine any mechanical force except such as was embodied in some material substance, such as a rope, or a bar. The very same difficulty was felt about the air; it was long before men were able to familiarise their minds with the idea that the air had weight. But every tyro now knows that gravity is a mechanical force which may be measured, and that a corporeal force may balance an incorporeal one. Thus a rope which supports a weight balances gravity. So in Political Economy, a service, an incorporeal element, may balance, or be equivalent to a product, which is a corporeal one. For so many

hours' work I may give a man so much food and clothes. And each of these is an Economic Element—the work, and the food and clothes. This we have seen above Beccaria notices.

60. We, then, in accordance with the immense majority of Economists, in strict accordance with the use of the word in the language from which it sprung, define *Capital to be an Economic Element used for the purposes of profit*. There is, in our opinion, a broad, fundamental, and natural distinction between things used and enjoyed, and things which are appropriated to the purposes of increase. This distinction is most clearly pointed out by Aristotle, the founder of Political Economy (ARISTOTLE), and has been adopted by nearly every Economist of name since. And in our opinion it is founded in nature.

61. And it appears to us, that any Economic Element whatever, that is used for, or conduces to, the purposes of profit, is Capital—no matter whether it increases itself. Because the increase of everything is measured in money, and not necessarily in the thing itself. Thus to the farmer, his increase consists in the increase of corn, and of cattle. But to the proper increase of these, tools, instruments, and buildings are necessary. Now, the farmer's profit does not arise from the increase of ploughs, harrows, spades, and houses, but from the increased value of his crops and cattle. The value of these instruments is replaced in the increased value of the produce. Whatever, therefore, is necessary to that end, appears to us to be Capital.

62. We say this, because we think that a distinction has obtained among a number of Economists which is not founded in nature. They restrict the term Capital to things which are the produce of human industry, and draw a distinction between them and natural agents. Now, we cannot assent to this distinction. We have endeavoured to shew that the limitation of the "produce of human labor" must be eliminated from the definition of Capital. Now, by a very considerable number of Economists, land has been carefully excluded from the definition of Capital. But Economists who do that, include the buildings of manufactories, and cattle, under the term Capital. Because they consider them to be the result of human labor. But this distinction appears to us to be unfounded. A manufactory is an instrument necessary to produce cloth; it is built of materials furnished by Nature, and modified by man. But the land itself is that instrument which is necessary for the peculiar species of the product, corn. And as for cattle, we think it a positive abuse of language to say that they owe their existence, in any way whatever, to human labor. The land is that instrument which is peculiarly appropriated to the production of corn and cattle, just as the manufactory is the instrument peculiarly appropriated to the production of cloth. And the value laid out upon both is replaced in the value of the produce. Moreover, it would be greatly more correct to say, that the present state of the land in all civilized countries is the result of human labor, than it is to say that either corn or cattle are the result of human labor.

63. The fact is that these views arise from the fatal introduction of the notion that labor is the essence, or a necessary element, of Value. This

notion must be entirely expelled from Political Economy, before it can make any progress.

64. Capital, then, in our view, is any Economic Element whatever appropriated to the purposes of increase, either directly or indirectly. It increases directly when the thing itself is capable of being used. It increases indirectly when it is employed in the production of the thing used. And the profit and the value of the indirect capital is found and replaced in the value of the direct capital.

65. As therefore the value of all the instruments and materials is comprehended in the value of the finished product, the last is all that we need consider in a scientific point of view, and we may say that, in Political Economy, Capital is an increasing, or a CONTINUOUS QUANTITY.

66. But we must especially remark this. It is particularly to be observed that Mr. Mill says above the distinction between Capital, and non-capital, resides in the intention, or the mind, of its owner. So we must observe that in all the subdivisions of capital, we must preserve the same analogy. Capital, as we shall find hereafter, is divided into distinct species, and as the fundamental notion of Capital depends upon intention, and method of use, and not upon the nature of the thing; so all the different species into which capital is divided must, by a similar analogy, depend upon intention, and method of use, and not upon the nature of the thing. We shall find this to be of great use hereafter.

67. These remarks apply to what we are now considering. We have said that the value of the finished product, which may be called direct capital, comprehends the value of all the instruments and materials, which may be called indirect capital. Now we must observe that what is a finished product to one person, is merely an instrument or a material to another. Thus to the iron master, a bar of pig iron is a finished product, but to an engineer or cutler it is only a material, or an instrument. Thus ploughs and harrows are finished products to the agricultural instrument maker, but they are only an instrument to the farmer. The corn is direct capital to the farmer, but only indirect capital, or a material, to the miller. Flour is direct capital to the miller, but only indirect to the baker. And bread, the finished, or ultimate, product comprehends the value of all the preceding operations.

68. We may say, then, in a general way, that Capital is a CONTINUOUS QUANTITY. And any one familiar with physical science, will at once see the immense consequences of this doctrine, or conception. It immediately brings Political Economy within the pale of mathematical and Natural Philosophy.

69. When we say that Capital is a continuous quantity, it is quite evident that it *extends from the past into the future*; and this opens up consequences of immense magnitude, suggested by the analogy of Natural Philosophy.

In Natural Philosophy, if time *past* is POSITIVE, time *future* is NEGATIVE.

70. As this, perhaps, may place the matter in somewhat a new light to some of our readers, we must dwell a little on it, and explain the difference between positive and negative, in Arithmetic, and Algebra and Natural Philosophy.

In Arithmetic, the positive and negative signs

merely mean addition and subtraction. There are no such things in Arithmetic as absolute negative quantities. Thus 0, in Arithmetic, is a positive limit which quantities cannot pass.

But in Algebra and Natural Philosophy, the case is wholly different. The terms positive and negative denote any opposites whatever, and 0, or zero, is merely the boundary, or limit, between positive and negative.

Thus, in Algebra and Natural Philosophy, negative quantities have as real an existence as positive ones.

Thus, if a force pulling one way is positive, a force pulling in the opposite direction is negative.

If a person walking one way were positive, then if he walk in the opposite direction it is negative.

71. But we need not go to any abstruse subjects for examples. It is well illustrated by a common globe.

In any globe, or map, the Equator is marked 0, which is merely the boundary between north and south. And if we call either of these, say the north, positive, the other, the south, will be negative.

So in longitude, the meridian passing through the national observatory is 0, and east and west may be positive and negative.

72. Let us illustrate this by an example. If we called north, positive, and south, negative, then of course a ship placed in north latitude would be in positive latitude, and a ship placed in south latitude, would be in negative latitude. And if the ship sails in a northerly direction, she would sail in a positive direction, and if southerly, in a negative one.

Thus if a ship were actually in 20° north latitude, we should say her position was $(+20)$, and if she sailed 10° further north, she would then be $(+30)$. If she sailed, instead, 10° south, her position would be $(+20-10)$, or $(+10)$.

But if she sailed 30° south, her position would then be $(+20-30)$, or (-10) , that is in 10° south latitude, or 10° beyond 0, or the equator.

If then being (-10) she sails 20° further south she would then be $(-10-20)$ or (-30) .

And similarly with reference to east and west.

And we observe this, that though part of the course of a ship is in the positive hemisphere and part in the negative one, the part in the negative hemisphere is not to be *subtracted from*, but to be *added to* the part in the positive hemisphere. So that her whole course sailed consists of one part in the positive hemisphere, together with a part in the negative one.

73. So in a Thermometer; if 0, or zero, be the freezing point, the degrees above freezing will be positive, and those below freezing will be negative, and if the mercury be rising, it is proceeding in a positive direction, and if falling, in a negative one.

Thus, also, we observe, that if the mercury falls from $+20^{\circ}$ to -10° , or rises from -10° to $+20^{\circ}$, the whole space passed over is 30° , and the negative part is to be *added to*, and not *subtracted from* the positive part.

74. Thus universally, in Natural Philosophy, 0 is the boundary between any two opposites. And this idea is applied to TIME. If time past is positive, time future is negative, and the pre-

sent time, which is the boundary between the past and the future, is 0, or zero.

75. There is a law in Natural Philosophy which is obvious from the preceding considerations. It is this, *That any quantity passing through 0, or zero, changes its sign.*

From the above statement of positive and negative, this law is self-evident. For as 0 is the limit between positive and negative, any quantity that passes from one to the other must necessarily change its sign.

And from the samples in §§ 72, 73, it is evident that in Algebra and Natural Philosophy, when a quantity passes through 0 and changes its sign, in order to find the total value, the part of its course which is negative is not to be *SUBTRACTED FROM*, but *ADDED* to the part which is positive.

Now, applying the preceding remarks to capital, the subject in hand, they suggest a law which will be obvious to any one familiar with Natural Philosophy. It is this—*Capital is a continuous quantity which, passing through 0 (the present) into futurity, CHANGES ITS SIGN.*

76. That is to say, having defined capital to be a continuous quantity, or a quantity continually producing a profit, the profits which it has already produced are positive, and those which it is to produce are future, or negative.

But though those future profits are yet to be produced they have a present value, and the right to receive them is a present valuable and saleable commodity, and is an Economic Entity.

And by the considerations just stated, it is manifest that to find the total value of capital we have to *ADD* together the value of the past profits and the value of the future profits, the value of the past being positive, and the value of the future negative.

77. But though capital is a continuous quantity, it may be limited to a certain term. And this term may extend to infinity. Because the capital itself may last for ever, or it may be worn out in a certain time. And, of course, capital of different sorts may wear out in longer or shorter periods.

Now as it produces a continuous profit, it may be supposed to do so at certain definite intervals. And the value of all capital is the present value of the sum of the profits at all these definite intervals.

78. Thus, to take a simple example. When a man buys a landed estate, he does not merely pay for the value of the present produce on the land, but he pays a sum equal to the present value of all the supposed future profits for ever.

And these profits lie wholly in the future, and are therefore negative, according to the preceding considerations.

So the value of railway stock, bank and other shares, is always calculated on this principle.

Now, it is not usual to express these transactions at full length, but it is evident that that is the real nature of the operation.

79. But not only the land, stock, shares, &c., have a power of productivity which is saleable, but also a merchant's skill, judgment, industry, and character are also capital, as Adam Smith, and all leading Economists, have allowed; and he may sell the right to the future profits of his trading, just as much as the future profits of the land may be sold. When this is done, the nega-

tive sign always appears, as it is done by means of Bills of Exchange, and other instruments of credit. These are always affected with the negative sign; and the universal error of Economists is, that they suppose they are to be *subtracted* from a merchant's present property.

This, however, is a profound delusion. They are only engagements to pay at a future time, and thus credit is analogous to the future products of the land, future dividends, &c.

That is to say, the RIGHT, or PRIVILEGE, of receiving these future dividends and profits is real existing property, which may be bought and sold, which is future, or NEGATIVE.

80. Having premised this, we shall now investigate more closely the different species of Capital, upon the principles of the system of Political Economy which we adopt.

We have said (PRELIMINARY DISCOURSE; VALUE) that there is a broad and fundamental distinction between Economists on the source and origin of Value. The two schools of Political Economy, founded by Turgot and Quesnay, and Adam Smith, agree in this, that they consider Value to be some quality, or attribute, fixed in something. There are, no doubt, differences of opinion among them about the matter, but their common principle is, that Value is to be found in the object. Now, the insurmountable objection to this is, that if Value consists in anything inherent in the object itself, its value cannot change, while that attribute remains the same. Thus Ricardo, who makes labor the source of Value, consistently with his system, says, that the same labor of men will always produce the same value, and that that commodity would be invariable in value which was always produced by the same quantity of labor. But very little reflection will shew that this is inaccurate, for the value of things produced by exactly the same quantity of labor may be very different.

81. Now, according to the views of these Economists, in considering the value of land we should look to something in the land itself for its value, either the cost laid out in bringing it to its present state, or its fertility, or something of that sort. But is this correct? Not to mention that the value of landed property greatly depends upon the average rate of interest, being three times as great when the usual rate of interest is 3 per cent. to what it is when the rate is 9 per cent., we may ask this question—Suppose that the people of England were, like the Phœceans and Teians of old, to emigrate in a body, where would the value of the land be? Where would the value of all the houses, &c. in England be? Now, these would remain just as they were, and yet their value would manifestly vanish. It is, therefore, perfectly manifest the value of the land must be sought for elsewhere than in the land itself.

82. Where, then, is the source of the value of the land in England, if it does not reside in itself? We must go back to the idea of Aristotle. The founder of Political Economy declared that the WANTS or DESIRES of mankind are the source of Value, and the quantity of money (or anything) they would give to obtain possession of what they wanted is the *measure* of Value. And that we believe to be the true fundamental conception of Political Economy. The source of the value of the land of England lies in the wants of the people

to be fed and clothed, and their readiness to give something in exchange for its products. It is this desire that gives value to the land, to corn, to cattle, and to all the products of the land.

These wants are permanent, and consequently so long as they exist the value of the land will be permanent. If it were possible to imagine that men would cease to require food and clothing, or should they change their tastes, and require such food and clothing as could not be produced in England, then the value of the land would immediately die off.

83. This, therefore, is the general idea of the value of land. It is the source from which an annual revenue springs, because it supplies something that is wanted by men. And men invest their money and labour in cultivating the land, and rearing cattle, because they expect that they will continue to have a permanent value. And the value of an estate in land is found by finding the present value of all the annual revenue for ever according to certain rules.

84. But this conception may be generalised. And we may affirm that if men require any service whatever continuously, and will pay to obtain it, the annual revenue, or the sum paid annually to obtain these services, may be capitalised, and form a great estate.

85. Thus the continued desire of men for the services of lawyers, and the certainty that they will continue to pay for them, creates a great incorporeal estate—the LAW; and this causes men to invest their money and labour in the acquisition of law.

86. The certainty that men will continue to require and pay for the services of medical men, creates a great incorporeal estate—MEDICINE; and this causes men to invest their money and labour in acquiring a knowledge of physic.

So men require and have endowed a great incorporeal estate, the CHURCH.

87. And as new wants spring up, and men will pay for their satisfaction, new incorporeal estates spring into existence. Thus, in comparatively recent years, the demand for canals and railroads has called into existence a new incorporeal estate—ENGINEERING.

88. So the necessity men have to be defended from their enemies by sea and land, and their willingness to pay for such defence, creates two great incorporeal estates, the Military and Naval Services.

89. In rude times men had few wants but corporeal ones, and consequently there was little besides material property. But in process of time new desires were created, mental wants were excited, and men became willing to pay for products to gratify their minds. They became willing to pay for books, and this created and gave value to a great incorporeal estate—LITERATURE.

90. A desire for Art, too, sprung up, and this created great estates in ART, either embodied in a material form, such as pictures and statues, or in an incorporeal form, such as music, and dancing, and acting, and so on down to its lowest forms.

And so through the whole catalogue of trades and professions. It is the demand of the public which confers value on them.

91. Now each of these, the land, cattle, &c.,

the law, the church, medicine, engineering, the army, the navy, literature, the arts, and all trades of all sorts, are each of them a great estate, all deriving their value from one great common principle—the wants of mankind, and their willingness to pay for their products. As it is this desire and willingness which call them into existence, and confer value on them, so a cessation of this desire, and a cessation of the willingness to pay for their products, would immediately annihilate their existence.

If men ceased to care for art of all sorts, and literature, the whole literary and artistic estates would immediately cease to exist.

If men inaugurated the reign of universal peace, those great estates—the military and naval professions—would immediately cease to exist.

During the reign of George III., the fashion for bobwigs and steel shoe buckles suddenly ceased. Those trades were immediately dissolved, all that capital was suddenly dissipated, causing dire distress.

And the very same thing is true of all trades and manufactures of all sorts. It is the demand for their products which gives them their value, and constitutes them capital.

92. Hence every new want and every new desire of men calls into existence and creates new capital. Every change of fashion, every extinction of a want or desire, extinguishes capital.

93. And each of those great estates, the land and material products, the law, medicine, art and literature, scientific trading, and manufacturing knowledge, is transmissible and inheritable. No doubt they are transmitted in different ways, but still the general principle is true. Nor do we say that it is possible to produce transcendent genius at will. But yet, in each of the incorporeal estates, especially the professions, in trades, in manufactures, there are accumulated hoards of knowledge, which are augmented by each succeeding generation, and transmitted just as much as material products are, and are *WEALTH*, or *Economical Elements*, just as much as material products, and will continue to be so, so long as men continue to want and to pay for them.

And the money and labor men spend in acquiring this knowledge, and cultivating their skill in a useful profession, is, in all respects, *CAPITAL*, just as much as money and labor expended in tilling the ground, or invested in any material product, and we have shewn below is fully admitted by Adam Smith to be so, although the contrary is generally supposed.

94. And hence we arrive at this great fundamental law in Political Economy—

IT IS DEMAND, OR CONSUMPTION, AND NOT LABOR, THAT GIVES VALUE TO PRODUCTION.

It is Consumption alone which gives Value to Production, and adopting the definition of Mr. Senior in its widest generality, any source whatever, corporeal or incorporeal, which produces anything which is exchangeable, is *CAPITAL*.

And these considerations appear to us to shew conclusively the truth of the doctrine we have so often affirmed, that it is *not Labor which is the cause of Value*, but *Value which is the cause of Labor*.

95. It is, moreover, the entire overthrow of the Ricardian system of Political Economy. Ricardo considers the value of a thing to consist in the labor which it has cost. We should imagine that there is scarcely an Economist, at the present day, of any note, who will not agree that the *value of a thing is not what it has cost, but what it will sell for*.

96. We have now to examine the nature of a species of property which has given rise to more discussion almost than any other, namely, the *Funds*.

When Governments desire to execute some great work, which requires means beyond what they have, or find it necessary to borrow large sums of money in war, they promise to pay a sum annually, either for a limited time, or for ever. And this engagement to pay confers a value on the shares in the original loan, which may be made transferable, and the certificates so attesting this ownership are called the *Funds*.

97. Now the most diverse opinions have been entertained as to whether the funds, or this stock, are to be reckoned part of the *wealth* of the nation, or not. When they are called the “public debts,” many persons think that the intellects of a man must be somewhat crazed who can suppose that these *public debts* are part of the *public wealth*. And we shall see that some very able Economists maintain that the income of the fundholders must not be reckoned as part of the National Wealth.

98. Thus J. B. Say, *Cours d'économie politique*, Vol. I. p. 523, blames M. Dufresne de Saint Léon for considering the public funds as part of the general wealth of society, because, he says justly, that they are only a title granted to the creditor of the state to receive the future taxes, which augments, in no way, the sum of the capital and the revenue of the nation. And Mr. Mill says at p. 9, after mentioning a mortgage (the nature of which he has mistaken), “The position of fundholders, or owners of the public debt of a country, is similar. They are mortgagees on the general wealth of the country (in which Mr. Mill is in error.) The cancelling of the debt would be no destruction of wealth, but a transfer of it, a wrongful abstraction of wealth from certain members of the community, for the profit of the government, or of the taxpayers. Funded property therefore cannot be counted as part of the national wealth. This is not always borne in mind by the dealers in statistical calculations. For example, in estimates of the gross income of the country, founded on the proceeds of the income tax, incomes derived from the funds are not always excluded; although the tax payers are assessed on their whole nominal incomes, without being permitted to deduct from it the portion levied from them in taxation to form the income of the fundholder. In this calculation, therefore, one portion of the general income of the country is counted twice over, and the aggregate amount made to appear greater than it is by about 30 millions. A country, however, may include in its wealth, all stock held by its citizens in the funds of foreign countries, and other debts due to them from abroad. But even this is only wealth to them, by being a part ownership in wealth held by others. It forms no part of the collective wealth of the human race.”

99. This argument of Mr. Mill's requires

some investigation. He says that the income of the fundholder ought not to be reckoned separately from the general income of the country, because it is paid out of the general incomes of the taxpayers; and he says, that doing so makes the income of the country appear 30 millions greater than it really is.

Now if Mr. Mill's argument were true, it is perfectly clear that it ought to be extended not only to fundholders, but to all persons who receive their incomes out of the taxes which are paid out of the general income of the country. Thus the civil list of the crown ought to be excluded from the catalogue of national incomes. So ought the whole pay of the military and naval professions; so the whole of the administration of the civil service, from the prime minister down to the humblest policeman; so the incomes of the judges. If Mr. Mill's argument be true the incomes of all these persons must also be excluded from the general catalogue of national income, because it is perfectly clear that they all stand on exactly the same footing as the fundholder, they are all paid out of the taxes of the country. Is Mr. Mill prepared to adopt these consequences? If his argument be true, how can he escape from them?

But if Mr. Mill's argument be true it must be immensely extended. The income of railways is paid out of the general income of the country, just as much as that of fundholders. Only in one case the taxation is voluntary, and in the other compulsory. It is wrong to reckon the income of railroads separately. But the fact is, to make the matter short, a slight consideration will show that *the income of every trade, business, and undertaking whatever, in succession, is paid out of the general income of the country.*

100. We state the proposition in this form:—

Every man's income is paid out of the income of some one else.

The doctrine stated thus abruptly may startle some persons, and they may think it a paradox, nevertheless a very slight examination, with the assistance of some of the acknowledged fundamental truths of modern Political Economy, will very soon unravel the paradox.

We need scarcely remind our readers that the old doctrine was that in an exchange *neither* side gained. Aristotle and Cicero both maintain this, and Luther was driven into one of his customary fits of fury, by the bare idea that in an exchange either side could gain, except by robbing the other. (ARISTOTLE; CICERO; LUTHER). This doctrine, which had some show of plausibility in it, gave way to another which was palpably absurd. It was then maintained that, in commerce, only one side gained, and what one side gained, the other lost.

Then mankind, as usual, having tried every species of absurdity, were at last perforce driven to adopt the only remaining conclusion, *that in commerce both sides gain.* And this is now the acknowledged doctrine of modern Political Economy, (EXCHANGE; PROFIT), which we need not spend any further time in explaining here, as it is now universally admitted.

101. The proposition we have stated above, that *every man's income comes out of the income of some one else*, stands exactly on the same footing as the doctrine that in commerce both sides gain.

Now let us take a few examples.

We have said above that it is the wants of men alone which give value to the land. It is well known that men will continue to want food and clothing, and therefore owners of land devote their money and labour in producing corn and cattle. Now this is their capital. When this capital, in the form of corn, say, has produced its increase, the landlord offers it for sale to the public. The proceeds of the sale in ordinary times will exceed the cost of production. Now the portion of these proceeds which equals the cost of the investment replaces the capital, and all above that is profit or income. No doubt the landlord might, if he chose, spend the whole proceeds in personal enjoyment and then it would not be capital to him. But we suppose him to be a prudent man, and not disposed to diminish his capital. We may therefore consider, without error, all the excess of the proceeds above the cost of production, as profit or income, which he may spend upon his own enjoyment without diminishing his capital. Now, where does that income come from? Most clearly from the income of some one else.

102. A merchant, we will say, does business on a similar principle to the landlord. He invests a sum of money in business as capital, and that capital brings him in a profit, or income, which he may spend on personal enjoyment. With this income he buys corn and meat from the landlord. Hence the landlord's income is derived from the merchant's income.

Reverse the case. The landlord has made an income, and he wants things from the merchant for personal use. Therefore, out of his income he purchases things from the merchant, and hence the income of the merchant comes out of the income of the landlord.

103. It might, perhaps, be said by some, that though this is true, so far as it goes, yet it is not the whole truth. Because there are many traders who never deal with the public, or ultimate consumers, but only with intermediate consumers. Thus merchants deal with wholesale dealers, and these again with retail dealers. When the wholesale dealer purchases from the merchant, he purchases with capital, because he means to sell again. But the merchant of course must make a profit; and this comes, in this case, from the capital of the wholesale dealer, and not from income. So the profits or income of the wholesale dealer come from the capital of the retail dealer. And here again is income made from capital.

But this objection, which seems plausible at first, is soon dissipated, when we consider that the ultimate consumer replaces all these profits in the price he pays for the article. The price he pays for it manifestly replaces the capital and the profits of all the intermediate parties, and consequently the profits made by these intermediate parties is, in fact, only an advance of the profit which is to be recovered at a future time from the ultimate consumer.

104. Now, the very same mechanism is true of all other traders and dealers whatever. Their incomes always proceed from the incomes of the ultimate consumers of the articles they deal in.

This is obviously true of Railways. The income of railways evidently comes out of the incomes of other classes in the community, and

yet the income of railways is justly reckoned separately in the general income of the country.

It is also obviously true of all professional men. The incomes of lawyers and medical men manifestly come out of the incomes of their clients and patients. So the incomes of actors, and those of the musical profession, evidently come out of the incomes of those who frequent theatres and places of amusement. And the incomes of all these persons are justly reckoned separately in the general income of the country.

We will take a case even yet more clear and decisive. A noble lord has an income of £50,000 a year. He keeps a French cook at £300 a year, a Scotch gardener at £250 a year, besides a large retinue of domestics. Now, it is quite evident that the incomes of all his domestics and employés come directly out of my lord's income; and yet their income is reckoned separately in the income of the country, over and above and distinct from my lord's income. And my lord pays income-tax on his income, and each of his employés, whose income is above the limit, pays income-tax on his income. And justly so.

Thus we arrive at this general truth, after exhausting the whole catalogue of incomes in succession—that the income of every man is made up by driplets out of the incomes of other people, and every man's income (at least of those who spend it) goes to make up the income of all the persons he deals with, directly or indirectly.

These considerations satisfactorily prove, we think, that Mr. Mill's objection to the incomes of the fundholders being reckoned separately, as well as the incomes of the general public, is not well founded.

105. But we have still to investigate another question. Are the Funds separate property? Are we to conclude that they are part of the *wealth* of the nation? Now, to determine this we must not let dust be thrown in our eyes by names, but we must look to the nature of the thing.

Let us suppose that a country was subject to inundations of the sea, and that, to preserve the lives and property of its inhabitants, it should be absolutely necessary to erect vast sea-dykes. Now, as these sea-dykes would be for the general benefit, it is manifestly just that all the inhabitants should contribute to their formation and maintenance. Now, suppose that the government, wanting to execute the work quickly, borrows large sums of money upon the promise to pay interest for it out of the taxes of the country. Now, the money borrowed to erect the sea-dykes is withdrawn from other purposes; and if it had not been spent in erecting the sea-dykes, something else might have been created with it. But this is perfectly evident, that the sea-dykes are something. The people of the country wanting them have paid money for them, and therefore they are to be placed in the same category as any other property.

Now let us suppose that in order to make the original loans more generally useful and convenient for the lenders, the government makes the certificates, or vouchers of the loans, and the right to receive the interest, transferable—Would it not be separate and independent property? call it by what name we please—stock, or funds, or public debts—it is perfectly evident that it is independent property.

Now such a country is Holland, which draws 20 feet of water. The sea-dykes of Holland were formed, and are maintained, at a great expense.

Now let us ask this question, are the sea-dykes of Holland part of the *wealth* of Holland? Under the peculiar circumstances of that country, they are wanted, they are a utility, they are the result of human labor, and they are embodied in a material form. Taking the very narrowest view of wealth that any Economist has taken, these sea-dykes, under the peculiar circumstances of the case, answer all the conditions of wealth. It is perfectly clear that they stand in just the same position as roads, canals, and railways, and a great quantity of the other fixed capital of the country. The people continually want them, and they pay a portion of their annual income to the persons who made them, and that forms the income of the persons who constructed them, and is justly reckoned as a separate item in the catalogue of the general income of the country.

So the stock of any other public company engaged in any trading enterprise is manifestly part of the wealth of the country. But the value of this stock manifestly depends upon the income which accrues to the company, and that income is derived from the incomes of the general community. The subject of shares in public companies is more fully considered further on.

It is perfectly manifest that the public funds are property analogous to the stock or shares of any public trading company. But a country may have other enemies besides the sea. She may have human enemies, and it may be necessary to raise fleets and armies to defend her existence. And to preserve her security from these enemies it may be necessary to borrow large sums of money upon the promise of paying an annual interest for it out of the income of the country, and the shares of those who advance this money may be made transferable, and are the public funds, or public debts.

Now it is evident that the funds, created to obtain this moral security, are just as much separate property as the funds, or stock, created to obtain the material security of the sea-dykes. In either case it is a service done to the general public, who have to pay for it out of their general income, just as they pay for every other service whatever. And the incomes of those who render this service, stand in the same position as the incomes of those who render any other service whatever.

These considerations manifestly shew that the funds, or public debts, are property, as much as any other property, and they are properly reckoned as independent items in the general property of the country. No doubt the money might have been spent in some other way, and some other product might have been obtained instead. It is also true that the expenditure may have been injudicious, and other things might have been produced which would have been more advantageous for the country, but these considerations in no way affect their existence as property.

106. Mr. Mill says that "the cancelling of the debt would be no destruction of wealth, but a transfer of it, a wrongful transfer of it from certain members of the community for the profit of the Government, or of the tax-payers. Fund-

ed property, therefore, cannot be counted as part of the national wealth." This seems to be a very strange conclusion. A *transfer* of wealth, in no case that we can imagine, is *destruction* of it. But Mr. Mill says, that because the *transfer* of it is not the *destruction* of it, it is not to be counted as part of the national wealth. A highwayman knocks down a traveller, and robs him of his money and his watch, now this is not a *destruction* of wealth, but only a *transfer* of it, and, therefore, the money and the watch are not to be counted as part of the national wealth! A servant robs his master, that is only a *transfer*, and not a *destruction*, of wealth, and, therefore, the thing stolen is not to be counted as part of the national wealth!

What we have said here is sufficient, we think, to shew that the funds are independent property, and that the income of the fundholders is property reckoned as part of the income of the nation. For more on the subject we refer to **FUNDS**.

107. We must now endeavour to make a concise survey of property in general. To enter into all its minutiae would, of course, require a large volume. What we shall now attempt to do is merely to endeavour to classify and enumerate the different species of property which exist. Most persons would assent, we think, to the proposition that "wealth" and "property" are convertible terms. If, therefore, we wish to obtain an accurate definition of wealth, the subject matter of Political Economy, it seems to us to be clearly necessary to consider all the various species of property that exist, and then to frame a definition of wealth in accordance with those species. We must frame the definition from the science, and not construct a science from the definition.

108. In the first place, then, what is **PROPERTY**?

The idea suggested to most persons by the word *Property* would be goods, and chattels, land, &c., &c., and *things* of all sorts. Just as when people hear of a man's having a great *estate*, they think of the acres of land: but this is a very great mistake indeed.

The word "Property" is, like several other words, an example of that philosophical inaccuracy which is unfortunately so prevalent in English, by which something related to, or connected with, a thing is used as a name of the thing itself. There are a large class of such words, but we shall only mention three here:—they are "Currency," "Estate," and "Property."

The word *currency* was first used as an attribute of money. Money was said to be current. Hence writers began to speak of the *currency* of money. Just as they speak at the present day of the *currency* of a *report*, or the *currency* of an *opinion*. At last, about the middle of the last century, writers began to call the money itself *currency*, by a most gross abuse of language. This however has now become a practice far too strong to be shaken. But it is nevertheless a gross confusion of idea. It would be just as rational to call an opinion, or a report, *currency*, as it is to call money, *currency*.

The same observation is true of the word "Estate." The word *estate* properly means a person's **INTEREST** in land, or in goods and chattels.

But by a gross confusion of idea, it is in common parlance applied to the land itself, or the goods and chattels.

The word **PROPERTY** has been used with a similar confusion of language. It is almost invariably used to denote things, such as land and goods. But the meaning of the word *Property* is the **RIGHT** to *use a thing*, and not the thing used. Thus as the correct expression is the "Currency of money", an "Estate in land", so also the correct expression is "Property in land," or "Property in goods," &c.

Hence we see that **PROPERTY** is not anything vested in the thing itself, nor the thing itself, but it is an attribute vested in the **PERSON**.

109. Now things which may be the subject of property are, as regards Political Economy, divided into two fundamentally distinct classes.

I. There are certain things which we may buy, which are actually in existence at the time we buy them.

Thus if we buy a watch, the whole thing is actually in existence. We may buy it for the sake of continuous use, to last all our lives; or for an indefinite period. But the whole thing that we buy is in actual existence. So if we buy bread, or articles of food, they are in a state of complete existence. They, it is true, are bought for the purpose of immediate destruction, and not continuous use. So articles of clothing; they last longer, and are for the purpose of continuous use. So articles of furniture, books, carriages, horses, &c. All these are bought for the purpose of use, which may be more or less continuous, as the case may be. But this feature is common to all these things. When we buy them, they exist in a complete state, and capable of immediate use and enjoyment. We may say therefore that all these things may be used in their totality at the time of the purchase.

But these things are only a very small portion of the things which may be made the subject of property. The incomparably greater portion of things that may be made the subject of property, have no actual present existence at all, but only come into existence at future intervals of time.

II. Such is the foundation of the value of the Land, the Public Funds, all annuities, shares in all commercial enterprises of all sorts, Banks, Railways, Insurance Companies, and Commercial Credit.

Now the fundamental characteristic of all this class of property, which from its mere enumeration manifestly includes nineteen-twentieths of existing property, at least in this commercial country, is this, that it cannot all be used or enjoyed at one time. The actual use and enjoyment can only come into existence and possession at definite intervals of time. But yet although the enjoyment is future, nevertheless the **RIGHT** of enjoyment and use is **PRESENT**, and may be bought and sold, and, in fact, the present value of all these future intervals of use and enjoyment is the value of the *Property*.

110. And here we may say that the study of the Theory of Property is absolutely indispensable to the student of Political Economy: a truth which has been greatly lost sight of by many writers on the subject. It is the very basis of his science. We may take this opportunity of recommending as admirable summaries of

it; *Williams on the Law of Real Property*, and *On the Law of Personal Property*. These works are quite as indispensable to the student of Political Economy as they are to the student of Law. We may also commend to their attention a paper *On some Points in the Theory of the Law of Property*, by Mr. Stephen Martin Leake, in the *Papers read before the Juridical Society*, 1855-8, p. 531, which contains several points on the subject very clearly stated, and from which we shall make some extracts. Mr. Leake says, p. 533, that the entire property in a thing is the right to the *whole* use of a thing. That things differ in their use according to their nature, some perish in the use, some perish from causes independent of the use, but afford a continuous use so long as they endure. Some, like land, are absolutely indestructible, and supply a continuous, uniform, and constant use for ever. Of all these land is the standard, or type, that is to say, a subject indestructible in its nature, its use is unlimited in duration, and constant and uniform in quality, and possesses all qualities in the highest degree, which other subjects of property possess only partially, and in a limited degree." For these reasons, Mr. Leake says that the Law of Real Property in practice may be called the grammar of the Law of Property in general. In this remark we entirely concur, and we may say that the theory of the Value of Land is the grammar of the theory of Value in general.

111. We must now still further investigate the nature of the value of land. When it is said that the value of the land of Great Britain is some enormous sum, we don't know what; but say 2,000 millions, what does that mean? Does it mean that the value of the existing produce of the land is worth 2,000 millions?—Certainly not. The value of the Land consists in this, that it produces year by year for ever something which men want, and will pay for, or for which they will give some other product, or service, in exchange. Now it is evident from this that as the actual use and enjoyment of the land can only come into possession at successive intervals, no man can use or enjoy the whole of his property in land. And as these products cannot be accelerated, no man could squander away the whole of his land as he might property which was in a complete and final state of existence. Hence, if families were put in possession of a large extent of land, although they might squander the yearly produce, they could not waste or dissipate their capital. In many countries families have endured for centuries, in possession of the same land.

112. But by the introduction of money, a new power was called into existence. Although men could not sell the actual produce of their land, which was only to come into existence several years afterwards, they could sell their property in it, or their Right to receive it. And it is quite clear that each annual product is the subject of distinct property, and that the whole series for ever, is a series of separate properties, each, or all, or any number of which, may be sold, or exchanged, for anything else. And the method of ascertaining their present value is as follows.

113. We have said that Capital is an increasing quantity, and the continual increase may always be capitalised, and so used to produce

further increase. The increase of different species of Capital proceeds, of course, at very different rates. But it is quite evident that it all has the capacity of increase in a geometrical ratio. Not that it ever actually does so, for various reasons, to be more fully examined hereafter. But at least it has the capacity for so increasing. As this law is universally applicable to Capital, it holds good with regard to money, as well as other species. Thus, if money be invested in the funds, and allowed to accumulate, it will manifestly increase at compound interest, or in a geometrical ratio. And it is quite easy to tell what any given sum of money will amount to in any number of years, at any given rate of increase. And it is just as easy to perform the inverse operation, and find what sum, at the present time, would amount to any sum in a given number of years, at any given rate of interest. And that sum is called the *Present Value* of the future sum.

114. Now the produce of the land in any given future year may be valued in money, and the *present value* of that money may be ascertained. The same may be done for all the future years for ever, and the sum of the series of these future values is the total present value of the land for ever.

Although this series is infinite, yet its sum is a finite quantity, which is easily ascertained.

Thus the value of the property in the land for ever may be accurately measured, and exchanged for money like any other commodity, and the owner of the property may use and enjoy the whole value of it.

115. To show how the value of things may vary without any change in the thing itself, and upon what incorporeal considerations it depends, we may observe the difference in the value of land caused by a difference in the rate of interest.

As the present value of each of these annual products is calculated at compound interest, it is clear that the higher the rate of interest is, the faster they will diminish. Hence if the rate of interest is high, the value of the entire property will be a great deal less than when it is low.

The value of any number of these future products may be ascertained. But it happens that when the value of the whole series is to be found, the practical rule is very simple.

To find the value of a perpetual annuity of £1, we have only to divide £100 by the rate of interest, and the result is the present value of the annuity.

Thus if the rate of interest were 10 per cent., the value of a perpetual annuity of £1 would be £10.

If the rate of interest were £3 per cent., it would be £33 6s. 8d.

Thus the present value of the very same annuity is extremely different according to the rate of interest. And the value of the very same land producing the same annual revenue will be three times as great, when the rate of interest is 3 per cent. as when it is 9 per cent. In the reign of Charles II., the usual value of land was 10 years purchase. In the present day it may be taken at an average of 30 years purchase. Thus we see how enormously the value of the land of Great Britain may vary without any change in the land itself, or any depreciation of the value of money with respect to commodities.

116. We thus arrive at this fundamental conception that the saleable value of land consists in the **RIGHT** to receive the annual profits of the land.

Thus we see that a mere **RIGHT** to receive a thing which has no actual existence at present is an Economic Entity, or an Economical Element, which may be bought and sold like any existing useful article. This is a mere right of future enjoyment, and according to what we have said regarding negative quantities, it is to be classed with them.

We may say without any violent metaphor, that when a man has purchased an estate in land, it *owes* him an annual payment. And this is more clearly manifest when he lets it to a tenant, who enters into an obligation to pay him an annual rent. Each obligation to pay him rent year by year is an independent Economic Entity, just the same as if it were embodied in a Bill of Exchange, or a Promissory Note.

Now the entire property in the land consists in the **RIGHT** to receive all the profits that can be made out of it of every description, either on the surface or below it. But these profits are of extremely different sorts. And the entire property may be divided and separated into any number of smaller parts. And it is scarcely necessary to say that each separate portion is also an Economic Element, and may be sold and exchanged separately, and is a separate article of wealth. And each of these separate properties may be in separate hands, or they may be all merged in one person. But though they may be all vested in one person, they are nevertheless separate articles of wealth. And, in short, whatever may be separately and individually exchanged without any connection with anything else, is a separate and independent article of wealth, and must be reckoned separately in any catalogue of wealth.

This perhaps, may appear an unnecessary truism to some readers, but we shall find hereafter, that it is a doctrine of immense practical importance, which has been greatly lost sight of in many economical discussions and treatises.

117. We may then define property in land in general terms thus:—It is the right to exchange products which are not yet in existence, for other products also not yet in existence, and for services to be done by men who are not yet born, to the end of time.

Now, this entire property in land, says Mr. Leake, p. 536, "is divisible in three distinct ways:—

"1. By division of the subject of property.

"2. By division of the current use into concurrent portions.

"3. By the division of the continuous use into successive intervals."

In the first case, the division may be either vertical or horizontal. The land may be split up into any number of portions. Thus the owner may sell entirely one acre out of ten and keep the rest, or he may retain the whole right to the surface himself, and sell the right of digging for minerals, coals, stones, &c., below the surface. And each of these rights is a separate article of property.

In the second case, the property in the land itself may remain with the proprietor, but separate estates may be carved out of the profits of

it. Thus tithes, rent charges, annuities, may be charged upon it. So also there may be what are called *easements*, that is, where other persons have a right to use it in a particular way, or for certain limited purposes, such as a right of common, right of pasture, right of way, right of shooting, right of fishing, &c.

In the third case, a man may have the right to the actual use, possession and enjoyment of the land for a certain number of years, and then it may pass to other persons. The person who has the right of present possession and enjoyment is said to have an estate in possession, and the estates of those persons which are only to commence at a future time are said to be in reversion, or remainder.

118. Now of all these various rights, which are all distinct subjects of property, the estates of those persons alone who are in actual possession and enjoyment of the surface of the land, are usually called corporeal rights, or hereditaments, all the others are called incorporeal rights, or hereditaments. Mr Williams (*Law of Real Property*, p. 196) considers that estates in reversion and vested in remainder, may be considered as somewhat of a mixed nature, because in process of time they become corporeal. All the others are considered as purely incorporeal. But Mr. Leake, justly we think, says p. 541, "The distinction however between corporeal and incorporeal rights is altogether questionable, both in the nature of things, and in theory. All rights are equally incorporeal, inasmuch as they subsist in a person by mere force of law; and all rights are equally corporeal inasmuch as there must exist a real subject matter in the use of which the right consists. All property of whatever kind is an incorporeal right to the corporeal use and profits of some corporeal thing." In the first part of this extract we entirely concur. The distinction between the property in the surface of the land with the right to grow corn, &c., as a corporeal right and the right to dig for minerals and coals below its surface, or the right to shoot game on the surface, as an incorporeal one, seems to us to be unphilosophical. We therefore concur with Mr. Leake that all property is equally incorporeal, inasmuch as it really means a **RIGHT** residing in the person, and not a thing.

119. But with respect to the next part we are not so disposed to concur, at least if we have understood him correctly, which we are by no means certain of. He says that all rights are equally corporeal, because there must exist a real subject matter in the use of which the right consists. "All property of whatever kind, is an *incorporeal* right to the *corporeal* use and profits of some *corporeal* thing." Now to all this we agree up to the last four words. That profits are corporeal we admit, but to say that the source from which these profits are derived is necessarily *corporeal*, in the sense which we think Mr. Leake means, is, we think, an oversight. No doubt there must be a subject matter out of which profits arise, but that source, or capital, may be incorporeal. The subject matter, therefore, of a right may be purely incorporeal, as we shall see further on.

We have said enough we think on the subject to explain the general nature of the theory of the Value of Land, the standard case of Value.

In this case we observe that the source of the

annuity, the land, is corporeal, and before our eyes. It may be seen and handled. Moreover the fruits of it from which profits are made, viz., the corn and the cattle, exist corporeally before our eyes, and may be handled, and measured. It is by the exchange of these corporeal products for other products and services that we obtain the enjoyment of the property in the land.

120. But we shall now proceed to shew the analogy between this standard case of Value, and other immense classes of cases. We shall first deal with a class of cases in which the source or instrument of the profit is corporeal, like the land. But we shall sponge out the materiality or corporiety, of what is analogous to the produce of the land, namely the service performed by the instrument, and which brings in the profits, or the instrument, as corn and cattle bring in the profits of the land. And we shall call upon our readers to believe in the real existence of these profit-producing incorporeal elements just as much as in the existence of the material corn and cattle.

We have thus obtained two cases of Capital and Produce. The first, in which the Capital and the Produce are both material; the second, in which the materiality of the Capital remains, but the Produce is immaterial. But in either case, each are Economic Elements. We shall also find that there are two other cases, correlative to the two first; namely, a third one, in which the Capital or source of Produce is immaterial, and the Produce material; and, lastly, we shall sponge out the corporiety both of the Capital and the Produce. And we shall call upon our readers to believe in the real existence of these incorporeal sources of revenue, or this incorporeal capital, producing incorporeal entities, or elements, which are exchanged for corporeal profits, and which have as real an existence as much as the land, and the corn and cattle. And this incorporeal capital and its incorporeal produce may be measured and valued with as great certainty as any material article whatever. And when we have surveyed all these kinds of property, we shall be able to form some estimate of the magnitude of property in this country, and the domain of Political Economy.

121. As an example of the first case of this latter species of property, we shall instance Railways, and Canals. It is perfectly clear that what we may call the source or instrument of the annuity, analogous to the land, namely the railroad, or the canal, formed and maintained at a vast expense, is corporeal and visible like the land. But is the service which the railroad or canal is capable of rendering, and which produces, or *draws forth*, (*PRODUCTION; LABOR*) the profits, corporeal? Whence do the profits of the railroad or canal come? They are given by the public in exchange for the service which the railroad or canal is capable of rendering, namely the transport of persons and goods. Something which is purely incorporeal. And yet though this service can neither be *handled* nor *seen*, its value may be *measured*, and is so, with as great certainty as any corporeal element.

The railroad is constructed on the expectation that the public will require and pay for the transit of their persons and goods. This is a mere incorporeal service, and yet it is exchanged for

profits, just as corn and cattle are, and is as real a source of revenue as they are.

Now it is perfectly clear, that though the railway or canal may have cost a very large sum of money, the value of the shares or stock has no reference at all to the cost of construction, but is entirely dependent on the value of the custom of the public. The actual line of road, and the waterway, are wholly distinct elements from the business which is conducted on them, and they may be separated and divided.

In fact, the business of the railway or the canal, may be *separated* from the railway, or canal, itself. And it is perfectly well known that when railroads were first made in England, it was intended and expected that the property in the railway itself, and the property in the business on the railway, should be separated. But it was found that such a separation of powers would probably be dangerous, and it was necessary for the safety of the public, that both the railroad and the business of working the railroad should be vested in the same hands.

But in canals the same reasons do not apply. And the property in the canal itself, and the property in the business of working the canal, are almost invariably, we believe, in different hands; the latter merely paying a toll or rent to the former. Now, it is perfectly clear, that the canal is corporeal property, and the business of the canal is wholly incorporeal, and yet that business produces a revenue just as much as the corn and cattle from land.

122. Now in the case of railroads and canals, it is perfectly clear, that it is the incorporeal property which gives value to the corporeal property. It is the custom of the public which gives the whole value to the railroad, or the canal; just as it is the demand of the public for corn and cattle that gives value to the land. If there were no demand for the services of the railway, or canal, they would be worth nothing whatever, whatever sum they may have cost. More than that, they would probably be a nuisance. Or if the demand of the public for their services were to cease, they would cease to be valuable, however valuable they might once have been. There are many instances in England of canals which were once extremely valuable, having been totally ruined by the competition of railways.

Here, therefore, are manifest instances of the second case we mentioned, where the source or instrument of production or capital, is corporeal, and the product is incorporeal, and yet the whole value of the corporeal capital depends upon the incorporeal product.

And the truth of the great fundamental law we laid down above is indisputable. *It is demand, or consumption, and not labor, that gives value to production.*

123. In the cases we have just mentioned, the outlay of capital in forming the instrument which is to render the service is so great, that the profit is often considered as little more than profit on the sum spent on the instrument. And in these cases we may consider without any violent metaphor that the instrument itself produces the service. Because though no doubt there is human labor employed in driving engines, &c., and men and horses in the barges and canals, so also there is a great deal of human labor em-

ployed in growing corn, but yet we consider corn as the produce of the earth, rather than of the labor of men, because, after all, the earth is the predominating element in the production of corn, and the labor of man is subservient to it. So also in railroads and canals, they are in a similar way the predominating elements, and the labor of men and horses is subservient to them. In each of these, we think it will be acknowledged that the corporeal element is primary, and labor, though indispensable, is secondary. But there are a great many other trading companies, in which the importance of the corporeal element constantly diminishes, and the importance of the human element constantly increases, till at last the corporeal element sinks altogether into insignificance, and is only incidental, and is only present in consequence of the necessity of men to have some place to rest upon. But the actual business is wholly human.

124. Thus in great public trading companies, like banks, and insurance companies, the corporeal instrument in which the business is carried on, is altogether subordinate to the nature of the business carried on. In a great bank or insurance company, the value of the actual building is a mere fraction of the capital. The value of the shares is entirely regulated by the value of the business, which is a purely incorporeal entity. The value of the shares in the London and Westminster Bank does not in any way depend upon the value of the banking house, nor even upon the quantity of money paid in, or original capital; that only forms a limit below which it would not sink. But it depends upon the gigantic business created by the skill of the managers of the company. And can this be seen, or handled, or is it a corporeal matter? Certainly not. It is purely incorporeal. But yet it may be measured in value as accurately as a hundred weight of cheese, and it may be transferred in just the same way.

125. Now, what does the value of the shares in these immense companies consist in? It is the *RIGHT* to receive and participate in the future profits of the business. An incorporeal right in an incorporeal entity.

And here, perhaps, it may not be amiss to say a few words as to the nature of shares in commercial companies, such as a bank. It might perhaps seem to some persons, that the stock, or shares, in a bank were identical with, and *represented*, or were one property with the very money paid in as actual capital. Thus if the money paid in as the capital the bank were £1,000,000, and an equal amount of shares were created and given in exchange for this money, it might perhaps seem to some that these shares were *one* property with the actual money. This, however, is a most important error. In the first place, it is clear that if the shares were merely *one* property with the actual capital, they never could exceed it in value. For if a man has merely the right to receive back the identical quantity of money he has paid in, why of course the share cannot exceed it in value.

126. But when a shareholder pays in money to form the capital of the bank, the property in it is entirely gone from him, in his individual capacity. The property in the money passes to the corporation, which is a distinct entity from its individual members. When then the share-

holder transfers the property in the money to the corporation, he receives in return a share.—And what is a share? Is it an individual right to part of the original capital? Certainly not. Except in the extreme case of the dissolution of the company, a shareholder has no right to demand back any of the original capital. What then is the share?—It is the *RIGHT* to a certain portion of the *profits* to be made by the business of the company. The shareholder gives the property in his money to the company, and he receives in return the *right of sharing the future profits*.

127. Now it must be perfectly clear beyond dispute, that the money paid in, and the right to receive the future profits of trading, are two separate and independent properties. Hence the capital of the company, and the shares in the company, are two separate and distinct properties. And it is perfectly possible that the capital of the company may be entirely lost and dissipated, and yet the shares be of immense value.

In the first place, the money capital may have been converted into other things, which are wholly useless and valueless if divided or broken up. The money capital of a railroad company has been converted into embankments, and drains, and tunnels, and bridges, and station houses. What is the value of these things, to sell independently? If the demand for a railway were to cease, the original capital would be found to be almost entirely dissipated and sunk. In the case of a Bank, it would be different, because there the capital, supposing it not to have been lost in business, remains actually in the form of money, and that can be divided among the shareholders in the case of dissolution. But even in that case, the same rule applies to a certain extent. There are many banks whose stock has risen 200 per cent. above the value of the money originally paid in. If such a bank were suddenly dissolved, and the original capital paid in, divided among the shareholders, would they receive in money the value of the shares of the bank as they stood before the dissolution? Certainly not.

And this very clearly shews that the shares in a Bank may be of great value, and yet the actual capital gone. The value of the shares depends, as we have said, on the profits of the business established by the Bank. Now in establishing such a business the Bank may lose money, and yet after having lost money it may establish a sound and flourishing business and that gives a real value to the shares, wholly independent of the money originally paid in.

Let us take a very simple case. The sum actually paid on the shares of the London and Westminster Bank at the present time is £20, and the total paid up is £1,000,000. But the actual market price of the shares is £50, hence the total value of the shares is £2,500,000. That is, the property of the Shareholders is £2,500,000. But suppose the Bank were dissolved to-morrow, and the capital divided among the Shareholders, do they believe that they would actually receive £2,500,000 in money? They do not suppose any such thing. They know perfectly well that there is an actual deficiency of £1,500,000, to make the capital equal in value to the shares. And yet the shares have a real value, though there is no money to represent them. It is perfectly clear that that

Bank is just in the same portion as regards the shares, as if it had originally £2,500,000 of money paid in, and had lost £1,500,000 in establishing its present business.

Thus the money paid in as capital is analogous to the land, or to the railway, or the canal; the stock represents the value of the business generated by the skill of the traders,—two distinct things.

The shares bear to the capital paid in the same relation that the value of land does to the land itself. The one is the source or instrument of the annuity, the other is the annuity itself.

It is the same relation as a ship bears to the profits to be made by trading with it, which are manifestly distinct.

Now the cases of a Bank, or Insurance Company, to which the same arguments obviously apply, and a ship, afford us some considerations worth notice.

When we say that the Capital, or Source of income, is a distinct and separate property from the income itself, many persons, looking to the cases of a railway or land, might say, that it is the value of the produce which gives the value to the railway, and to the land, and if the income were to cease, the capital would be worth nothing, and that therefore they are but *one* property. This argument has some degree of plausibility, because it does apply in appearance to those particular cases, and yet it is not true generally. In the case of the railway, the original money capital has been converted into something which has no general exchangeable value. A railroad has no value except as a railroad. Should the railroad not pay in one place, it is not possible to convert it into some other property, or to transport it to another place where it would pay better. The railroad therefore has value in that particular place only, or it has none at all. But the case where the original capital remains in the form of money which is universally exchangeable, or is converted into something which is again exchangeable, or convertible, is different. Thus the Capital of a Bank, or Insurance Company, remains actually in the form of money, supposing no losses in business to occur, or it is exchanged for something, which can be reconverted into money, as bills of exchange, the funds, &c. If the business of the bank, or insurance company, should not succeed, and therefore the profits be worth nothing, the capital may still be invested in something else, and remains intact. Here it is quite evident that the original money paid in as capital, and the profits arising from trading, are two distinct properties.

So in a Shipping Company. The original capital in money is converted into ships. If the company should not succeed and make no profits, still the actual ships have value and may be sold, and succeed in another trade. And here it is quite clear that the ships are separate and independent property, distinct from the profits.

Hence we obtain this general law,—

That the Capital, or instrument, or source of profit, is a distinct and separate property, from the profits made by it.

In some cases the value of the capital may remain, and the value of the profits may remain.

In other cases the value of the profits may remain, while the value of the capital vanishes.

In other cases the value of the capital may remain, while the value of the profits vanishes.

In other cases the value of the profits and the value of the capital may vanish together.

No one accustomed to mathematical reasoning will have the slightest difficulty in comprehending this.

128. Now, the point we have been aiming at all this time, and we think it is satisfactorily shewn, is this, that shares in public companies are separate and independent property. And they are purely of an incorporeal nature. For we need hardly say that the actual piece of paper on which the writing or certificate is, is merely the *evidence* of the right, which might exist without any material evidence at all.

Here then is incorporeal property, which is not embodied in any matter, which may be transferred from person to person just as much as material property, and it is really existing property as much as gold or silver, and is a portion of public wealth.

129. But not only has a public company shares which are saleable, and valuable property, of an incorporeal nature, but every successful trader and merchant has attached to his business, property of a like incorporeal nature, which he may sell and transfer, just as much as, and separately from, all the stock in his place of business, and the premises themselves in which the business is carried on, and this is called the *GOODWILL* of the business. It is the right to receive the future profits of the business. When a man has established a business in any place, and by his reputation created a demand for his products, or services, the expectation of the continuance of that demand, and the *RIGHT* to receive the profits to be made from it, is independent and separate property, and capable of transfer and sale. And is fully recognized by Courts of Law as part of the fruits of accumulated industry, just as much as any material product.

J. B. Say, we believe, was the first to notice this species of property, *Cours d'économie politique*, Vol. I. p. 532, and he gives a curious instance. "Il y a dans Paris plusieurs magasins qui par cette portion de leurs fonds, ont successivement enrichi depuis plus de deux cents ans, les familles entre les mains de qui ils sont tombés. Les uns ont passés des pères aux enfans, comme le magasin portant l'enseigne de l'Y, rue de la Huchette, qui date du commencement du dix-septième siècle, d'autres ont été acquis à titre onéreux par différens propriétaires. Ces réputations durent aussi long temps que les propriétaires se conduisent d'après les mêmes principes, et même un peu par delà. Lorsqu' ils en changent, la réputation se perd graduellement, comme un capital que l'on dissipe; et alors la chalandise ne vaut plus que ce que valent les autres, et quelquefois moins.

"Dans les villes populeuses et considérables, où toute espèce de vogue équivalant à une fortune, c'est un bon calcul que d'acquiescer une chalandise par des soins assidus; parce qu'alors elle repaie avec usure ce qu'elle a coûté. Il n'y a personne qui ne puisse en citer plusieurs exemples."

Now the value of the goodwill of a business of a private shop, which manifestly depends so much upon the personal qualities of the tradesman, is far more precarious than the expectation of the profits to be made by a great and permanent pub-

lic company. And, therefore, it sells for much less. But yet it is a value, and a very important one, and is absolute property, of the same nature as the share in a public company.

130. The same considerations apply to a literary work, which has established a reputation. When a demand for a work has been created, there is an expectation that it will continue, and that future profits will accrue from its publication and sale. And the RIGHT to publish and sell the work, and receive its future profits, is a distinct and separate property from the actually existing printed copies of the work, and may be sold separately. It is purely incorporeal, and yet it is recognised as actually existing property. It is called COPYRIGHT.

131. And this copyright, or right of receiving future profits, may be of immense value, even although the actually printed copies should very soon lose the greater part of their value. Thus a well established newspaper is an extremely valuable property, even though the value of any particular copy diminishes extremely rapidly, and sinks almost to nothing very soon after it is published. The value of the *Times* newspaper is enormous, even though the back numbers would sell for very little. And this value of course springs exactly from the same source as the value of the land, or a railway—the demand of the public. And this newspaper property is manifestly incorporeal, and is just as real a source of revenue, and wealth, as any material capital whatever.

132. But not only may a dealer in material products, create a business by his industry and labor, which may be sold, but dealers in immaterial products, such as medical men, solicitors, &c., may do the same, and it is capable of being sold, and is of a purely incorporeal nature. And this is usually called the *PRACTICE*, in French *clientelle*. Which is the RIGHT of receiving the future profits to be made by it. And this is evidently of the same nature as the other species of property we have just been describing.

These seem to us to be a pretty full enumeration of the different species of business. But in order to cover and provide for all omissions, we state this general proposition. *That the RIGHT to receive the future profits of any business whatever, though called by a variety of different names, is an incorporeal Economic Entity, or Economic Element, which has as real an existence as any material product.*

133. Now, before we enter into more disputed territory, let us make a few remarks. We have, we hope, satisfactorily shewn that shares in commercial enterprises of all sorts, copyrights, the "goodwills" of businesses, the "practices" of professional men, are substantive Economic Elements. And they are all of a purely incorporeal nature. What the value of all the shares in commercial enterprises may be, including Railways, Canals, Banks, Insurance Companies, &c., &c.; what the value of the goodwill of each place of business may be, what the value of all literary property, what the value of all professional incomes may be, is not easy to estimate. But it is quite clear that it is to be reckoned not only by hundreds, but by thousands of millions, in this country. And it has as real an existence, it is as true a source of revenue, it is taxable

property, in all respects as much as material property, and yet it is wholly neglected by Economists in framing a definition of Wealth!

134. Even those Economists, who have admitted the existence of incorporeal elements in Political Economy, have, with few exceptions, confined their remarks to qualities of the person, or mind, which produce a revenue, but which are fixed and inherent in the person, and of which he cannot divest himself. These we have seen above (sec. 52,) are the only immaterial products which M. Baudrillart contemplates, when he denies the admission of immaterial products into Political Economy, and remarks as one reason for doing so that they cannot be exchanged, "*Les produits, qu'on appelle immatériels, soient en eux-mêmes pourvus de la faculté d'être échangés.*"

"* * En elles mêmes, elles sont invendables, inaliénables, intransmissibles." Moreover, it is commonly said, that these incorporeal elements perish in the using. But here we have shown the existence of a stupendous mass of incorporeal property of a wholly different nature from that contemplated by Malthus, or M. Baudrillart. The incorporeal property we have been considering, is as permanent, and enduring, as capable of perpetual existence as the land itself, or any material product. What is there to prevent the Bank of England, or the London and Westminster Bank, enduring as long as the land of England itself? Why should not shares in them, a purely incorporeal property, exist as well 1,000 years hence, as well as to-day? There is no principle of decay in them. Still more, is there not every probability of the shares in the London and North Western Railway enduring as long as this country itself? No doubt there is the contingency even of the Bank of England failing, or being destroyed, but that is only an accident, and not necessary. Moreover, this incorporeal property is capable of being transferred from hand to hand, or from person to person, just as easily as any material product. A man can denude himself of the property in these shares, or in a copyright, just as easily as of the property in a watch. And Economists in treating of property, and in framing a definition of wealth, have wholly omitted all notice of this enormous mass of property. One of the objections against admitting incorporeal elements into Political Economy is that they cannot be valued. We reply that they not only can, but are, valued with as great a precision as material products.

135. These considerations also confirm the necessity of expelling the limitation of "the result of past human labor" from the definition of capital, as we have already shewn. When a man invests money in the shares of the Bank of England, those shares become his capital. The money he bought them with may have been the result of past labor, but are the shares he purchases, the result of past labor? Certainly not, they are the expectation of profits to be derived from future labor, or industry. Yet as anything which produces a revenue is capital, they become capital to him.

136. We now come to the third division of the subject, in which the capital, or source, or instrument of production is immaterial, or intellectual, but the product is embodied in some matter in which the ideas are the predominating

element, and the materials in which they are embodied, subordinate or insignificant. In which, in fact, the cause of value is the ideas represented in the matter.

These comprehend the cases of great painters, sculptors, and authors.

It is evident that the source of production, or capital, is in their minds. But they have no means of communicating their ideas to the world at large, except through the medium of paintings, sculpture, and books.

In books, which can be multiplied *ad libitum*, the value of the product is reduced, and profits are made by extracting a small one on the sale of each copy of the work. In sculpture, the material is itself expensive, but it bears a very small proportion to the value of the finished work of a great sculptor. In paintings, the value of the actual materials is infinitesimal. A great artist may produce a picture worth £1,000, out of materials whose value is not above a few shillings. Yet it is indispensable to all these, that the creations of their mind should be embodied in some matter, in order to make them appreciable to the world at large. Hence we think their productions may justly be styled material. Now it is exactly the same cause that gives value to their minds as gives value to the land, namely, the demand of the public for their products. And the minds of these artists produce the same revenue to them as if they had so much land. How then is it possible to say that the value of their abilities cannot be measured? If an artist, or an author, can make £1,000 a-year, the value of his capital, his mind, is to him just the same as the value of any other source of revenue. The only thing is, that it is more precarious. It is liable to fail. But that does not affect the question so long as it exists. It is clear also, that it is equally national capital, with any other capital, or source of revenue, because it produces something which people will pay for. And the products of this immaterial capital can be accumulated, and preserved, and transferred; nay, they usually increase enormously in value by time. The value of pictures by the old masters has been constantly rising. And the very same thing is true of most of the works of the deceased English masters. Pictures which they parted with for mere trifles, comparatively speaking, now fetch immense prices. It is well understood now that a well-selected gallery of pictures is an excellent investment for money. And this arises from the constantly increasing taste of the English people for works of Art. We see, therefore, that Malthus was in error when he said that mental capital could not be valued. We have only to take the incomes of all the artists, sculptors, authors, &c., to discover the value of such capital.

138. We now come to the fourth class, in which the capital, or source, of the revenue is immaterial, or intellectual, and the product is also immaterial.

This comprehends the professions of the law, and medicine, and the Church, composers, actors, and performers of all sorts, and education.

A lawyer, or a doctor, may write his opinions, or prescriptions, but it is clear that their products are essentially immaterial. All of these persons undergo a long course of education, in many cases very expensive. All bestow an im-

mense deal of labor in perfecting themselves for their various duties. And that labor and expense produce them a revenue, just as much as any material source. It is, therefore, capital. And it can quite easily be valued, just like any other species of capital, namely, by the income it produces. The mind of a great lawyer produces him a revenue of £10,000 a year, it is manifestly capital to him. It is manifestly, also, capital to the nation, because they require and pay for such products. Enumerate the incomes of all the lawyers, all the doctors, all the clergy, all the composers, all the performers of all sorts, and there is the value of all these incorporeal estates, as easily ascertained as the value of all the land. Not only can the value of this capital be ascertained, but it is taxed just the same as any other capital.

139. But we have a further objection to the criterion proposed by Malthus and M. Baudrillard. We have, we think, shewn that they are mistaken when they say that immaterial capital cannot be valued in a catalogue, or inventory, of the property of the nation. Now, we object to this mode of valuing the wealth of the nation. The mode of estimating the wealth of a country by the amount of commodities existing in it at any particular time would lead to very erroneous conclusions. A country may in reality be a great deal richer when there are much less of actually existing commodities in it, than when there are more. The explanation of this apparent paradox is extremely simple. In former times it took fifteen days to convey goods from Manchester to London. Consequently it was absolutely necessary to have fifteen days' supply of any given demand constantly in existence, and on the way. Canals were then introduced, which reduced the time of transport to five days. It became then manifestly necessary to have only five days' consumption in existence, and on the road. The railroad reduced the time to one day. Consequently it is only necessary to have one day's consumption on the road. Now, it would be a very grievous error to suppose that the nation is less wealthy because there is a less amount of commodities in actual existence, at any given time, than formerly. On the contrary, the nation increases faster in wealth on that very account. Because it is a great waste of capital to call so much into existence, and to wait so long before the returns come in. Now, although there need not be so many commodities actually in existence, they can be called into existence in a much shorter space of time than formerly. Any given demand can be supplied much quicker than formerly. And that is the true test of the wealth of a country. It is to be judged of, not by the quantity of goods it may have in stock at any given instant, but by the speed with which it can supply any given demand. (COMMUNICATION; PRODUCTION.)

140. In the preceding paragraphs we have endeavoured to establish a fact that has escaped the notice of almost all Economists, viz., that a RIGHT is an Economic Element. J. B. Say was, we believe, the first to recognize the existence of RIGHTS, as Economic Elements. He was the first to acknowledge that the "custom" or "goodwill" of a shop is capital. But he has not developed the subject at sufficient length, or adequately seen its importance, nor the enormous

mass of property which falls under that principle. Lawyers have been immensely in advance of Economists on this point. Dr. Whately is, we believe, the first Economist who has seen the matter in its true light. He says, *Lectures on Political Economy*, p. 6, "I think it more convenient, on the whole, to describe Political Economy as concerned, universally and conclusively, about *exchanges*."

"It was once proposed, indeed, to designate it the 'Philosophy of Commerce;' but this, though etymologically quite unexceptionable, being indeed coincident with the description just given, is open to the objection, that the word Commerce has been in popular use arbitrarily limited to one class of exchanges."

"The only difficulty I can foresee, as attendant on the language I have now been using, is one which vanishes so readily on a moment's reflection, as to be hardly worth mentioning. In many cases, where an exchange really takes place, the fact is liable (till the attention is called to it) to be overlooked, in consequence of our not seeing any actual transfer from hand to hand of a material object. For instance, when the copyright of a book is sold to a bookseller, the article transferred is not the mere paper covered with writing, but the exclusive *PRIVILEGE* of printing and publishing. It is plain, however, on a moment's thought, that the transaction is as real an exchange, as that which takes place between the bookseller and his customers, who buy copies of the work. The payment of rent for land is a transaction of a similar kind; for though the land itself is a material object, it is not this that is parted with to the tenant, but the *RIGHT* to till it, or to make use of it in some other specified manner. Sometimes, for instance, rent is paid for a right of way through another's field; or for liberty to erect a booth during a fair; or to race or exercise horses," &c. And in a note to the part of this passage relating to the sale of a copyright, Dr. Whately says,—“This instance, by the way, evinces the impropriety of limiting the term *Wealth* to *material* objects.” In this passage Dr. Whately fully acknowledges the principle we have been endeavouring to enforce in the preceding paragraphs. Now the fact is, not only are we to acknowledge the existence of *RIGHTS* as Economical elements, but it is the fundamental conception of the whole subject, that—

PROPERTY IS NOT A THING BUT A RIGHT.

Wherever a new exchangeable Right is created, there is a new Property. Where no Right is created, there is no Property. Goods may pass into the possession of a man, and yet no right to them, or Property in them, pass with them. The property may remain with some one else.

And this distinction between the transfer of the possession of a thing, and the transfer of the property in it, has never received sufficient attention from Economists. And yet it is one of the most important points in the whole subject, and is the basis of the Theory of Credit.

Thus for instance, I may put my watch into my friend's hand, and he may put thirty guineas into mine. That operation may transfer the *possession* of these things, but it does not transfer the *property*. There is no transfer of the property until

there is an agreement, a consent of our *two minds*, that the property in each article shall pass to the other. Thus in all cases, transfer of the possession is an operation of the body, but a *transfer of the property is purely an OPERATION OF THE MIND*.

When I deposit my furniture &c. in a warehouse and receive a ticket, or warrant, to certify my right to it, and entitle me to get it back, there is a transfer of *possession*, but no transfer of *property*. The property in the goods still remains in me, and the ticket and the goods are *OWN* property, or right. There is no new right created.

But if I deposit my money in a bank and receive an instrument of credit, entitling me to demand an equal sum back at will, there is a transfer of possession *and of property* to the banker, and the instrument of credit and the money are totally separated, and form *TWO* properties. There is a new right created.

This is the basis of the Theory of Credit.

141. We shall find that this great conception will throw a blaze of light over the obscure and most controverted points in Political Economy. It has been a great stumbling-block to many persons to understand how a thing which does not yet exist can be an Economical Element, or Wealth, which must be something *PRESENT*. The true interpretation of the word Property clears up the difficulty. *The property is not the thing itself, but the right to it*. And although the thing itself may not exist, the *RIGHT* to possess it, when it does come into existence is *PRESENT*, and is an Economical Element, or Wealth. We have already seen what light this throws on the theory of the value of land, commercial shares, copyrights, &c. We shall now see what a flood of light it will throw upon two of the most controverted and least understood portions of Political Economy—*CREDIT*, and the *FUNDS*. We shall find that this conception will unravel some of the most subtle perplexities, and point out the error in some of the most widespread and dangerous fallacies in Political Economy.

142. And now that we are come to the great subject of *CREDIT*, we need hardly remind our readers, that it is one of the most controverted in Political Economy. In this place, however, we shall abstain from all controversy. We shall not even describe all the effects of credit. That is fully done under *CREDIT*, where we have collected and examined the opinions of Economists on the subject, and shewn their astonishing self-contradictions. In this place we shall merely examine shortly into the *nature* of Credit, and determine how it is to be classed.

143. We have seen above, that Adam Smith, J. B. Say, Mr. Senior, and Mr. J. S. Mill have all admitted that the natural and acquired abilities and education of men are to be reckoned as part of the fixed capital of the nation. Aristotle calls men living instruments, and J. B. Say, allows them to be accumulated capital. And we have, we think, shewn that this is not a metaphorical, but a literal truth. The industry, therefore, and expense that a man bestows upon acquiring a profession, or a knowledge of trade, is as *bonâ fide* CAPITAL, as the industry and expense he bestows upon improving and cultivating the soil.

Every man engaged in business may therefore be considered as an instrument, or source pro-

ducing profit. And not only has produced profits, but is CONTINUALLY producing them, like any other similar capital. His future productivity, therefore, is an Economical Element, which may be dealt with in precisely the same manner as the future productivity of the land, or a commercial company. And the right to its future produce may be sold just as much as the right to the future produce of land.

But though a man's future productivity may be profitable to himself, in order to make it marketable, or saleable, it is absolutely necessary that it should be BELIEVED in by others.—It is therefore called his CREDIT.

144. The money that a man possesses is the fruits of his past industry, just as the actually existing products of the land are the accumulation of its past powers of productiveness. Now, not only may the property, or right, to these be sold and exchanged, as we have seen, but the INVERSE operation may be performed, and the PROPERTY, or RIGHT, to the future products may be sold. So a man may not only sell the property, or right, to his actual money, but he may perform the INVERSE operation, and sell the PROPERTY, or RIGHT, to the future products of his industry.

Thus a trader expects that there will be a certain demand for the produce he deals in by which he will make profits. Not having the ready money to pay for the produce to the merchant, he offers him the RIGHT to receive payment at a future time. The time is calculated on the expectation that he will have sold the produce, and reaped the profit. The merchant believing in his character and capacity to pay, or fulfil his engagement, sells him the actual produce, in exchange for the RIGHT to receive payment at a future time. And this operation is called CREDIT.

145. And now, we must particularly observe this, that this transaction is not a loan but a perfect and complete SALE, just as much as if the exchange had been for money itself. The entire property in the goods passes from the merchant to the trader, in as complete a manner as if he had received money for them, and the RIGHT to demand future payment is itself an independent Economic Entity, which is considered as the equivalent of the goods, at the time they are sold. Now, though the RIGHT to demand future payment is itself an incorporeal entity, it is so likely to be disputed, or lost, that it is usual to embody the evidence of it on paper. And that paper is called an instrument of credit. These instruments are of two different forms, *orders* to pay, called *BILLS of EXCHANGE*, and *promises* to pay, called *PROMISSORY NOTES*. But as these differences of form are of no consequence whatever in considering the general nature of the subject, we may call them engagements to pay, or instruments of credit.

146. We must also observe that the paper instrument is only evidence of the right, and not the right itself. The right itself would be equally valid, and equally real, if it existed in the purely incorporeal form of a mere debt. If a man owes me money, my right is just the same, whether that right is recorded on paper or not. A man is equally the shareholder in a public company whether he has lost the certificate of his share or

not. In all cases the PROPERTY resides in the person, and is transferred by the will, or mutual consent, of the parties.

147. Now, though we shall abstain from all controversy here, we think it especially necessary to call the reader's attention to this, because it has been the real source of all the confusion on the subject. As soon as the trader has parted with the RIGHT to demand a future payment to another person, that RIGHT itself is an Economic Element, and is what is called CREDIT. It is *not* the transfer of the goods which is credit, but the disposal of the *right* to demand a future payment.

It is also to be specially observed that, because a trader sells the right to demand a future payment from him, it is no diminution of his present possessions. The future payment is to come out of the future produce. Just as when a farmer takes a farm and promises to pay a rent annually, those engagements to pay are no diminution of his present possessions. Those engagements are manifestly intended to be paid out of future produce.

148. We thus obtain this conception—That just as the future productivity of the land is a saleable Economic Entity, over and above the past products of the land, so the future productivity of a trader is a distinct and marketable Economic Entity, over and above the realized fruits of his past industry.

Now all the qualities which are necessary to make this future productivity marketable, skill, industry, and integrity, may be summed up in one word—character.

149. These considerations immediately shew the fundamental distinction between instruments of credit of all sorts, and Bills of Lading and Dock Warrants. (BANK NOTE; BILL of EXCHANGE; BILL of LADING; DOCK WARRANT; PROMISSORY NOTE.) This may truly be called the *Pons Asinorum* of Political Economy. It is one of the most subtle and important points in the whole subject. It is upon a confusion of the distinct nature of these species of documents that Law's theory of money is founded.

150. We have seen in the case of traders, that they buy goods in exchange for the right of demanding a future payment. The quantity of credit brought into commerce by these means is enormous in this country. But that is only one division of the subject.

There is a class of persons called Bankers, whose sole business consists in creating these "engagements to pay" by purchasing money, and also the "engagements to pay" of traders.

When a man deposits money with a banker, the property in the money immediately passes from the depositor to the banker, and the banker gives in exchange for it a "promise to pay" money on demand, or a RIGHT to demand money. And the property in this right to demand money, or credit, passes from the banker to the customer. The banker, having the entire property in the money, may use it as he pleases, and the customer having the entire property in the right to demand payment may use it as he pleases. Each therefore may put his property into circulation, and they form two distinct and separate Economical Elements.

151. Moreover, when a merchant has sold goods to a trader in exchange for a right to de-

mand a future payment, the latter right is not very convenient, because it is not so saleable as a right to demand immediate payment of money. The merchant therefore having a stock of these rights, or instruments of credit, goes to his banker who buys them, and gives in exchange for them a right to demand immediate payment; that is, by creating new credit. And these rights circulate just like any other Economic Elements, and are independent quantities. Here, therefore, we have goods sold for rights, and these rights sold for other rights, and each of these is independent and separate property.

152. Commercial credit is usually embodied in the form of Bills of Exchange, and more rarely in Promissory Notes.

A banker is a person who buys money and credit, usually rights to demand a future payment at a fixed time, with credit, usually a right to demand immediate payment.

A banker buys this money and credit, by creating a credit in his books in favor of his customer.

That credit created in the banker's books is called a **DEPOSIT**.

Many persons might imagine that the money deposited in a bank is the deposit. But this is a very great error. The deposit is the credit created in the banker's books; it is also called a **Bank Credit**, and is what was called **Bank Money**, or *Moneta di Banco*, in the great foreign banks, such as those of Venice, Amsterdam, &c. (**BANK MONEY**; **BULLION REPORT**, § 23; **BANKING IN AMERICA**, § 451; **DEPOSIT**.)

153. Traders' and bankers' engagements to pay are therefore separate and independent property. With the clear and distinct comprehension of this, the whole subject of credit becomes intelligible and simple. It is the want of understanding this that has plunged it into such obscurity and controversy.

154. Now, having shewn the separate existence of credit as property, we are entitled at once to draw the conclusion that it is capital. Mr. Mill says, that *anything* which may be exchanged may be capital as much as money. Instruments of credit, or simply credit, is exchangeable, and therefore it may be capital as much as money.

Now, what the measurable amount of the future productivity of traders may be, it is impossible to say. As Economists, we are only concerned with that portion of it which is actually brought into commerce; and that portion, including all sorts of it, cannot be less than £600,000,000, at the very lowest computation.

155. The difficulty of even approximating to its amount consists in this, that an enormous amount of credit is never embodied in the form of Bills of Exchange at all, but is locked up in the books of traders. These rights, as we have shewn above, are just as real entities as when embodied in circulating paper, but how is it possible to form even a conjecture of their amount? Of banks that publish their accounts we can of course ascertain their "deposits," or the amount of credit created by them. But who can guess at the amount of the deposits of all the private bankers in England, some of the greatest of which are understood to be fully as large as those of the Joint-Stock Banks?

Nevertheless, whatever the amount of these

credits may be, they are all "property," separate and distinct from all other property, and they perform the functions of money, only in much smaller sphere. They are, as we have shewn (**CREDIT**; **CURRENCY**), particular credit—money is general credit.

156. And this affords ample proof, if, indeed, any were necessary to any one familiar with physical science, that *materiality* must be entirely expelled from the general conception of an Economic Element.

157. When a man has done a service to another, and wants no immediate service in return, he receives, perhaps, a piece of money in return. And what is this piece of money? It is merely the right of demanding some service from any one he pleases. It is only a general right, or general credit. But if, instead of receiving money, he allows the debt to remain against the other, he has equally the right of demanding a future service in exchange. The only difference is, he can only demand it from his individual debtor. It is therefore only particular credit. And this may be embodied on paper, or may exist only as a debt, or invisible right. We thus see that money and instruments of credit of all sorts represent the same fundamental idea—debt,—and are homogeneous. A debt has long been recognized by law as personal property.

158. Such is the nature of Credit—or Debts. For a full exposition of its effects, and an examination of the opinions held respecting it by the most eminent Economists since it became a controverted question, we must refer to **CREDIT**. The only difficulty in the case is to understand that a **RIGHT** to demand a future payment is an independent Economic Entity, entirely distinct from any specific money or goods, and is capable of circulating in commerce, and produces all the effects of money: and it therefore may be capital. As it depends upon the belief in a person's character, it is moral capital.

Credit therefore is to the person of the trader, what the future productivity is to the land, what copyright is to a work, what goodwill is to a business, and is incorporeal capital, just as they are. They all are founded on the same principle, belief in the capacity of the respective sources to produce future profits. It is by credit that the immensely greater portion of modern commerce, in all civilized countries, is carried on.

159. Every writer who has seized the true idea of the subject, has maintained the doctrine that Credit, in both its forms of banking credit and mercantile credit, is productive capital, though some of those quoted below have contradicted themselves in the most astonishing manner, as we have shewn in **CREDIT**.

Thus Mr. Hamilton, the Secretary to the Treasury of the United States, in the Report to Congress, upon which the first Bank of the United States was founded, says (**BANKING IN AMERICA**, § 421).—"The following are among the principal advantages of a bank:—First, The *augmentation of the active or productive capital* of a country. * * * This additional employment given to money, and the faculty of a bank to lend and circulate a greater sum than the amount in coin, are to all the purposes of trade and industry an *absolute increase of capital*."

And Mr. Webster, in his speech on the renewal

of the Charter of the Bank of the United States (Ibid, § 448), said,—“Credit is the vital air of modern commerce. It has done more, a thousand times, to enrich nations than all the mines of all the world. * * * Credit is to money what money is to articles of merchandize.” In this sentence Mr. Webster has exactly seized the true idea of Credit. Money is exchangeable for commodities, but yet is distinct and independent property; so an instrument of credit is exchangeable for money, but yet is distinct and independent property, over and above money and commodities.

So also Mr. McCulloch, *Commercial Dictionary, Art. Bank*, p. 68, says,—“Those who issue such notes coin, as it were, their credit. They derive the same revenue from the loan of their written promises to pay certain sums, that they would derive from the loan of the sums themselves, and while they thus increase their own incomes, they, at the same time, contribute to increase the wealth of the society.”

Mr. Senior has, strange to say, entirely omitted the subject of Credit in his treatise; but as he says that all Economists are agreed that whatever gives a profit is Capital, that admits, by implication, that Credit is Capital.

Mr. John Stuart Mill says, that ANYTHING which may be exchanged like money, may be Capital. Now, as all instruments of credit may be exchanged like money, that at once admits that Credit is Capital. But he is a great deal more explicit than this in Book III. ch. xxii., *Influence of the Currency on Exchanges and on Foreign Trade*. He says there, “The same effects which would thus arise from the discovery of a treasure, accompany the process by which bank notes, or any other substitutes for money, take the place of the precious metals. * * *

“The value saved to the community by thus dispensing with metallic money, is a clear gain to those who provide the substitute. They have the use of twenty millions of circulating medium, which have cost them only the expense of an engraver's plate. If they employ this accession to their fortunes as productive capital, the produce of the country is increased, and the community is benefited, as much as by any other CAPITAL of equal amount.”

So also Bastiat has exactly seized the true idea of credit, (*Harmonies Economiques, Art. Capital*, p. 210, *Édit. 1855.*)—“Ainsi chose admirable, et grâce au merveilleuse mécanisme de l'échange, tout service est, on peut devenir, un Capital. * * *

Ce qui est plus surprenant encore c'est que nous pouvons faire l'opération INVERSE, quelque impossible qu'elle semble au premier coup d'œil. Nous pouvons convertir en instrument de travail, en chemin de fer, en maisons, un capital, qui n'est pas encore né, utilisant ainsi des services, qui ne seront rendus qu'au xxe siècle. Il y a des banquiers qui en font l'avance sur la foi que les travailleurs et les voyageurs de la troisième ou quatrième génération pourvoient au paiement, et ces titres sur l'avenir (i.e. instruments of Credit) se transmettent de main en main sans rester jamais improductifs.”

Thus we see that Mr. McCulloch, Mr. Mill, and Bastiat, in these passages expressly maintain the doctrine that credit is capital. How surprisingly they have contradicted themselves in other

parts of their works, is fully shown under CREDIT.

160. So much for Economists. We may quote from legal writers to show that they fully understand the truth that instruments of credit are separate and independent property. Thus, Mr. Justice Byles says, (*Treatise on the Law of Bills of Exchange, Introduction*, p. xii.) “It will not perhaps be an unreasonable inference that the Bills and Notes of all kinds, issued and circulated in the United Kingdom in the space of a single year, amount to many hundred millions, and that this species of property is now in aggregate value, inferior only to the land, or funded debt of the kingdom.” When we consider that all book debts are in reality of the same nature, and must be added to the amount of debts actually circulating in Bills and Notes, we shall see that the above estimate of the credit property in the United Kingdom is certainly within the bounds of moderation.

Mr. Leake, also, in the paper we have already quoted from, has seen the true nature of Credit. At page 534, after noticing that the Law of Real Property may be called the grammar of the law of property in general, he says, “This view of real property might be carried still further. Its principles would serve to form the foundation, not only for the law of property in general, but also for other important branches of the law. All rights are property in some sense, and are subject in some degree to the laws of property. In the law of rights in personam, or obligations, we may notice, for example, the strong analogy between obligations, or debts payable in futuro, and real estates vested in remainder.”

This, our readers may observe, is the very doctrine we have been endeavouring to enforce. That Credit is the right to make a future demand for money.

161. Without entering into any account of the controversies here, on the nature of Credit, we may endeavour to impress upon our readers' attention the distinction between Instruments of Credit, and other paper documents, such as Bills of Lading and Dock Warrants, which are frequently confounded with them.

It is one of the most important points in Political Economy to understand the distinction between an *Exchange* and a *Bailment*.

In the case of an *Exchange* there is always a transfer of properties, there must manifestly be two properties, or two rights to be exchanged.

In the case of a *Bailment* there are not two properties exchanged, but only one property entrusted by some one to another person's keeping, for a special purpose.

Now all instruments of credit arise out of an exchange, either of money, or goods, or other instruments of credit. There is always, in such a case, an exchange of two separate rights, or two properties.

Bills of Lading and Dock Warrants, on the other hand, always arise out of a *Bailment*, where there is no exchange of properties, or rights. But only some particular goods are entrusted to a person for a special purpose.

All instruments of credit are therefore separate and independent properties, or rights; they are by law and custom absolutely severed from any particular goods, or money. Bills of Lading and Dock Warrants are, on the contrary, *not* separate

and independent properties, or rights, but mere adjuncts or tickets, inseparably joined to some specific goods, and forming only *one* property with them.

Now instruments of credit, and Bills of Lading and Dock Warrants, have many features in common, they are both transferable from hand to hand; but the fundamental distinction between them is that instruments of credit of all sorts are independent property, amounting to certainly not less than £600,000,000 in this country; Bills of Lading and Dock Warrants are *nothing*.

In fact, credit is the *inverse* of money.

When a trader buys goods with money he exchanges the fruits of his *past* industry for the goods. When he buys goods with credit he engages to exchange the fruits of his *future* industry for the goods.

In each case there is a *sale*, or an exchange of *two* properties.

In order, however, to make this "promise to pay" saleable for goods, or money, the trader is obliged to inspire confidence in his character and capacity to pay at a future time. Hence it is moral Capital. It is entirely the result of his personal qualities and abilities, which Adam Smith, and all leading Economists since his time, have acknowledged to be national wealth, or capital.

Thus we see Credit is always attached to the person, Bills of Lading and Dock Warrants to things.

It has been usual to call instruments of credit, *fictitious values*, and *values of convention*. But this is a very grievous error indeed. No doubt they are often precarious. But where the credit is safe, an instrument of credit is a real value. Only being future, it is inverse to the past, which is positive, and therefore it is negative. The negative roots of equations were long called *fictitious roots*, *res or estimationes fictæ*, by the early Algebraists, who could not interpret their meaning. It was then discovered that they were equally real roots with the positive ones, only inverse to them.

162. These considerations lend additional proof to what we have said about the error of making "the saving of past labor" a necessary Element in the definition of Capital. Mr. Mill fully acknowledges that instruments of Credit, Bank Notes, and Bills of Exchange are productive Capital—but how are Bank Notes and Bills of Exchange the result of past saving? Unless, indeed, a good character, which is the thing that gives instruments of credit negotiability, or value, may be considered as the result of previous industry.

This must suffice here to explain the nature of Credit. Our readers need scarcely be reminded of the controversies about credit. What we have said is, we hope, sufficient to shew that the quantity of credit which is in the market, is a gigantic mass of exchangeable property, separate and distinct from, and over and above commodities and money, and that it is CAPITAL.

163. We now come to the last species of property, which has also been a subject of much controversy—The *Funds*. Every one would admit that a man who had £300,000 in the Funds was a wealthy man. But are the funds themselves *wealth*? The word *wealth* has received

such an arbitrary interpretation that it may perhaps be better to adopt another of similar signification. We may enquire therefore—Are the funds independent property? And there can be but one answer, they are independent property, call it *wealth*, or whatever other name we please. We have already, in the preceding part of this article, § 105, explained the nature of public debts, so that we need not repeat it here. The considerations offered there shew that the funds are distinct and independent property, just as much as railways, or any other capital, and that their value depends upon the same principle as the value of railways, or canals, viz.: the willingness of the public to pay the interest of the money sunk in them. If the public were to refuse to pay the dividends on the funds, it would be just the same as if they were to cease to use a canal. The value of the capital would immediately fall to nothing.

164. But though a consideration of the nature of the funds inevitably leads to the conclusion that they are separate and independent property, we must observe that it is in many cases very probable that the money might have been more profitably and advantageously laid out on something else. There is now we believe, scarcely a dissentient voice among men of competent judgment, but that the policy of the Statesmen and Parliaments who spent such enormous sums was utterly erroneous and injurious to the true welfare of England. It is just like some rich man spending a vast sum of money to gratify some expensive architectural whim. There the thing exists as independent property, although the policy which created it is condemned. There have been many commercial enterprises undertaken whose policy has afterwards been condemned. Many railways have been made, which it is now admitted it was a mistake to have made, and the money employed in constructing them might have been more advantageously employed. But that does not prevent these railways having a separate existence. The case of the Funds is somewhat similar; our predecessors unfortunately conceived that the objects for which these funds were created were of sufficient national importance to be equivalent to the money spent on them, and accordingly they bound the nation to pay for them. We think differently, and are still unfortunately bound to pay for them, and while we continue to do so the capital which these payments represent is independent property.

165. Mr. Mill compares the funds to a mortgage, and denies them the title of *wealth*. But his conception of the nature of a mortgage is not quite accurate. He says, p. 8. "Things for which nothing could be obtained in exchange, however useful or necessary they may be, are not wealth, in the sense in which the term is used in Political Economy. Air for example, though the most absolute of necessities, bears no price in the market because it can be obtained gratuitously, to accumulate a stock of it would yield no profit or advantage to any one, and the laws of its production and distribution are the subject of a very different study from Political Economy. But though air is not wealth, mankind are much richer by obtaining it gratis, since the time and labor which would otherwise be required for supplying the most pressing of all wants can be devoted to

other purposes. It is possible to imagine circumstances in which air would be a part of wealth. If it became necessary to sojourn long in places where the air does not naturally penetrate, as in diving bells sunk in the sea, a supply of air artificially furnished would, like water conveyed into houses, bear a price; and if from any revolution in nature, the atmosphere became too scanty for the consumption, or could be monopolized, air might acquire a very high marketable value. In such a case, the possession of it beyond his own wants would be to its owner wealth; and the general wealth of mankind might at first sight appear to be increased by what would be so great a calamity to them. But this would be an error; for however rich the possession of air might become, at the expense of the rest of the community, all persons else would be poorer by all that they were compelled to pay for what they had before obtained without payment.

"This leads to an important distinction in the meaning of the word *Wealth*, as applied to the possessions of an individual, and to those of a nation, or of mankind. In the wealth of mankind, nothing is included which does not of itself answer some purpose of utility or pleasure. To an individual, anything is wealth, which, though useless in itself, enables him to claim from others a part of their stock of things useful or pleasant. Take, for instance, a mortgage of a thousand pounds on a landed estate. This is wealth to the person to whom it brings in a revenue, and who could perhaps sell it in the market for the full amount of the debt. But it is not wealth to the country; if the engagement were annulled, the country would be neither poorer nor richer. The mortgagee would have lost a thousand pounds, and the owner of the land would have gained it. Speaking nationally, the mortgage was not itself wealth, but merely gave A a claim to a portion of the wealth of B. It was wealth to A, and wealth which he could transfer to a third person; but what he so transferred was in fact a joint ownership, to the extent of a thousand pounds in the land of which B was nominally the sole proprietor. The position of fundholders, or owners of the public debt of a country, is similar," &c. (*For the remainder, see § 98.*)

In this passage, Mr. Mill says that a mortgage is wealth to the person to whom it brings in a revenue, but not to the country at large. There is some misconception of the nature of a mortgage here. When the owner of a landed estate borrows money, the form of English law is that he conveys the estate to the lender, with the right reserved of having the estate reconveyed to him when the money is repaid. By this means the legal ownership of the estate passes from the mortgagor to the mortgagee, and the *deed of conveyance* is called the *mortgage*. The mortgagee thus becomes the legal owner of the property, and the mortgagor becomes his tenant. Now no one ever supposed that a mere deed of conveyance of property, which is all that a mortgage is, is wealth. Such is the form of the mortgage, but the *substance* is that it is a purchase of a portion of the right of the future produce of the land. Now this wealth stands in relation to the country just as it did before. The whole produce was wealth before it was divided. It remains just the same after it is divided. The portion purchased by the sum

advanced on mortgage, is just as much wealth to the country as it was before. It must be so, into whatever number of portions it is split up. There is no new object called into existence, but a mere purchase of part of an existing one.

166. But in the case of public debts there is a new object. They are money expended upon obtaining something new. Thus public debts are contracted either to make something necessary for the public security, like the sea-dykes of Holland, as we have before said, or they may be contracted to make a work of national utility, such as a railroad, or canal. It is now quite customary for governments to guarantee public companies a certain annual payment, on their undertaking to construct an important work, such as a railway, or perform some public service, as when subventions are granted to the Ocean Mail Steamers. Many persons, we allow, dispute the policy of these public guarantees. That may or may not be. But it is quite clear that some new undertaking or service is created by them, and that they are paid in exchange for something new, which is supposed to be equivalent. Now it is quite clear that the capital expended upon these undertakings by private companies, upon which a dividend is guaranteed by the government, are exactly in the same position as the public debts, or funds, although the money is not actually paid to the government, nor the service performed under the actual control of the government, like the naval and military defence of the country.

It is quite clear, then, that the sums expended by these companies are nothing but public debts, or funds, in disguise. And that they are perfectly distinct in their nature from mortgages. A mortgage calls nothing new into existence. It is a mere exchange of a definite existing sum of money for a right which is already in existence and in the hands of another person. But public debts are created to produce something new, either material, or immaterial.

167. The present discussions on the military and naval defences of the country will illustrate our meaning. Rightly or wrongly, that is of no consequence here, it is supposed that the country is not in a secure position, in consequence of the extraordinary progress recently made in the science, and the means of attack. There is a very general demand that our coast defences should be augmented. It is supposed that it will require £10,000,000 to do this. Now that money must be borrowed, which will create a public debt, and as it is a service to the entire public, they must pay for it. With the money so borrowed, and withdrawn from other production, these new coast defences will be created—a new property. Or the navy may be augmented,—a new property. Or an additional number of sailors and soldiers may be engaged, and new warlike stores of all sorts, some durable to a certain extent, such as artillery, and some perishable, like powder and ball, may be manufactured. Yet we see that something new is always done with the money advanced on the creation of a public debt. Now many persons may say that this expenditure is absurd, mischievous, and unnecessary, and that the money might have produced something more advantageous, but yet no one can deny that it is new and independent property.

168. We hope that we have made it clear to

our readers that a public debt is not analogous to a mortgage. A mortgage is a conveyance or transfer of the actual *corpus*, or capital out of which a revenue springs; a public debt is money devoted to perform some service which it is judged, rightly or wrongly, that it is for the interest of the public should be done, and which they should pay for. The public debt, or funds, are precisely in the same category as the shares of a railway company, or a bank. They are the right to receive the future payments of the general public for the service done to them in their national capacity, just as the shares of a railway are the right to receive the future payments of that portion of the public who travel by, or use, the railway, in their individual capacity. Hence we see that the Funds are a great incorporeal estate, of the same nature as copyright, commercial shares, credit, &c.

169. We have now, we think, completed a sufficient survey of the different kinds of property to enable us to form a general conception of it. Of course each separate portion of it may, and, indeed, requires to be treated at much greater length. But, in order to form a general conception, we have only to enumerate and consider all the different species of it. And all property may be reduced to one of the different classes mentioned above. We are now in a position to see whether the term "wealth" can be restricted to things embodied in *matter*. So far from it, that it is certainly within the bounds of moderation to say, *that nineteen-twentieths of actually existing wealth, or property which may be measured, exists in a purely incorporeal form, which is incapable of being embodied in matter.* We are surrounded on all sides by *impalpable, intangible, invisible*, but *MEASURABLE* wealth, just as we are by *impalpable, intangible, invisible*, but *MEASURABLE* mechanical force. The value of the land, *i.e.*, the right of receiving its future produce, is *thirty* times as great as the existing products of the land, and it is purely incorporeal. And who shall estimate the value of all other incorporeal property in Great Britain? There can be no possible doubt that its value is several thousand millions of pounds.

170. We said above, that there is a great division of opinion among Economists, as to whether the word *Wealth* is to be restricted to material things, or is to be extended to immaterial products, such as services, or personal abilities. Adam Smith admits that personal qualities fixed in a human being are part of the capital of the nation; but he denies the name of wealth to their products, unless they are fixed in something material. Malthus, however, and M. Baudrillard, and Mr. Cazenove, entirely exclude personal qualities from the catalogue of national wealth. Mr. Mill, p. 57, is obliged to consider what *Wealth* is, and whether it includes only material products, or whether all useful products are to be included in it. He says,—

"Now the utilities produced by labour are of three kinds, they are,

"First—Utilities fixed and embodied in outward objects, by labour employed in investing external material things with properties, which render them serviceable to human beings. This is the common case, and requires no illustration.

"Secondly—Utilities fixed and embodied in human beings; the labor being in this case employed in conferring on human beings, qualities which render them serviceable to themselves and others. To this class belongs the labor of all concerned in education; not only schoolmasters, tutors, and professors, but governments, so far as they aim successfully at the improvement of the people; moralists, and clergymen as far as productive of benefit; the labor of physicians, as far as instrumental in preserving life, and physical or mental efficiency of the teachers of bodily exercises, and of the various trades, sciences, and arts, together with the labor of the learners in acquiring them; and all labor bestowed by any persons, throughout life, in improving the knowledge, or cultivating the bodily or mental faculties of themselves, or others.

"Thirdly and lastly,—Utilities not fixed or embodied in any object, but consisting in a mere service rendered, a pleasure given, an inconvenience or a pain averted, during a longer or shorter time, but without leaving a permanent acquisition in the improved qualities of any person or thing; the labor being employed in producing a utility directly, not as in the two former cases, in fitting some other thing to afford an utility." Mr. Mill then enumerates the persons whose labor falls under this class—performers, actors, declaimers, showmen, soldiers, sailors, legislators, judges, &c.; and considers, "which of these three classes of labor should be accounted productive of wealth, since that is what the term productive, when used by itself, must be understood to import." Utilities of the third class, consisting in pleasures which only exist while being enjoyed, and services, which only exist while being performed, cannot be spoken of wealth, except by an acknowledged metaphor. It is essential to the idea of wealth to be susceptible of accumulation (?); things which cannot, after being produced, be kept for some time before being used, are never, I think, regarded as wealth, since however much of them may be produced and enjoyed, the person benefited by them is no richer, is no wise improved in circumstances. But there is not so distinct and positive a violation of usage in considering as wealth any product which is both useful and susceptible of accumulation. The skill and the energy and perseverance of the artisans of a country are reckoned part of its wealth, no less than their tools and machinery. According to this definition, we should regard all labor as productive which is employed in creating *permanent* utilities, whether embodied in human beings, or in any other animate or inanimate objects.

"But in applying the term *wealth* to the industrial capacities of human beings, there seems always in popular apprehension, to be a tacit reference to material products. The skill of an artisan is accounted wealth, only as being the means of acquiring wealth in a material sense; and any qualities, not tending visibly to that object, are scarcely so regarded at all. A country would hardly be said to be richer, except by a metaphor, however precious a possession it might have in the genius, the virtues, or accomplishments of its inhabitants; unless, indeed, these were looked upon as marketable articles, by which it could attract the material wealth of other coun-

tries, as the Greeks of old, and several modern nations have done. * * *

"I shall therefore, in this treatise, when speaking of wealth, understand by it only what is called material wealth, and by productive labor only those kinds of exertion which produce utilities embodied in material objects."

Now we think it is perfectly clear, that in this passage Mr. Mill has intended to sketch out the different species of things to which the term Wealth, in its widest acceptation, has been applied. Of these he rejects the last class, and only retains the word as applied to material products, and he applies the word productive labor to that which is employed in creating *permanent* utilities, which are capable of accumulation. But we think such a classification will land us in inextricable difficulties. If we only regard the permanence of the material product, in what category are we to place the producers of all articles of food, bakers, confectioners, &c.? They are employed in creating material products, which are meant to be destroyed, and not accumulated. When a person has eaten a cream ice, how is he richer or improved in circumstances? Is the confectioner who makes a cream ice, or a fruit tart, a productive laborer? Clearly he is not, if *permanence* is the essence of productive labor; clearly he is, if the materiality of the product is the criterion. But since material products are of all degrees of permanence, where is the line to be drawn between productive and unproductive labor? Where does the one shade into the other? It is clear that the same objection applies to Mr. Mill's distinction between productive and unproductive labor, as applies to Ricardo's distinction between fixed and circulating capital. They both violate the *Law of Continuity* (CONTINUITY, LAW or.) Now, how is a cream ice, the enjoyment of eating which lasts only a few minutes, a more permanent thing than an opera, the enjoyment of hearing which lasts several hours? When a man has had his enjoyment in either case, how is he richer or more improved in circumstances, more in one rather than in the other?

171. There is one class of products which we are in doubt how those Economists who restrict wealth to material objects would treat, namely, gas. Would they admit a gasometer, full of gas, to be Wealth?

172. We propose this question to all Economists who deny admission to incorporeal elements into Political Economy—Is not a man who possesses £300,000 of Bank of England stock a *wealthy* man? Would not such property be CAPITAL to him? Is not the copyright of Lord Macaulay's works CAPITAL? And what is that Stock, and what is that Copyright? Are they *material*? Are they not wealth in every sense of the term? They are certainly not material. For we do not imagine that any one would confound the certificate, or the paper on which the evidence of the right to the stock, or the copyright, is recorded with the stock or copyright itself. This Stock and this Copyright are nothing but mere abstract RIGHTS, which are purely incorporeal.

173. The fact is that in arguing for or against the admission of incorporeal elements into Political Economy, Economists have almost universally had solely in their minds services, or enjoyments which perish in the using, which are personal

products as we may say, the result of personal qualities which cannot be transferred from person to person. But they have wholly omitted all consideration of a gigantic mass of purely incorporeal property, which is augmenting every day in this country, which may be accumulated, which is as enduring and permanent, and which may be transferred from person to person, and whose value may be measured with as great facility and precision as any material product whatever. We believe there is scarcely an allusion in the works of Economists to what the Law recognizes as incorporeal personal estate, and whose value, even excluding the funds and instruments of credit, amounts to many hundred millions!

We have now completed the survey of the different species of Property, the subject matter of Political Economy, and we may say that it comprehends,—

1. Rights to the use and enjoyment of existing material products, such as land, houses, corn, cattle, furniture, books, pictures, sculptures, food of all sorts &c., &c., &c. These are of various degrees of permanence, or durability.

2. Rights to the use and enjoyment of immaterial products, such as services of all sorts, which perish in the using.

3. Rights to the use and enjoyment of products of all sorts, which have no present existence, but will only come into existence, at some *future* time, such as the future produce of the land, the future profits of trading of all sorts, either by public companies, or private persons, which includes shares in all public companies, copyrights, goodwill of business, and commercial credit; also all personal annuities, and the public funds. Although these products are future, the RIGHTS to them are *present*, and may be accumulated, and transferred by sale or exchange in exactly the same manner, and they may pass from person to person, just like any material products.

Of these three classes, the products of the first are the accumulations of the past, and those of the second are usually called into existence almost simultaneously along with the product or service, usually money, exchanged for them, they may therefore be called **POSITIVE**.

But the products of the third class only come into existence at a future time, and often only at definite intervals of future time, in some cases extending to infinity. This latter class may therefore be called **NEGATIVE**.

Nevertheless although the last class is negative, it is not to be *subtracted* from the first two, but to be **ADDED** TO them, in an inventory or catalogue of national property, if such a thing were made. They are cumulative property.

174. These considerations appear to us conclusively to decide the question, whether we are to consider materiality as an essential element of *Wealth*. "All things," says Aristotle, "are Wealth whose value is measured in money." To this definition we unreservedly adhere. If we want to know what Property, or Wealth is, we must go to an actuary, or a lawyer. It is only by surveying and contemplating ALL species of property, before we frame a definition, that we can give the same expansion and generality to our ideas, that Physicists of all classes are accustomed to. And by doing so we obtain a conception of the widest generality, in all respects analogous to the funda-

mental conceptions of the Physical Sciences, and one fitted to form the basis of a science of Political Economy as extensive as one of them.

Whatever, then, may be exchanged is an Economical Element, and whatever Economical Element is made the source of profit, is CAPITAL.

Positive, or present, Capital may be corporeal or incorporeal. Negative, or future, Capital is always incorporeal.

175. There are some of the most important classes of business which almost exclusively consist in dealing with future, or negative incorporeal capital. Thus, the business of bankers and bill-discounters consists almost exclusively in buying and selling debts—rights to future payment—purely future incorporeal property. There are persons whose business it is to deal in reversionary payments of all sorts, negative incorporeal property. So insurance offices of all sorts, for present payments deal in future risks. And as they all derive a profit from this trading, it must, according to the definition, which Mr. Senior says all Economists are agreed in, be capital to them.

176. We have said above that Capital is a continuous quantity which, passing through the present, 0, into futurity, changes its sign. The effect of this conception is at once to bring Political Economy within the category of the Physico-Mathematical Sciences.

Moreover it is perfectly manifest that all Capital has the capacity of increasing at a geometrical ratio, since the increase at any time may be capitalised, and produce new increase. Nature herself shews this, because the value of all annuities must be calculated at compound interest to bring out a rational result. Thus population, corn, cattle, money, &c., have all manifestly the capacity to increase in a geometrical ratio. This consideration alone would at once show the entire fallacy of Malthus's doctrine (*Principle of Population*, Book I., Ch. 1.) that population has a tendency to increase in a geometrical ratio, and that subsistence cannot be made to increase at more than an arithmetical ratio. (POPULATION.)

177. There is a very large class of problems in Political Economy to which the conceptions of the Differential Calculus are directly applicable.

When persons speak of cause and effect, it is a very common notion that the effect must be directly proportional to the cause, that is to say, that if we increase the cause to any extent, we shall obtain a correspondingly increased effect.

But those who are familiar with Physical Science know well that this is a very great mistake. There is an immense class of cases in Physical Science in which by increasing the cause to a certain extent an increased effect is obtained. But by increasing the cause beyond that, the effect begins to decrease. That is, at a certain point the effect reaches a *maximum*, and then diminishes.

We have exactly an analogous class of cases in Political Economy.

It would be perfectly possible to build houses that would last 1,000 years, by laying out a sufficient quantity of money and labor upon their construction. But it is well known it would not be so profitable to do so, as to build them to last for a shorter time. That is, it is bad economy to build houses to last beyond a certain time.

On the other hand, it would be bad economy to build houses that would last too short a time. It

might be possible to build houses only to last 10 years. But it would be very bad economy to build houses in a town so as to require to be renewed every 10 years. Hence it would be bad economy to build houses to last too short a time.

Hence we see that there is some point between 10 years and 1,000, for which time it is most advantageous to build a house to last. Hence there is a *maximum* of advantage which exists. And to discover that, is a direct problem in the Differential Calculus.

178. Many ancient housekeepers, especially in the Highlands, mourn over the degeneracy of the modern "naper," as they call it, *Anglicè*, bed and table linen. In their younger days, it was made by the villagers, with their handlooms, and was so excellent that it would last for generations. The modern manufacture, made by machinery, is in every way inferior in durability, but then it is only one-third of the price. But it is much better economy to pay only one-third of the price, and have a stuff which will last only one-third of the time, than to pay down three times as much capital to have a stuff to last three times as long.

179. The same consideration is applicable to agriculture, and shews the fallacy of the Ricardian Theory of Rent. Ricardo affirms that the best lands are always the first cultivated; that when lands of the second quality are brought into cultivation, then rent commences on the first, and that every increased quantity of produce is always obtained by a constantly increasing quantity of labor and expense, the latter always increasing at a much greater ratio than the former.

Any one who knows anything of agriculture, knows perfectly well that this broad assertion is a complete delusion. In an immense multitude of cases, it is perfectly possible to lay out sums of money and labor, or to expend capital on land so as to cause a very much greater proportionate increase of produce. We are very far indeed from saying that this will go on for ever. It is, in fact, an example of a *maximum*. New scientific discoveries, new manures, new methods of cultivation, may, and do, give returns greatly exceeding the increased expense, or capital. What that maximum is, we believe is very far from being discovered yet, and it is very difficult to say what it may become in the progress of agricultural science.

Thus, for instance, the discovery of deep draining produced returns far greater than the capital laid out. Agricultural improvements have been found within recent years to be the most profitable of all investments. The returns from the use of guano have greatly exceeded the proportionate expense. In fact, the progress of agricultural science has entirely overthrown the basis of the Ricardian theory of rent and Malthus's doctrine of population, even if they were not both entirely erroneous on other grounds. (RENT; POPULATION.)

180. In accordance, then, with the original meaning of the word, and the opinions of the immense majority of Economists, we adopt the view that an Economic Element is, or is not, capital according to the intention of the person who uses it, and depends upon the method of his using it, and in no way whatever upon the nature of the thing itself. We reject, however, the idea of its being the result of past human labor, as an essen-

tial element of the definition. But Capital itself is divided into species; and we may remark this, that as the fundamental conception of capital depends upon intention, and method of use, and not upon the nature of the thing itself, so a similar analogy must be maintained in the different varieties of Capital itself. They must depend upon the method of use, and not upon the nature of the thing.

When commodities are used as Capital, they are used for the purpose of profit, which is usually gained by exchanges. But this may happen in two ways.

1. The entire article may be parted with, and the whole profit made in one operation.

2. Or else the article may remain the property of the Capitalist, and he may derive a profit from its use, either by letting it out or otherwise. In this case only a portion of the profit is made in each operation.

In the first case, it is clear that the entire capital, as well as the profit, must be repaid in one operation. In the second, as most capital wears out by use, a portion of the income made at each operation goes to replace the capital, and a portion to profit.

Adam Smith says, B. II. Ch. I. "There are two different ways in which a capital may be employed so as to yield a revenue or profit to its employer.

"1st. It may be employed in raising, manufacturing, or purchasing goods and selling them again with a profit. The capital employed in this manner yields no revenue or profit to its employer, while it either remains in his possession, or continues in the same shape. The goods of the merchant yield him no revenue or profit till he sells them for money, and the money yields him as little till it is again exchanged for goods. His capital is continually going from him in one shape, and returning to him in another, and it is only by means of such circulation or successive exchanges, that it can yield him any profit. Such capitals therefore may very properly be called circulating capitals.

"2nd. It may be employed in the improvement of land, in the purchase of useful machines and instruments of trade, or in such like things as yield a revenue or profit without changing masters or circulating any further. Such capitals, therefore, may very properly be called fixed capitals."

Adam Smith, therefore, in perfect harmony with his fundamental conception of capital, makes the distinction between circulating, or floating, and fixed, capital to lie in the method of use. He says, fixed capital consists chiefly,—

"1st. Of all useful machines, and instruments of trade, which facilitate and abridge labour.

"2nd. Of all those profitable buildings, which are the means of procuring a revenue, not only to their proprietor who lets them for a rent, but to the person who possesses them, and pays that rent for them; such as shops, warehouses, work-houses, farm-houses, with all their necessary buildings, stables, granaries, &c. These are very different from mere dwelling-houses. They are a sort of instruments of trade, and may be considered in the same light.

"3rd. Of the improvements of land, of what has been profitably laid out in clearing, draining,

enclosing, manuring, and reducing it into the condition most proper for tillage and culture. An improved farm may very justly be regarded in the same light as those useful machines, which facilitate and abridge labour, and by means of which an equal circulating capital can afford a much greater revenue to its employer. An improved farm is equally advantageous, and more durable than any of those machines, frequently requiring no other repairs than the most profitable application of the farmer's capital employed in cultivating it.

"4th. Of the acquired and useful abilities of all the inhabitants or members of the society. The acquisition of such talents, by the maintenance of the acquirer during his education, study, or apprenticeship, always costs a real expense, which is a capital fixed and realised, as it were, in his person. Those talents as they make a part of his future, so do they likewise of that of the society to which he belongs. The improved dexterity of a workman may be considered in the same light as a machine or instrument of trade, which facilitates and abridges labor, and which, though it costs a certain expense, repays that expense with a profit."

This last paragraph is deserving of especial notice, because it has been almost universally supposed that Adam Smith confines Wealth to material objects. J. B. Say and Malthus both thought so. But this is seen to be a complete error, as he especially enumerates mental or intellectual abilities, and education, as part of the capital of the nation. The confusion has arisen from Adam Smith's self-contradiction. For under labor, he classes all labor as unproductive, which does not fix and realise itself in some material vendible commodity. This passage quite contradicts the one we have just quoted, and it is the one on labor, which authors have chiefly regarded. (LABOR.)

181. Circulating Capital, Adam Smith says consists of—

1st. Of the money by means of which all the other three are circulated and distributed to their proper consumers.

2nd. Of the stock of provisions, which are in the possession of the butcher, the grazier, the farmer, the corn merchant, the brewer, &c., and from the sale of which, they expect to derive a profit.

3rd. Of the materials, whether altogether rude, or more or less manufactured, of clothes, furniture and building, which are not yet made up into any of those three shapes, but which remain in the hands of the growers, the manufacturers, the mercers and drapers, the timber merchants, the carpenters and joiners, the brick-makers, &c.

4th and Last. Of the work which is made up and completed, but which is still in the hands of the merchant, or manufacturer, and not yet disposed of or distributed to the proper consumers; such as the finished work which we frequently find ready-made in the shops of the smith, the cabinet-maker, the goldsmith, the jeweller, the china-merchant, &c. The circulating capital consists in this manner of the provisions, materials, and finished work of all kinds that are in the hands of their respective dealers, and of the money that is necessary for circulating and distributing them to those who are finally to use or to consume them.

"Of these four parts, three, provisions, materials, and finished work, are, either annually, or in a longer or shorter period, regularly withdrawn from it, and placed either in the fixed capital, or in the stock reserved for immediate consumption.

"Every fixed capital is both originally derived from, and requires to be continually supported by a circulating capital. All useful machines, and instruments of trade, are originally derived from a circulating capital, which furnishes the materials of which they are made, and the maintenance of the workmen who make them. They require, too, a capital of the same kind to keep them in constant repair."

182. It is clearly to be understood that it is according to the method in which any article of Capital is used, and not according to its nature, that it receives the name of fixed or circulating. The same article may receive different names according as it passes to different owners, who produce it, or cause it to be produced for different purposes. The same article may be *floating* capital in the hands of one man, and *fixed capital* in the hands of its next possessor, if the first produces it for the purpose of selling it, and the second purchases it for the purpose of deriving an income from its use.

The distinction may also be stated thus. That if the whole price of an article is paid out of the current income of the country, it is *floating* capital; but if only the interest, or revenue derived from its use, then it is *fixed* capital. This distinction is often overlooked, and the term fixed capital is applied to articles of a certain nature. Thus houses, lands, machinery, railways, and ships are frequently termed fixed capital. But this is an error. If a person employs his capital in building houses for the purpose of selling them again immediately, they are floating capital in his hands, for their price is paid in one operation. This is by no means uncommon. But if another man buys them for the purpose of letting them out to tenants, and so only deriving a revenue for his capital, they become fixed capital in his hands. Many persons buy land on speculation, for the purpose of selling it again at a profit. The land in the hands of these jobbers is floating capital, but if another man buys that land for the purpose of letting it out to farmers, or cultivating it himself, and so only making a revenue of it, it becomes fixed capital to him. It is the same with machinery. To the machine maker, who makes it for the purpose of selling it to the manufacturer, it is floating capital. In the hands of the manufacturer, who buys it for the purpose of increasing the quantity of his productions by its use, and so only making a profit of it, it becomes fixed capital. Hence we may state generally that all articles, whatever be their nature, while they are in the hands of a person who deals in them, that is, who produces or buys them for the purpose of selling them again with a profit, as soon as he can, are floating capital. As soon as they pass into the hands of a person who only makes a profit by interest derivable from their use, they are fixed capital.

183. The articles we have just mentioned are, it is true, generally produced with the intention of their ultimately becoming fixed capital; but we have shewn that they may or they may not be fixed capital when they are produced, accord-

ing to different circumstances; and unless we know what these circumstances are, it is impossible to decide which name is to be given to them. It may also be easily shewn how articles which are usually classed as floating capital may become fixed capital. Furniture and clothes would usually be termed floating capital, because they are generally made for the purpose of being sold. But if a person made them for the purpose of only letting them out for hire, they would become fixed capital in his hands. An ordinary tailor usually makes clothes to be sold to his customers; they are therefore floating capital to him. But in the hands of a person who lets out uniforms and dresses for particular occasions, they become fixed capital, just as much fixed capital as a house or a mill. So if an upholsterer lets out furniture for hire, it becomes fixed capital as much as any railway.

We thus see how improper it is to apply the term either of floating, or fixed, capital to any object, whatever be its nature, unless we know the intention of its owner in using it. There are very few articles to which the name of fixed capital may be invariably applied—none to which it is necessarily applied. Those to which it may be applied with the least risk of error are railways, canals, docks, and agricultural improvements. The instances are very rare in which railways, &c. are made for the purpose of being sold. If that did happen, they would have to be called floating capital in the hands of such a person, or such a company. Nor are there any articles which are necessarily floating capital. The mode of expending capital which is almost invariably floating capital, is the wages of labour. In all ordinary cases in this country the wages of of labor are floating capital. But in slave countries the case is different: there a slave is fixed capital, like any machine. The same thing occurs, to a certain extent, in this country, where people sometimes enter, as it were, into a species of modified servitude. It is not unusual for eminent singers and musicians to contract to serve the large music-sellers for a definite period, during which their employer has the right to let them out for hire on occasions, like instruments or plate.

184. To the capitalist who lives merely on the profits of his capital, it may make very little difference whether he reaps that profit in one operation, or in many, as the result must always be the same to him in the end. But to the class of persons who live by their daily labor—the workmen in his business—the difference in the mode of employing capital may make a very great difference. Thus, if the builder of a ship means to sell it immediately, and be paid the whole price for it at once, he will employ that money in building another ship; and the full amount of the price of the ship, deducting the part which goes to support himself, will be expended in the wages of the shipwrights, and on the producers of the materials for the new ship. In this case it is floating capital. But if the builder of the ship changes his purpose, and only lets it out for hire, and only receives a periodical instalment for its use, he can only employ that part which represents the deterioration in building a new ship. Consequently, if he changes the nature of his business very suddenly,

that is, if he suddenly changes his floating into fixed capital, the fund applicable to the promotion of labor will be greatly diminished, and it must infallibly cause great distress among the persons who were dependent on him for their support. By seeking other employments they may, perhaps, ultimately be as well off as before; but it is quite clear, that if a large number of persons have been accustomed to have a particular kind of labor found for them, any sudden change by which the system is disorganized, must produce at least temporary distress. It might be said that the capital of the purchaser of the ship, instead of going to the builder of the ship, and being spent among that class of workmen, might be employed in encouraging other species of industry, so that the result to the whole community would be the same. But the overthrow of any system upon which a great number of people depend, must be followed by much suffering. It appears, then, that the conversion of floating into fixed capital requires to be done with much caution, and only in certain quantities at a time, to avoid its being injurious to the interests of large classes of persons. And if a large class of the public are seized with a sudden mania to convert an unusual quantity of their floating into fixed capital, it must inevitably be followed by at least temporary distress. The truth of these remarks was conspicuously verified by the universal distress throughout the country, at the time of the great railway mania in 1846, and subsequent years. The first railways were successful beyond all expectation. In a few years a complete mania for buying railway shares, and constructing new ones, seized the people. Traders withdrew their capital from their legitimate business to invest it in railway stock. They changed it from floating into fixed capital. Every one knows the consequences. The most intense distress pervaded the country for many years. The frightful sums lavished on these undertakings, has sunk their value for a long period of years; and, judging by the present value of railway stock, nearly one-third of the money invested in them has been lost for the present.

185. The distinction between floating and fixed capital, as stated above, and which entirely coincides with that propounded by Adam Smith, presents one that is clearly founded in nature, and one which is attended with important consequences. Moreover, it is in harmony with the fundamental conception of capital itself, because it is clearly founded on a difference in the method of use. Ricardo totally failed to see the true ground of the distinction, and has introduced a new one, which has been a source of much confusion. He says, p. 25,—

"In the former section, we have supposed the implements and weapons necessary to kill the deer and salmon to be equally durable, and to be the result of the same quantity of labor, and we have seen that the variations in the relative value of deer and salmon depended solely on the varying quantities of labor necessary to obtain them; but in every state of society the tools, implements, buildings, and machinery employed in different trades may be of various degrees of durability, and may require different portions of labor to produce them. The proportions, too, in which the capital that is to support labor, and the ca-

pital that is invested in tools, machinery, and buildings, may be variously combined. This difference in the degree of durability of fixed capital, and this variety in the proportions in which the two sorts of capital may be combined, introduce another cause, besides the greater or less quantity of labor necessary to produce commodities for the variations in their relative value—this cause is the rise or fall in the value of labor.

"The food and clothing consumed by the laborer, the buildings in which he works, the implements with which his labor is assisted, are all of a perishable nature. There is, however, a vast difference in the time for which these different capitals will endure: a steam-engine will last longer than a ship, a ship than the clothing of the laborer, and the clothing of the laborer longer than the food which he consumes.

"According as capital is rapidly perishable, and requires to be frequently reproduced, or is of slow consumption, it is classed under the heads of circulating or fixed capital. A brewer whose buildings and machinery are valuable and durable, is said to employ a large portion of fixed capital; on the contrary, a shoemaker whose capital is chiefly employed in payment of wages which are expended on food and clothing, commodities more perishable than buildings and machinery, is said to employ a large proportion of his capital as circulating capital.

"It is also to be observed that the circulating capital may circulate or be returned to its employer in very unequal times. The wheat bought by a farmer to sow, is comparatively a fixed capital to the wheat purchased by a baker to make into loaves. One leaves it in the ground, and can obtain no return for a year; the other can get it ground into flour, sell it as bread to his customers, and have his capital free to renew the same, or commence any other employment in a week."

The reader will at once perceive that this is a distinction of a totally different nature from that of Adam Smith. It is contrary to the fundamental conception of capital. Ricardo himself says in a note to the above passage, "A division not essential, and in which the line of demarcation cannot be accurately drawn." This last observation is perfectly true, it is utterly impossible to draw any line whatever, founded in such a principle. Articles are of all sorts and degrees of durability, and if durability be the criterion between fixed and floating capital, it is wholly impossible to tell where one shades off into the other. It is a violation of the Law of Continuity.

186. The considerations we have presented of the nature of capital entirely overthrow many of the established doctrines of capital. That is, the very same remark is applicable to them that Dr. Whately has applied to value, and the same thing must be done to them as we have already done to the definition of capital. They must be cleared of accidental circumstances. Thus, one of the received doctrines of capital is, that it necessarily wears out, and is all replaced out of income. Thus, Adam Smith says, Book II., ch. I,—

"Every fixed capital is both originally derived from, and requires to be continually supported by, a circulating capital. All useful machines and instruments of trade are originally derived from

a circulating capital, which furnishes the materials of which they are made, and the maintenance of the workmen who make them. They require, too, a capital of the same kind to keep them in constant repair."

This doctrine has been repeated in different varieties of form by nearly every Economist since Adam Smith. Thus, J. B. Say says, besides what we have already quoted in § 22, at p. 573,—

"Un tel langage, messieurs, est tout-à-fait en arrière de l'état actuel de nos connoissances économiques. Il est de l'essence des capitaux, non d'être inconsommables, mais au contraire de se consommer. Ils ne peuvent servir, qu'en se consommant sous une forme, pour reparaitre sous une autre; et même plus la consommation en est prompte, et moins long temps on en perd l'intérêt. Aussi quand on a une portion de capital en argent, cherche-t-on à la transformer le plus tôt possible en une marchandise consommable, ou en main d'œuvre, qui est aussi une denrée consommable. Tant qu'un capital reste en écus, il peut être destiné à faire des avances à la production mais il n'en fait point encore; pour devenir utile, il faut qu'on le troque contre des objets de consommation."

Now, it may be necessary here to inform our readers, that by *consumation* J. B. Say means destruction. (*CONSUMPTION*.) This is one of the fundamental errors of his system of Political Economy, which we have fully examined in its proper place. But the meaning of the above passage is, that Capital is necessarily destroyed to be reproduced. But here we have one of his inconsistencies, for he fully admits money to be a species of Capital, and yet money is in no way destroyed in performing an exchange.

Mr. J. S. Mill has also been unfortunately led to adopt the same doctrine, as one of the fundamental theorems respecting capital, p. 87,—

"A third fundamental theorem respecting Capital, closely connected with the one last discussed, is, that although saved, and the result of saving, it is nevertheless consumed. The word saving does not imply that what is saved is not consumed, but only that it is not consumed by the person who saves it. If merely laid by for future use, it is said to be hoarded; and while hoarded, is not consumed at all. But if employed as capital, it is all consumed, not indeed by the capitalist, but by his workpeople. Part is exchanged for tools or machinery, which are worn out by use: part for seed or materials, which are destroyed as such by being sown, or wrought up, and destroyed altogether by the consumption of the ultimate product. The remainder is paid in wages to productive laborers, who consume it for their daily wants, or if they in turn save any part, this also is not, generally speaking hoarded, but (through saving banks, benefit clubs, or some other channel), re-employed as capital, and consumed.

"The principle now stated is a strong example of the necessity of attention to the most elementary truths of our subject; for it is one of the most elementary of them all, and yet no one who has not bestowed some thought on the matter is habitually aware of it, and most are not willing to admit it when first stated."

187. When we come to examine the nature of capital, according to the extent of it explained in the preceding paragraphs, we shall see that this

proposition is only one of that large class to which Dr. Whately's remarks on Value are applicable. It so happens, that it is true with reference to a very large portion of capital, but as a general proposition regarding *all* capital it is utterly untenable. In the first place it is altogether inapplicable to that immense mass of incorporeal capital, in the form of shares and stock, which we have described. A man who purchases £10,000 of Bank of England Stock acquires so much fixed capital. How does that wear out? or how is it consumed? How is it consumed and reproduced? If a publisher buys the copyright of a valuable work, it is fixed capital to him, but how is it consumed and reproduced? No doubt the law at present says that it shall not last as private property more than 42 years, and then gives it to the public, just as if one were to give land to the public; but supposing copyright to be allowed to exist beyond that, and supposing the public demand to continue for the work, how can this capital be possibly be said to be consumed and reproduced? How could the income of this capital in any way whatever be applied to repair the loss or diminution of the capital? Nothing whatever could impair or increase the value of the capital, but a diminution or increase of the demand of the public. If it were not for this arbitrary law we might have a "Shakespeare estate", or a "Milton estate", or a "Gibbon estate" as permanent and enduring as the land itself. It is no doubt a very dangerous thing to prophecy about the public taste, but if there were one prophecy of the smallest degree of danger, we might we think hazard the one that the demand for Lord Macaulay's Works will last as long as the English race and language, and beyond them. We think it a perfectly safe prophecy to say that the copyright in Macaulay's works would be fixed capital to its owner, if permitted to subsist, for centuries to come. And it would be national wealth in every sense of the word, as much as any goods or commodities, and how can we possibly say that this capital is worn out or destroyed, to be reproduced? The very same remarks are applicable to the land itself. It is true that when applied to particular purposes its qualities do wear out, and require to be constantly renewed, at a considerable expense of money and labor, as when it is applied to agricultural purposes. But there are other purposes to which it may be applied, in which it is not worn out, and does not require renewal. If I possess an estate in the country and let it out, it is capital to me, and there, no doubt, the land may be said to want renewing, and the qualities of the land are absorbed and destroyed in the produce. But if I have an estate in the heart of London, which produces me an annual income, how do the qualities of that land wear out, or how are they reproduced? An acre of land there is worth very nearly £1,000,000, that is to say it produces an income to its owner equal to that of £1,000,000 invested in any other way. But how is it consumed and reproduced?

Now it so happens, it is true, that there is a very considerable portion of Capital to which that proposition may be applied, but there is also Capital to the amount of thousands of millions, to which it is wholly inapplicable, and consequently as a general or fundamental theorem, it must be entirely rejected.

188. There is another proposition which we believe was originated by Bentham, and which Mr. Mill calls fundamental, namely, that industry is limited by Capital. Now the fact is, that this proposition has no definite meaning at all, until we settle what Capital is. In the terms in which Bentham meant it, it is undoubtedly a complete fallacy; for he had no notion of Capital, except material products. And, in fact, the disquisition on the proposition is so mixed up with the meaning of production, from the interpretation of which as used by a considerable number of Economists we so entirely dissent, that it would be too long to discuss the matter here. (PRODUCTION.)

But we must stop to point out one great fallacy of J. B. Say's, whose notions of Credit we have examined elsewhere. (CREDIT.) He says, Vol. I., p. 137,—

“La nature des capitaux, la nature de leurs fonctions, nous découvrent des vérités assez importantes. L'une d'elles est que les capitaux productifs ne consistent point en valeurs fictives, et de convention, mais seulement en valeurs réelles, et intrinsèques, que leurs possesseurs jugent à propos de consacrer à la production. En effet, on ne peut acheter des services productifs qu'avec des objets matériels ayant une valeur intrinsèque; on ne peut amasser en capitaux et transmettre à une personne, que des valeurs incorporées dans des objets matériels.”

What? Will not a bank note (which he calls a fictitious value) purchase productive services of all sorts as well as money? Is it not absolutely certain that instruments of credit perform exactly the same function in circulation that money does?

We have shewn already the great error of calling instruments of credit fictitious values. They are real values, but future. We have moreover shown from Say himself, that he has contradicted himself in saying that nothing but values incorporated in material objects, can be amassed and transferred.

189. We have observed that, if the owner of an article disposes of its use for ever, or sells it, the price should be sufficient to replace the article, together with the profits. When he only lets it, the rent, or hire, is composed of one part for the deterioration of the article, and the other for the necessary profits. From this it follows, that the more permanent the article is, the lower will be the rent, or hire, compared to the price, because, assuming the profits to be the same, the deterioration is less during any given time. If it be of a perishable nature, the hire will be high compared with the price, because the deterioration will be great. A few cases will verify this remark. The rent of land is very low compared with the price, usually not more than 3 or 4 per cent., because the deterioration is very small. The rent of houses is much greater compared to their price, usually 8 or 9 per cent, because the deterioration is greater. The hire of furniture is considerably more, usually 15 or 20 per cent., because the deterioration is greater still, and so on, so that the hire must always be greater as the deterioration increases. From this it follows that the hire must always be greater as the deterioration increases.

190. From the observations in the preceding paragraphs we obtain as the fundamental conception of Political Economy that,—

DEMAND IS THE ONLY SOURCE OF VALUE.

We may have things of Value upon which no labor has been bestowed, and we may have things upon which immense labor has been bestowed, and yet have no value.—

Therefore LABOR is not the ESSENCE but the ACCIDENT of VALUE.

We may have things of Value of all degrees of durability, from perpetuity down to those which perish in the using; also we may have things of all degrees of durability from perpetuity downwards, which have no value.—

Therefore DURABILITY is not the ESSENCE, but the ACCIDENT of VALUE.

We have shewn that there is property of gigantic magnitude which is wholly incorporeal, or immaterial, which is of enormous Value; also there are abundance of things which are material, which have no value.—

Therefore MATERIALITY is not the ESSENCE, but the ACCIDENT of VALUE.

Hence neither labor, durability, nor materiality is separately the essence of Value, they are only the accidents of Value, nor is any combination of them necessary to Value.

But on the other hand whatever men desire, or want, has value, whatever they do not desire, or want, has no value. Whenever human desire is shed on any object it has value, when human desire passes away from it, it ceases to have value.

Thus demand is the only source of value, and the measure of value is what men will give to obtain what they want.

191. Speaking strictly, anything is a measure of value, which has the capacity of being exchanged. In former times when barter prevailed, and commodities were exchanged directly, each of course was the measure of the other.

In modern times, however, since the introduction of money, money has been usually considered as the measure of value. And, therefore, it has been said by Aristotle, that demand is the origin of value, and money is the measure of value.

But though the introduction of money produces great advantages in commerce, and is found to have great convenience, yet it in no way alters the nature of the thing. And though it is usual to speak of money as the measure of the value of commodities and services, yet commodities and services are equally the measure of the value of money.

If one man is willing to give another 50s. for a quarter of wheat, that 50s. measures the value of the wheat to him. If the other is willing to give a quarter of wheat for the 50s., that quarter of wheat measures the value of the 50s. to him.

Thus value springs from the reciprocal wants of men. Nothing can have value independently *per se*. The value of my produce consists in this, that some one else will give me something for it; the value of that other person's produce consists in this, that I will give him something for it. If each of us have things which the other does not want, those things have no value. Or if one has things which the other wants, but the other has no things which the first wants, there can still be no exchange, and consequently no value. Hence we see that *Value indispensably*

requires the concurrence of two minds. As Mr. Samuel Bailey says, (BAILEY,) Value is like distance, it denotes an external relation between two objects. It is also like weight, which denotes the force of attraction between two objects. To suppose that an isolated object can have value, is as absurd as to suppose that an isolated object can have distance, or that an isolated body can have weight.

192. Hence we observe that in order that any object should have value we must bestow our labor upon something some one else wants, and all labor bestowed upon anything which no one wants, is labor thrown away and lost.

Hence in order to make labor profitable, we must observe what things are wanted, or what things have value, and bestow our labor on them.

Therefore it is perfectly clear that, *It is not Labor which is the cause of Value, but it is Value that attracts Labor.*

193. There are many things we want that we must labor for ourselves; a man will often produce himself what he requires. In such cases we do not consider whether the labor is worth the produce, because we should only be too glad to obtain the produce without the labor, but we consider whether the produce, or enjoyment, is worth the labor, or trouble.

If a man were told that by making a long journey he would see something very remarkable, and if believing this, he incurred a great expense and trouble, and found nothing worth seeing, he would say that he had lost his pains and money; he would never suppose that the worth of what he saw depended upon the trouble and expense of his journey. On the contrary, he would consider whether the worth of what he saw, recompensed him for the trouble and expense of the journey.

A man in London, hearing of the beauty of the ruins in Upper Egypt, goes to a great expense and trouble to go to see them. Does the beauty of the ruins in Upper Egypt depend on the length and expense of the journey? Is it not plain that our traveller bestows great expense and trouble in going to Upper Egypt, because he thinks the beauty of the ruins worth the expense and trouble? He would only be too glad if some kind fairy would whisk him from London to Thebes in the twinkling of an eye.

Hence, universally, it is not the *labor which gives value to the product*, but the *product which gives value to the labor*.

194. Hence we see that Value resides altogether in the mind. We must entirely expel all notions of Labor, Materiality, or Durability from the definition of Value. Whatever men desire, and will give anything for, is an Economical Element, no matter whether it is material, or immaterial, whether it lasts for ever, or only for a second. And this for no other reason whatever than because men think them equal, and will give the same quantity of things to obtain them.

Exactly in the same way we may have a pound weight of air, a pound weight of lead, of water, of iron, of cheese, of bread, of butter, of milk, of wine, of clay, of wood, of sugar, of gunpowder. Does their materiality, or their durability, or the labor in producing them influence their weight? Certainly not. Why are they all of equal weight? For the very simple reason—that they all weigh a pound!

It is just the same with Economical Elements. Whatever may be exchanged for a pound, is an Economical Element, whether it be material or immaterial, durable or perishable, and these elements are all equal in value, and why? For the very simple reason—that they are all equal in value to a pound!

195. We hope that we have satisfied our readers that labor, materiality, and durability, must all be dismissed from the conception of Value. There is one thing more specious still, which has been advocated by very able Economists, as the source of Value—namely, Utility. Thus, J. B. Say makes Utility the basis of Value; and Mr. Senior says, p. 13, "We use the word *VALUE* in its popular acceptation, as signifying *that quality in anything which fits it to be given and received in exchange*; or, in other words, to be lent or sold, hired or purchased.

"So defined, Value denotes a relation reciprocally existing between two objects, and the precise relation which it denotes is the quantity of the one which can be obtained in exchange for a given quantity of the other. It is impossible therefore to predicate value of any object without referring expressly, or tacitly, to some other objects in which its value is to be estimated; or, in other words, of which a certain quantity can be obtained in exchange for a certain quantity of the object in question."

196. Now, in fact, Utility is a much more specious basis of value than either labor, materiality, or durability, and therefore we have reserved it for separate discussion. But when we examine the matter, we shall find that Utility cannot be made the basis of Political Economy, because utility itself is, we may say, the result of a certain state of mind. Dugald Stewart has some very pertinent remarks on this subject, (*First preliminary dissertation to the Encyclopædia Britannica*, p. 66. *Eighth edition*.)

"To this reference of the sensation of colour to the external object, I can think of nothing so analogous as the feelings we experience in surveying a library of books. We speak of the volumes piled up on its shelves as *treasures* or *magazines* of the knowledge of past ages; and contemplate them with gratitude and reverence, as *inexhaustible sources* of instruction and delight to the mind. Even in looking at a page of print or of manuscript, we are apt to say that the ideas we acquire are received by the sense of sight, and we are scarcely conscious of a metaphor when we employ this language. On such occasions we seldom recollect that nothing is experienced by the eye but a multitude of *black strokes drawn upon white paper*, and that it is our own acquired habits which communicate to these *strokes* the whole of that significance, whereby they are distinguished from the unmeaning scrawling of an infant, or a changeling. The knowledge which we conceive to be preserved in books like the fragrance of a rose, or the gilding of the clouds depends for its existence on the *RELATION between the OBJECT and the PERCEPT MIND*; and the only difference between the two cases is, that in the one, this relation is the local and temporary effect of conventional habits; in the other it is the universal and the unchangeable work of nature. The art of printing, it is to be hoped, will in future render the

former relation as well as the latter coeval with our species; but in the past history of mankind, it is impossible to say how often it may have been dissolved. What vestiges can now be traced of those scientific attainments which, in early times, drew to *Egypt*, from every part of the civilized world, all those who were anxious to be initiated into the mysteries of Philosophy? The symbols which still remain in that celebrated country inscribed as eternal monuments, have long lost the correspondent MINDS, which reflected upon them their own intellectual attributes. To us they are useless and silent, and serve only to attest the existence of arts, of which it is impossible to unriddle the nature and the objects.

"—— Variis nunc sculpta figuris
Marmora trunca tamen visuntur, mutaque nobis;
Signa repertorum tuimur, occidere reperta."

"What has now been remarked with respect to *written characters*, may be extended very nearly to *oral language*. When we listen to the discourse of a public speaker, eloquence and persuasion seem to issue from his lips, and we are little aware, that we ourselves infuse the soul into every word that he utters. The case is exactly the same when we enjoy the conversation of a friend. We ascribe the charm entirely to his voice and accents; but without our co-operation its potency would vanish. How very small the comparative proportion is, which in such cases, the words spoken contribute to the intellectual and moral effect, I have elsewhere endeavoured to shew."

197. These remarks apply very strongly to the word *Utility*. If we admit utility as the basis of Value, we in fact open up the whole of mental and moral science. Whether an object has utility, depends entirely upon the habits of feeling, and the *percipient mind* of the person with whom it is brought into relation. If utility is the basis of Value, unfortunately it is not confined to things which are productive of benefit. The depraved taste and reckless character of too large a portion of mankind confer a value upon things of the most mischievous and noxious nature. The unhappy passion for intoxicating liquors among our lower classes confers enormous value on gin, as an Economical quantity, which is to the last degree injurious. But so long as that desire continues, gin will continue to be an article of wealth. However much the moralist may deplore it, the Economist must consider gin as much an article of wealth as the most beneficial product. It is for the moralist to bring about the change of mind in the people, so as to make them cease to desire these things; until he does so, it is the melancholy duty of the Economist to acknowledge them to be Capital so long as they are desired.

198. As allied to this we may take the masses of low and licentious literature which formerly abounded. While there was a demand for it, the Economist could not help acknowledging it to be Capital. But certainly it would be an abuse of the term *Utility*, to apply it to such masses of abomination. It is for the moralist to eradicate the morbid craving for it, and cause it to cease to be capital.

199. And the same remarks apply to other things which are indifferent. While things remain in all respects the same in themselves, the fashion, or desire for them changes. Things rise

and fall in value, without undergoing any change in themselves—the change is in the *mind* of the public. When we say that the pictures of one master, like Sir Thomas Lawrence, are falling, and those of another, like Sir Joshua Reynolds, are rising in public estimation, is it the pictures themselves which change? Certainly not; they remain in all respects the same. *It is the public mind which undergoes a change.* It is according to the state of the percipient mind that value is shed upon, or dies off from any object. So Tennyson says,—

"A happy lover who has come
To look on her that loves him well,
Who 'lights, and rings the gateway bell,
And learns her gone and far from home;

"He saddens, *all the magic light
Dies off at once from bower and hall,
And all the place is dark, and all
The chambers emptied of delight.*"

200. These remarks admit of universal application. And hence we see that there is no such thing at all as absolute utility, which can be made the basis of Value. To make utility the basis of Value would, in fact, let in the whole of Psychology into Political Economy, which is the very thing we are so careful to exclude. It would be an error in the mental or subjective department of the subject of a similar nature to what it would be in the external, or objective department, to admit the whole process of manufactures and agriculture.

Political Economy rigorously excludes all considerations of the preparation and cultivation of the mind which produces the desire, equally with all considerations of the preparation or cultivation, or manufacture of the product. It only deals with the desire which is the cause of Value, and the product which is the subject matter of Value.

201. We have fully discussed the objections to making *Utility* the basis of Value in the *PRELIMINARY DISCOURSE*, and we need not repeat here what we have said there. We will only remark, that what we have just said is in entire harmony with Mr. Senior's opinion, which we have already quoted, § 28. We have shewn there how clearly he has seen that the true cause of Wealth resides in the mind. In order to give value to material, or any other products, it is first necessary to prepare and cultivate the mind; to create new wants and desires. If these are totally wanting in the mind, vain and unprofitable is the toil of the laborer. It is only by creating new desires that new species of capital can be created. Heavy taxes, of course, can only be borne by an industrious and wealthy people, and no people can be wealthy who are not inspired with strong and various desires. Hence we may see, in a purely economical point of view, the enormous importance of an educated and enlightened people. The multiplication of wants multiplies industry, multiplies capital, multiplies incomes, multiplies the persons to bear the burden of taxation, and renders the nation capable of great achievements, and of taking a leading position among the nations of the world. It is the constantly increasing intelligence and industry and education of the English people that makes the interest to be paid for the national debt a constantly diminishing burden. If the people were suddenly to sink to the apathy and

indolence of the Neapolitans, or Spaniards, it would soon become a burden so intolerable, as to invite the operation of the sponge.

202. Upon the principle, too, that demand is the origin of Value, and that the quantity of money, (or anything) which people will give for a thing is the measure of its value, we are enabled to understand clearly the existence of incorporeal capital, just as much as corporeal capital. If any product has value, the source or Capital, from which it springs, has a real Value. It is nothing but the demand for the products of the land which sheds a value on the land. The deserts of Africa are of no value in an economical point of view. They cannot be made the subject of taxation. On the other hand the great incorporeal estates of the law, medicine, engineering, and all trades and professions, are as really existing quantities as land, and can be made just as easily the subjects of taxation. These considerations have much importance in respect to the Theory of the Income Tax. (INCOME TAX.)

203. These considerations shew that the essential preliminary to the increase of Capital in a nation is the increase of the wants and desires, either corporeal or mental. This being premised we observe that Capital is an increasing quantity, and we may consider the modes in which it does increase.

There are two fundamentally distinct ways in which Capital may increase;—

I. By a direct and actual increase of the thing itself.

II. By exchange; that is by exchanging any thing which has a low value in any particular place for one that has a higher value.

The first of these methods has always been understood and lauded from the time when Political Economy began to be studied. Aristotle especially commends all the arts which tend to increase the quantity of things, such as agriculture, hunting &c. And this has been so often described that we need not further dwell on it. The Physiocrate School allowed the epithet of productive alone to such labor as increased the actual quantity of matter. They allowed that the labor of artisans &c. added to Value, but that it did not produce Value. (PHYSIOCRATES). A somewhat nice distinction. Adam Smith however justly held that adding to Value was in reality producing Value, and included manufacturing industry under the title of productive. And this is unquestionably true, and has been adopted by every Economist since.

The second method of increasing capital by exchange, has had a very different reception from the first. In fact until very recent times indeed, comparatively speaking it has been an insoluble puzzle. Aristotle, Cicero, and Luther all repudiated the idea that profit was to be made by exchanging. Luther was furious at the idea that any one could gain by exchange unless he robbed the other party. However, plain experience was against the doctrine. A new one then sprung up more absurd still, and has Montaigne for its sponsor. It was then held that in exchange one side only gained, and the other lost as much. This was the accepted notion for a long time, and gave rise to the unfortunate Theory of the Balance of Trade, and was the parent of innumerable

wars, and fills many a dreary page in the annals of mankind.

204. Nevertheless the slightest reflection on the reality, ought have wakened men to doubt this. If one side always lost in an exchange, why were not the majority of traders in the bankruptcy court? If some men were always gaining, and some always losing, why were not half the nation insolvent?

205. Boisguillebert was the first, that we know of, to proclaim the manifest truth, that in commerce both sides must gain. His writings, however, attracted very little attention, and were almost forgotten till very recently.

The truth of this maxim could not but force its way on any one who would look abroad on commercial society. No doubt there is always a certain per-centage of unfortunate traders. But are even a large proportion of traders insolvent? Clearly not. It is quite possible that all might gain, all might be prosperous. Loss is not the essence but the accident of trade.

206. It is perfectly clear, therefore, that profits may be made by exchanging. The slightest attention to facts shewed the utter futility of the brainspun doctrine of philosophers. Now we observe, that what was usually called productive labor, increased value by adding to the actual quantity of things, then manufacturing industry increases value, by making anything more desirable than it was before, putting it into a more useful shape, &c. These are both now called productive labor by all Economists. But commercial industry, or the industry of exchange, increases value by substituting a more valuable article in the stead of one that is less valuable. It takes away from any given locality something that is abundant there, and takes it to a place where it is scarcer and more valuable, and seeks to bring back some article which is abundant and cheap in that locality, and is more scarce and valuable in the locality from which the operation began.

207. The least reflection will shew that this is as truly productive labor as the other two cases. Each of these three kinds of labor augments the sum of articles of value in any given place, and therefore each of these three species of industry augments capital. What we say is this, that if we take away an article worth £10 from any given place, and substitute in its stead some other article worth £20 in the same place, that operation augments capital. And it is quite clear that the difference by which the imported article exceeds the value of the exported article, is the measure of the increase or profit. This is the function of commerce.

208. This doctrine is so plain that it cannot, we think, be disputed. We shall now shew how beautifully it harmonizes with the fundamental doctrine of Value, propounded by Aristotle.

If value be considered to be anything residing in the article itself, it is perfectly manifest that value cannot alter so long as that quality remains unchanged. It has accordingly been objected, says Mr. Senior, that if the definition of Value be what anything will exchange for, and Wealth a general name for the things which have value, that, "the same thing will be wealth to one person and not to another. This consequence is evident; and it is evident that even to the same

person the same quality may be wealth under some circumstances, and not so under others. The knowledge of English law is profitable in England, and that of French law in France; if an English lawyer, with no other property but his knowledge were to settle in France, or a French lawyer in England, he would find himself instantly reduced from affluence to poverty. The power of telling long stories is a source of profit in Asia, but valueless in Europe. According to our nomenclature, therefore, it would be wealth in Persia, and cease to be so in England. If an actress should embrace a religious sect, of which the tenets should be incompatible with the stage, her vocal and dramatic talents would no longer be exchangeable; she would no longer be able to let them out by the evening. We should say, therefore, that they had ceased to be a part of her wealth.

"Again, Colonel Torrens supposes a solitary family, or a nation, in which each person should consume only his own productions, or one in which there should be a community of goods; and urges as a *reductio ad absurdum*, that in these cases, though there might be an abundance of commodities, as there would be no exchanges, there would, in our sense of the term, be no wealth. The answer is, that for the purposes of Political Economy there would be no wealth; for, in fact, in such a state of things, supposing it possible, the science of Political Economy would have no application. In such a state of society, Agriculture, Mechanics, or any other of the Arts, which are subservient to the production of the commodities, which are with us the subjects of exchange, might be studied, but the science of Political Economy would not exist. We may add, that if the common usage which identifies wealth with the things which have value is a convenient one in all the forms which human nature really exhibits, it is no objection to it that it would not be convenient in a state of society of which we have no experience."

209. This passage of Mr. Senior's deserves the most attentive consideration as touching the very foundation of Political Economy. His reply to Colonel Torrens is perfectly conclusive. It is the very fundamental notion of Value to understand that it is purely conventional and local. The very same thing may have enormous value, may be great wealth in one place, and have no value at all, and be not wealth in another. We may also say, that since the foundation of Political Economy in modern times by the Physiocrats, the words "wealth" and "riches" have been used exclusively as technical words to signify not productions, or commodities, in general, but those things only which, in a state of society which admits the right of private property and exchanges, have exchangeable power. It is just the same with the word "property." In a state of society which permitted no such thing as private property, there could manifestly be no such thing as property. There might be abundance of eatables and drinkables, and all sorts of other things. But if no one was allowed to have an individual and exclusive right in these things, there could of course be no "property." Property, therefore, is a technical word arising out of a particular state of society. It is exactly the same with "wealth" and "riches." They are technical words arising

out of that state of society which permits individual and exclusive "property" in things, and an *exchange* of those things. And those words have been used by the earliest Economists, with the distinct announcement that they refer exclusively to exchangeable things. Thus Baudeau says (*Introduction à la philosophie économique; Physiocrates, Édité. Guillaumin, Vol. II. p. 661*),—

"*Des Richesses.* Les objets propres à nos jouissances utiles ou agréables sont appelés des *biens*, parce qu'ils procurent la conservation, la propagation, le bien-être de l'espèce humaine sur la terre.

"Mais quelquefois ces biens ne sont pas des *richesses*, parce qu'on ne peut pas les échanger contre d'autres biens, ou s'en servir pour se procurer d'autres jouissances. Un beau temps, une bonne santé, une belle âme, sont des biens sans être des richesses. Les productions de la nature, ou les ouvrages de l'art les plus nécessaires et les plus agréables cessent d'être richesses quand vous perdez la possibilité de les échanger, et de vous procurer par cet échange d'autres jouissances. Cent mille pieds des plus beaux chênes de l'univers ne vous formeraient point une *richesse* dans l'intérieur de l'Amérique Septentrionale, où vous ne trouveriez point à vous en défaire par un échange.

"Le titre de richesses suppose donc deux choses: premièrement, les qualités usuelles, qui rendent les objets propres à nos jouissances, utiles ou agréables, et qui les constituent des *biens*; secondement, la possibilité de les échanger, qui fait que ces biens peuvent vous en procurer d'autres, ce qui les constitue *richesses*.

"Cette possibilité de l'échange suppose qu'il existe d'autres biens contre lesquels on peut les échanger.

Thus we see that the word "riches" or "wealth" was exclusively used in a technical sense by the founders of Political Economy, to signify things which could be exchanged.

Now, as according to the conception of Value which we adopt, it resides entirely in the mind, and is measured by the quantity of anything, such as money, which people will give for the object desired, it follows that that object whatever it is, for which people will give more to obtain than another object, is the more valuable of the two. It is an object of greater wealth. The one is more riches than the other. And if there are two places, in one of which the very same object will exchange for more than at another place, it is manifestly an object of greater value in the first place, than in the second.

Now from this fundamental notion of Value, this proposition follows, which may appear a paradox at first, but yet it is perfectly simple. *That by a mere change of position of all the articles in the world, those very articles remaining exactly the same both in quality and quantity, it would be possible to annihilate all the wealth in the world.*

The proposition, paradoxical as it may appear, manifestly follows, by the Law of Continuity, from the considerations we have just mentioned. Because, if it be possible by a mere change of position to make the very same article of greater value in one place than in another, we have only to reverse the process and move the article from where it has greater value to where it has less, and it is quite easy to find a place where it shall

have no value at all, and cease to be wealth. Place it simply among people who don't want it, and it ceases to be wealth.

Take for instance all the literary treasures of civilized Europe. They are undoubtedly wealth in Europe, because people desire them strongly, and will give much to obtain them. Place them among the Hottentots, or the Esquimaux, and they would be no more valuable than the sand of the sea. They would cease to be wealth.

Do the same with everything that civilized men consider most valuable, diamonds and precious stones, and gold. Place them among the Bosjesmans, and they would cease to be wealth.

Do the same with what is most highly valued among the Esquimaux. A tureen full of train oil or whale blubber, would be a delicious feast to an Esquimaux, he would give much to possess it; it would be wealth there. Place the very same thing on table at the Lord Mayor's dinner, and would it be equally esteemed? Would it be wealth there? We trow not.

Now these remarks may be applied to every single article in succession, and they shew the truth of that fundamental conception in Political Economy, that all value is conventional and local. There is no such thing as *intrinsic value*. An article may have value through a greater or smaller area, its value may be more or less general; but it cannot be *intrinsic*, for the very good reason, that it requires the *percipient mind* of a person to exist at all.

210. It appears then to us to be perfectly clear, that, as the general conception of productive labor is, that it is labor which produces something of value, or which is exchangeable, i.e., which has the power of *DRAWING FORN* something in exchange; commercial industry, whose peculiar function it is to substitute an article of greater value in any given place for one of lesser value, is as truly *productive labor*, as that which is bestowed on increasing the actual quantity of things, or in changing the qualities, or shape of existing things, so that they shall be of greater value. All these three species of industry are merely varieties of one fundamental conception, augmentation of value.

211. We thus see that Capital may be profitably, or productively, employed in three distinct ways—1st, by adding to quantity; 2dly, by adding to the value of existing quantity; and, 3dly, by substituting things of more value for things of less value, i.e., by exchange. And as the profit in each case may be added to the principal, and also increase, it is manifest that it has the capacity of increasing in each way in a geometrical ratio.

Although all capital, however, has this capacity, it very seldom indeed does so in any case whatever. The standard case of such an increase is where a man invests his money in the funds, and constantly capitalises the dividends, without using them. In that case the capital remains untouched, and is not destroyed, consequently at any time after being left to increase, there would be both the capital and the interest. But such a case as this very seldom occurs, because people usually require the interest of their capital to live upon, and thus it is not devoted to the purpose of increase.

212. Now the rate of increase of Capital ma-

PART IV. VOL. I.

nifestly depends upon the Rate of Profit. But what is *Rate of Profit*?

By a most extraordinary oversight, Economists have used the expression, rate of profit, in a sense which is most clearly erroneous. When we speak of rate of interest, it is perfectly clear that we measure rate, both by the actual amount of the sum paid, and the *time* it is paid for. When we say that the rate of interest is 5 per cent., we always mean 5 per cent. for the year. If a man were to say that he had borrowed £100, and had agreed to pay £5 for its use, we of course could form no conception of what rate of interest that was, until we knew how long he was to have the use of the money.

213. Now it is perfectly clear that the very same considerations apply to *Rate of Profit*. If a man tells us that he has got a return of £5 on his capital of £100, how can we possibly tell what *rate of profit* that is, unless he also tell us in what *time* he made that profit.

This remark seems self-evident, and yet the expression, *Rate of Profit*, is used by Economists to mean simply the proportion of the profit to the capital. This is clearly the sense it is used in by Adam Smith. It is the sense on which the whole of Ricardo's theory of Profits is based, and it is the sense adopted by all his school. Thus, Mr. McCulloch says, Note VII., to the *Wealth of Nations*,—

"By *profit*, in Political Economy, is meant that part of the produce, or the value of the produce, obtained by the employment of capital in industrious undertakings, which remains to its employers, after replacing the Capital, or such portion of it as may have been wasted in the undertakings, and every other expense necessarily incurred in carrying them on.

"The *rate of profit* is the proportion which the amount of profit derived from an undertaking, bears to the capital employed in it."

It would be just as sensible to define *rate of interest* to be the proportion which the interest bears to the capital.

Now from this definition of rate of profit, Ricardo deduced the doctrine that the rate of profit depends upon the rate of wages. Ricardo's doctrine is, that as wages rise, profits fall, and as wages fall, profits rise.

Mr. McCulloch however, though adopting Ricardo's definition of rate of profit, says, that profits may rise together with wages by increasing the productiveness of industry. And he says,

"It is obvious that the rate of profit may be raised in three, but only in three ways,—viz. (1) By industry becoming more productive; or (2) by a reduction in the rate of wages; or (3) by a reduction in the amount of taxation: and it may be reduced by the opposite circumstances; or (1) by industry becoming less productive; or (2) by a rise in the rate of wages; or (3) by a rise in the amount of taxation. Profit cannot be affected in any way not referable to one or other of these heads."

And so Mr. Mill says, *Vol. I. p. 510*—

"The cost of labor then, is in the language of mathematics a function of three variables; the efficiency of labor; the wages of labor (meaning thereby the real reward of the laborer); and the greater or less cost at which the articles composing that real reward can be produced or pur-

chased. It is plain that the cost of labor to the capitalist must be influenced by each of these three circumstances, and cannot be effected by any others. These, therefore, are also the circumstances which determine the rate of profit; and it cannot be in any way affected except through one or other of them. If labor generally became more efficient, without being more highly rewarded; if without its becoming less efficient, its remuneration fell, no increase taking place in the cost of the articles composing that remuneration; or if these articles became less costly, without the laborer's obtaining more of them; in any one of these three cases profits would rise. If, on the contrary, labor became less efficient (as it might do from diminished bodily vigor in the people, or from deteriorated education); or if the laborer obtained a higher remuneration, without any increased cheapness in the things composing it; or if without his obtaining more, that which he did obtain became more costly; profits, in all these cases, would suffer a diminution. And there is no other combination of circumstances in which the general rate of profit of a country, in all employments indifferently, can either fall or rise."

214. Now, there is one consideration which is omitted by both of the authors last cited, which has the very greatest effect on the rate of profit namely, the time in which it is effected. It is quite easy to see that the rate of profit may be very great, when the actual profit is very small, and the rate of profit very small, when the actual profit is very large.

If a trader made 50 per cent. profit on one transaction, that would be a high actual profit. But if he only made one transaction in the year, his rate of profit would be 50 per cent. per annum. But suppose he makes only 5 per cent. profit on any one transaction, but makes a transaction every day, it is clear that he would make 1,565 per cent. per annum, there being 313 working days in the year. This would be supposing he did not capitalise the profit. If he did that, of course they would increase at a very much faster rate. Hence it is perfectly clear, that it is infinitely to the trader's advantage to make a number of *small profits with great rapidity*, than a few large profits slowly.

215. Our readers can exercise their ingenuity in ascertaining the different rates of profit per annum, according to the different actual profits, and the speed they are made at. But these considerations shew that small and quick profits conduce much faster to opulence than slow and large ones. A profit of 5 per cent. made in one day, is three times a faster rate of profit than 50 per cent. made in one month. Thus we see the enormous importance in a national point of view of encouraging the multiplicity of exchanges. When a trader has bought goods, and sold them again, it is called to *turn-over* his capital. We may call it the *revolution* of capital.

Now money and credit are called the *CIRCULATING MEDIUM* (*CURRENCY*; *CIRCULATING MEDIUM*) because they facilitate this buying and selling of goods, &c. They are the great instruments of this circulation. And it is this motion, or circulation of them, that generates wealth, and the rapidity of that circulation which indicates the rate of increase or progress. This considera-

tion will enable us to solve a question long debated by Economists and Statesmen,—Which employment conduces most to national opulence? From the time of Colbert to the French Revolution, the question whether the towns or the country most conduced to national opulence was keenly disputed, and according as one side or the other prevailed, the one was encouraged and cockered, and the other depressed. Now as the velocity of the revolution of capital indicates the rate of progress, it is quite easy to see whatever employment most increases the speed of this revolution, most augments national opulence. Now of all species of industry, it is well known that agriculture causes the most languid circulation of the currency. A farmer turns over his capital but once in the year. By offering an extra stimulus of reward, the productions of human industry can be multiplied and quickened to an extraordinary extent, but the process of nature is slow and cannot be accelerated at command. Different trading pursuits causes a brisker circulation in different degrees—all much faster than agriculture. Hence a purely agricultural country must increase slower in opulence than any other, and other countries very much in the proportion of their inhabitants engaged in agriculture as compared to other pursuits. Experience amply verifies this remark. It is always manufacturing and trading countries which increase fastest in opulence. Poland and other countries which have few resources but agriculture, are the poorest and most barbarous in Europe. Great Britain and Holland, in which the smallest proportion of the inhabitants are engaged in raising food for the rest, are the wealthiest, and other countries very much in similar proportions. The fortunes made in our manufacturing and commercial districts are colossal. Who ever heard of a man making a great fortune by agriculture? But there is scarcely probably a small country town where some industrious and energetic individuals have not made a fortune by trading.

216. These considerations throw some light, we think, on a question which has been much debated among Economists, the advantages of peasant proprietorship, or *la grande* and *la petite culture*. It is well known that a considerable number of eminent writers and Economists have always strongly advocated the system of small properties in land. There is no doubt that in many parts of Europe the industry bestowed by the proprietors of small farms excites the warmest admiration. Who can see the terraced hills of Tuscany clothed with vines, without admiring the laborious industry which has converted these apparently sterile mountains into sources of wealth. This question has been so well discussed, we think, by Mr. John Hill Burton, in his *Political and Social Economy*, that we shall lay before our readers his arguments, which appear to us to be quite conclusive, and are in complete harmony with the doctrine advocated in the preceding paragraphs. He says p. 190—

"When Sismondi looked around him to the comfort and happiness of his fellow countrymen of Switzerland, each man sitting under his own vine and his own fig tree, he saw likewise around him, a body of petty proprietors, and he appealed to the world in favor of small holdings as a substantial element of happiness. He addressed

himself particularly to the British nation; and as the happiness of mankind should be the great aim of legislation, he called upon our senators to abandon a system that piled up and protected wealth, for one that would aid the people in the acquisition of happiness. He desired them above all things to abandon those employments and transactions, and proprietary rights which produced manufactures, large farms, and great inequalities of fortune, and to model our system according to those pristine usages, which alike avoid great poverty and great wealth. Without adopting all these views, which would simply be applying the paternal and corrective system of a small Swiss canton to a vast empire, many able writers have followed Sismondi in his partiality for peasant proprietors, and they now count on their side the powerful pen of Mr. Mill. * * *

"One of the great arguments in favor of peasant proprietorship, is the great amount of labor it calls into existence. Mr. Young, who is an opponent of the system, is often cited as making a concession in its favor, when he says that 'the magic of property turns sand into gold.' 'Give a man, we are told, the secure possession of a bleak rock and he will turn it into a garden—give him a nine year's lease of a garden, and he will convert it into a desert.' What is most conspicuous through all the authorities which Mr. Mill and others have brought together in favor of peasant proprietors, is the intensity with which they labor the ground. They pluck every weed, remove every stone, pulverize every clod, irrigate, trench, and drain with unwearied industry. In some of the flat valleys of Switzerland, the avidity with which every inch of level land is applied to productive purposes is sometimes troublesome to the pedestrian, who cannot cross the country without the risk of treading on some valuable plant, and of feeling as if he were trespassing in a garden. * * *

"It cannot fail to be remarked that the great boasted peculiarity of peasant proprietorship, even in the accounts furnished by its admirers and supporters, is that it is a stimulus to labor. This is in itself a valuable quality of any social state, but it is also a necessary qualification of real labor that it be directed to a profitable purpose; and labor will be rendered valuable in itself, not by the time it occupies, or the apparent difficulties with which it combats, but by the extent to which it performs any services of which the community desires performance. The hardest endurance on the treadmill is not in this sense labor; and the hardest exertions to make the surface of a rock yield grain while there is tillable ground, or any other productive means of employing the labor remaining neglected beside it, are not acceptable or commendable service. If we find in small isolated communities men thus laboring hard and acquiring all the moral discipline that follows continued exertion—even if we should respect such a phenomenon when it happens to be exhibited, we cannot expect large and intelligent communities will imitate the example, and waste their labor.

"If we appeal to the working classes in this country—and it is only by appealing to them, that they can be prevailed on to adopt any change of habit on such matters as labor and occupancy—we do not hold out any very inviting prospect,

when we recommend them to save money to be invested in land, in order that when they possess it, they may be induced and impelled to work so much the harder. Such an appeal would be simply calling on the working classes to place their earnings in a bad investment; and they would only be following the example of the educated and richer classes, if they avoided it, for those classes do not generally invest in land merely because it is land, unless the investment be otherwise beneficial. It will not be felt as a sensible improvement to the workman's condition, that he is called a landlord, even if he should obtain the privilege for nothing, if he has still to labor as much as he previously labored, and must fare worse; nor would any discreet adviser recommend him to take advantage of the opportunity so to raise his condition should it be offered to him. If the possession of a small holding, upon the mere condition of working it, would not be an advantageous speculation for the working man of this country, still less would it be so, if he had to pay a rent for it as a tenant, or had to pay what is the same as rent—interest for money secured on the land, and paid either to the person from whom he has nominally bought it, but to whom is still due the purchase money, or to a creditor to whom he ought to have transferred the land. That large estates should be burdened, and deprived of the manifest advantages of having capitalist proprietors, has been already alluded to as an evil; but it is feared that a numerous peasant proprietary, with burdened possessions, is a still greater evil. * * *

"There is an element likely to deceive partial observers in the superior productiveness per acre of small over large holdings—when there is such a superiority, which is a feature so often vouched for, that it must sometimes really exist." Mr. Burton then quotes from Mr. Laing's *Notes of a Traveller*, a passage exalting the labor of Flanders, East Friesland, Holstein, and all the coast from the Sound to Calais, over that of the corresponding country from the Firth of Forth to Dover. Even granting this to be true, Mr. Burton says,—

"It is possible to apply too much labor to the land, and thus to buy its productiveness too dear. A forcing frame is twice or thrice as productive as the same square area subject to ordinary cropping, or gardening; but it does not follow that it would be advantageous to the community to spend so much labor and capital on production, as would be necessary to procure it through the instrumentality of forcing frames. An acre covered with glass will perhaps produce as much as five acres exposed to the atmosphere; but if it would cost as much labor, or money, to cultivate the single acre after this fashion, as to cultivate twenty acres in the ordinary manner, and the twenty acres are to be had, there will be no profit in the forcing system. To make the man who produces a blade of grass, where no blade of grass has grown before, eminently meritorious, he must find out the place where, and the manner in which, his blade is to grow the cheapest. Labor spent in working up land, to make it give forth a small additional produce, when it might have been applied to other land with such efficacy as to effect a larger produce, is misspent. The man who first stated that a pin a day is a groat a year should

have informed people how many groat's worth of labor they will expend in collecting a pin a day : he evidently was not the author of the other embodiment of popular wisdom, which describes a certain course of action as 'penny wise and pound foolish.'

"To produce food is the aim of agriculture; and, economically speaking, the people who obtain the largest quantity of food with the least expenditure of labor have made the best investment of their industry."

217. These arguments so admirably stated are perfectly conclusive. And, indeed, it is somewhat remarkable that these small properties should be so earnestly espoused by Mr. Mill, who is a disciple of the Ricardian Theory of Rent. It is the fundamental dogma of the Ricardian school of Economists, that every increased quantity of labor devoted to the land produces a proportionably less and less return. Mr. Mill himself distinctly states it, *Vol. I. p. 216*,—

"After a certain and not very advanced stage in the progress of agriculture; as soon, in fact, as men have applied themselves to cultivation with any energy, and have brought to it any tolerable tools; from that time, it is the law of production from the land, that in any given state of agricultural skill and knowledge, by increasing the labor, the produce is not increased in an equal degree; doubling the labor does not double the produce; or to express the same thing in other words, every increase of produce is obtained by a more than proportional increase in the application of labor to the land. This general law of agricultural industry is the most important proposition in Political Economy."

Thus Mr. Mill, in advocating these small peasant proprietorships, on the score of the industry of their owners, is advocating a system of labor which he maintains produces a constantly diminishing result for a constantly increasing quantity of labor. But this is the very doctrine which Bastiat has combated with such brilliant success in the *Sophismes Economiques*. It is exactly the old Protectionist doctrine of encouraging labor, merely for its own sake. The true Economical doctrine is to produce the greatest result with the least labor. Now, if a nation can obtain a greater amount of corn and agricultural produce with less labor and expense, by exporting its manufactures than by growing it for themselves, it is clearly for their advantage to import it than to grow it. It is just an example of what Adam Smith says about growing vines under hothouses and making wine in Scotland. No doubt it could be done, but at thirty times the expense at which wine could be imported from the South of Europe. It is, therefore, much more advantageous for the country to purchase wines with its produce, than to make them itself.

218. Nor is the notion of encouraging mere industry for its own sake better founded. There can be little doubt, indeed, but that artisans work a very great deal harder, much more continuously, and with much greater intensity than agricultural laborers, and that their labor is much more productive.

219. The last argument is national happiness. It is said that a nation of peasant proprietors is a much happier people than a manufacturing one. We very much doubt that national happiness is

produced by legislation. Bad legislation may produce much misery, and much poverty, but we doubt that it can produce either wealth or happiness. The function of legislation is to remove causes which obstruct progress in wealth, and obstruct happiness, but it cannot produce them directly. But the happiness argument seems to us a very vague and intangible one. Are we sure that the people in those countries are so very much happier than the people in England? We are somewhat sceptical on that point.

But, after all, the countries from which those who most favour peasant properties chiefly draw their arguments are but very secondary countries. The examples chiefly cited are Switzerland, Tuscany, and Norway. But of what weight are they in the councils of the world? It is perfectly notorious that they exist merely by the sufferance of their more powerful neighbours. Switzerland *may be* a happy country, but does she exist of her own strength, or by the toleration of her more powerful neighbours? France would eat her up for a morning meal. What is Tuscany among the nations? What is Norway? Each of these countries may be happy, but it is a happy obscurity. They have no position to maintain in the world, no fleets and armies to support, to make their voice heard and respected among nations. They may therefore waste their labor in any fanciful way they please. But the question is, is such a system applicable to England? England stands in a very different position from either of these. She has an enormous debt to provide for, and gigantic fleets and armies to maintain. These must be kept up in order to enable her to keep her place among peoples. To keep these up requires constant and unrelenting toil, and moreover that, that toil should be directed in the most remunerative channel. That England should outwork every other nation is the very condition of her existence. The first place in the world must remain to that nation which can outwork and outborrow every other. The maintenance of the power of England depends upon the increase of her Capital, and to promote that, it is indispensable that it should be employed in the most productive manner. The most productive manner of employing capital most conduces to the increase of a thriving population, and in a thriving population and abundance of capital the power of the nation manifestly consists. There can be no possible doubt that it would seriously impair the progress of the power of England to cut the land up into peasant properties. And it would be but a sorry day for her, when she should adopt the fatal advice of designedly diverting her industry from a more productive employment to one avowedly greatly less productive. It would be nothing less than an overthrow of the whole modern science of Political Economy.

220. From the considerations we have seen above, shewing how much more the increase of Capital depends upon the rapidity of revolution than upon actual profits, it is manifest how greatly it is promoted by the multiplicity of exchanges. In order to encourage this, it is manifestly of the greatest importance to have things as cheap as possible. This shows how injuriously ignorant legislation may affect the progress of national wealth. It shows how injuriously the raising of

the prices of commodities by heavy taxes acts, by arresting the rapidity of their circulation, and so preventing the growth of Capital. It shows that it is far more injurious to the progress of wealth than the actual sum levied in the way of taxation.

221. The truth of these remarks is abundantly verified by the prodigious advance the industry and wealth of the country have made since the inauguration of Free Trade. This increase affords some measure by which we may form some idea of the enormous injury sustained during the long prevalence of Protection. It may be asserted with the greatest safety that England would have been a richer country by many thousands of millions, if she had not been cramped in her progress by these fatal theories. Boisguillebert was one of the first to call attention to the Economical effects of good or bad administration. If any one wishes to have some idea of the destructive effects of bad government on national wealth, he may read them in Mr. Senior's Turkish Journal.

222. We must now bring this article to a conclusion. It is but a brief survey of the subjects it comprehends. Each of them demands a separate investigation, and for fuller information we must refer to the several heads of ANNUITIES; BANK NOTE; BILL OF EXCHANGE; BILL OF LADING; DOCK WARRANT; CREDIT; COPYRIGHT; GOODWILL; FUNDS; PRACTICE; PROPERTY; RICHES; WEALTH; VALUE.

223. The preceding article is only one among many examples, of the immense importance of obtaining true conceptions. As soon as we obtain a firm grasp of the conception that PROPERTY is not a THING, but a RIGHT, we find that a blaze of light is thrown over the whole subject. It immediately proves the independent existence, and explains the nature, of gigantic masses of property, which have either been entirely overlooked by Economists, or whose nature has been greatly misunderstood. We are persuaded that no one acquainted with Mathematical and Physical science can fail to see that the preceding considerations give as great an extension to the field of Political Economy, as Algebra did to the field of Arithmetic, by the introduction of negative quantities. Algebra shews us that quantities extend on both sides of 0 to infinity, and that positive and negative quantities are to be ADDED together to find the mass of the totality. This is also the case in Natural Philosophy. And the preceding considerations shew by the strictest analogy that the PROPERTY, or the RIGHT to the future may be measured with as great exactness as the Property, or right to the past. And that these two—the Property in the past, which is positive, and the Property in the future, which is negative—are to be ADDED, to find the mass of the totality of Property.

224. But not only do the preceding considerations give this extension to the field of Political Economy, but they introduce as great a revolution in the *method* of treating it, as the introduction of the doctrine of motion into the old geometry. As soon as we understand that Capital is an increasing quantity, there is at once the doctrine of motion introduced into Political Economy, with all its consequences. These ideas have been actually involved in the very language which Economists

have used. All have admitted that capital is an increasing quantity, and in this age when the knowledge of Natural Philosophy is so spread, it is little less than marvellous that they should scarcely have had the slightest notion of the necessary consequence of the language they were using. It was positively bursting with this conception. Yet only two, that we are aware of, seem to have felt its true significance. Thus Bastiat says, *Harmonies Economiques; Capital* p. 221. "Le vire acquirit eundo s'applique avec une exactitude rigoureuse au Capital, et à sa bienfaisante influence. Tout Capital qui se forme laisse nécessairement disponible, et du travail, et de la rémunération pour ce travail. Il porte donc en lui-même une puissance de progression. Il y a en lui quelque chose qui ressemble à la loi des vitesses."

So Mr. Jennings, *Natural Elements of Political Economy*, p. 259.

"Our instruments, although acting on and through the principles of human nature, are found to consist of metallic indices related as parts and multiples, and not less capable of being made subservient to the processes of exact calculation than are the instruments of any purely physical art. The results of these principles, when observed, may thus be expressed in figures, as may also be the anticipated results of their future operation, or such relations as those of Quantity and Value. Value and Rate of Production may be exhibited in the formula, and analyzed by the different methods of Algebra and Fluxions."

225. Seeing, then, that the very language which Economists are compelled to use necessarily involves conceptions which are strictly analogous to those of Natural Philosophy, the time has come when the science of Political Economy must be treated in a manner strictly analogous to that applied to Physical Science. The work of Economists since the days of Adam Smith has been almost entirely destructive. There is no one who has conferred more enduring benefits on the human race than Adam Smith, and those eminent men who have given effect to his doctrines in practice. But we must never forget that their principal work was to beat down and destroy the mischievous theories of Protection. To destroy error is a very different matter from erecting a great science. Since the time of Adam Smith vast masses of economic truth have been discovered, but they lie in a crude and unconnected state. The business of future Economists is to reduce these masses of acknowledged truths into one great harmonious science, by discovering the fundamental conceptions and axioms which connect them. The time has come to realize the sublime conception of Bacon, who was the first to see that Natural Philosophy is the mother of all science, and that the reasonings of all science must be referred to that for comparison and rectification. That Political Economy is based on certain peculiar conceptions and axioms, like every other great science, is an indubitable fact. And when they have been searched out and investigated, and tested by the acknowledged laws of Inductive Logic, Political Economy will then be fitted to take rank as the youngest sister of the Physical Sciences. (PRELIMINARY DISCOURSE.)

ANALYSIS OF THE ARTICLE.

- § 1-9. *Necessity of obtaining accurate conceptions, which are not arbitrary, but founded in nature.*
- § 10. *Two Canons applicable to the formation of Economical Conceptions and Axioms.*
- I. *The fundamental Conceptions and Axioms of any Science must be perfectly general.*
 - II. *No general Conception, and no general Axiom, must contain any element involving more than one fundamental idea.*
- § 11. *Examples of this—The definition of Mechanical force; and Aristotle's definition of Wealth.*
- § 12. *When conceptions are obtained inductively, we must proceed deductively to discover all classes of cases to which they are applicable.*
- § 13-17. *Investigation of the origin and meaning of CAPITAL in Greek, Latin, Italian, and French.*
- § 18-34. *Investigation of the meaning attributed to the word CAPITAL by Turgot, Adam Smith, J. B. Say, Ricardo, Malthus, Mr. Senior, James Mill, Mr. McCulloch, Rossi, Mr. J. S. Mill, Coquelin.*
- § 35. *General sense to be collected from these writers that—Capital is Wealth accumulated from past human labor, and employed in a particular manner.*
- § 36. *This conception violates the Canons above stated in § 10.*
- § 37-39. *The limitation "accumulation of past labor," not the essence, but the accident, of Capital, and to be rejected from the general conception.*
- § 40, 41. *This agrees with passages in Mr. Senior, and Mr. J. S. Mill.*
- § 42. *Remarks of Dr. Whately on the conception of Value, applicable to other conceptions.*
General conception of Capital—Capital is an Economic Element devoted to the purposes of profit.
- § 43. *Investigation of the question—What is an Economic Element?*
- § 44-54. *Examination of the opinions of Economists, whether incorporeal elements are to be admitted into Political Economy. The opinions of Socrates, Aristotle, Turgot, Quesnay, Beccaria, Adam Smith, J. B. Say, Ricardo, Mr. Senior, Malthus, Bastiat, M. Baudrillard, Mr. Cazenove.*
- § 55-59. *The question is to be determined by the analogy of the Physical Sciences.—They shew that incorporeal elements are to be admitted into Political Economy. Everything of which the value may be measured is an Economic Element. Agreement of M. Michel Chevalier in this opinion.*
- § 60-69. *Conception of Capital adopted—Capital is an Economical Element used for the purposes of profit.*
Capital is, therefore, an increasing, or CONTINUOUS QUANTITY.
It, therefore, extends from the PAST into the FUTURE.
- § 70-75. *Explanation of the meaning of the terms positive, and negative, in Algebra and Natural Philosophy.*
CAPITAL is a CONTINUOUS QUANTITY, which passing through 0, or the present, into futurity, CHANGES ITS SIGN.
- 76-79. *Which means that the property, or right, in past profits is positive, and the property, or right, to future profits is negative. And these latter, or negative, rights are to be added to the former, or positive, ones.*
- § 80-93. *Investigation of the different species of Capital, based upon Aristotle's doctrine of Value.*
- § 94, 95. *IT IS DEMAND, OR CONSUMPTION, AND NOT LABOR, THAT GIVES VALUE TO PRODUCTION.*
- § 96-99. *On the nature of the Funds, and the opinions of J. B. Say and Mr. J. S. Mill respecting them.*
- § 100-104. *Every man's income is paid out of the income of some one else.*
- § 105, 106. *The funds are independent property.*
- § 107, 108. *The word PROPERTY denotes an attribute vested in the person, and not in a thing.*
- § 109. *Things which may be the subject of property are divided into two fundamentally distinct classes,—*
- I. *Those which are in a state of complete and final existence at the time of possession.*
 - II. *Those which only come into existence at future intervals of time*
But although they only come into existence at future intervals of time, the PROPERTY or RIGHT to them is PRESENT.
- § 110. *The Theory of the Value of Land is the grammar of the Theory of Value in general.*
- § 111-127. *Investigation of the theory of the Value of Land, Railways, Canals, Shares in Commercial Companies of all sorts.*
The Capital, or source of Profit, and the Profits, are separate and distinct property.
In some cases, the Value of the Capital may remain, and the Value of the Profits may remain.
In other cases, the Value of the Profits may remain, while the Value of the Capital vanishes.
In other cases, the Value of the Capital may remain, while the Value of the Profits vanishes.
In other cases, the Value of the Profits, and the Value of the Capital, may vanish together.
- § 128-134. *Shares in Commercial Companies are separate, independent, and incorporeal, property.*
Analogous to a share in a company, are the Goodwill of a business, Copyright, the Practice of a Professional man.
All these are separate, independent, and incorporeal property, which may be accumulated, and transferred from person to person, like material products.
All this mass of property has been omitted by Economists in framing a definition of Wealth.
- § 135. *This confirms the necessity of rejecting the "accumulation of past human labor" from the definition of Capital.*
- § 136, 137. *Third species of property, where the Capital, or source of profit, is immaterial, but the product material.*
- § 138. *Fourth species of property, where the Capital and the Product are both immaterial.*
- § 139. *Objection to the criterion of Wealth proposed by Malthus and M. Baudrillard.*
- § 140, 141. *J. B. Say and Dr. Whately were the*

first Economists to see that Rights are Economical Elements.

PROPERTY IS NOT A THING BUT A RIGHT.

Distinction between the transfer of the possession of a thing and a transfer of the property in it.

§ 142-162. *Investigation of the nature of CREDIT.*

Opinions of Hamilton, Daniel Webster, Mr. McCulloch, Mr. J. S. Mill, and Bastiat, that Credit is Capital.

§ 163-168. *Investigation of the nature of the FUNDS.*

§ 169. *Enormous extent of incorporeal Wealth.*

§ 170. *On Mr. J. S. Mill's account of Utilities.*

§ 171. *Is gas Wealth?*

§ 172. *Question proposed to Economists who deny incorporeal elements admission into Political Economy.*

§ 173. *The different species of Property: the domain of Political Economy, may be divided into three classes,—*

1. *The right to the use and enjoyment of existing material products of all degrees of durability.*
2. *The right to the use and enjoyment of immaterial products, which perish in the using.*
3. *The right to the use and enjoyment of products of all sorts, which have no present existence, but only come into existence at some future time. Although these products are future, the RIGHT to them is PRESENT, and may be accumulated, and transferred by sale, or exchange, equally as any material products.*

The first two classes of products having an actual existence at the time of the exchange, may be called positive.

The third class having no actual existence at the time of the exchange, may be called negative.

The rights to products of the third, or negative, class are to be ADDED TO, not SUBTRACTED FROM, those of the first two.

§ 174, 175. *Further considerations respecting Incorporeal Capital.*

§ 176. *Error of Malthus's doctrine of population.*

§ 177-179. *Problems of maxima and minima in Political Economy. Error of Ricardo's Theory of Rent.*

§ 180-185. *On fixed and floating Capital.*

§ 186-188. *Error of some prevalent doctrines on Capital.*

§ 189. *Comparison of hire, or rent, with price.*

§ 190, 191. **LABOR, MATERIALITY and DURABILITY are all the Accidents, and not the ESSENCE of VALUE.**

DEMAND IS THE ONLY SOURCE OF VALUE.

Value requires the concurrence of two minds.

§ 192, 193. *It is not Labor which is the cause of Value, but Value which attracts Labor.*

§ 194. *Value originates in the mind.*

§ 195-201. *Rejection of Utility as the basis of Value.*

Quotation from Dugald Stewart illustrating the Doctrine of Value.

§ 202. *These considerations useful in the Theory of the Income Tax.*

§ 203-215. *On the Increase of Capital.*

Capital may be productively employed in three ways:—

1. *In augmenting the quantity of existing things.*
2. *In adding to the value of existing things.*
3. *In substituting things of greater value in the stead of things of less value in any place.*

On the revolution of Capital, and Rate of Profit.

§ 216-219. *On la grande and la petite culture.*

Quotation from Mr. John Hill Burton regarding this.

§ 220, 221. *Desirable to promote multiplicity of Exchanges.*

CAPITAL AND LABOR.

A brief and candid enquiry as to the present state and future prospects of the agricultural and manufacturing labouring classes, with the mutual dependence of Capital and Labor upon each other. London, 1849.

CAPITALISTE.

Lettres d'un Capitaliste nouvellement établi en France à un Banquier de Londres. Paris, 1803.

CAPITELLI, DOMENICO.

Comento ideologico-storico-pratico delle leggi relative all' accessione industriale mobiliare. Napoli, 1836.

CAPMANY Y MONTPALAU, ANTONIO

DE, an eminent Spanish writer of the last century, was born at Barcelona, 24th November, 1742. He served in the army for some time, and then took part in a scheme to colonize the Sierra Morena. This having failed, he went to live at Madrid. He travelled in Italy, France, Germany, and England. He resided at Madrid till 1808, greatly respected by the government. When the French entered Madrid, he retired to Seville, and afterwards was a member of the Cortes of Cadiz, where he died of yellow fever in 1813.

Capmany published several works in general literature. His economical writings are,—

Código de los costumbres marítimas de Barcelona, hasta aquí vulgarmente clamado libro del consulado. 1791.

Memorias historicas sobre la marina, comereio y artes de la antigua ciudad de Barcelona. Madrid, 1779-92.

Quêstiones críticas sobre varios puntos de historia economica, politica, y militar. Madrid, 1817.

Discurso economico-político en defensa del trabajo mecanico de los menestrales, y de la influencia de sus gremios en las costumbres populares. Madrid, 1778.

This latter work did not appear in Capmany's name, but is generally attributed to him. The

others are very highly esteemed by all writers. The second is more especially valuable, as it contains a large collection of original documents relating to the commerce of Barcelona in the middle ages.

Cinque Lettere de economia Toscana. Firenze, 1845.

CAPPS, EDWARD.

Early in 1857, the Society of Arts announced that a Mr. Henry Johnson had placed £200 in their hands, as a prize to be given to the author of the best "Essay on the present Financial Position of the Country, as affected by recent events, in which the principle of a Sinking Fund should be discussed, and also an investigation made as to the best mode of gradually liquidating the National Debt." The Society appointed Mr. J. T. Danson, Fellow of the Statistical Society; Mr. Charles Neate, Professor of Political Economy in the University of Oxford; and Mr. Jacob Waley, Professor of Political Economy in University College, London, as adjudicators of the Prize. Mr. Edward Capps was the fortunate winner of the prize in an essay entitled,

The National Debt financially considered.

The importance of the subject certainly invites our attention to the essay which obtained this prize. The author tells us in his preface, that he is not a litterateur by profession, but regularly occupied during eight or nine hours of each day in commercial pursuits, and that the essay was composed during the intervals before and after business. This, he says, does not exempt his essay from fair and candid criticism. This is unquestionably true; and in the following remarks we shall do nothing but examine into the book as it stands, without reference to its origin. At p. xiii., however, of his Preface, Mr. Capps rather shakes our confidence in his Economical knowledge, for he says, "There does not appear to be any general agreement among public men and public writers, as to the main point to be aimed at in the prosecution of our trade with foreign countries? Ought we to aim at an excess of exports, or an excess of imports? Has the trade which we have been carrying on with other nations for the last fifty years, resulted, on the whole, in a fair exchange of equal values on the

part of the respective trading parties?" We should have imagined that every public man and every public writer of the present day, who had the slightest claim to be considered as an Economist, and who understood the fallacy of the Theory of the Balance of Trade, was perfectly aware of the fact, that the value of our foreign Trade was measured by the excess of the value of the imports over the exports. Mr. Capps is a commercial man. Would he consider that he was flourishing in business according as he sells to the public at prices exceeding or falling short of what his commodities cost him? We should imagine that every person knew that he gains just in proportion as he can sell his goods for more than they cost him. So it is with the national shop. The nation must manifestly gain just in proportion as it sells its goods to foreign nations for more than they have cost it. If Mr. Capps had been well posted up in economical knowledge, he would also have known that in commerce both sides gain,—not of course in every individual instance, because many persons make bad speculations, but upon the whole,—or else how could commerce be carried on?

The essay is divided into two parts:—I. The Statistics, History, and Operation of the National Debt. II. The present financial condition of the country, and suggestions for improving it.

Introductory remarks occupy Chap. I. of Part I., and Chaps. II. and III. give a slight sketch of the history of the debt from its rise to 1816, in which Mr. Capps animadverts on the improvident manner in which several of the loans were raised; and at p. 10, thinks that if no debt existed, the expenses of each year might always be provided for by the taxation of each year, and that all borrowing upon annuities, temporary or perpetual, should be prohibited.

In Chap. IV. he inquires, "What was the value really borrowed by the State in the contraction of the National Debt, up to the year 1816." He says, that up to that time the nominal Capital of the Debt was augmented by at least 276 millions sterling beyond the sum actually received, and that this difference was increased by the various alterations in the monetary system of the country, by the measures of 1797, 1819, and 1844. He proposes, therefore, to ascertain the real value lent to the nation. In 1815, he says, it stood at 816 millions of pounds. He criticizes Sir Robert Peel's definition of a pound, that "according to the ancient monetary policy of this country, the meaning of a pound is neither more nor less than a certain definite quantity of gold, with a mark upon it to determine its weight and fineness." That Sir Robert Peel fell into a slight error in saying that the "pound" was always gold, is true, because it was anciently silver, and then gold and silver conjointly; but he is substantially right, that it is a definite quantity of silver or gold, with a mark to certify its weight and fineness.

Mr. Capps however maintains that during the period when the greater part of the debt was contracted, "the pound was not practically a metallic pound at all, but merely a piece of paper issued by the Bank of England, of no intrinsic value whatever, but alone valuable in the proportion that it would purchase commodities." Pray, let us ask Mr. Capps, what intrinsic value have gold and silver? What value have they at all,

except as they will purchase commodities? Further, Mr. Capps is a commercial man; he, therefore, probably receives and accepts Bills of Exchange in the course of his business. Now suppose he has received, or given, a Bill of Exchange, i.e., received or given a debt contracted in paper, would he consent to receive, or would he demur to pay, gold for a debt contracted in paper? We imagine he would scout such a notion. Well, then, what were Bank notes during the suspension? They were "promises to pay" solemnly pledged to be redeemed in gold at the end of the war. To refuse to pay these notes in gold would have been as much a bankruptcy, as it would be in Mr. Capps to offer to pay his own acceptances at 15s. in the pound.

Mr. Capps then goes into an investigation of the nature of a standard of value, and at p. 44, says, that gold and silver are no standards of value apart from the price of provisions. Thereby shewing that they have no intrinsic value, any more than Bank Notes. Having rejected, then, gold and silver as standards of Value, he adopts corn as the only true standard, a notion which we may say is altogether exploded now. He says, "During the century which elapsed from the commencement of the debt, to the beginning of the French revolutionary war, the average price of wheat was as nearly as possible 36s. per quarter, or 4s. 6d. a bushel. The debt contracted during this period stood, nominally, at the beginning of 1793, at £229,614,496, from which we must deduct £29,119,710, being the amount artificially added to the debt by the mode of borrowing adopted. This will leave a balance of £200,494,786, which being reduced into wheat at 36s. per quarter, gives the real sum borrowed, in the necessities of life, as 111,385,992 quarters of wheat.

"From 1793 to 1816, the price of wheat may be reckoned at about 80s. per quarter. The debt contracted during this period, was, as we have seen in a former chapter, nominally £586,697,433, but really only £339,131,500; which also being reduced into quarters of wheat at 80s. a quarter gives a further amount borrowed of 84,782,875 quarters; and adding this to the former amount, we arrive at a grand total of 196,168,867 quarters of wheat, as the real, true, and just amount of our National Debt, as it stood at the close of the French war, if measured in the real and natural standard of Value. It is this, or the equivalent of this, that the fundholder parted with to become the creditor of the nation, and to the repayment of this, he is at least, fairly entitled, if the contract with him be, as Colonel Thompson expresses it, 'substantially fulfilled.'"

Now let us ask what is the drift of all this long investigation? Does Mr. Capps really propose that the fundholder should be compelled to accept this, in discharge of his claims? Would any commercial man seriously propose such a thing in his own business? He accepts a bill at six months. During that time, wheat has fallen from 70s. to 50s., no uncommon occurrence. Would Mr. Capps seriously propose that in such a case the acceptor of a bill should be discharged on paying the price of as many quarters of corn at 50s., as would have bought the same number at 70s.? Suppose the reverse case, supposes Mr. Capps had accepted a bill at six months, wheat

being 50s., and during the currency of the bill wheat rises to 70s.; would Mr. Capps be willing to pay his creditor as much additional money as would be sufficient to buy an equal number of quarters of wheat at 70s., as the sum he agreed to pay would, when wheat was at 50s.?

There is no man in business but would scout such a notion, as utterly visionary and absurd. It would introduce perplexities into commerce a thousand times worse than what exist already. When will writers learn that the finance of the nation is to be treated exactly in the same way as the monetary concerns of a private person?

Mr. Capps's 4th chapter, therefore, either helps us to nothing, or it favors a scheme that no statesman or Parliament would ever entertain.

Chap. V. continues the sketch of the history of the debt to 1857. Chap. VI. is on the "*Change produced by the national debt in the system of taxation of the country*," in which he maintains that a great and permanent alteration in the system of taxation, namely, from one chiefly direct, to one chiefly indirect, was established at the period of the debt. But Mr. Capps is not consistent with himself, for he says immediately after, that the Long Parliament originated the change in 1643, fifty years before the Bank! Moreover, even granting the change took place *concurrently with*, that does not prove that it was produced by it. That is even a worse fallacy than the *post hoc, ergo propter hoc*. However by the imposition of the Income Tax, and the growing feeling in favor of it, we are manifestly coming back to direct taxation. So that it is clear that the National Debt has nothing whatever to do with any particular mode of taxation, either direct, or indirect.

But if Chap. VI. is dark, Chap. VII. is a hundred times darker. It is on "*The antagonism produced by the National Debt between our system of taxation and currency*." How a national debt can produce an antagonism between a system of taxation and currency, is to us an inscrutable mystery, nor does the chapter itself, of three pages, render the matter any clearer to us, and we confess to being entirely baffled in our efforts to divine the meaning of this chapter.

Chap. VIII. is on the "*Operation of the National Debt upon the Currency of the Kingdom*," which we understand as little as the preceding one.

Chapter IX, is on "*Two popular fallacies respecting the debt*." In this chapter, Mr. Capps undertakes to shew the fallacy of two common opinions on the debt. He says, p. 86, "There are two antagonistic and conflicting fallacies respecting the National Debt, which are very prevalent. The first is that funded property forms as much a portion of the wealth of the country, and is therefore to be reckoned among its assets, as lands, houses, or any other description of tangible property. The second, which is precisely the opposite of the former, is, that the debt is a subtraction, or deduction from the wealth of the country; that the country is so much the poorer for it. Neither the one nor the other is correct; for the truth is, that the country, with the trifling exception, which we shall hereafter name, is neither the richer nor the poorer for the existence of the Debt, and that consequently, both the opinions we have mentioned as being prevalent,

are erroneous; which we shall now proceed to shew.

"With regard to the first—we have seen estimates made of the total wealth of the country, in which after the enumeration, as a portion of the wealth of the nation, of lands, houses, raw materials, and manufactured products of all descriptions, there has been an item inserted of 'Funded Property,' which has been considered as of itself, an actual property, separate from, and in addition to, all other wealth. Now the debt, or the funds, though a property to the parties who hold them, are not so to the nation as a whole; *for they are only a mortgage upon the rest of the property of the country*, and by just so much as they are property to the holders, they are an incumbrance, and a diminution of the value of the things so mortgaged, or encumbered.

"It is precisely a parallel case to the following:—A is worth £10,000 in the shape of an estate of that value. B is worth £5000 in money. A mortgages his estate to B for £5000, and *spends the money unproductively*. Let now a valuation be made of the amount of the property of A and B jointly, and we shall find that the amount of their united wealth is just the value of the estate, and nothing more. The estate is worth £10,000, £5000 of which belongs to B as mortgagee, and £5000, the value of the equity of redemption, to A as mortgagor. The mortgage in nowise adds to the value of the estate; and though it is a property to B, as mortgagee, it is to the same extent a diminution to A of the value of the estate.

"It is the same with the national debt. The whole country and its productions are mortgaged to the fundholder, to the extent of about *one-seventh of their value*; and though such funds form a property to the holders of them, they are only so in the character of a mortgage, which reduces the value of the property mortgaged to its proprietors by just the amount of the mortgage. In taking, therefore, any account, or making any valuation of, the total wealth of the country, funded property must not be put down as an item, unless you make a corresponding deduction, on the other hand, from the value of the property of which it forms a mortgage."

Mr. Capps values the wealth of the country at £6,000,000,000, both with the debt, and without it. The difference is, that without a debt of £800,000,000, everybody would possess his property without deduction, on account of the mortgage.

We have quoted this passage at length, because it expresses a view which is by no means uncommon among Economists, which, however, is completely erroneous, and, as we shall shew, involves Mr. Capps, in a subsequent chapter, in inextricable contradiction, when we come to estimate the comparative burden the National Debt is to the country.

Mr. Capps says the National Debt is not wealth, because it is only a mortgage on the country, and its productions.

Now, what is a mortgage? A mortgage is the name of a deed of conveyance of property. It is a deed of sale of some special property with the right of repurchase, upon paying off the money borrowed. The mortgagee becomes the actual owner of the property.

Now, when were the fundholders ever put by

a formal deed of conveyance into possession of the country and its productions? Let us see the Act of Parliament that did so. Until the deed of conveyance which gave over the country and its productions to the fundholders can be produced, it is clear that the funds are *not* similar to a mortgage on the property of the country.

No one ever pretended that such a thing ever took place. The property in the country and its productions remains with their owners, and was never given to the fundholders. Hence the funds are not a mortgage on the property of the country.

What, then, are they?—*They are a charge on the incomes of the people of the country*. A property of a perfectly distinct nature from a mortgage on the country.

Some persons may not perceive the distinction. But we shall shew that there is a very great difference indeed in the two things, and it will be especially seen when we estimate the comparative burden the funds are upon the wealth of the country. In the following remarks, as well as those on Chap. I., Part II., we take Mr. Capps's figures as we find them. We shall not, here at least, make any attempt to rectify them.

Now, Mr. Capps values the wealth of the country at £6,000,000,000. Where does he get this value from, and what is included in it? At all events, taking this value, he says that the National Debt is about one-seventh of the wealth of the country.

But what is the *wealth* of the country?

Adam Smith, and nearly every Economist of name since his day, have all maintained that the natural and acquired abilities of all the members of society are part of the "wealth" of the country. They all admit that the expense and labor bestowed upon education is fixed capital, and to be counted in the wealth of the country. Are these included in Mr. Capps's estimate of the wealth of the country? We will be bound to say they are not. Moreover, we will venture to say that that gigantic mass of property called incorporeal personal estate of all sorts, and described under CAPITAL, is not included in this estimate. What, then, is its worth?

Now, when Mr. Capps says that the National Debt is about one-seventh of the wealth of the country, we must manifestly know what he includes under "wealth." When he says that it is a mortgage on this wealth, we must clearly know what is mortgaged. When Mr. Capps says that the national debt is a mortgage upon the property of the country, we wholly deny it. We say it is a charge upon the *income* of the people, which is a totally distinct thing.

Some of our readers may not see the difference. Well, the difference is just the same as between a merchant accepting a Bill of Exchange, and granting a mortgage upon his premises. The one is a right to share in the *future* produce of his industry, the other is a conveyance of his actually existing property. Two things which any one conversant with law or commerce will see are totally distinct.

The importance of this distinction in comparing the weight of the national debt to the *wealth* of the country is manifest; when we consider that the payment of the interest of the debt is not only a charge upon persons who have material property, but a charge upon the industry of

persons who have no material property. The industry of all the professions is just as much pledged for the payment of the dividends as the incomes of those who have real estate. Intellectual Capital is just as much pledged as material Capital; a consideration of the greatest importance, when we consider the weight of the debt, and the proposed means of paying it off, as well as the plan of raising all the charges of the year by taxation in the year.

Some persons propose that the debt should be extinguished by compelling every one who has property to give up so much of it. But how are we to compel those whose whole property consists in their abilities to give up a part of it? Some persons propose, indeed, that all taxation should fall on realized property, but we should imagine that there is no chance of such wild folly ever being countenanced by rational men. At all events, we shall not discuss the matter here. (TAXATION.) Now, no doubt, it is possible to confiscate material property. If a man has a hundred acres of land, or a thousand pounds, the State may take away ten acres of land, or a hundred pounds of his money, one-tenth of his Capital, but how is the State to take away the one-tenth part of incorporeal or intellectual capital? A great lawyer makes, we will say, £10,000 a year. While he does so, his talents are as much capital to him as an estate in land of £10,000 a-year to its owner. But how is the State to get hold of one-tenth of his capital? Is it to take an axe and chop off a bit of his head? It is perfectly clear that there is no possible method of taxing incorporeal capital, but by taxing its profits, or income. Now the industry of every lawyer, and every other professional man, is as much pledged for the payment of the dividends, as the income of men of real estate.

The funds, then, do not resemble a mortgage. They resemble Bills of Exchange, which are quite different from a mortgage (FUNDS.) They are not a pledge of existing property, but of the right to share in future profits. We shall soon see the application of these remarks.

In Chap. X., Mr. Capps gives a short sketch of the different sinking funds, which have in turn deluded financiers and statesmen. As the fallacy of these has long ago been demonstrated by Dr. Hamilton, there is nothing new in this part of the work. Nor is there anything new in the one he has to propose. He says, p. 109, "It seems now to be admitted, on all hands, that the only legitimate foundation upon which a sound Sinking Fund, can be based, is that of an excess of ordinary revenue over ordinary expenditure. In order, therefore, to the carrying out of this intelligible and unimpeachable principle, it is essential that those steps be now especially taken, which tend to develop and increase the general wealth of the country. It is from the increase of this wealth that the government alone can look for that revenue which will yield the necessary surplus for the maintenance of a sinking fund. All arrangements which have a tendency to hinder the production of wealth, and to prevent the constant and steady employment of laborious industry, must steadily and upon principle be discountenanced and discouraged." In these general remarks we cordially concur, but they

are manifestly equally true, whether there be any sinking fund or not.

Mr. Capps says, "A Sinking Fund derived from such a source is most legitimate and admirable." We suppose, therefore, that he seriously advocates a permanent increase of taxation for the express purpose of raising a sinking fund to pay off the national debt. If this be so, we can only say that it is a delusion, of the same nature, though not so mischievous in degree, as all previous sinking funds. There is no advantage gained by such a course. No doubt it is a desirable thing that the revenue should always be arranged, so as to exceed the expenditure. And when it does so, rather than let the accumulations be idle, it is better to pay off so much of the debt. But the idea of raising taxation for the express purpose of paying off the debt is a pure delusion. (FUNDS).

We now come to Part II., which contains suggestions for discharging the debt.

In the 1st Chapter, Mr. Capps compares the respective proportions between the wealth of the country and the debt at different periods, and we shall now see the application of the remarks we made on Chap. IX, Part I.

He says that in 1700, Gregory King estimated the total wealth or capital of the country, at 615 millions sterling, and the debt at 15 millions, so that the debt was one forty-first part of the wealth of the country.

In 1800, he says, Dr. Becke estimated the national wealth at 2,500 millions, and Sir William Pulteney at 2,000 millions. Mr. Capps takes the medium 2,250 millions, and the debt being 450 millions, it would be one-fifth part of the wealth.

In 1812, the wealth was estimated by Dr. Colquhoun at £2,736,640,000, and the debt at 670 millions, it would therefore be nearly one-fourth part of the wealth.

Mr. Capps then says, that in 1857 the sum of 6,000 millions may be thought a moderate and fair estimate of the national wealth. The total debt may be taken at 800 millions, from which it appears that the debt would be about one-seventh of the property.

Now we will venture to say that all such estimates of the wealth of the country are mere delusions, and snares. No government inquiry, much less any single writer ever could have any valuation of the wealth of the country which would be of the slightest service in a scientific point of view. We will be bound to say that in this estimate all intellectual capital, and incorporeal estate is wholly neglected, which all contributes to the payment of the dividends. Such an estimate is perfectly worthless, and we will shew it to be so, from Mr. Capps's own figures.

We have said above, what we think, that no one competent to judge will dispute, that the National Debt is not a mortgage on the property, but a charge on the *income* of the people, and it is perfectly manifest that the true mode of comparing the burden of the debt with the wealth of the country, is by *finding what proportion of the income of the country goes to pay the interest on the debt*. The nation is bound to pay about 30 millions a year out of its income to the fundholders. What proportion then does that bear to the income out of which it is paid? That is clearly the true weight of the debt.

Mr. Capps says that the income of the country may be taken in 1857, at between 5 and 6 hundred millions. But as we believe that this estimate only includes those who pay income tax, it is clear that a very large addition must be made for the incomes of those persons who fall below the limit of the income tax, but yet who all pay taxes, out of which the dividends come, and whose incomes are all equally pledged to pay the dividends, as well as those of a duke. Moreover it will be found, we believe, that the greater part of the taxes are paid by those who fall below the income tax, including of course the whole of what are somewhat superciliously called the working classes. In order, therefore, to ascertain the whole of the incomes of the people of the United Kingdom, we must take the incomes of every single person in it, and we shall not be very far wrong in raising this 600 to 1,000 millions.

Now it is quite clear that to obtain a just comparison of the weight of the debt, we must compare the sum actually paid for the dividends, with the income out of which it is paid. Even taking Mr. Capps's estimate, that is in the proportion of 30 to 600, or one-twentieth part.

We now see the consequence of Mr. Capps's misconception of the nature of the debt. By comparing it to a mortgage on the property he makes it *one-seventh* of the national wealth. By comparing the annual payment with the income out of which it is paid, it is *one-twentieth*!

We believe that the real proportion is much less than this, and that the ratio of 30 to 1,000, would be much nearer the truth, that is, one-thirty-third part.

In Chap. II. Mr. Capps considers the plans hitherto proposed for liquidating the debt. One is that of a direct seizure of property, this Mr. Capps justly pronounces impracticable. He then considers the plan of converting it into terminable annuities, which he pronounces so advantageous, that it would have been long since adopted had it been found possible to accomplish it. Only unfortunately every one objects to it, and he says, "Generally speaking, it has been found that money cannot be raised by terminable annuities on any but the most extravagant terms; and the same objection would operate to prevent any voluntary conversion of the debt, except upon terms that would not be thought of. With regard to small portions of the debt, the holders of which might voluntarily offer to accept a terminable annuity upon moderate terms, there could be no objections to the plan being adopted, though we fear few offers would be made.

"But while admitting its general advantageousness, we think that even this mode of liquidating the debt, if it could be carried out, would still be open to the objection that it would throw an additional burden upon the present generation; for no terminable annuity would be taken in exchange for a perpetual one, unless a higher annual interest were paid to the annuitants, during the time the annuity continued. It is useless therefore to think of terminable annuities, if we want any present relief from the burden of the debt."

Mr. Capps then mentions a sinking fund, and says that the only one to be approved of is such a one as he mentioned before, a surplus of revenue over expenditure. However, he seems to dis-

miss all these plans as affording no real relief, in which we agree with him. But unfortunately his plan of a sinking fund kept up at a large surplus of revenue over expenditure is open to exactly the same objection as the one he brings against terminable annuities; in fact it is substantially the same thing, it taxes the present race at a higher rate to redeem the debt.

However, Mr. Capps treats all these expedients as of very subordinate importance, and at p. 157, we find these words:—

"We are persuaded, therefore, that it is not from property that already exists, or that may arise in the natural order of things, that we are to derive the fund by which the National Debt may be redeemed; but from property that can be made to exist for the express purpose of paying off the debt, and the production of which property will benefit all parties engaged therein."

Heigho! Here is something at last. Mr. Capps has surely Aladdin's lamp in his pocket! He is going to make property exist for the express purpose of paying off the debt, when that property neither does exist, nor ever would exist, but for Mr. Capps! Who says that there is nothing new under the sun.

What then is this miraculous plan?

His plan is this, to convert the national debt into annuities, not only terminable, but progressively diminishing—that is, if they began at 3 per cent., at the end of five years they should be reduced to 2½; at the end of another five years to 2¼, and so on, till they should be extinguished at the end of sixty years.

Very fine this. But Mr. Capps acknowledges that the holders of the annuities must receive compensation for this compulsory conversion. And where is this compensation to come from? Here, our readers will say, is the grand secret which Mr. Capps has discovered of creating property which does not exist, and never would exist, but for his plan.

When the reader is anxious to know where this property comes from, he will probably be surprised to read at p. 158,—

"In a few words we think that the fund is to be found in our immense colonial empire, the lands and capabilities of which, comparatively valueless at present, may be made under proper arrangements to furnish ample funds for the redemption of our national debt, were it even twice or thrice its present magnitude."

So after all, this property which does not exist, and never would exist in the natural order of things, is all actually existing in our colonies!

Mr. Capps's plan is simply this, that subscriptions for redeeming stocks should be invited, in sums of not less than £100. That each subscriber should have a terminable and constantly diminishing annuity as above, and be entitled to a grant of public lands in any of the colonies he pleases, to be adequate compensation for the difference in the value of the annuity. That, as the land would be valueless in its unreclaimed condition, each subscriber is to be entitled to an advance, for a certain number of years, of a portion of the money subscribed by him; which portion with others, should be set apart as a general fund to open up proper access to and clear, as far as the fund will admit, the section

of the land so granted. The necessary works for this purpose might either be undertaken by the government, with or without convict labour, or committed to Boards of Commissioners in whose appointment the subscribers should have a voice, or a certain number of whom the subscribers might actually appoint.

"Whatever sum or proportion of the original subscription it might be found necessary thus to set apart, let it form a lien or mortgage upon the land so granted, to be repaid within a given number of years, the subscriber in the meantime paying such an interest for the advance as would be equal to that which was payable in the government stock at the time of his subscription. Subscribers to have the power to redeem the said lien, or mortgage, at any time within the period named.

"Let the remainder of the subscription money, after the above advance is provided for, be devoted to the purchase of stock for the redemption of the debt; and let the interest receivable from the subscribers on account of such advance go to the payment of the dividends on that portion of stock which cannot at present be redeemed until the advance is repaid."

We have given this proposal in Mr. Capps's own words, that our readers may judge of it for themselves.

Mr. Capps points out, that in our colonies and India there are boundless regions which may be applied to such a purpose.

After all, Mr. Capps says that this is the very plan that has been adopted in America to pay off her public debts, which is undoubtedly true, though we think that there is some difference both between the magnitude of the debt to be paid off, and the distance of the land to be disposed of from the parent state.

Mr. Capps thinks that the entire liquidation of the National Debt within sixty years might be effected by these means. We think he is a great deal too sanguine. Taking the debt at 800 millions, it would require 8 millions of persons with £100 each to come forward to do it. Is there the remotest chance of finding such a number of persons? Moreover, all this money is to be withdrawn from productive employment in this kingdom, where it contributes to the revenue, and sunk in distant regions, where it will contribute nothing to the revenue. We fear that there is little more chance of a solid result from such a scheme than from either of the other plans.

We have noticed this essay at such length because the points discussed in it have a real interest, and are much misunderstood. Though we do not think that Mr. Capps is master of them, we congratulate him on his £200.

CARDWELL, EDWARD, D.D. Principal of St. Alban's Hall, and Camden Professor of Ancient History, in the University of Oxford.

Lectures on the Coinage of the Greeks and Romans; delivered in the University of Oxford. Oxford, 1832.

These are very interesting lectures. (COINAGE).

CARDWELL, EDWARD, The Right Honorable; son of a Liverpool merchant, was born in 1813. He was educated at Balliol College, Oxford, where he took a double first class in 1835. He entered the Inner Temple, and was called to the bar in 1838. From February 1845 to July 1846, he was Secretary to the Treasury. From December 1852 to February 1855, he was President of the Board of Trade, and in June, 1859, he was appointed Chief Secretary for Ireland. He was member for Clitheroe from 1842 to 1847; for Liverpool from 1847 to 1852. He has sat for Oxford, with a short interval, from 1853 to the present time. He was appointed one of his literary executors by Sir Robert Peel, and, in conjunction with Lord Stanhope, has edited one volume of his memoirs.

Mr. Cardwell was chairman of the Committees of the House of Commons on the Bank Acts in 1857 and 1858. The great commercial crisis of 1857 having occurred in the interval, was of course a prominent subject of inquiry. One would naturally expect that a gentleman filling the office of chairman of such a committee, and the author of the Report adopted by the Committee, and presented to the House, should at least be familiar with the mechanism of Banking. Still less should we expect that he should in his questions shew the most manifest want of knowledge on the subject. We will make an extract from the Report first. It says, § 67,—

"Those who advocate what is called the theory of the Act of 1844, are guided by the following principles. They regard Bank Notes as being for every practical purpose, equally with the gold they represent, the money of the country—the measure of value—that which extinguishes debt

—not as a mere form of paper credit, depending on the credit of the issuer, and constituting only the evidence and vehicle for transfer of a debt, which still continues. If complete effect were given to their view, the result would be, that for the whole United Kingdom there would be one description of note only, issued by the State, based on bullion in the custody of the State. This note so secured by bullion, would be a legal tender everywhere, except at the place of issue. Experience having shewn that, even in the times when the paper circulation is most contracted, the sum in circulation with the public at large can never fall below a certain amount, and cannot therefore be presented to the Bank for payment in gold,—they are satisfied that to this extent—so limited by experience—the actual deposit of bullion may safely be dispensed with, the notes in question resting on the security of the State. This is their justification for the permission accorded to the Bank of England to issue 14 millions of notes without the deposit of a corresponding amount of bullion. They consider any addition to the circulating medium of the country to be the act of the private individual who carries bullion to the Mint to be coined, or to the department of Issue to be exchanged for notes; fixing the standard of money, and verifying the conformity of the pieces therewith, by either of these processes to be the duty of the State; *the use of money, and that only, they regard as the province of a bank, whether of a private person or incorporation, or of the banking department of the Bank of England.*

If our readers will refer to the article **BANK** they will see what an entire misconception of the nature and effects of Banking it displays; it will be seen there that Banking especially consists in the *creation of credit, in the form of Bank notes, or deposits.* But we have the most distinct evidence from Mr. Cardwell's own mouth of his total want of knowledge of the subject, in a remark made by him in the examination of one of the witnesses.

Mr. John Torr, a Liverpool merchant, went to America during the pressure in the autumn of 1857, and was examined before the Committee. He was questioned by Mr. Wilson upon the transactions of the American Banks.

4939. "I believe I am correct in the fact, that all the transactions of the banks in New York are published periodically, and at very short intervals, by the banking department?—I believe they are published weekly.

4940. "These accounts, as they are published, shew the circulation of notes, the amount of specie held by the banks, the amount of advances made by the banks, the amount of securities held by the banks, and all the items in great detail; do they not?—They do.

4941. "Are you aware that during the last two or three years, while the circulation of notes had not increased at all, or had increased to the very smallest possible amount, *the amount of advances, as shewn by those accounts, had, as you have referred to, increased to a very enormous amount?*—Yes; I must apologize for the answer which I gave; I meant the advances when I said the notes; I meant the liability of the bank from its advances made on securities.

4942. *Chairman (Mr. Cardwell): "The mere*

act of making an advance does not render a person liable; OF COURSE THE LIABILITY IS THE OTHER WAY?—Yes.

4943. "Will you trace the process by which the banks increased their own liabilities by making advances to others?—Looking at the securities which they held from other parties by making advances to a number of merchants to a larger amount than usual, they felt that the indebtedness of these parties to them was more than was prudent.

4944. *Mr. Wilson:* "Do you mean that the banks had made undue and imprudent advances in the loan of their capital and *deposits?*—I apprehend that they thought so. * * * * *

4945. "Are you aware that during the last three or four years, the amount of the capital subscribed to the banks in New York had very greatly increased?—I do not know it of my own knowledge.

4946. "Are you aware that the amount of *deposits* had very greatly increased?—I do not know it from my own knowledge.

4947. "But it would either be from deposits, or from capital that increased advances could be made by the banks?—Certainly.

4948. "Therefore if you are aware that increased advances were made to a large extent, it must have been either from an increase of subscribed capital, or from an increase of deposits?—Yes, I apprehend so."

In the extract from the Report given above, we have shown how completely Mr. Cardwell has misconceived the nature and effects of Banking, when he says that it only uses money already existing. The very nature of Banking being to *create credit.* In question 4942, he has also shown beyond dispute, how entirely he misunderstands it. Mr. Torr had a perception of the true nature of it, for he says that the Banks increased their liabilities by their advances, which is undoubtedly true. However, Mr. Cardwell catches him up, for he says "*The mere act of making an advance does not render a person liable; of course the liability is the other way!*" The witness was so easily shaken out of his own knowledge that he weakly answers, "yes!" And then Mr. Cardwell follows up his advantage by Q. 4943. Mr. Wilson asks him if the Banks had made imprudent advances out of their Capital and *Deposit.* Why, the "deposit" is the credit created in the Bank's books! Surely we may marvel that such extraordinary ignorance of the mechanism of Banking should pass unchallenged by the Committee, who counted more than one banker among its members. At all events we may cease to wonder at the futile nature of Parliamentary inquiries into Banking, when those who conduct them display such ignorance of the facts of what they are inquiring about, as would make them the laughing stock of any bank clerk.

CARELLIUS, FRANCISCUS.

Nummorum veterum Italia quos ipse collegit, et ordine geographico disposuit descriptio. Neapoli, 1812.

Idem. Edidit C. Cavedonius; accesserunt F. M. Avellini adnotationes. Lipsiæ, 1850.

CAREY, HENRY C. The son of Matthew Carey, an Irishman, who was obliged to quit his

country from being obnoxious to the government, in 1783, was born in 1793 at Philadelphia where his father had established a newspaper, and publishing business. Mr. H. C. Carey succeeded his father in the latter business in 1821, and continued it till 1838. In 1824, he established the system of periodical trade sales, which subsists in America.

Mr. Carey is generally considered as the most eminent economist whom America has produced, and his writings in many instances have been directed against the doctrines of Ricardo.

Essay on the rate of Wages, with an examination of the causes of the differences in the condition of the labouring population throughout the world. Philadelphia, 1835.

This is a very able essay, consisting in a great part of a commentary on Mr. Senior's Lectures on Wages. It contains a great deal of useful miscellaneous information, and one of its main objects is to disprove the doctrine of Ricardo, that high profits can only come from depressed wages.

Principles of Political Economy. Philadelphia, 1837-8-40.

The first part of this work is on the production and distribution of wealth. In Chap. I. Mr. Carey treats of production, which he defines to be "an alteration in the existing particles of matter, by which that matter may be rendered more useful or agreeable, than in its present state." This, though longer in form, agrees substantially with our own definition, for he includes in it all who are engaged in either altering the form or the place of any product. He then quotes and adopts Mr. Senior's opinion that Adam Smith's distinction between productive and unproductive labor is untenable, and that all exchangeable products, material or immaterial, are Economical Elements.

Chap. II. and III. treats of Value, in which he maintains that *Labor is the sole cause of Value*, in which he follows the opinions of Malthus, McCulloch, Senior, and Ricardo, and does not introduce any novelty into the discussion. Chap. IV. is on the *Value of Land*. Chap. V. is "on the effects of the extension of cultivation upon Wages." This Chapter contains several useful strictures on Malthus and others, who have endeavoured to make out that the laborers in the 15th century were much better off than those at the present day. Mr. Carey shows how many corrections are necessary to be applied to the figures quoted, and that the condition of the people of England and Scotland has for several centuries been constantly improving, instead of getting worse, as has been so often said. This is in direct opposition to the doctrine, that profits are large and wages high only when the most fertile lands are cultivated. Chap. VI. is on the "Effect of the extension of cultivation upon the profits of Capital." In this, Mr. Carey has collected many interesting facts, and affirms, that, I. With the increase of Capital and extension of cultivation, there is an increased facility of production. II. That with this increased facility of production there is increased ability to accumulate Capital. III. That with this increased facility of accumulation, there is a diminution of the power to demand rent, or interest, and that the owner can claim, and the laborer will give, a diminished proportion of the product of labor, in

return for the use of any species of Capital. IV. That the diminished proportion of this increased product that is assigned to the Capitalist, gives him a larger quantity of the commodity produced. V. That the larger quantity that thus falls to both laborer and capitalist, is exchanged for other commodities at much less cost, as capital and production increase. The owner of the ship and of the wagon transport it to market, and bring in return the commodities desired, taking a constantly decreasing proportion for so doing. The proportion retained by the storekeeper for exchanging is also reduced, and thus everything tends to increase the quantity of necessities and conveniences that can be obtained by the laborer as wages, and by the Capitalist as profits. VI. That any given quantity of Capital is now obtained at much smaller cost of labor than at any time past. VII. That the quantity of commodities obtainable in return for permitting the use of any given quantity of capital, is greater now than it was 30, 50, 100, or 500 years since. VIII. That thus while the present reward of labor, in the form of wages, is constantly increasing, there is an equally constant increase in the reward of economy and prudence, in the diminished exertion required to secure to the laborer a future income, in the form of rent or interest.

Chap. VII. on the "Cost and Value of existing landed Capital." Contains many judicious and striking observations on colonization.

In Chap. VIII., Mr. Carey considers "objections" which may be made to the views advocated by him, and among others he says, "It may be said that labor is not invariably a cause of Value," and he quotes Mr. Senior, who says, "The fact that that circumstance (labor) is not essential to value, will be demonstrated if we can suppose a case in which value could exist without it. If, while carelessly lounging along the sea shore, I were to pick up a pearl, would it have no value? Mr. McCulloch would answer that the value of the pearl was the result of my appropriative industry in stooping to pick it up." There is no one who knows anything about Inductive Science who will not see that Mr. Senior's observation is perfectly conclusive. And what is Mr. Carey's answer? "Pearls may be found by those who do not seek them, and meteoric iron may be a gift to those who little anticipate its reception, while others may seek for pearls, or dig for iron, without profitable results. These are accidents which do not, in the slightest degree, militate against the assertion that all value is the result of labor. Nine hundred and ninety-nine out of every one thousand parts of those annually created are so, and the exceptions are too slight to be deserving of consideration? They are just sufficiently numerous to prove the rule!!"

This paragraph would alone be sufficient to prove Mr. Carey's want of scientific spirit. What person who had the slightest knowledge of Inductive Science, but would smile to hear that exceptions *prove* the rule! A fact that is totally irreconcilable with a theory is the proof of the theory! This is truly something new in Science. In the old world, facts are the tests of theories, and though 999 instances may seem to suit a theory, it is universally held that the thousandth, which does not agree with it, *disproves* it. What an admirable proof of the emission theory of

light it was to find that numerous facts could not be accounted for by it!

In Chap. IX., Mr. Carey gives us the "results" of his investigations, which we may present to our readers.

Of Value.

I. That all value is exchangeable.

II. That labor is the sole cause of Value.

III. That the value of commodities, at the time of production, is measured by the quantity and quality of labor required therefor.

IV. That with every improvement in the quality of labor, there is a diminution in the quantity thereof, required for the production of any given quantity of commodities.

V. That the value of existing capital cannot exceed that of the quantity and quality of labor required for its reproduction, and that the quantity of labor for which it will exchange tends to fall with every improvement in the quality thereof.

Of Labor.

VI. That labor, when aided by Capital, becomes more productive, and is thus improved in its quality.

VII. That every improvement in the quality of labor is attended by an increased facility of accumulation.

VIII. That this increased power of accumulating capital tends to lessen the value, in labor, of that already existing, and to diminish the proportion of the product of labor that can be demanded in return for permitting it to be used.

IX. That the proportion that can be claimed by those who transport its products, and by the storekeeper who exchanges them for the commodities required in return, is, in like manner, in a constant course of reduction, as labor becomes more productive.

X. That the laborer is thus enabled to retain a constantly increasing proportion of the commodities produced.

XI. That where population and capital are small, and where the superior soils, only, are cultivated, labour is unproductive: that the proportion claimed by the landowner is large, the cost of transportation is great, and the proportion taken by the storekeeper is so, while that which is retained by the laborer is small. He is therefore poor and miserable.

XII. That as population and capital increase, and as cultivation is extended over the inferior soils, labour becomes more productive, and there is a constant diminution in the proportion claimed by the owner of Capital, whether applied to the improvement of land, or to the transportation, or exchange, of commodities, accompanied by a constant increase in the proportion retained by the laborer, and a constant improvement in his condition.

Of Capital.

XIII. That the power to demand rent arises from labor applied to the improvement of land, and that rent and interest are alike profits of Capital.

XIV. That the aid of Capital tends to render labor more productive, thus improving its quality.

XV. That the further acquisition of Capital

is facilitated by every improvement in the quality of labor.

XVI. That this increased facility of accumulation is attended by a diminution in the labor value of all previously existing capital.

XVII. That it is also attended with a diminution in the proportion of the product of labor that can be claimed for permitting capital to be used.

XVIII. That labor is by its improvement in quality rendered so much more productive, that this diminution in the proportion claimed by the capitalist, is attended by an increase in the quantity of commodities obtained in return for the use of any given amount of capital.

XIX. That where population and capital are small, and where the superior soils, only, are cultivated, further capital is accumulated with difficulty, and its owner takes a large proportion of the product of labor in return for permitting its use; but that large proportion yields but a small amount of commodities, and thus a large quantity of labor is required to secure a given amount of income.

XX. That as population and capital increase, and as cultivation is extended over the inferior soils, further capital is accumulated with greater facility, and the proportion of the Capitalist is diminished; but that smaller proportion yields him a constantly increasing quantity of commodities, and thus a smaller amount of labor is required to secure a given amount of income.

XXI. That thus with the increase of population, and of capital, and with the extension of cultivation, there is a steady improvement in the condition of both laborer and capitalist. That the former, while enjoying a constantly increasing measure of the comforts and conveniences of life, experiences a constantly increasing facility in becoming himself a capitalist, to enjoy an equally constantly increasing measure of the conveniences and luxuries of life, in return for the industry, prudence, and integrity which enables him to become so.

"Such we believe to be the natural laws, regulating the production and distribution of wealth, that may be deduced from the experience of the world for hundreds, and thousands, of years. That they are so we feel assured, because they are like all the other laws of nature, *simple, and therefore likely to be universally true.*"

Here again, unfortunately, Mr. Carey's logic is somewhat at fault. Because all other laws of nature are simple, (which is a very doubtful assertion,) therefore, all simple laws are laws of nature. This is a simple argument, but, we fear, is not on that account a law of nature.

In Chap. X. Mr. Carey treats of "Fluctuations of Price," but this chapter is not sufficiently full. He however arrives at a very sound doctrine that, "Diminished production in any part of the world tends to diminish the quantity of commodities obtainable by the labor in every other part, while increased production in any one, tends to increase it in every other. It is therefore to the interest of all that universal peace should reign—that capital should increase—and that labor should be productive."

He also affirms that, "When the rise of money wages is preceded by a rise in the price of commodities, it arises from diminished production—

or from excess of the substitutes for money—is disadvantageous to the laborer, and temporary in its duration.

“When, on the contrary, it is accompanied by a fall in the prices of commodities, it arises from increased production—is advantageous to the laborer—and is likely to be permanent.”

The next seven chapters are occupied with examining the views of preceding economists, and comparing them with the doctrines obtained by himself.

In Chap. XI., he examines the doctrines of Malthus, and well shews his inconsistency in defining wealth as “the material things necessary, useful, or agreeable to man, which have required some portion of human exertion to produce,” and then saying that the Value of Land consists in the scarcity of that which is fertile, or possessed of advantages of situation, and that the owners derive the power of demanding rent for its use from the necessity which exists of having recourse to soils that yield a smaller return to labor. Two doctrines which, Mr. Carey justly says, contradict one another. He then enters into a long investigation to disprove Malthus's doctrine of Rent. In Chap. XII., he examines Ricardo's theory of Rent; and in Chap. XIII., he discusses the opinions of Mr. James Mill, J. B. Say, Col. Torrens, Mr. Wakefield, and Dr. Chalmers. In Chap. XIV., he reviews the opinions of Mr. McCulloch and Mr. Scrope; and in Chap. XV., those of Mr. Senior; and in Chap. XVI., those of Mr. Samuel Bailey, the author of the “Critical Dissertation on Value.” In Chap. XVII., those of Mr. Jones.

In Chap. XVIII., Mr. Carey adopts Dr. Johnson's definition of Revenue, as “Income; annual profits derived from lands or other funds.” A portion of this, he says, is expended, and the remainder being laid by to accumulate, constitutes capital.

In Chap. XIX., Mr. Carey agrees with Mr. McCulloch in his definition of Capital, and includes all articles possessing exchangeable value, the accumulated products of past labor. As we entirely dissent from this definition, we may refer to CAPITAL.

In Chap. XX., Mr. Carey endeavours to arrive at a definition of Wages and Profits, and says, “Profits are the compensation received for the use of capital, the accumulated labor of past times, while Wages are obtained by present labor, and are the reward of time, attention, talent, and often of the sacrifice of convenience, comfort, and even of health. The first is paid for the aid of things, and the last for the services of men.”

Chap. XXI. contains a general summary of Mr. Carey's doctrine; among other results he says,—

III. That as man cannot increase, or decrease, the quantity of matter of which the world is composed, he has it only in his power to alter in its form, or in its place, the matter already existing. Production, therefore, consists in the appropriation, alteration, or transportation, of the gifts of nature.

IV. That the articles so produced have value in his estimation, *because* of the labor that has been given in exchange for them.

V. That the value thus produced constitutes his revenue.

VI. That a portion of his revenue is applied to the satisfaction of present wants, and the remainder is laid by for future enjoyment, or to aid him in further production.

VII. That the portion thus laid by constitutes his Capital, under which head is embraced all articles possessing exchangeable value, whether in the form of land, houses, ships, provisions, diamonds, or commodities of any other description.

XIII. That as labor improves in its quality there is a constant tendency to diminution in the quantity thereof that can be obtained in exchange for existing Capital. The value of the latter is limited by the cost of production.

XIX. That when labor is of an inferior quality, production is small, capital is accumulated with difficulty, and the owner claims a large proportion of the product in return for granting its aid.

XXII. That as labor is improved in its quality, it becomes more productive, capital is accumulated at less cost of labor; and its owner can demand a smaller proportion of the product in return for granting its aid.

XXIII. That with every improvement in the quality of labor the quantity of commodities to be divided is increased. That then increased production is attended by the power, on the part of the laborer, to retain a constantly increasing proportion of the commodities produced. He is therefore constantly improving in his condition.

XXVI. That the interests of the Capitalist and laborer are thus in perfect harmony with each other, as each derives advantage from every measure that tends to facilitate the growth of capital and to render labor productive, while every measure that tends to produce the opposite effect is injurious to both.

XXVIII. That the interests of all nations are therefore in harmony with each other, as every measure that tends to lessen production in one nation, tends to lessen the reward of both labourer and capitalist in every other nation, and every measure that tends to increase production in one nation tends to increase the reward of the laborer and capitalist in every other nation.

XXXI. That in the infancy of society, the want of capital compels man to depend for a supply of the necessities of life upon the appropriation of those articles produced by nature without his aid, and he is compelled to roam over extensive tracts of land to obtain sufficient to support existence. He relies, exclusively, upon the superior soils.

XXXII. That he is therefore compelled to live apart from his fellow men, or to associate with them in very small communities. Population is, consequently, thinly scattered over the land. Fertile land is abundant, but he has not the means of rendering it productive.

XXXIII. That if successful in his search after food, he does not possess the means of transporting, or of preserving that which he does not require for immediate consumption. His life is, therefore, a constant alternation of waste and starvation. He is poor and miserable.

XXXIV. That with the first accumulation of capital he acquires the power of resorting to an inferior soil for subsistence. He finds that a more limited space will supply his wants; and he is

enabled to draw nearer to his fellow men, to unite with them in the division of employment, and thus to obtain their co-operation, by which the labor of all is rendered more productive.

XXXV. That with the further accumulation of capital, he brings into action soils still more inferior, and with every such change finds increased facility in obtaining the necessities of life from a diminished surface; he is, therefore, enabled to draw daily nearer to his fellow men, and daily more and more to co-operate with them, by which co-operation his labor is rendered daily more productive. This increased facility of obtaining the means of subsistence, causes a constant diminution in the proportion of the population required for the production of food, and enables a constantly increasing proportion to apply themselves to the production of clothing, shelter, and the other comforts of life.

XXXVII. That thus as Capital increases, population becomes more dense, and the inferior soils are brought into action with a constantly increasing return to labor. Men are enabled to benefit by the co-operation of their neighbours, and habits of kindness and good feeling take the place of the savage and predatory habits of the early period. Poverty and misery gradually disappear, and are replaced by ease and comfort. Labor becomes gradually less severe, and the quantity required to secure the means of subsistence is diminished, by which he is enabled to devote more time to the cultivation of his mind. His moral improvement keeps pace with that which takes place in his physical condition, and thus the virtues of civilization replace the vices of savage life.

Mr. Carey, in his first part, considered the production and distribution of Wealth, as they would naturally be, if not controlled, thwarted, and restrained by disturbing causes. These he finds in want of security to person, to property, and under these latter, Mr. Carey very properly includes all sorts of unjust interferences with the right of disposing property, protection, trade restraints of all sorts. Unproductive expenditure has also been a retarding cause. Mr. Carey then examines the differences in the quality of labor, and under this head includes credit. Mr. Carey then considers the quantity of labour, the distribution of the product between the laborer and the capitalist. All these several branches of inquiry are applied to India, France, England, and the United States. There are a vast number of curious and interesting facts collected, and on each subject the author assigns the superiority to the United States.

In Chap. IX. he considers the support of Government, which must be supported by taxation, which may assume four forms. I. A specific tax upon each individual, payable in money. II. A tax on capital. III. A tax on commodities consumed. IV. A tax on income.

The first he says is unequal and unjust. The second he says is equally injurious. The third he says is also unjust, as it tends to throw nearly the whole burden on the working classes. Mr. Carey decides that the last, or an income-tax, is the only fair method, and he evidently means that it should be levied on all incomes equally, from whatever source they come. "By such a tax every man contributes in the ratio of his

interest. The capitalist, with a large revenue, pays his share, while the laborer, with an income of two or three hundred dollars per annum, pays, as he ought, for that tranquillity, which tends to promote the growth of Capital, and to secure him a large reward for his exertions. Paying for it, he values it, and while he will be disposed to furnish the necessary contribution, he will have every inducement to watch that the quantity is not greater than is required for an economical administration. Both laborer and capitalist will feel that every dollar unnecessarily taken tends to limit their power of expenditure, or their power of accumulation, and both will have the same interest in regulating the proceedings of the government in such manner as will tend most to permit the growth of capital. They will be opposed to the maintenance of large armies, or navies, and especially opposed to wars. They will see that no advantage can be derived from foreign colonies, because these colonies, where taxation is equitably levied, cannot be made to contribute towards the payment of the cost of maintaining any government but their own.

Chap. XI. treats of the effect of taxation on wages and profits, and he arrives at results, some of which are,—

VI. That the growth of Capital is most rapid where the expenditures of government are small, and that every increase in the amount expended tends to diminish its growth.

VII. That, consequently, every measure that tends to lessen the expenditure of government, tends to increase the power of production, and to increase the proportion of the product that may be claimed by the laborer.

VIII. That every measure tending to increase the demands of government, tends to diminish the power of production, and to diminish the proportion of the product that may be claimed by the laborer.

In Chap. XII. Mr. Carey examines the revenue systems of India, France, England, and the United States.

Chap. XIII. treats of the distribution of private revenue, and Chap. XIV. treats of the social condition of Scotland and Ireland, in which Mr. Carey disagrees from Mr. McCulloch's Theory of Absenteeism. In Chap. XV., he treats of the Netherlands, Spain, Sweden, Norway, China, and Turkey.

The third Volume of this Work has not come in our way.

The Credit system in France, Great Britain, and the United States. Philadelphia, 1838.

This consists chiefly of a reprint of a chapter in the Principles of Political Economy, with a few additions.

The Past, the Present, and the Future. Philadelphia, 1848.

In his former work Mr. Carey had declared his dissent from the Ricardian theory of Rent. In this one he enters into a more elaborate refutation of it. But it is impossible not to see that he has shifted his ground. In his former one he allows that men begin by cultivating the best soils, but maintains that their returns are small because they have not the benefit of numbers and Capital

to assist them. In this work, however, he has taken up a new position altogether. In it he maintains that the first settlers in a country always begin by cultivating the inferior soils. He says that the best soils are always covered with immense trees that he cannot fell, or they are swamps that he cannot drain. These, he says, cannot be brought into cultivation till men and Capital increase. But there are always spots of an inferior degree of fertility, on the hill side for instance, where the thin soil has prevented the growth of trees and shrubs, which are always brought into cultivation first, because they afford the readiest return for labor.

Mr. Carey then (p. 17.) attacks the Ricardo theory of Rent and says, "Nearly 40 years have elapsed since Mr. Ricardo communicated to the world his discovery of the nature and causes of rent, and the law of its progress. The work by means of which it was first made known has since been the text work of that portion of the English community who style themselves, *par excellence*, political economists, and anything short of absolute faith in its contents is regarded as heresy, worthy of excommunication, or as evidence of an incapacity to comprehend them, worthy only of contempt. Nevertheless, imitating in this the action of the followers of Mahomet, in regard to the Koran, the professors, one and all, who have undertaken to teach this doctrine, insist upon construing it after their own fashion, and modifying it to suit their own views and the apparent necessities of the case; the consequence of which is, that the inquirer is at a loss to determine what it is that he is required to believe. Having studied carefully the works of the most eminent of the recent writers on the subject, and having found no two of them to agree, he turns in despair to Mr. Ricardo himself, and there he finds in the celebrated chapter on rent, contradictions that cannot be reconciled, and a series of complications such as never before we believe, was found in the same number of lines. The more he studies, the more he is puzzled, and the less difficulty does he find in accounting for the variety of doctrines taught by men who profess to belong to the same school, and who all agree, if in little else, in regarding the new theory of rent as the great discovery of the age.

"At first sight, it looks to be exceedingly simple. Rent is said to be paid for land of the first quality, yielding one hundred quarters in return to a given quantity of labor, when it becomes necessary, with the increase of population, to cultivate land of the second quality, capable of yielding but 90 quarters in return to the same quantity of labor: and the amount of rent then paid for No. I. is equal to the difference between their respective products. No proposition could be calculated to command more universal assent. Every man who hears it sees around him land that pays rent. He sees that that which yields forty bushels to the acre pays more rent than that which yields but thirty, and that the difference is nearly equal to the difference of product. He becomes at once a disciple of Mr. Ricardo, admitting that the reason why prices are paid for the use of land is that soils are different in their qualities, when he would at the same moment, regard it as in the highest degree absurd, if any one were to undertake to prove that prices were paid for oxen because one ox is

heavier than another; that rents are paid for houses because some will accommodate twenty persons and others only ten; or that all ships command freights because some ships differ from others in their capacity!"

At p. 23, he says, "It will be perceived that the whole system is based upon the assertion of the existence of a single fact, viz., that in the commencement of cultivation, when population is small, and land consequently abundant, the soils capable of yielding the largest return to any given quantity of labor alone are cultivated. The fact exists, or it does not. If it has no existence, the system falls to the ground. That it does not exist; that it never has existed in any country whatsoever; and that it is contrary to the nature of things that it should have existed, or can exist, we propose now to show."

This then, we may say, is the main purpose of this work. Mr. Carey, from a general survey of different countries, maintains that men always have, and necessarily must have, commenced cultivation on inferior soils, and when men and capital increased have then progressed to bring the best soils into cultivation. The reason for this general and sweeping conclusion is, as above indicated, because the best and most fertile lands are always covered with forest or swamp, and the inferior lands free from them. Hence settlers begin with those lands most easily attainable. The universality of this law Mr. Carey attempts to prove. This then is the basis of his theory of Rent, and as seen above it is in diametrical opposition to that of Ricardo. He also maintains that as men and capital increase, and better lands are brought into cultivation, rents rise, and population becomes better off. We shall make some observations on this afterwards.

In Chap. V. entitled, "*Man, and his Standard of Value*," Mr. Carey advocates a complete abstention of legislative interference with Banking, and shews that it has always been best managed where there has been least interference and worst where there has been most. At p. 187, he shews that he knows perfectly well that "deposits" are credits created in the bank's books, and the paradox of banking which so puzzled Mr. Cardwell, that banks create liabilities by making advances. Speaking of the Bank of England, he says, "People do, however, require protection against the exercise by the Bank, of the vast power confided to it, by means of which it is enabled to purchase securities, passing the amount to the credit of their owners, and calling them 'deposits'; by which operation prices are forced up, the rate of interest is diminished, capital is made to appear superabundant." Also, p. 189, "Its 'deposits' have grown with the increase of its investments. Such success emboldens it to repeat the operation, and another million is purchased, with similar results. It obtains the bills, and the owners obtain credits on the books of the Bank, which thus runs in debt, and the more debt it contracts the more means it appears to suppose itself to have at command. With the second million prices have risen; and with the third they rise still higher, and so on with each successive million. Capital appears superabundant, because the former owner of these millions of securities is seeking for profitable investments,

when the real superabundance consists only in *debts* which the Bank has incurred."

Mr. Carey then enters into considerations of a social nature, into which we cannot follow him, and has a chapter on *Colonization*, which contains much that is good.

The Slave Trade, domestic and foreign, why it exists, and how it may be extinguished. Philadelphia, 1853.

Answers to the questions; What constitutes Currency? What are the causes of unsteadiness of the Currency? And what is the remedy? Philadelphia, 1840.

In answer to the first of these questions, What constitutes Currency? Mr. Carey says, "Currency consists, I. Of gold and silver coin or bullion. II. Of the engagements of individuals, or of associations of individuals, to deliver on demand given quantities of money. These engagements exist in the form of circulating notes, or in that of credits, commonly called *deposits*, transferable by means of checks or drafts. * * *

"To constitute gold, silver, bank notes or deposits, a part of the currency, it is necessary that there should exist power to apply the same *directly* to the purchase of commodities, and to the fulfilment of all contracts for the delivery of money.

"Gold or silver in the possession of individuals who are not permitted to use it, ceases to constitute a part the currency.

"A note, or certificate of deposit, payable at a future time, whether by an individual or a bank, is not currency."

Whether this distinction is tenable or not we have examined under CONTINUITY, LAW OF, and CURRENCY.

He concludes that *Currency is Capital seeking investment*, a definition which will strike our readers as somewhat strange.

Mr. Carey advocates the abolition of all restraints on Banking.

Principles of Social Science. Philadelphia, 1858. This work contains a *résumé* of Mr. Carey's doctrines which he published at various times in his preceding ones. We may consider it therefore as his matured system. There is not much that is absolutely novel in it, but it is mixed up with such a strong infusion of mysticism, as to render it in many parts almost unintelligible. In his earlier writings Mr. Carey was an ardent and enlightened Free Trader, but in this work he has become a thorough Protectionist. A very rare instance we should imagine of such retrograde progress. The author has imbibed a perfect abhorrence of everything British. Throughout the whole course of his work he seeks every occasion to exalt Colbert and the French system, and to cry down England and the English system of Free Trade, which he looks upon as a deliberate attempt on the part of England to keep down every other nation.

Mr. Carey is the boldest and most original speculator in Political Economy that America has

produced, and some of his countrymen consider him to have effected a revolution in the science. If we conceived such an opinion to be true, we should gladly endorse it. But we are very far indeed from being able to do so, and his later productions are mingled with so much mysticism as to be beyond the reach of comprehension.

Mr. Carey's system is built upon the doctrine that *labor is the sole cause of value*, a dogma which he holds in common with the whole of the second school of Political Economy.

The absurdity of this doctrine was pointed out long ago by Dr. Whately, who shewed that pearls are not valuable because men dive for them, but men dive for them because they are valuable.

According to the doctrine that labor is the sole cause of value, which is strenuously advocated by Mr. McCulloch, a diamond is valuable because it is picked up. A fine diamond lying on the ground has no value until it is picked up, and it is the act of picking it up which gives it its value!

Mr. McCulloch maintains that the increased value due to the fermentation of wine in a cellar is to be considered as labor! (*Note I to the Wealth of Nations.*)

Mr. Carey says that we value the product in proportion to the intensity of labor bestowed on producing it. Thus he, with the second school of Political Economy, makes the labor precede the value.

We reply that it is manifestly exactly the reverse. We labor to obtain a thing very much *because* we want it very much. The *desire* must in all cases precede the labor. We do not bestow much labor on a thing and then suddenly find out it has great value, but we must clearly desire a thing very much, *before* we bestow much labor on it.

A person in London learns that there are some magnificent ruins in Upper Egypt, and he lays out much money and gives himself much trouble to go and see them. Is it not clear that he must desire intensely to see them *before* he lays out so much money and trouble in going to see them?

And it is clear that this law is universal; it is manifest that *Value is the cause of labor*. It is because a thing is desired by the producer, or because he knows that some one else desires it, or because he expects that he can inspire a desire for it, that he bestows labor in producing it. If there be no demand for a thing, and if none can be created, it can have no value, whatever labor be expended in producing it.

It is perfectly clear, therefore, that *Demand is the sole cause of Value*.

Thus the whole foundation of Mr. Carey's system of Political Economy is cut away. Labor is the *accident*, and not the *essence* of Value, as Dr. Whately said in 1831, and Bastiat in 1850. (PRELIMINARY DISCOURSE.)

The chief point, however, of novelty, upon which Mr. Carey's reputation rests, is his Doctrine of Rent. It is well known that Ricardo's Theory of Rent is founded upon the assertion that the best lands only are cultivated, and that no rent is paid for them; that as population increases, inferior lands are required to feed them; that rent then commences, and is the difference between the cost of cultivating the best and the next best land. In a similar manner, when land of the third quality

is required rent commences on the second, and so on; and then rent is defined to be the difference between the cost of cultivation of the different qualities of land.

Now, for this theory of Rent to be true, it is essential that men should begin to cultivate the best soils, and that there should be a difference in the qualities of soils. If men did not begin upon the best soils, or if there were no difference in the qualities of soils, there could be no such thing as rent.

Mr. Carey challenges, as well he might, an assertion of so general a nature, and says that men firmly believe in this theory of rent who would deem it the height of absurdity to say that a price was paid for cattle because some were better than others; or, as we might say, it would be equally ridiculous to say that hire was paid for horses because some horses are better than others; and to define the word hire to be the difference of cost of rearing the best and the next best horses.

Between Mr. Carey's first publications and his last, there is a considerable difference in his theory of Rent; but as he has declared that he has abandoned his first theory, and adheres to his second, we shall of course only examine that one.

Mr. Carey then maintains the exact reverse of Ricardo. He maintains that men invariably commence on inferior soils, and work their way to better ones. The reason of this is that the best soils are always covered with timber, or swamps, which a scanty and poor population, as the first inhabitants of a country always are, have neither time nor instruments to clear. He says that the inferior soils are the most free from timber, and the most easily cleared, and that men always begin with these and gradually extend their cultivation to the better soils as their numbers and capital increase.

Mr. Carey maintains the necessary universality of this course, and he has taken a wide survey of the history of nations in different ages, in all countries of the world, to prove its truth.

Now Mr. Carey has undoubtedly so far succeeded as this. He has certainly completely overthrown the basis of Ricardo's Theory of Rent, which depends on the universality of men occupying the *best* land first. It is indubitably true that in a great many cases men do begin with the light middling soils first. And this is all that is required by the laws of Inductive Science to overthrow the generality of Ricardo's Theory. But to assert as a necessary, invariable, and universal law, that men do and must in all cases begin by cultivating the inferior soils is preposterous. In multitudes of cases men did begin cultivation on the best soils. It has often been remarked what a keen eye for good land the monks had. In multitudes of cases the monasteries will be found placed in the centre of the richest and best lands.

Now if there are abundance of cases, as there undoubtedly are, in which men began by cultivating the best lands, that is fatal to the generality of Mr. Carey's theory, just as the instances which he has adduced of men beginning on the light middling lands are fatal to Ricardo's theory. Each of them has perilled his theory on the universality of a particular course of proceeding.

From every general theory all accidental and particular circumstances must be eliminated. The particular state of the case as asserted by Ricardo is sometimes true, and the particular state of the case as asserted by Mr. Carey is also sometimes true; and therefore it is clear that neither is true as a general theory. A true general theory must include them both.

We have endeavoured to exhibit a true general theory of Rent (*Rent*) which is quite independent of the particular assumptions either of Ricardo or Mr. Carey.

The next point of novelty which Mr. Carey claims to have brought forward is, that it is not cost of production which regulates value, but the cost of *reproduction*. The first capital he says is produced at a great cost of labor. But that capital facilitates the production of fresh capital, and the value of the first will immediately fall to the cost at which it can be reproduced. There is much plausibility in this view, but it is easy to shew that like the law that Cost of Production regulates Value, it is only a modification of the law of supply and demand in particular cases.

On the subject of Banking, Mr. Carey shews that he understands its mechanism, and that *Deposits* are the credits, or the debts, created in the bank's books, and that they are created by the discount of bills.

He justly includes Bank Credits, or Deposits, as well as Bank Notes, as Currency. He excludes Bills and Notes payable after date from the Currency; because, says he, these are contracts to pay money, and therefore a contract to pay money cannot be the same thing as money itself.

But he seems to have forgotten that Bank Notes and Bank Credits are *contracts* to pay money, and yet he admits them to be currency!

Moreover, Bills and Notes payable in *future* are payable on demand, like Bank Notes and Cheques, on the day they mature, consequently they answer the definition of Currency on the day they mature. How can a thing which is not currency one day become currency the next? This is manifestly a violation of the law of Continuity. (*CONTINUITY, LAW OF*).

In his earlier works Mr. Carey was an ardent advocate for Free Trade. In his later ones, a complete change has come over him. He draws some extraordinary distinction between Trade and Commerce, which to us is wholly unintelligible.

But perhaps the most astounding paradox which Mr. Carey has produced is his new theory of money, propounded in his last work. (*Principles of Social Science*. Vol. II., p. 327.) Economists have hitherto considered that an excessive quantity of gold would diminish its value, and make things dearer. It has also been universally held that money will naturally go to where it is most valuable, i.e., to where, *ceteris paribus*, the rate of interest is highest. If there is one law more than another which Economists consider to be proved by reason and universal experience, it is that Bank Notes drive out coin of the same denomination. Mr. Carey maintains the exact reverse of all these propositions; he says that the increase in the supply and circulation of money, so far from having the effect of causing men to give two pieces of money for an article that could before have been had for one, has, on the

contrary, that of enabling them to obtain for one piece the commodity that before had cost them two!

If this be so, what remarkably cheap places Australia and California should be! How wonderfully the prices of all commodities must have fallen since the gold discoveries of the 16th century!

If money naturally flows to where the rate of interest is lowest, why does not every commodity naturally go to where it is cheapest?

If Bank Notes have the effect of attracting instead of repelling coin, what floods of gold must deluge the Western States of America! Scotland should be at this moment labouring under a plethora of gold!

What can we say to such paradoxes as these? They are simply Political Economy turned upside down.

Upon the whole then, although Mr. Carey's works contain many important observations, and much valuable information, we regret that we can by no means assign such a high place to him as a scientific writer, as his admirers claim for him. Many of his observations, no doubt, expose the erroneousness of what was too readily believed, but the facts accumulated are heaped together in too crude and indigested a form to be of much scientific value. The basis on which his whole system rests—that *labor is the sole cause of Value*, is most manifestly erroneous (*LABOR; VALUE.*) His doctrines of Rent and Currency are examined under those articles.

Statistik öfver Skaraborgslän. Mariestad, 1853.

CARLI, GIAN RINALDO, Count, one of the most celebrated Italian authors, Economists, and administrators of the 18th Century, was born at Capo d'Istria on the 11th April, 1720. His literary and scientific talents displayed themselves at a very early age. After having studied physics at Hambro, in Friuli, he was sent to Padua to learn Greek, Hebrew, and Jurisprudence, in his 19th year, when he had already attained reputation as a writer, and he was immediately admitted into the Academy of the Ricovrati. In his 21st year he had already begun to write on the subject in which he afterwards principally distinguished himself,—money. He published a pamphlet, in which he corrected some errors into which Muratori had fallen. He bestowed much attention on the ancient dramatists, and composed some plays himself.

In 1744, when he was in his 24th year, the Venetian Senate created a chair of Astronomy

and Navigation for him at Padua, and gave him the superintendence of the arsenal and navy of Venice. He immediately introduced improved models of ships of war, which were very successful.

His fame was now so great that he was elected President of the Academy of the Ricovrati. In 1747 he published his *Dissertazione sull' impiego del danaro*, which laid the foundation for his subsequent great work on the Coinage.

In 1751, he lost his wife, which preyed so much on his spirits that he resigned his professorship, and returned to Istria with the naturalist Vitaliano Donati. They travelled together to the ruins of Pola, which he afterwards described in his work on the antiquities of Italy. Carli also edited his friend Donati's work on the Natural History of the Adriatic, after his death.

He now devoted his entire attention to his great work on Coinage, which occupied him nine years. The first part was published in 1754, and the last in 1760.

In 1765, Kaunitz and Firmian invited him to Vienna, where he was appointed President of the Supreme Council of Political Economy. But as this did not occupy his time, he was made Dean of the Tribunal of Studies at Milan, where he went to reside.

In 1771, he edited Verri's *Meditations in Political Economy*, with notes, and was appointed President of the Royal Ducal *Magistrato Camerale*. This board consisted of Beccaria, Frisi, the two Verri, besides himself, and it introduced immense reforms into the administration of the Milanese. At Carli's suggestion the Inquisition, which had existed for centuries at Milan, was abolished. The Council effected a complete reformation of the coinage.

In 1780, he was struck by an illness which eventually proved fatal to him. He was relieved from his duties, and at first he was allowed to retain his full salary, but in the following year, a general law of the Empire reduced it to two thirds. Carli does not seem to have been a good manager, and this reduction of his pension left him in great distress. He then produced his work on Italian antiquities. In 1790, his friend, Leopold of Tuscany, became Emperor and restored his pension. He died on the 22nd of February, 1795.

Carli's works were published in a collected form in 18 volumes 8vo, Milan, 1784-94, the first eight of which contain his Economical writings.

CARREL, ARMAND, A celebrated leader of the Republican party in France, was born at Rouen, 8th August, 1800. He entered a cavalry regiment at 17, and two years afterwards changed into the 29th regiment of infantry. When the French invaded Spain in 1823, Carrel joined the constitutional party and fought against his countrymen. He was captured and tried twice by court martial and sentenced to death; the sentence in each case was quashed for informality. He was tried a third time and acquitted. He then became secretary to Augustin Thierry; but he soon left him and commenced writing independently. In 1830 the *National* was started, with Thiers, Mignet, and Carrel as editors. This paper contributed greatly to bring about the revolution of July, 1830. Carrel's colleagues formed part of the new government, and he then conducted the paper alone, and raised it and himself to an extraordinary height of power. In 1836 he was led into a quarrel with Emile de Girardin, the editor of the *Presse*. A duel was the result, in which Carrel was mortally wounded, and he died on the 24th July, 1836. His funeral was attended by a crowd of the most distinguished deputies and men of science. For an appreciation of this remarkable man see Mr. Mill's *Dissertations and Discussions*.

CARY, JOHN, Merchant of Bristol. Mr. Cary was evidently a person of some mark in his own day, as we have met with his name several times in the literature of the end of the 17th century. Some of his works were published by the request of influential parties. But we regret that they are full of the exploded commercial fallacies of that day. There is one which contains passages of great importance in the theory of the Currency, from which we have made quotations below. We have not been able to discover any details of his life.

An account of the proceedings of the Corporation of Bristol, in execution of the Act of Parliament for the better employing the poor of that City. London, 1700.

A discourse concerning the East India trade, shewing it to be unprofitable to the kingdom of England. London, 1696.

A discourse concerning the trade of Ireland and

Scotland, as they stand in competition with the trade of England. London, 1696.

A discourse on the advantage of the African trade. London, 1710.

A discourse of trade and other matters relative to it. London, 1745.

This work was translated into Italian by P. Genovesi in 1764, and into French, by Butel-Dumont in 1755.

An essay on the coin and credit of England as they stand with respect to its trade. Bristol, 22nd October, 1696.

At the beginning of William III.'s reign the silver coinage, which was then the sole legal tender, and in reference to which the course of exchange was computed, had fallen into a very disgraceful state. It continued to get worse, till, in the beginning of 1695, guineas had risen to 30s., the exchange with Holland had fallen 25 per cent., and the Irish exchange in a similar proportion. After many ineffectual attempts at remedying this by legislation, a general recoining of the silver money was effected (COINAGE), which rectified the exchanges, and reduced the price of guineas. In May, 1696, the Bank of England stopped payment, which soon sent its notes to a heavy discount. This crisis is of a very considerable importance, as it is alluded to in the Bullion Report. (BULLION REPORT § 49), but unfortunately that passage is full of the most serious chronological errors, which render its arguments invalid. The first thing to be done is to ascertain at what time guineas rose and the exchange fell, at what time guineas and the exchange were restored to par, and when Bank Notes were restored to par. After some remarks shewing that the value of the silver coins depended solely on their weight and fineness, and not upon their name, as so many persons have imagined, and that an ounce of silver in bullion must always be equal in value to an ounce of silver in coin, there being no charge for coinage, he says, p. 12—

"But all this is a jest, for no nation esteems silver but for its weight and fineness; and though the money of some countries may not agree with ours of the same denomination in either, yet the exchange sets that right. Thus the French crown (called here six shillings, or three livres) hath not usually been worth in exchange above 56 of our pence; now should any man be so imprudent to bring it thence, and expect to pass it here for six shillings, because 'tis called so there, he would soon see that neither our goldsmiths nor traders would take notice of the denomination; on the other side, should any one carry the English crown to France, because 'tis there worth above three of their livres, vulgarly six shillings, he would find no more advantage, either in buying of goods, or remitting it home again, than he might have made by exchange. When our coin was corrupt and base, all exchange rose upon us, but now (i.e. 22nd October, 1696) it is returned to its ancient standard, exchange returns to its old course; not that the standard of our money is always the exact rule of our exchange, the balance of our trade often causes it to alter, either to an advantage, or to our loss, besides the charge of management. But this is little in comparison with the other; a familiar instance we have in the case of Ireland, where, whilst our coin was base, seventy pounds was worth one hundred pounds here, which

was in some measure proportionable with the value of pieces-of-eight (which they took in Ireland) by weight to our clift money, and also to our guineas at 30s. per piece, and how far this carried the trade of England into that kingdom, the traders to the West Indies have been too sensible. But since the error of our coin hath been corrected, that very exchange is so much varied, that one hundred pounds here is worth one hundred and fifteen pounds there.

"And since I have mentioned guineas, I cannot let them pass without some observations; how eager was the contest for keeping them up to that exorbitant value? Whereas it was well known that the reason why guineas were so high was the badness of our coin. Gold doth not receive a value from the stamp, but whether in the mass, or in the coin, its weight and fineness are to be regarded; the standard of both in England is the same, being twenty-two carats of finest gold, one carat of finest silver, and one carat finest copper. The guinea is five dwt. eight grns. which at the price of four pounds per ounce (when money was at its full standard and weight) came to 21 shillings and 4 pence, but when our coin was so corrupted, that 30s. contained no more silver than 21s. 4d. formerly did, 'twas necessary guineas should rise, to put them on an equal basis with silver. On the other side, when the current coin of the kingdom came to be rectified, and 2s. 4d. contained the same quantity it formerly did, guineas must as necessarily fall, because their value did not arise from their denomination, but from a proportionable standing of their weight in competition with the weight of silver. And, by the way, it is to be observed that guineas at 22s. (as now allowed to pass by Act of Parliament) are worth eight pence per piece, or 3 per cent. more than standard gold in the mass will yield at four pounds per ounce."

Thus we find it is established as a chronological fact, that the exchanges were rectified at latest by the 22nd October, 1696, as that is the date of the publication of the pamphlet, probably some time before. The last paragraph we have quoted seems perhaps of little importance yet it was the cause of the substitution of gold instead of silver as the legal standard in England.

Mr. Cary also says p. 17, "One thing more I would observe to these Gentlemen in their own dialect, that as our coin grew bad, so standard silver rose in its price, those who had it demanding 6s. 6d. to 7s. per ounce of the then current coin of the Kingdom, the reason of which is plain from what hath been said before."

Mr. Cary also shews that he knew a fact which is of great importance in the theory of the Currency and Exchange, and which was fatal to the mercantile theory of his day. That theory supposed that money was the only wealth, and that the great object of legislation ought to be to encourage the import of money by every possible means. Now it is well known that money and bullion is the least profitable of any merchandize, and merchants never resort to it when they can help it. He says p. 19, "before a due consideration we find that as nothing but the balance of our trade brings it in, so nothing but the balance of our trade with particular places carries it out, neither of them proceeding from the choice of the

merchant, who desires rather to trade in any other merchandize, silver neither answering freights or insurances, and therefore it is that our merchants bring home from Spain, all the wines, fruit, wool, iron, cochineal, they can get, and whatever else is fit to load their ships, before they meddle with money, but the balance of our trade with Spain being so much in our favor, that all the product thereof cannot make it good, we are obliged to bring home the rest in bullion."

CASH CREDIT. A *Cash Credit* or *Cash Account* is a permission granted by a Bank to a Customer to draw upon it to a certain limited amount, at such times, and in such sums as may suit his convenience. He may pay in day by day such sums as he pleases, and interest is charged only on the daily balance of the account.

A *Cash Credit* is, therefore, simply a drawing account, created in favor of a customer, upon which he may operate in precisely the same manner as a common drawing account. The only difference being that instead of receiving interest upon the daily balance at his credit, he pays interest upon the daily balance at his debit. It is thus an *inverse* drawing account.

The system of *Cash Credits* is one of the distinguishing features of Scottish Banking, and will deserve our closest attention, as it will shew the immense advantages of a judicious and well managed system of credit to a country. It is, moreover, entirely of the nature of *accommodation paper*, which has acquired such a disreputable notoriety in commerce. It will also serve to bring out and test the loose and vague and contradictory notions on *Credit* which are current in works on Political Economy.

The system of *Cash Credits* sprung from the peculiar constitution of the Scotch Banks. Most of the great foreign Banks were mere Banks of Deposit, and did nothing but create credit in exchange for bullion deposited with them, which they professed to keep locked up in their vaults. The Bank of England itself was at first limited in the amount of its issues to the sum it had advanced to government, and issued no notes under £20.

But the Bank of Scotland had unlimited powers of issue both in amount and denomination; it received no deposits at first from the public, but on the security of money paid in by its Shareholders it issued as many notes as it could in the discount of Bills of Exchange. These notes were at first for £100, £50, £10, and £5. For some time it issued no notes below £5, although it had many proposals to do so. John Law tells us that its notes in circulation very soon amounted to five times the amount of the cash in the Bank, which he very justly says was equivalent to the creation of so much additional money. At length, however, either in 1699 or 1704, for the accounts differ, and it is not easy to decide between them, they commenced the issue of £1 notes.

Now the issue of £1 notes has a very much more powerful effect in commerce, than the issue of higher denominations of notes.

It has been supposed sometimes that notes of a large amount do not drive coin out of circulation. But this is an error. It is perfectly clear that the use of any instrument of credit, whatever its nature or amount may be, supersedes the use of coin to that extent, in that transaction, and releases it and renders it applicable to other purposes either of internal or external use. It is, therefore, a *bonâ fide* augmentation of capital. Though, of course, the instrument of credit may

be subsequently unpaid, and, therefore, it is *precarious*, and the other is not.

But after all, the transactions in which large instruments of credit are used, are comparatively few compared to the enormous multitude of those in which coin is used. Consequently if an instrument of credit like a Bank Note of the same denomination as the coin, is put into circulation to an unlimited extent, it entirely supersedes and displaces coin. The metallic currency is exported, because the notes,—a cheap instrument—are equally efficacious at home, and the money, being an article of merchandize of general value, is sent abroad to purchase foreign commodities.

The effect, therefore, of issuing notes of the denomination of the coin is much more powerful than that of any other form of credit, and as it is more powerful, it is more liable to danger and abuse.

The effects of the issue of £1 notes by the Bank of Scotland were very soon seen. Specie disappeared from the country, and some contemporary writers say that the suspension of cash payments in 1704 was due to this cause.

In 1727, the Royal Bank was founded, and the system of cash credits is said by some authorities to have been invented by it, and by others by the Bank of Scotland.

These companies being in the warmest rivalry, racked their invention to devise some new methods of putting their notes into circulation. The field of commerce in Scotland was at that time extremely limited, and consequently the number of Bills of Exchange to discount was comparatively small. The banks therefore found themselves with a superfluity of credit, as we may say, on hand, and tried to devise some means to get it into circulation.

Cash credits are applicable to a totally different class of transactions from those which give rise to Bills of Exchange, and we may now explain their nature rather more fully.

Every man in business, however humble, or however extensive, must necessarily keep a certain portion of ready money by him to answer immediate demands for small daily expenses, wages, and other things. This could of course be much more profitably employed in his business, where it might produce a profit of 15 to 20 per cent., instead of lying idle. But unless the trader knew that he could command it at a moment's notice, he would always be obliged to keep a certain portion of capital unemployed. The trader must always keep a certain portion of ready money in his own till, or he must be able to command the use of somebody else's till. Now one object of a cash credit is to supply this convenience to the trader, to enable him to invest the whole of his capital in business, and upon proper security being given, to furnish him with the accommodation of a till where he may obtain ready money, at a moment's notice, in such small sums as he may require, on his paying a moderate interest for the accommodation.

So also they are frequently granted to lawyers, or writers to the signet, commencing business, who have occasion for ready money from day to day, to make many small payments. Now, if it was not for the facility thus created by the bank, a young man commencing business as a writer to the

signet, or solicitor, would require to be furnished with actual money, either of his own, or supplied by his friends, and it is a greater advantage to them to have it supplied merely by a guarantee, a mere contingency which they never would give if they thought there was any danger of its being enforced.

But the national advantages of the cash credit system have been, if possible, still more strikingly displayed in the prodigious stimulus it gave to the agriculture of Scotland during the last century. They have, indeed, been one of the main causes of making it what it is. In the Scottish system of farming, leases almost universally prevail, and a farm is not entrusted to the hands of a man who is not educated to his business. He usually enjoys nineteen years security of tenure; or where leases are granted for the purpose of reclaiming land, they are frequently longer than that. Now supposing a farmer who is known to be active, skilful, and industrious, obtains a farm on lease, he may go to the bank, and upon the security of his lease and some friends who become bound for him, the bank grants him a cash credit. He is able to invest the whole of his own capital in improving the land, and obtains any temporary advances he requires to make immediate payments with, from the bank. When harvest is gathered, he repays the bank with interest, makes a profit for himself, and adds to the capital of the nation.

This system originated with the power of creating £1 notes, which, in that country where the banks enjoyed such high credit, was exactly equivalent to the augmentation of actual money, and produced exactly the same effects in increasing the agriculture and commerce of the country as so much actual money.

The testimony of every one who has any experience of Scotland is unanimous in favor of the remarkable effects this system has had in promoting the prosperity of the country, and the morals and conduct of the people. It is no exaggeration whatever but a melancholy truth, that at the period of the revolution of 1688, and the establishment of the Bank of Scotland, that country, partly owing to such a succession of disasters as cannot be paralleled in the history of any other independent nation, and partly owing to its position in the very outskirts of the civilized world, and far removed from the humanising influence of commerce, was the most utterly barbarous, savage, and lawless kingdom in Europe. Though we may parenthetically observe that it may be mentioned to the immortal honor of this poor, savage, and barbarous country, that it was the first to receive and propagate the Newtonian Philosophy, and send missionaries to teach it at Oxford, a whole generation before there was a single convert to it in France. And it is equally undeniable that the two great causes of her rapid rise in civilisation and wealth were her systems of national education and banking. What the Nile is to Egypt, that is the banking system to Scotland, and it was fortunate for her that the foundations of her prosperity were laid broad and deep before the gigantic fallacy was dreamt of, that the issues of banks should be inexorably restricted to the amount of gold they displace.

The preceding remarks will suffice to explain to our readers the general nature of cash credits.

The effect they have produced on the morals of the people is described by the witnesses before the Committee of the Lords, in 1826, as having been very remarkable. At that time it was conjectured that there were about 12,000 cash credits granted to persons in Scotland, and as the average number of sureties was three, there were supposed to be about 40,000 people interested in the integrity, prudence, and success of each other. Mr. Kinnear said the banks very rarely suffered loss by small cash accounts. The magnitude of the operations carried on by means of cash credits in Scotland may be inferred from the statement of Mr. Sandeman, who said that during 21 years that he was connected with a provincial bank at Perth, the operations amounted to from 80 to 90 millions, and there was no loss except on one account to the amount of £200.

The advantage to the person who has a cash credit is that he only pays interest from day to day, on the sum he actually has at his debit, whereas, in discounting a Bill of Exchange he pays interest on the whole amount of his credit, whether he uses it or not, and discount is besides more expensive than interest. (DISCOUNT.) The bank, therefore, would naturally prefer to employ its resources by way of discount, rather than cash credit, if it could. There is also a further disadvantage attending them, that they cannot be called up on a sudden emergency, and if there be a run on the bank, the security cannot be negotiated like a Bill of Exchange. It is, therefore, only where a bank has a superfluity of credit, which it cannot employ profitably, that it would resort to a cash credit, and also where there is but a very slight chance of a run upon it.

For these reasons cash credits have always been looked upon with a very unfavorable eye by London bankers, who must always keep their funds well in hand. And for very good reasons. In the first place their credit is not so solid and well established as that of the principal Scotch banks.—They do not issue circulating credit in the form of notes.—They can always find employment for any superfluous cash they may have.—And they are more liable to runs.

Even in Scotland itself we believe cash credits are not so prominent a feature of business as formerly. Commerce has increased wonderfully, and consequently there is more employment for their resources in discounting bills. But though their relative importance may diminish, we must never forget the important part they have played in the advancement of the country. Scotland itself, like many an industrious young man, has begun with credit, and by zealous industry has accumulated solid capital.

The system of cash credits is of course only one department of the mighty system of credit, the most controverted and the least understood part of Political Economy. For a full examination of the contradictory and erroneous opinions on the subject of credit, and an explanation of the inaccurate conceptions of the nature of CREDIT and VALUE, we refer to those articles.

CAZENOVE, JOHN.

Questions respecting the national debt and taxation stated and answered. London, 1829.

In this tract Mr. Cazenove has very clearly seen the nature of the National Debt. It is not a mortgage on the property of the country, as several writers have said,—“What the govern-

ment did really undertake to do, was to guarantee to the lender sometimes a terminable, but more frequently a perpetual annuity, or income, in consideration of the sums which it had from time to time occasion to borrow.

"This annuity is part of the annual produce of the land and labor of the country, which is raised in the shape of taxes and placed at the disposal of the contractor or public annuitant; and the mode in which it has been secured to him by assigning him a certain amount of supposititious stock, bearing interest at 3, 4; or 5 per cent., as well as the stipulation which has been sometimes made of not reimbursing it below par, (that is, not compelling him to receive less than £100 money for £100 fictitious stock), is merely a matter of convenient arrangement, entered into at the time for the purpose of facilitating the transfer of the annuity from one party to another, and maintaining its value in the market.

"The National Debt then, consists properly of the annual charge to which the nation is subject, in order to furnish an income to the stockholder, and to increase this charge, is in reality to increase the debt, to diminish it, is to diminish the debt."

Mr. Cazenove then very truly shews that the taxes fall upon industry, as well as property, and therefore to make an assessment on property alone to pay it off would be manifestly unjust.

He then examines the effects of direct and indirect taxes, and is of opinion that the fairest and best system of taxation is that in which both are combined.

Mr. Cazenove has also published a second edition of *Malthus's Definitions in Political Economy*, with a preface and notes.

Thoughts on a few subjects of Political Economy. London, 1859.

In this work, Mr. Cazenove, p. 11, says that the inductive method of investigation is the only means of arriving at any sound knowledge on the subject. He restricts *Wealth* to material objects. This question we have fully examined under CAPITAL. He says, p. 19, that the total currency, or circulating medium of a country, consists of money and *all* its substitutes.

In the notes appended to his work, Mr. Cazenove has made some remarks on some of the articles in this Dictionary to which we feel it necessary to make a few observations. He says, p. 73, that we are in error in attributing to Adam Smith the doctrine that high rent is one of the causes of the high price of corn, and he refers us to a passage in which he says the reverse.

Now, we may observe that we were perfectly aware of the passage M. Cazenove refers us to, when we wrote as we did. But this is an example of the innumerable cases of difficulty in determining what is the doctrine of Economists. It is true that in the passage Mr. Cazenove refers to Adam Smith says that high price is the cause of high rent, but then, as we have shewn under RENT, in other places he has asserted just the reverse. And the difficulty is to determine from the general tenor of his work, which is the doctrine most conformable to it, and which also is the doctrine attributed to him by other writers. Now we have, we think, shewn under RENT, that the doctrine which we have mentioned under ANDERSON, was that which was generally attri-

buted to him, and understood to be his, by contemporary writers.

At p. 75, Mr. Cazenove has made a slight, and, of course, unintentional error. He says that we, in various places of this Dictionary, stoutly contend that Bills of Exchange are *money*. Now this is a mistake. We do not say they are money, but that they are *currency*, words which we do not consider as synonymous. We have shewn under CURRENCY that that word includes money, and instruments of credit of all sorts, which is the opinion Mr. Cazenove holds.

Mr. Cazenove has also contributed the greater part of the notes to *Jones's Literary Remains*, edited by Dr. Whewell.

CHADWICK, EDWIN, C.B., a distinguished member of the Civil Service, who has borne a very leading part in most, and the first part in some, of the great administrative and social reforms of the last 30 years, was born at Longslight, near Manchester, in 1801. He comes of a younger branch of an ancient Lancashire family, noted in the county histories. He was educated for the bar, and during his course of study became acquainted with many medical students and persons engaged in commerce. To these subjects he brought a mind strongly imbued with a statistical bent.

An opportunity fortunately occurred for bringing his special talent before the public. In 1825 and 1827 Parliament had turned its attention to Benefit and Friendly Societies, and in these years two Reports were issued. The Northampton tables had hitherto been exclusively used in the calculation of the Value of Government Annuities. These had been prepared by Dr. Price from the burial registers of the Parish of All Saint's, Northampton, from 1735 to 1780. It was contended by some eminent statisticians that these tables were no longer to be relied on. They maintained that experience had proved that, from various circumstances, the expectation of life was greater than represented in those tables. The very companies that professed to base their calculations upon them, acknowledged their inaccuracy, as though they used them in the operation of insuring lives, they refused to do so in the inverse operation of granting annuities. They were, however, used in the grant of government annuities. Mr. Finlaison, the actuary of the National Debt Office, had repeatedly urged this on the government, and his calculations shewed that the loss to the nation was £8,000 a week. Other eminent actuaries, however, such as Mr. Morgan, of the Equitable, defended the accuracy of the Northampton tables.

Mr. Chadwick's first paper was directed to this dispute. It was published in the *Westminster Review* for 1828. It is interesting as having laid the foundation of Sanitary Science.

At this time Mr. Chadwick became acquainted with Mr. John Stuart Mill, who was also a contributor to the same review, and through him, with Mr. Senior, who, in conjunction with Dr. Whately, was bringing out the *London Review*. To this review Mr. Chadwick contributed two papers in 1829, one on "Preventive Police," and the other on "The Administration of Medical Charities in France."

The article on Preventive Police, attracted the notice of Jeremy Bentham, then in his 82nd year, and led to a friendship between its author and the aged jurist, which continued to the end of his life. Bentham was then occupied in the preparation of an administrative code, and he wished Mr. Chadwick to undertake that part of it which related to the ministry of public health, and of police. Mr. Chadwick resided with him almost constantly during the last year of his life. Bentham offered to place him in in-

dependent circumstances, on the condition of his engaging to devote himself exclusively to the propagation of his doctrines. This offer Mr. Chadwick declined, but Bentham bequeathed him his library of jurisprudence, and a small legacy.

In fact, Mr. Chadwick, although engaged in kindred subjects with Bentham, could not very well be called his disciple, because he followed exactly the opposite method to what Bentham did. That eminent philosopher, especially in the latter years of his life, had fallen almost entirely into the dogmatical or *a priori* system. From the constant habit of living alone in his hermitage in Queen Square, he seems to have thought that men were to be dealt with as so many algebraical symbols, and did not hesitate to send off constitutions cut and dried in his pigeon-holes in Westminster, to any part of the world.

Mr. Chadwick's method is just the reverse. It is his maxim that a full inquiry should always precede any legislation, and that the whole subject should be investigated just as if nothing had already been settled in it. By this means it often happens that doctrines and theories which are repeated and handed down from writer to writer, and pass current as incontrovertible axioms, turn out upon inquiry, to be absolute fallacies and delusions. Mr. Chadwick has several times been applied to by foreign governments to advise them on matters of Poor Law Administration, but has invariably declined doing so, because he was unable to offer them proper advice without instituting a searching investigation of the local circumstances of the case.

That this is the only true method of proceeding no competent person will deny. As a very striking instance of the necessity of the reinvestigation into the fundamental doctrines of Political Economy, we will only mention one. The invariable method of describing Banking is, that it consists in borrowing from one person and lending to another. There never was a greater delusion, nor a more complete misconception of any facts, than the current notions on Banking. There is not a single English Economist who ever had the slightest conception of the nature and effects, or the mechanism, of Banking.

We shall return to this subject more at length afterwards. In 1831, Mr. Chadwick contributed an article on "Taxes on Knowledge," to the *Westminster Review*.

The event which brought Mr. Chadwick prominently before the public was the appointment in 1832, by Lord Grey's government, of the commission of inquiry into the operation of the existing English poor laws. Mr. Senior was one of the commissioners, and at his instance, Mr. Chadwick was appointed one of the assistant commissioners. Each of these, eighteen in number, had a district appointed him, in which he was to make inquiries and to report upon it. Mr. Chadwick was fortunate in having the most important of these, London and Berkshire, allotted to him. These reports were printed in 1833, and out of a volume of 410 pages, Mr. Chadwick's report occupies 139.

The immense superiority of this report among its compeers, both in the nature of inquiry, the method of investigation, and the breadth of its views, was manifest, and was acknowledged by

the immediate promotion of its author to be a commissioner. He was also employed on another very important inquiry. In April, 1833, a Royal Commission was appointed to collect evidence and report upon the whole subject of the treatment of factory children. Mr. Tooke, author of the *History of Prices*, Mr. Chadwick, and Dr. Southwood Smith were the central board. Commissioners were appointed to collect evidence, and in July, 1833, the evidence was digested and published by the Board, accompanied by a Report, in which interference with adult labor was deprecated, but it was said that children were severely overworked, and suffered much both physically and morally, and a ten hours' bill, if not a six hours' one, was recommended.

The evidence collected by the assistant commissioners in the Poor Law Inquiry, proved the necessity of immediate legislation. A general report from the Commissioners, of which Mr. Chadwick was one, and which he materially assisted to prepare, was presented to Parliament on the 24th February, 1834, and in the course of the session the Poor Law Amendment Act was passed. (POOR LAW).

Three Commissioners were appointed, Sir Frankland Lewis, Mr. George Nicholls, and Mr. John J. Shaw Lefevre. Mr. Chadwick was appointed Secretary to the Board, with the distinct understanding that he was to have the virtual powers of a fourth Commissioner.

The first results of the Poor Law Amendment Act were highly satisfactory. The rates were reduced by about two millions annually. But the Commissioners, who had had no hand in conducting the inquiries which led to it, or in framing the measure, naturally did not feel so great a zeal in carrying it out in its integrity, as their Secretary, who had in fact borne the chief part in both. In 1835, the Commissioners gave signs of intending to revive some of the objectionable practices of the old law. In 1837, they gave still more evidence of backsliding. They paid no attention to the remonstrances of their Secretary, who saw all his labors in the fair way of being undone. He was obliged to appeal to Lord John Russell, who interfered, and overruled their proposal. In 1840, new proposals of an objectionable nature were again brought forward. On this occasion Mr. Senior concurred with Mr. Chadwick in remonstrating with Lord Normanby, and the plans were again overruled. Upon this Sir Frankland Lewis and Mr. Lefevre resigned. And Mr. Nicholls, who coincided very much with Mr. Chadwick's views, became senior commissioner. But this naturally produced an unpleasant relation between the board and its secretary, and he was in future excluded from all participation in the administration, and confined strictly to routine duties.

During this time Mr. Chadwick was also engaged in another inquiry of the most important nature. The reorganisation of the metropolitan police force, in 1829, had the effect of driving out great numbers of the London criminals into the country. In 1837, a Royal Commission, consisting of Mr. Charles Shaw Lefevre, Mr. Chadwick, and Lieutenant-Colonel Rowan, was appointed to inquire into the best means of establishing an efficient constabulary force in England and Wales. The inquiries were conducted throughout 1838,

and were equally searching and exhaustive as those of the Poor Law Commissioners. The Report was published in 1839, and during the session an Act was passed for the formation of a county constabulary. But the recommendations of the Commissioners were not carried out by any means to their full extent.

One of Mr. Chadwick's chief maxims in social inquiries was to endeavour to ascertain as many as possible of the *causes* of the evil; and to see which of these could be removed by legislation or other social arrangements. He had long been engaged in an investigation into the preventible causes of pauperism, which might be reached by legislation, or other means. These he traced to a considerable extent to intoxication, produced in many cases by an injudicious time of paying wages. By an alteration of this time, in one instance, a manufacturer reduced his usual absentees on Monday morning from 50 to 4. So with military pensioners, most of their intemperance arose from paying their pensions at too long intervals. Among the removable causes of pauperism he considered the law of settlement as very prominent. His opinion, on this point were strongly developed before a committee of the House "On Settlement and Poor Removal." He advocated the abolition of the law of settlement, or at least its extension from parishes to unions.

The preceding narrative fully bears out, we think, what we said at the beginning, that Mr. Chadwick has borne a very leading part in almost all the great social and administrative reforms of the last 30 years. We now come to one which is probably the most important of all, and to which the merit belongs more exclusively to Mr. Chadwick, namely—Sanitary Reform.

The germ of this may be found in his paper on Life Insurance in the *Westminster Review* in 1828. Among other reasons for believing that the duration of life was longer than counted in the Northampton tables, Mr. Chadwick attributed great prominence to the sanitary condition of the district, and the general rural habits of society. This was abundantly shewn in that paper.

The investigations connected with pauperism afforded him ample opportunities of pursuing this course of inquiry, and proved beyond a doubt that an immense mass of pauperism was due to defective sanitary arrangements; and therefore was one of the causes of pauperism preventible by legislation. In 1838, typhus prevailed extensively in London. Mr. Chadwick obtained the consent of the Poor Law Board, to the appointment of a special commission for inquiry into the existence of physical causes of disease in the Metropolis. The evidence fully confirmed the anticipation, that much of the mortality of the Metropolis was due to preventible causes. In August, 1839, Lord John Russell addressed a letter to the poor law commissioners authorizing them by royal command, to extend a similar inquiry over all England and Wales, into the preventible causes of disease. The inquiry was also extended to Scotland. Mr. Chadwick, certainly the greatest expert in the kingdom in such a task, was appointed to collect evidence for the commission. In 1842, the "Report on the Sanitary Condition of the laboring population of Great Britain" was at length ready. The Commission were unwilling to incur the

responsibility of adopting and presenting it in their own name, it was consequently published as Mr. Chadwick's report to them.

The sensation created by the revelations of this report was immense, and, no doubt, would have received due attention from Sir Robert Peel's government, if it had not been engaged in the long and vital changes in the Economical policy of the country. In 1843, Sir James Graham requested Mr. Chadwick to extend his inquiries into the practice of intramural interments, which had not been included in the former Report. Mr. Chadwick produced a supplementary report on the practice of interment in towns.

The reforms proposed in these Reports were so vast, and involved interference with so many existing rights, and were calculated to offend so many prejudices, and moreover contemplated works of such an extensive nature, that no government could bring in bills to carry them out without the assistance of professional men to decide upon the best practical method of doing so. A commission of men of eminence in different departments, under the presidency of the Duke of Buccleuch, was appointed to consider the subject in its practical bearings. Two reports were issued in 1844 and 1845, confirming the leading principles of the Report. Legislation, however, was stopped by the famous Corn Law crisis, which resulted in Sir Robert Peel's defeat and retirement from office.

In 1846, a case of alleged cruelty in the Andover workhouse created great public excitement, and an inquiry was ordered. The evidence produced before the commission further increased the public excitement. At the same time two assistant poor law commissioners were dismissed for insufficient reasons by the commission. These things made such a ferment in the public mind that the commission was dissolved, and a new one constituted.

In September, 1847, Mr. Chadwick was appointed one of a commission of inquiry into the sanitary condition of the Metropolis. Two reports, one in February, and the other in July, 1848, were issued by the commissioners. In that year the efforts of sanitary reformers were successful, and the Public Health Act was passed. A general Board of Health was appointed to superintend its operation. Lord Carlisle was the chief commissioner, Lord Ashley second, Mr. Chadwick the third, and Dr. Southwood Smith the fourth.

The Board proceeded to carry out the principles of the Sanitary Reformers, and in upwards of 100 towns measures were in progress, which were attended with the most marked success. Epidemic disease was visibly reduced, and in several places the rate of mortality had diminished from 30 to 14 in the thousand. But the carrying out of these reforms disturbed too many local influences, and offended too many local prejudices, and the Government were defeated in bringing forward a Bill for the renewal of the Public Health Act in July, 1854. While he was acting on this Board Mr. Chadwick was made C.B., and at its dissolution he received a pension of £1,000 a year.

In the discussions raised at this period respecting the Board of Health, strong testimony was borne, both in the House of Lords and Com-

mons, to Mr. Chadwick's public services. The Bishop of London said, "Mr. Chadwick he had known for thirty years, and he could say that a more efficient, active, diligent, and honest servant of the public, never existed. This was sufficiently proved by his conduct as Secretary to the Poor Law Commission. It was to his knowledge and exertions, and to those of Mr. Nicholls, that we were mainly indebted for the amendment of the Poor Law. After faithfully discharging his duties as Secretary to the Commission, Mr. Chadwick turned his attention to sanitary matters, in which he had displayed an extraordinary amount of knowledge. It was his opinion that if the suggestions of Mr. Chadwick and Dr. Southwood Smith had been carried out, we should not now have had to dread, at least to the same extent, the return of the Cholera. At the root of Mr. Chadwick's knowledge, there was an amount of benevolent interest for the poor, which would prevent his sanctioning any measure which would inflict hardship on the poorest of his fellow creatures." Lord Carlisle "quite agreed with the Bishop in the opinion he expressed respecting the two measures of our time, which seemed to him beyond any others, to have effected the internal condition of the great body of the people—the amendment of the Poor Law, and Sanitary Reform, and he sincerely believed, that the most efficient agent in originating and producing these two great fundamental measures, and in clearing away a host of obstacles which beset their early birth, was Mr. Chadwick, and to one or other of these measures he had ever since devoted his time, his health, and his strength." Lord Brougham said that "He well remembered the services—the invaluable services—of Mr. Edwin Chadwick, with regard to the Poor Law Commission, and the inquiry into the state of the poor and the Poor Law; and he could most distinctly state that to Mr. Nicholls and Mr. Chadwick were mainly due the success, both of the inquiry and of the great measure which grew out of it." Lord John Russell said—"Mr. Chadwick was a man of the greatest energy, and with a spirit of inquiry which induced him to labor by zeal, by unremitting attention to the subject in hand, to go to the bottom of it, and to attempt some remedy for the evils which he conceived himself to find there. He was appointed an assistant commissioner to inquire into the Poor Laws, and if in that large blue book, the Report of the Commissioners, they turned to the Report of Mr. Chadwick, they would find there the germ of that amendment, which in his conviction had saved the country from great social evils, if not absolutely from social revolution. * * * With reference to the subject of health, Mr. Chadwick's inquiries into the health of the metropolis and of towns, had been carried on through various commissions and investigations which had been undertaken on this subject; so that on these various topics—the Poor Law, the improvement of the police of the country, and the improvement of the health of the country, there was no man to whose zeal and assiduity this country was more indebted, than to Mr. Chadwick."

The economical course of investigation pursued by Mr. Chadwick, as well as the principles evolved by him, may be characterised as belonging to the statistical, or what Mr. J. S. Mill calls "the concrete

deductive method," as opposed to the abstract or geometrical method of reasoning in Political Economy and general legislation. In illustration of the dangers attendant upon action on *a priori* conclusions obtained in the geometrical method, he averred, in a paper calling for enlarged inquiry, by a commission, for the settlement of the facts to serve as a basis for the reform of Parliament, that there had been no one investigation with which he, with other commissioners, had been charged, which did not conclusively reverse every assumed main economical and political principle, and almost every assumed chief elementary fact, in which not only the general public, but Parliamentary Committees and men of high political position, were prepared to base legislation. Thus as respects pauperism, the prevailing doctrine founded upon the theory of Mr. Malthus, of the geometrical ratio of the progression of the population concurrently with only an arithmetical ratio of progression of the production of food, was that the general cause of pauperism was the pressure of population on the means of subsistence, and the chief immediate remedy was an extensive emigration. In that sense several men of eminence wrote, Mr. Wilmot Horton lectured, and Mr. Ricardo, when in the House of Commons, was prepared with Mr. Scarlett to legislate. But a careful and particular inquiry under the poor law commission showed that the oppressive excess of pauperism had not the character of helpless and unavoidable destitution, which it must have had to have been consistent with the theory of an overwhelming pressure of population on the means of subsistence, and was in the main everywhere the result of maladministration of rates paid in aid of wages, of relief to the able-bodied without any return of work, and in terms more eligible than regular industry. As a compromise with the advocates of the population theory, provisions were introduced into the poor law amendment Act for the emigration of paupers from the more heavily burdened districts. As a commentary on the theory Mr. Chadwick stated that in a district where there were fully 30,000 persons receiving out-door relief, after the passing of the Act there was great difficulty, with all the exertions of emigration agents, in filling even two ships, and of the persons who went away in them few were of the class for whom relief was intended.

As the theory that labor and food were nearly fixed quantities, from the population being pressed fully up to the means of subsistence, it was predicted by the economists of that school, that when out-door relief to the able bodied was discontinued, and the recipients thrown upon the labor market, assumed to be already overburdened, wages must inevitably fall, and a dire aggravation of distress ensue. But where the law was most steadily acted on, wages rose. The sequence of facts was that under the operation of an amended administration the laborers became more steady and diligent. The labor was more efficient, and made the return to the farmer's capital larger. Consequently the profit and the increase of the fund for employment of labor enabled and induced him to give larger wages. In those same districts where the pressure of population was then deemed the most decided, with a greater or less subsequent increase of numbers, there soon began to be felt a serious scarcity

of labor for the ordinary cultivation of the land.

Of all countries in Europe, Ireland was regarded as the best illustration of the population theory. From his observations on the administration of relief to Irish paupers in England, Mr. Chadwick, with Mr. Nicholls, strongly urged the Government to apply a system of compulsory in-door relief for the able-bodied in Ireland, and that, too, without any law of parochial settlement; but only with the Union administrative machinery. It was anticipated that the new Union Workhouses in Ireland would be permanently swamped, and that greater masses, from the greater assumed necessary destitution, would be thrown as burdens upon the rates than in England. But with the doors of the Union Houses thrown open to the able-bodied, and rations better than those common in the laborers' cabins, and free relief to the destitute, the amount of able-bodied pauperism and the pressure of the poor-rates have been less in Ireland than in England, or in Scotland. In 1857 the rate of expenditure in poor-rates was, in England, 8s. 8½d. per annum per head of the population; in Scotland, where the administration is chiefly of out-door relief, it is 4s. 2d. per head of the population, and increasing; in Ireland, which ought to be the heaviest burdened, it was 1s. 9d. per head, and diminishing.

Whilst, on the empirical method of legislation, or sentiment, or on such abstract economical principle as there may at any time have been in the minds of the legislators, it was proved in respect to previous legislation, "That there is scarcely one statute for the relief of the indigent that has produced the effect intended, or that has not created new evils, and aggravated the evils they were intended to counteract," so, on the other hand, in respect to the legislation on the concrete or deductive method, there has been nothing omitted which after-experience has not shewn the need of restoring. The want of sound economical knowledge and legislative and administrative principle on the part of popular representatives is, however, highly unfavourable to systematic legislation, and occasions a condition of the representative assembly, in which, as a general rule, no large systematized measure can be expected to pass entire, in which no such measure comes out not merely unimproved, but impaired in some one important branch.

The fundamental principle of a compulsory system of relief, adopted by Mr. Chadwick's colleagues, was enunciated in these terms;—"In all extensive communities circumstances will occur in which an individual, by the failure of his means of subsistence, will be exposed to the danger of perishing. To refuse relief, and at the same time to punish mendicity, when it cannot be proved that the offender could have obtained subsistence by labour, is repugnant to the common sentiments of mankind. It is repugnant to them to punish even depredation apparently committed as the only recourse against want. In all extensive communities the occurrence of extreme necessity is prevented by almsgiving, by public institutions, supported by endowments or by voluntary contributions, or by a provision partly voluntary and partly compulsory, or by a provision entirely compulsory, which may exclude the pretext of mendicancy. But in no part

of Europe, England excepted, has it been thought fit that the provision, whether compulsory or voluntary, should be applied to more than the relief of indigence, the state of a person unable to labor, or unable to obtain, in return for his labor, the means of subsistence. It has never been deemed expedient that the provision should extend to the relief of *poverty*, that is, the state of one who, in order to obtain a mere subsistence, is forced to have recourse to labor." This distinction, which was marked by Bentham, between indigence and poverty, is one between large organic, economic principles, the want of perception of which, and the attempts to relieve not merely indigence, but poverty, have been great socialistic error, and have everywhere been productive of injurious results.

One main object of properly administered provision for the relief of the indigent, is the prevention of mendicity. As applied to Ireland, provisions were introduced for the concurrent action of the police to repress and get rid of the mendicity, by which that country was heavily afflicted, but there were provisions omitted, in consequence of the opposition of O'Connell, to anything which would interfere with the sentiments of the Irish priesthood in favor of almsgiving. So that in Ireland, the rate-payers are still heavily burdened with the vices of mendicity, concurrently with the tax of the poor-rates. The new law, however, imperfect as it is, has rendered benefits far more than equivalent to the tax. It has facilitated the diminution of the wretched cottier holdings, and the application of capital to the improved cultivation of land, and an improved demand for labor and a rise of wages. The industrial training and education of orphan children, and the children of the destitute, in the new poor law union schools, is such as to convert the hereditary vagrants and mendicants into permanently productive laborers, and good subjects.

Besides the ordinary purposes of workhouses, the new Union-houses serve as hospitals and medical institutions, where there were none before. But for these houses for the reception and treatment of the fever-stricken during the period of the potato failure and famine, and for the service of the new administrative machinery during that calamity, it would have been terribly aggravated. With all deductions made, the Irish poor-law, with its administration, is the nearest realization of the measures devised under the English poor-law commission of inquiry, and is the best approximation to sound economical and administrative principle of any in Europe. In England the want of an organized country constabulary, which was the object of the constabulary force commission, was an obstacle to the efficient direction of the new poor-law machinery to the prevention of vagrancy, and of mendicity. The present organization is deficient also for breaking the hereditary pauper succession, by the sound industrial training and education of pauper children, of whom a large proportion under petty local management, continue, or return as permanent burdens upon the rates.

Before systematic investigation, or, indeed, after it, with some of the most successful local administrators, the general view was to operate upon the parishes singly and separately for the reform of their administrations. Even Mr.

Nicholls, who had reformed the administration of one parish serving as a model, as shewn by his original answers, only contemplated proceeding with the parishes singly, or, in rare cases, the union of two parishes. Mr. Senior's original plan was to operate for the repression of maladministration in the single parishes by an extensive administration of government auditors, at an expense of £600,000.

Among the grounds alleged by Economists of the geometrical school of reasoning for maintaining the chargeability of destitution, and the administration of relief in small areas, or the separate parishes, were these, that it brought the burden nearer to every man's door, that it gave to the wealthy an interest in taking care of the poor (meaning the laboring classes), in order that they might not become burdensome to their parishes. A further advantage stated was, that it gave to those at whose expense a superabundant population must be relieved, an interest in checking population or preventing improvident marriages.

The examinations of Mr. Chadwick shewed that the practical application of these hypotheses was everywhere fraught with mischief. "The interest created by the law of settlement, or by the imposition of the burden upon the proprietors in the narrow locality, was not an interest to do all these things any more than it could be said to be an interest on the part of a landlord to teach his tenantry geometry, if by learning geometry or anything else a man might be enabled to gain his own livelihood. The interest really created was simply an interest in getting rid of the burden, and that, too, by the shortest means. Unfortunately, the shortest means were found in shifting the burden, and unhappily this process of shifting was always accompanied by the creation of additional burdens." Hence the pulling down cottages, the bandying about of paupers. Mr. Bentham's plan of pauper management was an entirely opposite course, of submitting the whole to one great contracting company, and receiving different classes in large and peculiar structures on the panopticon principle. Mr. Chadwick objected, in the first place, that practically, even if the principle of contract management were at all likely to gain acceptance, that it required an amount of trained administrative ability to conduct it, which had to be created, and that for want of such ability the contract principle had to be abandoned, when it would in competent hands be otherwise highly beneficial. He took his stand upon ground previously enunciated in 1828, in his article on the administration of public charities, in the London Review, wherein he described the advantages of consolidating the administration of the funds and the several establishments for the relief of the poor. "By the adoption of this system, a better classification is obtained, by a better classification a more close scrutiny into the cases, and a more efficient application of the means of relief. Cut up a district into small sub-divisions, and in each of them may perhaps be found one or two blind, one or two maimed, several idiots or lunatics. These will not be attended to, or badly attended to, or if well attended to, it must be at great expense. Interest and exertion, which can rarely

be insured, would be requisite to get them provided for in independent, and perhaps very distant establishments. Break down these subdivisions, bring the whole of the objects to be provided for within one general management, and establishments may be formed for each class,—the blind, the lunatic, and the infirm; each will be much better provided for, and at a cheaper rate, a greater amount of pain is thus alleviated, time is saved, money is saved. A large class may be made to work when a small one cannot. In short, all the advantages of the division of labor are gained in the larger aggregate, and utterly lost in the smaller ones.” A mass of evidence was adduced by Mr. Chadwick, in support of this principle, which the Commissioners deemed irresistible, and they adopted it. He contended for the formation of Unions sufficiently large for the classification of the paupers in separate houses, assigning one house for the able-bodied adult male paupers, another for the aged and infirm, but above all, one for the industrial training and education of orphan and other pauper children. For this course, the existing workhouses and buildings would have been generally sufficient, and new houses would only have been required in thinly populated rural districts, and in exceptional cases. This view of the classification of paupers in separate houses, in Unions sufficiently large to effect it, was adopted by Mr. Senior, and the other Commissioners of Inquiry (*Report*, p. 306-14), and powers for carrying it into effect were provided for in the Poor Law Amendment Act. Partly, however, by the influence of the members for the metropolitan districts, who were returned chiefly by the vestries of the larger separate parishes, and partly by the want of preparation in economical and administrative principle of the first Board of Commissioners, the original measure was set aside, and the principle of classification in single houses was maintained, and new union-houses constructed throughout the country. In the course of experience of the working of this principle of classification in single houses, however large, it is found to fail most seriously as respects the future source of mendicancy and pauperism, the orphan, deserted and destitute children. In town districts it has become matter of complaint that few of the females from these houses turn out well, and, indeed, that they form the principal source of the prostitution of the streets. In consequence of the complaints of these evil results, and the experience of the general impracticability of preserving children from the evil influence of the adult paupers living under the same roof, so much of the original plan of administration, for classifying, in populous districts, in separate houses, has been reverted to, as relates to children. Powers have been given for the formation of schools, for districts of unions, with the consent of the local boards. Such consent has been obtained only in a few instances. But such as have been obtained have been attended with remarkable demonstrations of administrative and educational power, when exercised on sound principles. Whereas formerly only one out of three orphan children brought up in the inferior parochial establishments, and two out of three of the somewhat improved union establishments, became permanently productive laborers, in the

complete and separate district schools, with appropriate industrial training, as well as sound book instruction, the great bulk, with few or slight exceptions, were got into permanently productive occupations, and that of a degree above the lowest sort of labor.

Besides the moral and social conclusions derived from such demonstrations of administrative and educational power for the conversion of hereditary mendicants and vagrants into a settled industrial and productive population, Mr. Chadwick gives the following as the chief economical conditions evolved, and it may be presented as an example of his method of treating social and administrative questions. “Every child or person living at large as a mendicant costs the public as much as he could be maintained for in a well administered public establishment, still more will he cost to the public by his spoil and waste as a predator. Taking the average cost as low as two shillings per week from infancy (and in respectable contract establishments on a large scale it was more than double) for food, clothing, house room and care, a pauper child will have cost £70, and may be considered as an investment of capital to that amount, at fourteen years of age, a period at which he ought to be enabled to earn (or replace by an equivalent) his own subsistence, and something over and above as payment to the capitalist, his employer, as interest on capital, as well as the labor and risk of providing and the skill of superintending productive labor.

“Under an unskilled, ignorant, and incompetent local administration of the funds raised for the relief of the indigent, two out of three of the investments in the training and education of pauper children were lost, that is to say, the subjects returned as permanent burdens upon the public, if not immediately as paupers upon the streets, as mendicants or delinquents. In whichever condition they lived, the expense for their maintenance for the remainder of life (which, according to the insurance tables, would from the adolescent stage average about 40 years) would not be less than double the previous rate, and would not be less than £400 in addition to bringing up the individual to the adolescent stage.

“Upon every three investments for maintenance to the adolescent stage there was a loss of two, and a subsequent loss of not less than £800. The prisons of Great Britain contain an average of not less than 20,000 able-bodied persons, chiefly of these legislative, administrative, and economical failures. That prison population being kept up from far greater numbers living at large, of which upwards of 100,000 are recognized, and upon the books of the police, are the criminal and vicious stock living upon the community. But an improved administration, involving the services of trained and skilled teachers at an additional expense of not more than from £1 to £1 10s. per case per annum, of the period of school teaching, or on the average about £24 of additional expenditure skillfully administered on the three, the entire investments are saved, with a few exceptions. The economical results are rendered so far certain that competent officers might guarantee their accomplishment, and the conversion of orphan children into good and productive, instead of bad subjects, at an insurance charge of about two per cent.”

A well-administered public provision, by compulsory rates, for the relief of the destitute, as contended for by Mr. Chadwick, besides giving to the community confident assurances of the strict performance of the duties of providing for the really destitute, relieving the minds of laborers from the apprehension of suffering from uninsurable calamities, and relieving the minds of others from the pains of sympathy, arising from the extreme calamities that may or do befall any portion of the community, it has an economical value, as sustaining productive labor, by shielding the laborers from the pernicious influence of habits of mendicancy, which has so depreciating an effect on the industry of some continental communities. 2ndly, by abating the pressure of the tax of mendicity. 3rdly, by breaking the mendicant and pauper succession in the manner above exemplified. It has also a jurisprudential value, as strengthening the hands of justice for the repression by punishment of large classes of offences. An ill-considered and an ill-administered provision for the relief of destitution, has the reverse tendencies, and a pernicious influence on public economy, chiefly by giving to the laboring classes the slave's security against want, with the slave's indifference to exertion for the attainment of results in which he has no adequate interest. This was one marked effect of the local administration of the poor rates in England, under the law of parochial settlements. In a large proportion of the country, which Mr. Chadwick, in his evidence before a committee of the House of Commons, designated as the slave labor districts, any one who purchases a whole parish, in effect often purchases the stock of labor, almost as much as the game upon it. The agricultural laborers upon it will find difficulty in obtaining engagements in any of the adjacent parishes, from the apprehension that they may obtain settlements. Within their own parishes, whether they work well or ill the parish must maintain them, and, comparatively, they work ill, and they are commonly comparatively dear at half the wages earned in other districts. The mere blind lust of dominion, and the supposed interests of the large land owners of single parishes in the House of Commons, and the low state of economical and administrative principle, has hitherto prevented the most important portion of the original plan of poor law amendment, the repeal of the law of parochial settlement, or the substitution of chargeability on large areas as in Ireland, without any settlement whatsoever, being adopted. Such partial improvements as have been effected in poor law administration, have occasioned an average reduction of between one and two millions on previous expenditure, but a continued excess of between one and two millions is estimated as due to the derelictions of principle specified, and other remaining shortcomings in the original outlines.

Mr. Chadwick entered into close investigations of the conditions affecting the efficiency and productiveness of laboring populations, and thence of the Wealth of Nations. The chief of these conditions are sanitary, affecting the bodily strength, mental, including other than those derived from book instruction. At the Congress of Bienfaisance held at Brussels, he read a paper in which he shewed, with the concurrence of ex-

perienced foreign employers of labor on a large scale, that as a rule, and in their actual condition, two Anglo-Saxon laborers were equivalent in the productiveness of their labor to three modern Norman, or three Danish, or three German laborers. In this economical condition in which the labor of two is equal to three, the food, the clothing, the house room, and the whole expense of one is saved, and constitutes a fund which is divisible between the two and the capitalist as profit. In the extra wages of the English workman, which are generally one half higher than the wages of the workman of any other nation, the extra produce obtained is so divided, and if he chose it might be saved by him. It follows that the economical efficiency of the twenty-six millions of the English population is more than equivalent to that of the thirty-six millions of the population of France, or of the other populations one third more numerous. Mr. Chadwick's economical view of the condition of the people of Ireland question, founded on the condition affecting the efficiency of the Irish laborers, differed largely from that of the political agitators as well as the economists of the day. In the first place, from the Irish laborer, as a Roman Catholic, observing the saints' days, from his regular attendance weekly at markets though he has nothing to sell or to buy there, his attendance at fairs, at the funerals, and lawsuits, and feuds of his tribe, his working days of productive labor are less than two hundred in the year; while the working days of his year are thus nearly one third less than those of the English laborer, the working hours of the Irishman's days at home are fewer, and generally not more than half so productive as those of one Irish laborer working under an English regime, or those of an English laborer. By the low sanitary conditions of the Irishman's cabin, the years of his life and working ability are reduced by one third below that of a healthy English agricultural laborer. Foreign economists agreed that the like deficiency of the working hours of the day, of the days of the year, and the years of life, accompanied and caused the poverty of populations within their own view, which it had been common to ascribe to unavoidable pressures on the means of subsistence.

Upon his own investigations in the poorest districts most ravaged by epidemics, he alleged in respect to the doctrine of the population check, "where the pressure of the causes of mortality is the greatest, where the average age of death is the lowest, and the duration of life is the shortest, there the increase of population is the greatest. The proportion of children is great, because life is short, and the generation transient, the middle aged and the aged are swept away in large proportions, and marriages are disproportionably early. But, says a Political Economist, in an essay in support of Mr. Malthus's view, 'The effect of wars, plagues, and epidemic disorders, those terrible correctives, as they have been justly termed by Dr. Short, of the redundancy of mankind on the principle of population, sets its operation in the most striking point of view. These scourges tend to place an old country in the situation of a colony. They lessen the number of inhabitants, without in most cases lessening the capital that is to feed and maintain them.' What I apprehend the actual facts when examined

place in a striking point of view, is the danger of adopting conclusions deeply affecting the interests of communities on hypothetical reasonings, and without a careful investigation whether the facts sustain them. The facts themselves when examined, shew that (be it as it may with war) epidemic disorders do not lessen the number of inhabitants, and that they do, in all cases that have been examined, lessen the capital that is to feed and maintain them. They lessen the proportion of productive hands, and increase the proportion of the helpless and dependent hands. They place every community, new or old, in respect to its productive economy in the position which the farmer will understand by the like effects of epidemics upon his cattle, when in order to raise one horse, two colts must be reared, and the natural period of work of the one reared is, by disease and premature death, reduced by one-third or one-half."

These conclusions are to be understood as applicable to ordinary epidemic visitations, and not to such extraordinary occurrences as that of the general potato failure and the Irish famine, which led to so enormous and continued an emigration as to preclude the manifestation of any results in the power of reproduction in Ireland itself after the visitation. The chief benefit which has accrued from it, has been in breaking up conditions of holdings in which the efficient application of capital and labor to production is prevented. Evidence may be adduced from actual results, that, under a highly advanced system of agriculture, a more numerous and highly paid population would be needed than Ireland has yet borne in any extensive district. But the increase of births under ordinary epidemic visitations and high amounts of mortality appeared in the course of Mr. Chadwick's investigations to arise from a physiological cause, such as would be apt to be overlooked in cursory examinations. It was evolved thus:—In the course of the investigation of the system of parochial allowances in aid of the wages of laborers with families, and of payments on account of the number of dependent children, it appeared that in the rural and least unhealthy districts the intervals of births averaged two years, so that if there were a family of eight children, the eldest was sixteen years of age, the next fourteen, and the next below that twelve, each of whom was capable of productive labor. But on attempting to apply this rule as to the intervals of births to the most unhealthy towns districts it was found to be wholly at fault, the intervals of births then averaging only about one year. The reason being the physiological one, that when the infant is cut off at the breast, conception takes place almost immediately, whilst it is deferred generally so long as the child continues to suckle, and by deferring the weaning, the intervals of birth may be protracted as long as three years.

To the general result of the increased fecundity concurrently with an excessive mortality, other causes, which are thus stated by him, appear to be contributory—"In works where the average period of working ability is extended to the natural period of superannuation, which the evidence shews that a combination of internal and external sanitary measures may be expected to give,—namely, an average of full 60 years, the account for one place would be one superannuated

workman and one widow, and a family of four or five well grown children, who having received parental care during that period, will probably all have obtained before its termination the means of independent self-support. Whereas with a population of only fifteen or twenty years of working ability, the same place of work may during the same period have been filled by two generations and one-fourth of work people, not one of which has brought all the children dependent on it to maturity, or a condition for self-support; and the account of widowhood and orphanage will frequently for the same place of work stand thus:

Workmen prematurely dead.	Orphan Children.	Years loss of support.
J. M., 1 Widow	2	39
S. H., 1 "	7	26
H. Y., 1 "	5	15

That is to say, three widows instead of one, and three sets of stunted and unhealthy children dependent for such various periods as those above specified, and competing for employment at the same place, instead of one set of healthy children arrived at the age of working ability for self support.

"The dependency of the duration of life upon the physical condition of the population, and the connection of the several classes of moral and economical facts with the proportionate mortality, may be thus exemplified.

"Taking the four counties in Ireland in which the proportion of mud hovels, with only one room, is the greatest, and the four counties in which the proportions of such tenements are the least; having obtained these proportions, I directed other returns to be obtained in their order, and confidently anticipated the general results following from the facts indicative of the physical condition of the population.

	The four counties where the average proportion of mud hovels as habita- tions is the lowest.	The four counties where the average proportion of mud hovels as habita- tions is the highest.
Proportion per cent. of families occupying habitations which are mud cabins, having only one room	29.	61.
Proportion of deaths from epi- demic disease to every 10,000 of the population	35.5	47.8
Average age of all who have died during the ten years ended 6th June, 1841	33.4	26.8
Proportion of births to the popu- lation	33.4	29.9
Increase per cent. of the popu- lation since 1831	5.	8.7
Per cent. of the population 16 years and under	38.8	41.9
Above 50 years	11.6	9.5
Proportion per cent. of male and female population 17 years and upwards—Unmarried	43.25	39.
Married	47.75	53.
Per cent. of the population 5 years old and upwards, who can neither read nor write	42.8	69.7
Proportion of crimes of violence or passion to each 10,000, on an average of 8 years, to 1842.	32.	73.
Rapes and assaults with intent.	17.	44.

He states that the fallacy of the geometrical reasoning, which erects pestilence into a good, is further illustrated by the effects of the proportions of the dependent populations of Ireland. Thus in England the population above 15 and under 50 years of age in every 10,000 is 5,023, and this 5,000 have 3,600 children below 15 years of age dependent upon them. In Ireland the population

above 15 years of age is 4,900—in other words there are 125 less of adults in every 10,000 and this smaller proportion of living adults with 8 or 10 years less span of life, or working ability, have 4,050, or 450 more children dependent upon them. In England there are 1,365 persons in every 10,000, or 13½ per cent., above 50 years old, to exercise the influence of their age and experience upon the community. In Ireland there are only 10 per cent., or 1,050 in every 10,000 of the population above 50 years of age.

"If the deaths in the whole of England and Wales had been in the proportions attained in some districts, and attainable in all, namely 1 in 50, there would during the year have been 31,866 funerals less, and more than ten times that amount of cases of sickness the less.

"If the proportion of births in the whole kingdom had been the same as those occurring in average healthy districts, such as that of the town district of Hackney for example, of 1 to 42, there would have been 139,958 births the less to make up for the excess of deaths.

"It may be observed that whilst in England there are 5,025 persons between 15 and 50, who have 3,610 children or persons under 15, in America there are 4,789 persons living between 15 and 50 years of age, who have 4,371 children dependent upon them. In England there are in every 10,000 persons, 1,365 who have obtained above 50 years' experience, in America there are only 830.

"The moral consequences of the predominance of the young and passionate in the American community, are attested by observers to be such as have already been described in the general sanitary report as characteristic of those crowded, filthy, and badly administered districts in England, where the average duration of life is short, the proportion of the very young great, and the adult generation transient.

"In the course of some inquiries under the Constabulary Force Commission, as to the proportions of a paid force that would apparently be requisite for the protection of the peace in the manufacturing districts, reference was made to the meetings held by torchlight in the neighbourhood of Manchester. It was reported to us on close observation by peace officers, that the bulk of the assemblages consist of mere boys, and that there were scarcely any men of mature age to be seen amongst them. Those of mature age and experience, it was stated, generally disapproved of the proceedings of the meetings as injurious to the working classes themselves. Those older men were assured by their employers were intelligent, and perceived that Capital and large Capital was not the means of their depression, but of their steady and abundant support. They were generally described as being above the influence of the anarchical fallacies which appeared to sway these wild and really dangerous assemblages. The enquiry which rose upon such statements was, how it happened that men of mature age feeling their own best interests injured by the proceedings of the younger portion of the working classes, how they, the elders, did not exercise a restraining influence upon their less experienced fellow workmen? An inquiry of the owner of some extensive manufacturing property on which between 1,000 and 2,000 persons were maintained,

at wages yielding 40s. per week per family, whether he could rely on the aid of the men of mature age for the protection of the Capital which furnished them the means of subsistence? He stated he could rely on them confidently. But on ascertaining the numbers qualified for service as special constables, the gloomy fact became apparent that the proportion of men of strength and of mature age for such service were but a small group against a large crowd, and that for any social influence they were equally weak. The disappearance by premature deaths of the heads of families and the older workmen, at such ages as those recorded in the returns of dependent widowhood and orphanage, must to some extent practically involve the necessity of supplying the lapse of staid influence amidst a young population by one description or another of precautionary force."

It was part of the population doctrine at the commencement of the present century that poverty was the result of an inevitable law, and was hence the parent of crime. This, if true, would have thrown great obstacles in the way of the penal administration, but Mr. Chadwick states that a careful and close inquiry, made under the constabulary force commission, he "could find scarcely an instance of a respectable workman falling into habitual delinquency from the pressure of any distress, which the exercise of ordinary prudence would not have averted—the general condition of habitual or professional depredation being that in the absence of a proper preventive police, and in the absence of appropriate penal administration, delinquency paid better than regular industry." And even as to the penal statistics received by Parliament and the public, as certain measures of the extent and progress, it was demonstrated that they were wholly fallacious. As an example, having reference to the social evil, which has lately attracted great attention in the metropolis, Dr. Colquhoun, a police magistrate, in a work on the "police of the metropolis," which has been received as a text-book, stated the number of the professed prostitutes at the commencement of the century as upwards of 50,000, and it was generally assumed that since then, they had increased in a greater proportion than the population, but on an actual enumeration, it was found that even with an unavoidable reduplication of numbers who were enumerated in the districts they resorted to, as well as those they resided in, that the actual number in the metropolis did not exceed seven thousand.

Adam Smith himself, from hasty generalization, has fallen into much error. For example, in speaking of the effect of the division of labour upon the intellectual condition of the masses, he says, "In the progress of the division of labor the employment of the far greater part of those who live by labour, that is, of the great body of the people, comes to be confined to a very few simple operations—frequently one or two. But the understandings of the greater part of men are necessarily formed by their ordinary employments. The man whose whole life is spent in performing a few simple operations, of which the effects, too, are always the same, has no occasion to exert his understanding, or to exercise his invention in finding out expedients for removing difficulties which never occur. He naturally

loses, therefore, the habit of such exertion, and generally becomes as stupid and ignorant as it is possible for a human being to become. The torpor of his mind renders him not only incapable of relishing, or bearing a part in, any rational conversation, but of conceiving any generous, noble, or tender sentiment, and consequently of forming any just judgment concerning many of the ordinary duties of private life. Of the great and extensive interests of the country he is altogether incapable of judging." (*Wealth of Nations*, B. v. c. i.) Other economists have adopted these gloomy views of the influence of the subdivision of labour. It is not to be supposed of such a man as Adam Smith that he drew this picture solely from imagination, and that he had no instances, as he might have had, of the kind described. Mr. Chadwick, whilst denying the fact as to the general results being as predicated, asserts that the very reverse is the actual tendency of the progress of labour. He finds laborers engaged in subdivisions of labor consisting of semi-automatrical operations, manifesting a higher degree of mental cultivation than others whose occupations are in varied occupations requiring more of thought. He finds hand-loom weavers studying geometry, shoe-makers advanced in polemics, tailors prominent in politics, whilst engaged in labour consisting of simple movements, chiefly repetitions of motions, all of which are being superseded by machinery. The machinery itself commonly requires a higher degree of responsible attention by the person directing it, but not all his attention, as assumed by Adam Smith, who had overlooked the psychological fact, which would have become manifest to closer and wider observation, that distinct mental operations often assist each other, that two mental operations may often go on better together than separately. Such laborers, in semi-automatrical processes, and superintenders, and workers of machinery, often hire persons to read to them during the work, and employers commonly find the work go on the better for the accompaniment of the second train of ideas raised by the reading, as the march of soldiers proceeds the better by the excitement of the imagination created by music. Subdivisions of such labor, instead of confining the mind to the process, liberate it, instead of depressing the mind, give room for its expansion, and open it to the reception of agreeable impressions. With the educated work people, singing and poetry attach themselves peculiarly to the semi-automatrical processes. If a man, who being compelled to earn his own livelihood, would study, or would indulge the imagination, he would seek for the purpose a peculiarly simple subdivision of labour. It is the manufacturer, the provider of the capital and machinery, the director of the processes, whose mind is commonly confined and narrowed to them, and who may not study geometry, though the educated hand-loom weaver may, and does. Whilst the more intelligent operatives in some of the manufacturing towns are found trooping in the evening to lectures and reading-rooms, the employer commonly, and certainly at the commencement of his business, and in bad times, and under competition, who has been obliged to shut his ears to the music and song of his workpeople during the day, and at night, if he have any force

left, he is constrained to look over his books, to ruminate over the day's outgoings, and probable incomings, the chances of bad debts, and the pressing needs of the payments due from him, as well as the chances of the failures of crops. The better paid workmen are often stouter and less careworn in their appearance than their masters. Prosperous workmen, who in their promptings of a laudable ambition, become small masters, or undertake positions of greater responsibility, requiring more attention to a greater variety of technical operations, are commonly after a time seen to have undergone a disadvantageous personal change, in which the effects of the care and anxieties belonging to their new condition are visibly manifest in their countenances.

But it is just to state that errors of imperfect investigation, and of hasty generalisation, are proved by the official reports relating to the condition of the laboring classes to be more frequent among members of the legislature, and even amongst practical men, the larger employers of laborers, than amongst philosophical and economical writers.

This fact was particularly displayed by the investigations under the commission of enquiry into the labor in factories, where though manufacturers, men of education, were met with, who had sound views, yet it was clear that if conclusions had been adopted upon the votes of the majority on either side, both would have been wrong. The claim put forward on behalf of the children employed in factories was a forcible limitation of their labor to ten hours a day. But on investigation it was proved that ten hours' labour for young children was excessive, and that efficient means for insuring even that limitation were wanting. Mr. Chadwick, who had charge of the bill, contended for a practical limitation of the labor of children under 13, to six hours a day, with securities for three hours daily instruction, to prevent them from being excluded from education, as also to prevent them from being used in double sets. But this plan was pronounced to be impracticable, and opposed by several of the leading agitators. Whilst these arrangements and others destructive of nightwork, and the use of double sets of laborers for long hours, and any regulations to limit the daily duration of factory labor, were resisted by manufacturers on assumed economical grounds, they asserted that any limitation of the hours of factory labor would be ruinous. In the first place they declared that the quantity of goods which could be turned off in a given time was fixed, that the interest of the outlay of capital in machinery, buildings, &c., and establishment charges, are fixed, and required given amounts of labor to pay for, say ten or eleven hours per diem, and that to cut off the eleventh or even the twelfth hour, was to cut off the profit which was the inducement to provide the capital and machinery, &c. On investigation, it turned out that the manufactories which were worked the longest hours, which according to this theory should have been the most prosperous, were the poorest, and that those which were worked with double sets, night as well as day, instead of making great fortunes, the most frequently became bankrupt, and, it may be added, are nearly all now extinguished. The truth had been overlooked that the proper working of ma-

chinery requires attention, and that physiological conditions prevent attention being sustained beyond given periods. It was proved that where the working of machinery was prolonged beyond given periods, the proportion of spoiled work increased and the total quantity of work turned off diminished, so that instead of the profit beginning at the last hour, or hours, which the practical manufacturers declared to be necessary, the loss generally began then. The principles of legislation as proposed by Mr. Chadwick and his colleagues having been carried against this opposition, and subsequent legislation for the reduction of the hours of labour of other young persons below the adult stage, having effected a reduction of the hours of labour in factories from twelve hours or more, to ten hours and a half of daily labor; and this limitation having compelled the adoption of improved arrangements, it is now admitted that the stock of working hands having become more vigorous, and capable of giving a better attention to larger amounts of machinery put under their charge, the regulated cotton manufacture has attained a degree of efficiency beyond any which it previously possessed, that the change has been accompanied by greatly extended investments of capital, and that the regulated manufacture is now capable of competing with unregulated labour, and long manufacturing hours and low priced labor in any part of the world. Manufacturers subject to the law are now recommending its extension, especially the extension of the half-time system of work and education for children, to other branches of industry.

The tendency of the official investigations conducted by Mr. Chadwick has been to abate despondency, and to give more hopeful views for the future of the working classes than has been taken by other economists. In a paper read before the Congress of Bienfaisance held at Brussels, he developed self-acting causes for the advancement of wages with the advancement of agriculture and the manufacturing arts, causes to a great extent independent of the numbers of workmen as affecting the demand and supply of labour. Some extracts from this paper will be found in their proper place.

On the means of Insurance against the casualties of sickness, decrepitude, and mortality. Westminster Review, April 1828, republished by C. Knight, in 1836.

This article was much quoted for its answer to Mr. Morgan, the actuary of a very successful insurance company, the Equitable, who contended that the mortality tables chiefly in use, the Carlisle, were founded on laws which were settled, and that no change could be made in the table with advantage. The article contended that the occurrence of sickness and mortality was governed by the surrounding conditions in which human beings were placed, and that as these changed, so must the insurance provisions or laws in respect to them be altered. It also shewed that these changing conditions in respect to the laboring classes not having been attended to, the existing insurance provisions for them were untrustworthy and ruinous. This article has been referred to as laying the foundation of sanitary science, that a great proportion of the sickness and mortality prevalent in the community, is dependent not on

fixed laws or conditions, but on such as are in many cases removable, or preventible by due legislative and administrative means.

On the administration of public charities in France, with a view of the means now adopted for the relief of pauperism and mendicity. London Review, 1828.

This article opened up the consideration of some fundamental principles of Poor Law administration, as that of aggregation of means, or as it is called by opponents, centralisation. The views contained in it have already been explained above. The article opened out the application of the economical principle of *aggregation for the purpose of segregation*, or classification, to effect a division of labor, to poor law and other branches of administration, as opposed to the plans of other economists and administrators of dealing with small parishes separately and independently. The study of the subject evinced in this and other connected articles led to an application to Mr. Chadwick to assist in the investigation of the administration of the poor laws in England.

This article also opened out the use of competitive examinations, or the *concours*, as a means of testing the fitness of junior candidates for admission into the public service. The principle was afterwards adopted and advocated by Mr. John Stuart Mill, and in part carried for the Indian Civil Service, and was next supported by Sir Charles Trevelyan, for application to the public service in England.

A Preventive Police. London Review, 1829.

This article displays the inefficiency of the parochial night watch and police, and objections to the ordinary repressive or detective action of such forces, and puts forward some leading principles for the preventive action of a new police. This article, which preceded Sir Robert Peel's bill for the establishment of a metropolitan police in 1829, produced a considerable impression at the time. It led to Mr. Chadwick's being sent for by Jeremy Bentham, and to the commencement of an intimacy with the philosopher, and a residence with him till his death.

In Mr. Chadwick's views the administrative action of a police should be concurrent with the action of a service for the relief of indigence, for the prevention of the economical charge, as well as for the prevention of the crimes involved in habitual mendicancy and vagrancy. In this view mainly, and upon his suggestion, a commission was appointed in 1838, for examining the constitution and action of the constabulary force throughout the country. He was appointed as a Commissioner for the purpose, and had for his colleagues Mr. Charles S. Lefevre, now Lord Eversley, as representing the county magistrates, and Colonel the late Sir Charles Rowan, the Commissioner of the new Metropolitan Police, as representing the practical experience of that force. The latter always expressed high admiration for the powers of investigation and judgment of his colleague, and adopted this as a text book of principle for the organisation of such forces.

On the Taxes on Knowledge. Westminster Review, 1831.

At the time of the agricultural riots and attacks on machinery in 1830, Dr. Whately and other economists were desirous of informing the po-

pulation on the subject, but they were debarred by finding that population inaccessible to communication by print. Agricultural laborers were not in the habit of reading even the local newspapers. Mr. Chadwick directed his attention to this state of things, and wrote the above article, which was afterwards reprinted and circulated with the support of Dr. Arnold, and other public men. In that article Mr. Chadwick first gave the designation which has since been attached to all the fiscal imposts by which the circulation of political and other knowledge is impeded. He shewed that whatever might be the objections to the existing means of communication by newspapers, or by print, it was a great improvement on verbal communication, in which the most noxious errors circulated without answer, and that the method by print was in all respects the most responsible and the least dangerous. To tax the press was to tax a better description of knowledge, however inferior to that which might eventually be communicated. Mr. Chadwick's views were first adopted by Sir Edward Bulwer Lytton, and brought forward by him in Parliament, where the question was first designated as "Mr. Chadwick's question." It was afterwards prosecuted by Mr. Milner Gibson, and eventually carried as regards advertisements and newspapers, and hence the cheap press which is now making rapid strides in England. In that article the following economical doctrine was stated, "it may be proved from an intimate inquiry into the means and habits of the people, that the capacity to purchase gratifications which do not form part of what are considered the necessities of life, extends in number from certain points in proportion to the cheapness in a greater than a geometrical ratio. Thus if in any town, or place, composed of the average proportions of the different classes of society, there are found one hundred persons who can purchase a work sold for one shilling, there also will be found more than three hundred able or disposed to purchase a work sold at three pence, and so on."

The elementary fact here indicated is one of great importance for the government of prices, with the view of obtaining the maximum of returns, as in charges for railway service by fares. Its application to postage has led to a five-fold use of the service. In the press since the repeal of the chief taxes the operation of the principle has been displayed in this, that whereas the sale of established weekly journals sold at 7d. were under 4,000, those at 4d. average 10,000, those at 2d. averaged 20,000, those at a penny upwards of 100,000. The sale of publications by which the vendor obtained a profit of a farthing each has in particular instances become five-fold of those in which he obtains the profit of a penny. Further observation would be necessary to ascertain exact ratios, and to define the operation of the principle, requiring an examination of the proportions and conditions of different classes of society. Thus, to take a medium community, that of the City of Bristol, we find the proportions as denoted by the different rentals of the houses they occupy, those of £5 and under, forming 27 per cent. of the population, those at £10 and under, 26 per cent; those at £20 and under, 20 per cent; those at £30 and under, 9 per cent; those at £40,

4 per cent; those at £50, 2½ per cent; those at £60, 2 per cent; those at £70, 1½ per cent; those at £80, 1 per cent; after which the proportions are reduced to fractions. The study of the like proportions, and such others as the numbers of fund-holders of different amount, is important as correcting popular conclusions from the more conspicuous cases, as to the amounts of contribution and relief obtainable by taxing large properties.

In this article on the Taxes on Knowledge, the question was raised of utilising the postal service for the conveyance of books, as well as letters. The economical grounds were thus stated:—"That the government having already established the complete agency for the distribution of letters, this same agency might be used to distribute the great mass of publications by post at a comparatively small additional expense. That to compete with the public establishment, the private distributors or vendors must maintain an agency almost solely for this one purpose. In all cases of the delivery of letters from the post office, the labor of distributing a great quantity of other things may be performed without any material additional expense. The postman who traverses a street to deliver half a dozen letters may in passing through it, deliver twenty or thirty newspapers, without any material additional expenditure of time, and the labor is all in his day's work. But the private vendor must employ a person for the one purpose of delivering the newspapers, and he cannot therefore do it so cheaply as the government." The economical principle contended for is that of saving establishment charges, which, howsoever multiplied, must eventually be at the expense of the public. The postal service has been utilised for the conveyance of books, and in a report made to the Society of Arts, Mr. Chadwick, with other persons, contended that it should be applied to the distribution of small parcels, as in Prussia and other States—but not as a monopoly. Before a Committee of the House of Commons, the railway companies represented that the conveyance of books by post was detrimental to the railways. In answer to this complaint it was proved by Mr. Rowland Hill, on the evidence of booksellers, that but for the transmission of the post, such works would not be sent at all, the railway charges being prohibitory, and consequently the railway companies instead of losing, gained by the consequent increased traffic of the articles in bulk, the post office performing the service of minor distribution through its 10,000 collecting-houses, with as many portrages for deliveries, which, it is contended, ought to be utilised for the public service, since it is impossible they could be rivalled by private companies, except at augmented expense which must be paid for. On the same economic grounds Mr. Chadwick contends that a cheap electric telegraph should be united to the postal establishment, as in Switzerland, and other continental states.

Report on the Administration of the Poor Laws—1833. The government being desirous of ascertaining the progress of the inquiry conducted by the Commission, at the head of which was the late Bishop of London (Blomfield), supported by the Bishop of Chester (Sumner, now Archbishop of Canterbury), who had written articles on poor

laws for the Encyclopædia Britannica; Mr. Senior, the Professor of Political Economy at Oxford; Mr. Sturges Bourne; Mr. Walter Coulson, now the chief government legal draftsman. The commission transmitted extracts from the information they had received, chiefly reports from the gentlemen acting as assistant commissioners. These extracts, including Mr. Chadwick's report, were published and circulated previously to the preparation of the Commissioners' final report, for which these extracts served to prepare the public mind. Lord John Russell in the course of a speech in Parliament, stated to the House that if they referred to Mr. Chadwick's report, they would find there the germ of that amendment, which in his opinion had saved the country from great social evils, if not absolutely from social revolution. Lord Brougham repeatedly referred to Mr. Chadwick's treatment of the subject in the highest terms. In consequence of the most searching and cogent nature of the evidence adduced by Mr. Chadwick, his general outline of remedial measures was accepted by the public, and by the Commissioners. He was at their request placed on the Commission to aid in the preparation of their report. This report opened up by the course of investigation the economy of sanitary measures, as a means of preventing pauperism (p. 316). He next drew up for them, to be submitted to the Cabinet, a concise exposition of the measures which they agreed to recommend, and he was charged with the more full exposition of remedies in their general report. Mr. Senior being charged with the statement of the evils as developed by the evidence collected under the commission. Mr. Senior gave a general literary supervision to the—

Report from his Majesty's Commissioners for inquiry into the administration and practical operation of the Poor Laws. February, 1834.

This Report had the unprecedented sale of upwards of 9,000 copies.

On the principles and progress of the Poor Laws' Amendment Act. Reprinted from the Edinburgh Review, with notes and additions. London, 1837.

This article in a condensed form contained a reassertion of the economical and administrative principles of the measure, with an exposition of the results of such of them as had up to that time been brought into operation. The student in Political Economy, or in legislation on the topic, will find in this paper the most compact exposition of principles which are spread over several volumes of the official report.

The first Report of the Central Board of Commissioners appointed to collect information in the manufacturing districts on the employment of children in factories, and as to the expediency and means of curtailing their labour. 1833. 2nd and 3rd Reports, 1834.

These reports, and the subsequent reports of Mr. Horner, and other inspectors appointed under the Factories Act, evolve important points of political economy, as to the treatment of the stock of labor of a country, and as to whether or not, it should, on economical principles alone, be subjected for its protection to legislative interference, and administrative control. The first Report was a joint one, in which the evidence on the economical principles involved was most

specially dealt with by the late Mr. Thomas Tooke, the author of the *History of Prices*; the legislative and administrative questions, by Mr. Chadwick; and the medical testimony as to the effect of long hours of labor on the health of young children, by Dr. Southwood Smith. The agitation had been for a simple ten hours bill for the whole of the factory workers, adults as well as children. The report concluded that a case had only been made out for legislative interference for the protection of those who were not free agents, who did not make contracts for themselves, namely, very young children. That for the protection of them, the state was bound to interfere in order to prevent the future stock of labor of the country being deteriorated, bodily, by overwork, and mentally and morally, by exclusion from education. For very young children the ten hours' labor agitated for was pronounced to be too long. The board agreed to eight hours as a compromise. But Mr. Chadwick who was charged by the government with the preparation of a bill provided practically for a limitation to six hours' labor for them, so as to enable employers to work them in double sets. It was made a condition of the employment of children in the factories under regulation, that they should bring with them a certificate from a competent school teacher, that they had been three hours a day during the week preceding in a school. This was the half school time system. The administrative provisions for schools and competent teachers were crippled in the House of Lords, lest they should lead to a national system of education. It was contended by manufacturers that the restriction proposed would diminish the productive power of the country, as against foreign competitors, but testimony has been given that from the superior efficiency of the regulated labor, it is as productive as in those countries where the labor is entirely unregulated by administrative interference. From the admitted success of the half-time system introduced by the Board, it has been recommended by manufacturers for introduction into agricultural districts for educational, as well as for industrial and economical results. The extension of the principles of legislation to other branches of manufacture, and to mining operations, is constantly agitated for. The same principles of legislation are in course of extension in France, Belgium, and Prussia.

The first Report of the Commissioners appointed to inquire as to the best means of establishing an efficient Constabulary Force in the Counties of England and Wales. 1839.

One main effect of this Report was to display the services needed for a trained force for other purposes, in addition to the purely penal purposes of the pursuit of criminals, or for the prevention of the loss of life and destruction of property from fire and other calamities, in reporting on the state of the roads, and maintaining the free transit of goods. The economical elements developed were in giving new securities to production and accumulation, and of giving them in reduction of existing charges. But this could only be accomplished by an extended organization of a general trained force, whose action should centre in the towns. The government could only attempt a permissive force for the

counties, exclusive of the towns where the Parliamentary interests were too strong.

In an inquiry, before a Parliamentary Committee of 1853, into the fragmentary execution of the measure in various counties, it was proved on the evidence of farmers that it gave an increased value to land, and that when fairly carried out, even without any combination of the towns, the expense of the new county police did not exceed that of the old parochial constables, and that the additional new force might be conferred, gratis, by an improved administration. Only a further extension of the permissive principle was, however, attempted by the government, and that by a payment of a proportion of the expense from the consolidated fund. The first report developed the principles of the organization of a preventive police service. Materials were collected for the preparation of another report on the principles of prevention, and on the preventive action of a police service when organized.

The general report on the Sanitary Condition of the labouring population of Great Britain. 1842.

Nearly 10,000 copies of this report were sold or authoritatively circulated. In the dedication to Mr. Chadwick, of a treatise on the decrease of deaths by the progress of civilization, by Dr. Muroc, of Göttingen, and Dr. Willis, the librarian of the College of Surgeons, they treat this report as beyond all question one of the most valuable contributions that has lately been made to the noblest department of medical science, the art of preserving the health of the community, and will have an influence upon the human family as long as it exists.

The leading conclusions contained in this report, which have a bearing on economical science, are thus stated.

That high prosperity in respect to employment and wages, and various and abundant food, have afforded to the laboring classes no exemptions from attacks of epidemic disease, which have been as frequent and as fatal in periods of commercial and manufacturing prosperity as in any others.

That the formation of all habits of cleanliness is obstructed by defective supplies of water.

That the annual loss of life from filth, and bad ventilation, are greater than the loss from death or wounds in any war in which the country has been engaged in modern times.

That of the 43,000 cases of widowhood, and 112,000 cases of destitute orphanage, relieved from the poor-rates in England and Wales alone, it appears that the greatest proportion of deaths of the heads of families occurred from the above specified and other removeable causes, that their ages were under 45 years, that is to say, 13 years below the natural probabilities of life, as shewn by the experience of the whole population of Sweden.

The experience of the effect of sanitary measures proves the possibility of the reduction of sickness in the worst districts to at least one-third of the existing amount. Amidst classes somewhat better situated, it was possible to reduce the sickness to less than one-third, it was an under-estimate to take the probable reduction at one-half. Taking it, however, at one-half, by the new payment of 1½d., or say 2d. weekly, for

drainage, the occupants of the tenements will save 7½d. of the weekly contribution for an allowance of 1s. per week each during sickness. But the allowance insured to be paid during sickness only replaces the earnings; the sickness, besides his own misery, entails the expense of medical attendance, which, at the usual rate of insurance in medical clubs, would be 5s. or 6s. per annum for such a family. This would also be reduced one-half, making the total family saving at the least 9d. weekly. But the single payment for structural alterations is to be regarded as general, and as a means of affecting the whole of the objects for the whole of the population. For this 2d. each tenement, or 1d. each family, then, they will not only save double the weekly amount, but they will save in the wear and tear of shoes and clothes from having a well drained and well cleansed, instead of a wet and miry district to traverse, they will also save the sickness itself, and each individual will gain a proportional extension of a more healthy life. In a district, where the wages are not one-half the amount above stated, the expenditure for efficient means of prevention would still leave a surplus of gain to the laborer.

These are the chief gains on the side of the laborer, but in general, every laborer, over and above what he consumes himself, produces enough to repay the interest on capital, and cost of superintendence, or the profits of the employer. The loss of this extra production is the loss of the community during the whole time the services of the laborer are abridged by sickness or death. To this loss is to be added, where the laborer has made no reserve, the loss of the cost of his unproductive maintenance as a pauper, and of medical attendance during sickness.

The existing insurance charge then represents the existing charge on the labouring classes from the loss of wages consequent on sickness, to which charge might be added the existing additional charge denoted by the insurance on account of the abridged duration of life and more frequent deaths."

This report, at the Birmingham meeting of the National Association for the Advancement of Social Science, Lord Stanley, as President of the Health section, stated, had been, ever since its application, the chief text-book of sanitary science.

A supplementary report on the results of a special inquiry into the practice of interments in towns, made at the request of Her Majesty's principal Secretary of State for the Home Department. 1843.

This report prepared the materials for the legislation for the discontinuance of the practice of intramural interment, now in progress in England and Wales. It displayed the practice of secret murder for burial money, and represented the need of the appointment of independent officers of health, to verify the cause as well as the fact of death, for the protection of survivors. It represented the need of reducing funeral expenses for the poor, and further, displayed the terrible condition in which they frequently were placed by the occurrence of death, and the prolonged retention of corpses in the only living and sleeping-room of the survivors, and urged the adoption of the plan of reception chapels for

keeping the remains of the dead until provision could be obtained for their proper interment. He renewed the subject of the state of the provisions amongst the labouring classes, for insurances against the casualties of sickness. Under the general Board of Health, of which Mr. Chadwick was the chief paid commissioner, with the assistance of Dr. Southwood Smith, as medical commissioner, the investigation was renewed, and a report made with a view to the special application of the principles of amendment in the metropolis. But these were frustrated by local opposition. The course of duty, according to Mr. Chadwick, was to submit complete remedies, whether they were in advance of the legislative administrative capacity of the time or not, and to leave to others the responsibility of cutting them down, or adapting them by compromises. This individual bent is exhibited in the following concluding passage of the report on interments of 1843.

"I would in conclusion beg leave to repeat and represent urgently, that Her Majesty's Government should only set hands to this great work when invested with full powers to effect it completely, for at present there appears to be no alternative between doing it well or ill, between simply shifting the evil from the centre of the populous districts to the suburbs, and deteriorating them, fixing the sites of interments at convenient distances, forming numerous separate and weak, and yet enormously expensive establishments, aggravating the expense, and physical and moral evils of the delay of interment, diminishing the solemnities of sepulture, scattering away the elements of moral and religious improvement, and increasing the duration and sum of the existing evils. There appears to be no distinct or practicable alternative between these results, and affecting such a change as, if zealously carried out, will soothe and elevate the feelings of the great bulk of the population, abate the apprehensions of the dying, influence the voluntary adoption of beneficial changes in the practice of obsequies, occasion an earlier removal of the dead from amidst the living to await interment, and insure the impressiveness of the funeral service, give additional securities against attempts on life, and trustworthy evidence of the fact of death, with the means of advancing the protection of the living against the attacks of disease, and at a reduced expense provide, in well arranged national cemeteries, places for public monuments, becoming the position of the empire amongst civilized nations."

On the demoralization and injuries occasioned by the want of proper regulations of laborers, whilst engaged in the construction and working of railways. London, 1845.

Among the preventible causes of pauperism which came within Mr. Chadwick's observations, was the excessive number of accidents occurring to laborers in the course of the construction and working of railways, and he determined to call the special attention of the public, and of Parliament to them, which he did by a paper, read at the statistical society of Manchester, published as above, in a pamphlet.

He shewed that from the reckless manner in which some of these works near Manchester were conducted, the casualties of wounds and per-

manent disablement, and deaths to laborers, were as great as those occurring to equal numbers of soldiers in battle, and that by the hulk system, they are defrauded of part of their wages, and by the mode in which the workmen were brought together, they were led into habits of intoxication, so that the extraordinary expenditure in wages did mischief rather than otherwise to those who ought to benefit by it. He procured the appointment of a committee of the House of Commons to investigate the subject. In respect to the injuries, disablement, widowhood, and orphanage occasioned in the course of the works, he mentioned, as a general principle applicable to all large works, mining works, collieries, or other similar undertakings, that the whole of the pecuniary consequences ought to be charged on the employers, and not be thrown upon the ratee, or upon society at large; even assuming that they were pure accidents. If, they were assumed as entirely unavoidable, then they should be charged upon the consumers of the commodity, in the production of which they occurred. The employers would then charge it, in the case of collieries and mines, upon the cost of production, to which it would form only a small addition, whilst it would constitute a bounty on careful arrangements in the selection of educated and more safe workmen, to whom for the gain to be obtained from the greater safety derivable from greater intelligence, it would be worth to pay better wages on account of that education, and that such employers on a large scale, ought not to be allowed to charge upon society the consequences of employing, for the sake of low wages, ignorance in conducting dangerous works, which could only be safely conducted by intelligence. The attention directed to the subject led to partial legislation by Lord Campbell's Act, which as a compromise with various interests in the House of Commons, limited the compensation of survivors to cases where blame could be proved. This limitation it has recently been contended is prejudicial to the employers, as involving them in litigation, for in the larger proportion of accidents blame is imputable, and as preventing the imposition of the costs as a regular insurance charge upon the commodity which they might otherwise do.

We may observe that the principle contended for by Mr. Chadwick, that employers should be answerable to workmen for accidents occurring to them in their business, is to a considerable extent, if not entirely, the law of Scotland, where it is held that if one workman injures another in a manufactory, the injured workman has a claim against the employer for the carelessness of his fellow workman. A case of this nature was decided recently by the Court of Session, in accordance with what was always understood to be the common law of Scotland, it has however been taken up by appeal to the House of Lords. We agree with Mr. Chadwick that it is a very beneficial principle, and we hope the decision of the Court of Session may not be reversed.

Report on Quarantine. 1849.

Succeeding Reports made under the Metropolitan Sanitary Commission were partly administrative and partly medical, the medical course of investigation and exposition being assisted by

Dr. Southwood Smith, Professor Owen, and Mr. Hodgson of the College of Surgeons. These reports chiefly relating to typhus, cholera, and other forms of epidemic disease, extended the demonstrations of their preventibility and their independence of poverty, as invariable antecedents, as assumed by most of the followers of Malthus.

Other reports followed, setting forth the results of further investigations, under the general Board of Public Health, when Dr. Southwood Smith acted as medical commissioner. The most important of these was that on quarantine, setting forth the errors prevalent on the subject, and the futility of quarantines, as a means of preventing the spread of epidemics, and displaying the evil effects of these errors, morally, on the public mind, and economically, in checking intercommunication. This report was translated into French and Italian, and circulated widely on the continent. The medical and administrative doctrines which it put forth were recognised as sound by the medical authorities of France, and were in substance adopted by a sanitary congress held at Paris, at the instance of the French government.

Report on Yellow Fever. 1854.

This report gave further illustration of the doctrines put forth in the report on quarantines, and displays the detection of false facts promulgated in support of the instructions for their enforcement. Several assistants were sent out from the Board of Health to deal with the epidemic cholera in the West India Islands. The report of one of these assistants, Dr. Milroy, contained very important facts, displaying the barbarous state of the population and of administration, and the great waste of productive power and pecuniary loss from an excessive mortality, all of which admitted of economical prevention by sanitary measures.

A series of reports followed, setting forth the results of investigations under the General Board of Health, involving economical, as well as engineering and sanitary results. The economical results displayed being the gain of populous districts from steam power and well-directed engineering appliances, in the collection of water from long distances, and its distribution to the tops of the highest tenements, at a far lower rate of expense than by the hand labour of inmates, or of water-carriers, even if water was to be had from wells, or ponds at the doors, gratis—also the practicability of the removal of all foul water and decomposing refuse from towns by self-cleansing channels, at a cheaper rate than any cleansing of cesspools, or any removal of foul matter by hand labor. It was shewn that the expense of sanitary engineering appliances, when in complete action, would be considerably less than the insurance charges against the expense of the excessive disease and premature mortality arising from the atmospheric impurities which these appliances, when directed by competent sanitary science, prevent. Demonstrations were given that the distribution of the refuse of towns was to be effected with the like economy by engineering appliances, as compared with hand labor. The system of works laid down was that of a venous and arterial system of constant supply, of circulation, and removal from towns. One collateral result of these appli-

ances was the removal of inferior classes of laborers, engendered by the inferior conditions of labor in towns, created by foul and degrading processes.

Report of the General Board of Health on the Supply of Water to the Metropolis. 1850.

Minutes of information on the drainage of the land forming the sites of towns; on road drainage, &c. 1852.

Minutes of information on the drainage of dwelling-houses, and the sewerage and cleansing of towns. 1852.

Minutes of information on the application of sewer water and other town manures to agricultural production. 1852.

In these reports are to be found deductions from wide past experience for the guidance of new colonies, in the selection and treatment of new sites and habitations, to avoid the waste of life and the loss of power by which the progress of so many have been impeded.

Report on the administration of the Public Health Act, from 1848 to 1854.

This report sets forth that by more systematised works, two houses and two towns might be supplied with water constantly and well, at an expense heretofore incurred for supplying one intermittently and ill; and three houses and three towns drained well at an expense hitherto incurred for doing one ill, and that better considered local privileges were conferred at one twentieth the expense theretofore incurred by the old procedure for obtaining local Acts of Parliament. In the latter Report, there was contained a vindication of the economy of administrative principles of local and central action, enunciated by Mr. Chadwick in the following terms respecting the proper position and principle of action of a central board. "First, as a responsible agency for the removal of those evils, in the repression of which the public at large have an interest. Next, as an authority for appeal in disputes between conflicting local interests. Thirdly, as a security for the due distribution of local charges, for the protection of minorities and absentees against wasteful works or improper charges; and fourthly, as a means of communicating to each locality, for its guidance, the principles deduced from the experience of all other places from which information may be obtainable." All the legislative arrangements proposed had a wide economical basis in the prevention of one form or other of waste.

On the application of Sanitary Science to the protection of the Indian Army.

This paper was read at the Liverpool meeting of the Association for the Advancement of Social Science, 1858, and published in their transactions. In it Mr. Chadwick adduces evidence to shew that the doctrine that the Anglo-Saxon race, or that Europeans cannot live, or labor, or last, or that their children cannot live in India, or in colonies in the tropics, is wholly erroneous. That the excessive mortality is due in part to local causes of disease, jungles, marshes, stagnant and impure air, which are removable by engineering art directed by sanitary science, and in part to grossly bad habits of life, and ignorant treatment of children. He shews that under moderately good conditions the death rate in India is lower than in some of the English cities. One result

of this exposition and of personal representations, was the appointment of a special commission to investigate the means of applying the means of prevention on which the permanence of European, or the more civilized dominion is dependent.

On the Reorganisation of the Civil Service.
1855.

After the disasters in the Crimea, when administrative reform was loudly demanded by the public, the then Chancellor of the Exchequer, Mr. Gladstone, asked the most experienced of the civil servants for their views as to the most eligible measures of reform. This paper of Mr. Chadwick's displayed the radical defect of the service in ill-arranged business conducted by men appointed and promoted by political patronage, and advocated the superior economy of the service of a few highly qualified, as against many inferior and ill-paid public servants. He repudiated as utterly untrustworthy "pass examinations" for first appointments, and renewed the advocacy of open public competitive, as the only safe test of capabilities, combined with prolonged probations. The principle of open competitive examinations was advocated in two lectures, the one at the meeting of the British Association at Dublin, the other at Leeds, both of which were published in the transactions of the Statistical Society. One economical ground taken as respects these examinations was, that they saved to the public what Mr. Babbage has designated as the labor of verification, and when conducted in a trustworthy manner performed the service of "hall marks" in plate, or coinage in metals. The principle of open competition was affirmed by Parliament, in several divisions against the government.

At the instance of Mr. John Mill, the principle of the open competition was introduced into the Civil Service of India, and at the instance of Sir Charles Trevelyan, and Sir Stafford Northcote, and Mr. Gladstone, into the English Civil Service, at the instance of Mr. Monsell into the scientific department of the army, and is now under partial trial.

De l'avenir de l'agriculture, et des travailleurs agricoles; mémoire présenté au congrès international de bienfaisance de Bruxelles. Publié dans *Le Moniteur Belge*.

Another part of the same topic was treated in a paper published in the transactions of the Society of Arts, mentioned below, on the future of the laborers in the mechanical arts. The object of both papers was to prove that improved and refined processes, or improved machinery, could only be conducted by workmen endowed with increased intelligence. That this intelligence could only be evoked by an interest in the result, that is to say an augmented share of the produce, or increased wages, and that these conditions, or the main one, the interest in the result, is almost entirely independent of the ordinary economical elements of the demand and supply of labor. In illustration of this doctrine, instances were given when on the occasion of a falling market it became necessary to reduce the cost of a manufacture and to make arrangements to enable one workman to manage machinery theretofore managed by two; who had each 18s. a week wages. But though in the depressed labor mar-

ket men were obtainable at a lower rate than 18s. a week wages, it was deemed necessary, on account of the increased responsibility of the superintendence of an increased amount of machinery, to give 24s. a week as wages. The term self-acting machinery was shown not to be of general application, and that the amount of production from machinery was governed more largely than is supposed by the interest and skill in working it. All the large advances in the use of machinery had, as a general rule, been accompanied by an average increase of wages, as well as by a reduction in the price of production. The future of agriculture, that is to say, its greatest profit, was shown to be, instead of a thin production, by rude and simple processes on wide areas, a high production on narrow areas, by which rents, expenses of roads, hedges and transport, are reduced, but for this high cultivation machinery, and more skilful labor, is needed, which increased skill can only be obtained by an increased interest in the work, that is to say, by increased wages, or a proportionate share of an augmented produce. These economical elements he propounds as grounds of hope for a bright future for the masses.

Mr. Chadwick's paper inserted in the *Journal of the Society of Arts*, November 14, 1856, gives many interesting details of the effect of machinery on wages, quite overthrowing the fallacy that machinery lowers wages, whereas its almost invariable tendency is to raise them. It also amply confirms what we have said (*Elements of Political Economy*; p. 106. *COST OF PRODUCTION*) of the fallacy of Ricardo's law that *cost of production regulates value*; for even in the cases to which that law is apparently applicable, it is often just the reverse, it is *Value that governs cost of production*. Mr. Chadwick says p. 805. "The periods of manufacturing distress have heretofore been the chief periods of improvement to the laboring classes themselves. It was an aphorism of the father of the cotton manufacture in England, Mr. John Kennedy, of Ardwick Hall, recently deceased, whose first spinning was by hand—then by a machine worked by a donkey—then by a horse—then by a Newcomen's engine—and lastly by a Watt of 500 horse power, and who had taken part in all the vicissitudes of the cotton manufacture from its commencement, that latterly no extensive improvement was made in the manufacture except in periods of *thread-bare profits*. At these periods, when demand is slackened, when prices fall, the manufacturer is driven to consider and execute whatever improvements he or others can devise, by which the expense of production may be reduced, and his profits be maintained at the reduced price of the market." Which shows very clearly that the manufacturer is obliged to *accommodate cost of production to market price*. The very same thing is notoriously true regarding agriculture. It is true that during the high prices caused by the war and a depreciated paper currency, vast quantities of poor land were taken into cultivation, but it is also true that in recent years the apprehended fall in the price of corn from the repeal of the corn laws, was the great parent of the marvelous progress in agricultural science of late years. In each case value was quite independent of cost of production; in the former case the increased value permitted increased cost of production, in

the latter, the diminished value compelled a diminished cost of production.

Mr. Chadwick also clearly explains the apparent paradox of manufacturers extending their works in times of depression, when unreflecting persons are apt to accuse them of reckless speculation. "But," says he, "on inquiry, I have always found that the capitalists knew best what they were about, and that the investment, instead of being more dangerous, was in reality more safe than ever.

"The economical sequence has appeared to me to be as follows:—

"Long depressed markets have necessitated the consideration and adoption, by the manufacturer, of improvements in processes and machinery, by which the cost of production is lowered to meet the fallen demand.

"These improvements have necessitated for their execution improved labor, at improved wages.

"The reduced price rendered possible by the reduced cost of production, has brought the commodities within the reach of greater numbers, and has stimulated and extended the habitual consumption.

"The restored and extended demand has, in the case of articles of what may be deemed primary necessity for civilised life, been from a higher to a lower class of consumers, who are the least affected by the fluctuation of fashion, or disposed to sudden changes of habit; and hence the consumption is placed upon a wider and firmer basis, rendering employment at the improved wages less liable to extreme fluctuations.

"The improvements in processes and machinery, which have occasioned a demand for improved labor, are attended with the additional security to the operative, that they compel the manufacturer to resort rather to short time, and struggle to the last before he stops his works, for if he once disperses his whole establishment, he may not again get such another together, and on such occasions, he often finds himself in this position,—that whilst he manufactures without a profit, or even at a loss, he will incur more loss by the deterioration which his machinery undergoes when stopped, than by keeping the works going."—(Cost of Production.)

The economical results of different principles of legislation and administration in Europe, especially those involving the principle of competition for the field, as compared with the principle of competition within the field of service. Read before the Statistical Society of London, Jan., 1859.

This paper displays, as a master evil, defective economic science, as a source of extensively disastrous legislation in railways, public works, and public service of intercommunication, and the production and distribution of bread and beer, arising from the public ignorance, that there are different conditions of competition, sound and unsound. That whilst there are conditions of competition which ensure to the public, the most responsible, and the cheapest and best service, and which are requisite for improvements of the greatest magnitude, there are conditions which create inevitable waste and insecurity of property, which raise prices, and check improvement, which engender fraud and violence, and subject the public to irresponsible monopolies of the worst

sort. He then states the condition under which the principle was presented to him. "From 1838 to 1841, whilst examining the sanitary conditions of town populations, I found urban districts in England, where there are two or three sets of water-pipes, carried through streets which might be as well, or better, supplied under one establishment, and competitions ending in strict monopolies, bad and deficient supplies to the public, with low dividends to the shareholders, and an almost impracticability of improvement in their separate condition without augmenting the already excessive charges of the ratepayers, or further reducing the low returns to the capitalists. These competitions are what I then designated as competitions 'within the field of service,' as opposed to that form of competition I proposed as an administrative principle, 'competition for the field,' that is to say, that the whole field of service should be put up on behalf of the public for competition on the only condition on which efficiency, as well as the utmost cheapness, was practicable, namely, the possession by one capital, or by one establishment, of the entire field which would be most efficiently and economically administered by one, with full securities towards the public for the full performance of the requisite service during a given period. The principle was, upon due consideration, extensively adopted, and advocated by permanent public officers, commissioners, and disinterested public investigators, for the regulation of enterprises in railways, then at their commencement. But the views chiefly advocated by speculators and persons who profit by multiplied conflicts, who gain whosoever else loses, were adopted by parliament. The principle was, however, upon independent considerations, adopted by continental administrators and legislators, and the results stand out in wide and undeniable contrast of legislative and administrative ability and integrity. In France, for example, is a much more responsible and regular service for the public at lower fares, with higher priced materials, with dearer fuel, poorer, thinner, and less active populations, and lower elements of traffic, and yet with an average return of from seven to nine per cent. to the original shareholders of the lines worked by companies. In England we have a clashing, immensely more dangerous, unsatisfactory, and generally less responsible service to the public, fares, as contrasted with those of the continent generally, one-third higher; with fuel, iron, and machinery cheaper, and yet with an average return of only 3.06 per cent. to the original shareholders—with extensive ruin to them, with gigantic fortunes to the promoters of conflicts. In France the original shareholders have, moreover, the elements of security and further improvement to their property, whilst the French public have in reversion at the termination of their concessions, the prospect of further reduction of fares, and increased facilities for intercommunication, as a new source of revenue derivable from past economy in the reduction of the general taxation of the country. In England the greater mass of original shareholders have before them the elements of further depreciation and loss, and even ruin, by the bounty afforded by the practicability of cheaper constructions, and competitive extensions."

The paper goes over several wide fields of ad-

ministration, and gives evidence to show that regulation is necessary to the perfect freedom of competition, and of trade, by preventing the competitors from being overweighted by unnecessary establishment charges, and subjected to needless risks and losses, which are equally waste, whether paid for by the private individual, or the public. The views which the paper propounds have been recognized by the chief Economists as corrections of the earlier doctrines of competition and free trade. Mr. Chadwick has introduced the term "economical analysis" as a process practicable for political economy, corresponding to that of chemical analysis. "To give," he says, "a conception of the extent of the financial bearing of the economical question as to the cost of production and distribution on a large or a small scale, I may state that some years ago I had occasion to make what I term an economic analysis of a 4 lb. loaf of bread, that is to say, how much the cost of production, of transport, of distribution, there was in the price, when I found that at the prices and rents of the time, averaging in England 25s. per acre, the rent in the four pound loaf was about three farthings, whilst the cost of distribution was more than three half-pence. On the like economical analysis of the cost of a pound of meat to the consumer, the charge to him appeared to bear the like proportion, i.e., double the rent in the price of the commodity to the consumer. It appeared generally that the cost of distributing the produce of the soil was double the rental of the soil. It appeared by the extension of the field of service and the saving of the charges of unnecessary establishments and labor, the service of distribution might be greatly improved, and the expense reduced to less than one half, or, in other words, the result was indicated of a possible aggregate saving to the community equal to the whole of the general taxation of the country."

We have given this long account of Mr. Chadwick's works partly on account of their great practical importance to the country, and partly because they chiefly lie entombed in blue books, and other places where they are in danger of passing into oblivion, and therefore it is the more incumbent on a person who assumes the office of recording the progress of Economic Science, to bestow particular care that the labors and merits of one to whom so much is due, should meet with just appreciation.

The result of Mr. Chadwick's labors is a pregnant example of what we have always strenuously maintained, that the Inductive is the only true method of investigation in Political Economy. What clouds of wide spread and dangerous error have the investigations with which he has been connected brought to light and dispelled! What a mass of surprising and unlooked-for principles, affecting the most important interests of Society, have been discovered by following the Baconian method of Observation and Experience! And we repeat again and again that the whole field of Political Economy must be resurveyed in the same spirit. When this is done with competent knowledge, it will be found that a great deal of Political Economy is infected with a like amount of error as that part investigated by Mr. Chadwick. When properly explained, it will be found that a very large portion of doctrines cur-

rent in works on Political Economy, is nothing but transparent fallacy and delusion. And there is the greater necessity for its being done at the present day when Political Economy is made the subject of examination in the public services. A careful survey of the whole science on the method pursued by Mr. Chadwick, would produce as great a transformation in it as took place in Mechanics by the researches of Galileo.

CHADWICK, WILLIAM ARTHUR.

The National Debt no debt at all, but what it really is explained, and the "Morals of Money" considered. London, 1855.

CHAILLON DES BARRES, Baron. Born in 1784. Prefect of Creuse under the first French Empire.

Essai sur la législation des grains jusqu'à ce jour. Paris, 1821.

CHAIX, B.

Préoccupations statistiques, géographiques, pittoresques, et synoptiques, du département des Hautes Alpes. Grenoble, 1845.

Annuaire officiel des chemins de fer. Paris, 1847.

CHALETTE, J.

Précis de statistique générale du département de la Marne. Chalons, 1844-5.

CHALMERS, GEORGE, a writer of considerable eminence in his day, was born at Fochabers, in Morayshire, in the year 1742. He studied at King's College, Aberdeen, and Edinburgh. In 1763 he went on business to America, and settled as a lawyer at Baltimore, in Maryland. At the revolution he warmly espoused the side of the mother country, and, in consequence, was obliged to leave the country and come to England. Having suffered severe losses by adopting this course, for which he received no compensation, he devoted himself to literature, and produced many works in history, antiquities, and politics, which, however, we must pass by.

In 1786 his writings had attracted notice, and he was appointed chief clerk to the committee of privy council in matters relating to trade and foreign plantations, an office which he held till his death on May 31st, 1825.

His works relating to Economic Science are:—

An estimate of the comparative strength of Great Britain during the present and four preceding reigns. London, 1786; last edition, 1804.

A chronological account of Commerce and Coinage in Great Britain, from the Restoration till 1810. London, 1810.

An historical review of the domestic economy of Great Britain and Ireland, from the earliest to the present time. Edinburgh, 1812.

Considerations on commerce, bullion and coin, circulation and exchanges. London, 1811.

This work is worth reading as containing the most complete mass of blunders and absurdities on the subject it treats of, which were yet believed in by the majority of the merchants of the day.

Comparative views of the state of Great Britain and Ireland, before and since the war. London, 1817.

CHALMERS, PETER.

Historical and Statistical account of Dunfermline. Edinburgh, 1844.

CHALMERS, THOMAS, D.D. This eminent divine, one of the very few Scotch clergymen who have obtained a European reputation, was born at Anstruther, in Fifeshire, on the 17th March, 1780. Three adjacent villages in this county are illustrious as having given birth to three of the most eminent Scotchmen of modern times, Adam Smith, Sir John Leslie, and Dr. Chalmers.

The father of Dr. Chalmers was a member of a respectable county family. He followed the business of a shipowner and general merchant, but he had several relations in the Scotch Church, which probably determined the bias of the subject of this memoir in that direction, in which he attained so great a celebrity. It is somewhat remarkable that Dr. Chalmers, long after he had attained the summit of fame as a preacher, and had published discourses which rivalled the Waverley Novels in popularity, declared that it was the highest object of his earthly ambition to complete his treatise on Political Economy. He always considered his economical writings as the greatest of his intellectual efforts, and he ranked the truths of Economic Science as next in importance to those of Religion and Ethics.

Dr. Chalmers was the sixth child, and fourth son, of a family of fourteen. The number of the family made it desirable to relieve the mother as much as possible from the care of them, and he was sent to school at three years of age, where he was very badly used. He shewed an early bent to the career he afterwards followed. One day he was found standing on a chair, vigorously preaching to a single auditor, one of his schoolfellows.

In his 12th year he was sent to the University of St. Andrews, where he was the youngest boy but one, and that one was John, Lord Campbell, Lord High Chancellor of England.

During two sessions he does not seem to have shewn any particular signs of genius. But at the close of the third he suddenly conceived a strong passion for mathematics, and at this time may be dated the commencement of his career of intense intellectual activity.

Influenced no doubt partly by the number of his paternal relations in the Scotch Church, he now determined to adopt that profession, and he passed the preliminary step, and obtained a licence to preach in 1799. But instead of entering on his profession at once, he went to Edinburgh, and attended the lectures of Dugald Stewart, Robinson, Playfair and Hope. He also gave much attention to Ethics and Politics, and was taken with a juvenile ardor for Godwin's *Political Justice*.

While waiting for a parish of his own, he went to assist a minister near Hawick. The difference of the administration of the poor law in that manufacturing district, and the effect of a legal assessment for the relief of the poor upon their habits and character, contrasted with its administration in the country parish he afterwards obtained, struck him very forcibly, and originated that persevering opposition to all legal assessment for the relief of the poor, which he so ardently maintained throughout his life.

In 1802, he returned to the neighbourhood of St. Andrews, where his great ambition was to obtain the office of assistant to the mathematical professor in the University. This gentleman had long been a confirmed invalid, and had availed himself of the services of a series of assistants, some of whom became distinguished men. In the autumn of 1802, he obtained the appointment he so much coveted.

In May 1803, he was presented to the living of Kilmany, about nine miles from St. Andrews, partly through the influence of his father's relations. He remained there till 1815.

A lecturer on mathematics would appear to be about the last person to have a field for the display of eloquence. Nevertheless Chalmers's peculiar genius soon showed itself. He introduced such a degree of fervid eloquence into his lectures as to excite the utmost enthusiasm among his pupils. The extraordinary phenomenon of an eloquent mathematical lecturer horrified and alarmed the College Dons. The professor gave certificates to the pupils without consulting him. He took umbrage at this, and remonstrated with some warmth, and the Professor seized the opportunity to dismiss him on the ground of incompetence.

He was deeply mortified at being not only deprived of the office which was the object of his ambition, but at having an unmerited stigma cast on his capacity. He adopted the extraordinary resolution to open an opposition to the University in the town. A rebellion against the University under its own nose! The quiet folks of the town were dismayed, the professors were furious, and combined against him, and threatened the students with their severest displeasure if they should venture to attend his lectures. The students were divided, and a considerable number went to hear him, in defiance of the College authorities.

His mathematical lectures were decidedly successful, and he completely turned the tide of favor in the town by giving a course of lectures on Chemistry, illustrated with experiments. These were immensely popular, and he repeated them on several occasions with equal success. Besides these he preached at Kilmany every Sunday.

In 1804, he was a candidate for the chair of natural philosophy at St. Andrews, and in 1805, for the mathematical chair at Edinburgh. The contest gave rise to much acrimony, and was long remembered in the University. The vacancy was created by the transfer of Playfair to the chair of natural philosophy. He favored the appointment of Leslie, and published a pamphlet in which he maintained that the vigorous prosecution of mathematics was incompatible with clerical duties. Chalmers published an anonymous reply, in which he said that two days in the week were sufficient for the due performance of all clerical duties, and that the minister might have the remainder to devote to any pursuit that interested him. This pamphlet he afterwards disavowed with much penitence and humiliation.

In 1807, he published his first economical work, *An Inquiry into the extent and stability of national resources*; in consequence of Napoleon's measures to cripple English commerce. The work met with considerable success, and he was preparing a new edition of it, when he was seized with a dangerous illness which brought him to the verge

of the grave, and which deprived him of all power of work for a year.

This illness produced a complete change in Chalmers's moral and spiritual nature, and his energy taking a new direction, eventually brought about that great event which gives an historical interest to his name.

The question of patronage has always been a festering sore in the Scotch Church. There had been so many contradictory Acts of Parliament, so many changes as one party or the other got the upper hand, and so many breaches of faith by the government, that the whole subject of patronage was involved in the utmost perplexity, and several schisms had been the consequence. During the latter part, however, of the last century, the Scotch Church had acquiesced in lay patronage in consideration of State support. The party who did this were called the "moderates." A small minority, however, always contended for spiritual independence, while maintaining the necessity of state endowments. This party was called the "evangelicals."

Chalmers, up to the time of his illness, had belonged to the moderate party. In consequence of his reflections during that time of trial, he joined the evangelical party after his recovery. His convictions were strengthened by the preparation of the article *Christianity* for Dr. Brewster's Encyclopædia. The fruits of this change were soon visible in the altered tone of his preaching, which exhibited a depth and earnestness which he never displayed before, and the fame of the minister of Kilmany, soon spread through the country, and drew crowds from far and near to hear him. He now devoted himself to parochial duties with all the innate fervor of his character, and formed those views of parochial organisation which he afterwards carried out and advocated with such zeal and perseverance.

His fame had now spread through the country, and in 1815, the town council of Glasgow appointed him to the Tron Parish. His success was instantaneous and immense. Glasgow, and soon all Scotland, rang with his fame, which was not long reaching the metropolis. In 1816, he gave a series of week-day sermons on the connection between Astronomy and Religion. They were given in the busiest time of the day. Glasgow merchants and men of business deserted the Exchange and their counting houses, lawyers gave their clerks leave of absence to hear him. There was almost a suspension of business. When they were published they ran through nine editions of 20,000 copies in one year. One of the Waverley Novels was published a month before them, and it was a neck-and-neck race between them.

Glasgow had now commenced taking those prodigious strides which have continued unabated to the present day. But her ecclesiastical provision had not kept pace with her population. Chalmers, whose whole soul was now absorbed in revivifying the ancient parochial organization of Scotland, proclaimed the necessity of erecting twenty new churches in Glasgow. In consequence of his urgent solicitation, the Town Council at last agreed to form one new parish, and they appointed him to it, in order to give him an opportunity of carrying his schemes into effect.

The parish erected for Dr. Chalmers was named St. John's, and contained a population of upwards of 10,000, consisting chiefly of operatives and the poorest classes of the population of Glasgow. The church was finished in 1819, and in that year he was appointed minister. After long negotiations and much opposition, he succeeded in severing the parish from the general system of poor-law management of Glasgow. It was in future neither to be assessed, nor to receive any assistance from the other assessed parishes in the city.

Dr. Chalmers, as we have said above, had, before obtaining the living of Kilmany, acted as assistant to the minister of a parish near Hawick. In the latter parish there was a legal assessment for the poor. On his settlement at Kilmany, which was an ordinary country unassessed parish, the extraordinary difference in the sums applied to the relief of the poor, in proportion to their numbers, struck him forcibly. But the difference between the character and spirit of the paupers in the two parishes made him reflect more deeply still. While those of Hawick showed nothing but discontent, and tried every subterfuge to get the parish money, which they looked upon as their right, those of Kilmany were grateful for the assistance they received, and were satisfied with much less. He also remarked the great deterioration in character of those poor of Kilmany who had been to Dundee. From this time forward, a rooted abhorrence of all legal relief took possession of his mind, and to oppose this system he devoted much of his writing.

He had urged this so earnestly on the authorities of Glasgow, that they determined to let him try an experiment in St. John's. The sum which had been expended hitherto in that district was £1,400, of which the morning and afternoon collections produced £400, and the evening one £80. Dr. Chalmers undertook to keep down the pauperism of this district and give all due relief, with no other fund but that arising from the collections.

His plan was received with ridicule and incredulity. No one could believe that the thing could be done. In fact, as the projector said, it was infinitely easier to do the thing than to persuade any one that it could be done. He divided the parish into twenty-five districts, and in each appointed a deacon who had the charge of fifty or sixty families. It was the deacon's business to make himself acquainted with the circumstances and resources of each family, and all applications for relief were to be made to them alone.

The public had thought that it was a desperate attempt to keep down the pauperism on the collections solely. Dr. Chalmers thought that they were a great deal more than enough. He would only trust the evening collection of £80 to the deacons, for fear that they might be extravagant. Every application was received and treated with the greatest courtesy and attention, but was investigated with the greatest rigour. By these means circumstances were suggested, and resources pointed out, which in most cases obviated the necessity of receiving public aid.

The success of the experiment was marvellous, and exceeded the most sanguine expectations. At the end of three years and nine months, the fund

had been found not only amply sufficient for its purpose, but there was a surplus of £900, of which £500 was allotted to the endowment of schools. The sum spent on the relief of the poor was reduced from £1,400 to £280. Dr. Chalmers said in a subsequent writing, that after the first month he never inquired into a single case, and that the average duties of the deacons did not exceed three hours a month.

The history of this experiment deserves to be read. It met, however, with no imitators, and was abandoned in 1837, to the infinite chagrin of its originator.

The immense popularity of Dr. Chalmers made serious inroads on his time, and his extraordinary activity began to tell on his constitution. After having repeated offers made to him to accept other appointments, he was glad to take refuge in the comparative repose of the Chair of Moral Philosophy in his own University of St. Andrews. With this chair Political Economy was united, and he gave a course of lectures on this subject in 1825.

In 1827, he received the offer of the chair of Moral Philosophy in the University of London, which, however, he declined.

In 1828, he was appointed to the Chair of Divinity in the University of Edinburgh, which he continued to hold till 1843.

In 1831, he was requested to write one of the Bridgewater Treatises; the subject allotted to him was, "On the adaptation of external nature to the moral and intellectual constitution of man." In 1834, he was elected a Fellow of the Royal Society of Edinburgh, and a Member of the Institute of France, and in 1835 he went to Oxford to be invested with the complimentary degree of D.C.L.

In 1832, he published his treatise on Political Economy. He also gave a course of lectures in defence of religious establishments, and in 1840 he read a paper at the meeting of the British Association at Glasgow against a pamphlet Dr. Alison had published advocating a general poor-rate.

These things, though they are what chiefly concern us here, are but minor events to the one in which Dr. Chalmers next played the leading part. But we rejoice that we are prevented by our plan from adventuring on the stormy waters of Scotch polemics. We need only tell our readers that Dr. Chalmers was the hero and moving power of the disruption of the Scotch Church in 1843.

Whatever judgment may be formed of that movement, it is perfectly certain that it brought on the very thing which Dr. Chalmers had been combating so energetically for 25 years, namely, a legal assessment for the poor. Throughout large districts of country, the people, led by their ministers, abandoned the establishment in a body. There were consequently no collections at the church doors to relieve the poor. The consequence necessarily was a Poor Law, which was enacted in 1845.

At the disruption Dr. Chalmers of course resigned his Professorship of Divinity at Edinburgh. The Free Church founded a College of their own, of which he was appointed Principal and Professor of Divinity. In this capacity he passed the last four years of his life, in which all his energies were tasked to organise the infant establishment. In

May, 1847, he went to London to give evidence before a Committee of the House of Commons, as to the refusal of sites to the Free Church by some proprietors in Scotland. After visiting different parts of England he returned to Edinburgh, to be present at the meeting of the General Assembly of the Free Church, but on the 31st of May he was found to have died during the night.

Whatever may be thought of the event of Dr. Chalmers's life which will give him his greatest historical celebrity, and on that subject opinions will of course differ, there can be no doubt that he was one of the most remarkable men that Scotland has produced. All contemporary writers testify to the extraordinary personal influence he acquired. Nor was his fame merely provincial. The sensation he made in London was equally great to that which he made in Glasgow. When he preached in London in 1817, the church was crowded for hours before the service began, ministers and statesmen of all parties crowded to hear him, and in their published correspondence there is abundant evidence of the extraordinary impression he made on the ablest men in the country.

Inquiry into the extent and stability of national resources. Edinburgh, 1807.

Dr. Chalmers published a collection of his works, 1836-42, in 25 vols., in which the greater part of his economical writings are included. We refer to this edition.

Vol. VI. *Commercial discourses*, delivered in 1820.

Vol. XIV, XV, XVI. *On the Christian and Economic polity of a nation, more especially with reference to its large towns.*

These three volumes were originally published at intervals. They are chiefly for the purpose of advocating Dr. Chalmers's favorite plan of parochial organisation. Vol. XVI. is particularly worth reading, as in it he has clearly seen and enforced the doctrine that we have so often maintained, *that it is the product that gives value to the labor, and not labor that gives value to the product.* He says, p. 10, "It has all the self-evidence of truism, and yet it is strangely overlooked, both in economic reasonings and in economic regulations, that the worth of that by which a thing is done is all derived from the worth of that for which the thing is done." * * *

"It is forgotten that the end is greater than the means; and although Smith has formally asserted that the end of all production is consumption, yet even he in the course of his argument seems often to have forgotten this maxim, in a certain value, *per se*, which he attaches to trade and manufactures. Now it ought ever to be kept in mind, that trade and manufactures have all their worth and significance as subservient to, and none whatever as apart from, the enjoyment of consumers. The worth of commerce lies wholly in the *terminus ad quem* and not in the *iter ad quod*.

"Now, both by politicians and political economists, this principle is traversed. It is in the working up of the commodity, in the buying of it, and selling of it, and transporting of it, in the succession of various movements and exchanges which it is made to undergo, in that whole series of transactions through which it passes from him who first put forth his hand upon its raw material, to him who made the final purchase of it, so that it ceased to be an article of merchandize any

more, it is in these various steps which properly belong to the manufacture of the commodity or to the merchandize thereof, that the whole prosperity of our land is conceived essentially to lie." These are, it will be observed, the same doctrines as published by Dr. Whately about the same time, when he said that men dive for pearls because they are valuable, and that they have not value because men dive for them. It is the entire reversal of the Ricardian system of Political Economy.

Vol. XVII. *On Church and College Establishments.*

Vol. XIX., XX. *On Political Economy in connection with the moral state and moral prospects of society.*

This is Dr. Chalmers's most elaborate work on Political Economy, and as he himself says, it is in no sense a formal treatise, but rather some materials for one. At p. 98, he has seen the true function of money. "There is nothing in the intervention of money which should disguise the real character of the operation. If landed proprietors be the chief customers for the commodities in question, they do not just give on the instant the *ipsa corpora* of their wealth, but they give what is equivalent, a lifting power to a certain extent, or an order to a certain amount for the produce of their land. This passes from the hand of the capitalist to the hand of his workmen, and they on presenting it at a shop or market, just get in food, that chief article of maintenance, the proper and essential return for their labor." This is in perfect conformity with the doctrine of Aristotle, Burke, Bastiat, &c., that money is a pledge for the future, or general credit. (CURRENCY.)

J. B. Say has been supposed to have demonstrated the impossibility of a general glut, or general overproduction of all commodities. Dr. Chalmers devotes his first five chapters to a refutation of this doctrine. There is much ingenious speculation in this, but we must forbear to examine into either of the opposing doctrines, because there is nothing really practical in either of them. Dr. Chalmers says, p. 167, "So that it is not in opposition to any apprehended practical evil, but in opposition to a theory, that we have been induced to frame, or at all to insist on, our present argument." This being so, it is scarcely worth while to say much about it.

In taxation, Dr. Chalmers has adopted to the full the doctrine of the French Economists, that all taxes fall ultimately on the land. He, however, supports this proposition by a different course of reasoning. His proposal is that all taxes should fall exclusively on the net rent of land, and that they should all be paid by landlords and mortgagees on land. He maintains that the funds are a mortgage on land, and that the landholders and fundholders should therefore bear the whole weight of taxation. A somewhat startling proposal. He ought also to have included tithe-owners. He says, xix., 304, "And it were no small advantage if landlords were made to bear the whole burdens of the state ostensibly, as they do really; that the importance, the permanent importance of landed wealth and of the landed interest, would stand forth nakedly and without disguise to the recognition of all men. So that it were well for them,

if compelled, even though against their will, to pay all taxes. The men who hold in their hand the necessities of life, have the obvious superiority over the men who but minister the superfluities, or the comforts. They have the natural ascendancy, and we think it wholesome and befitting, that they should have the political ascendancy also. We hold it the most exceptionable feature in the modern scheme of representation, as being a violation of the rightful and natural order, that the agricultural interest is not sufficiently represented in Parliament." Dr. Chalmers proposes to deliver over the exclusive political power in the State to the landed proprietors; somewhat a strange sentiment coming from such a quarter.

Chap. XI. is, *On the distinction between productive and unproductive labor.* Adam Smith has been betrayed into a most extraordinary self-contradiction on the subject of productive labor. While he fully admits that education is realized capital, and that intellectual abilities are part of the wealth of the nation, he has denied the title of productive labor to those whose business it is to supply that which he acknowledges to be capital. Mr. McCulloch has well shewn this inconsistency. Dr. Chalmers being one of the class so unceremoniously designated as "unproductive laborers," naturally resents such a stigma. In this chapter he gives a most complete and crushing reply to this false distinction. It is one of the very best in his whole work, and deserves attentive reading. (LABOR.)

Chap. XII. *On the law of Primogeniture.* This too is an admirable chapter. It strongly opposes the breaking up of the land into small properties. Dr. Chalmers, however, shares an error very common among writers in speaking of the law of primogeniture. He argues throughout, as so many others do, that the law compels a man to leave all his real property to his eldest son. This is an error. The eldest son only takes by right in the case of intestacy. The law leaves every man free to break up his property if he pleases, though no doubt it permits of its being tied up in certain cases. It is the general feeling of the country that maintains the custom of primogeniture. Dr. Chalmers shews that a gradation of ranks is the true basis of stability. p. 370. "For the best construction of a social edifice in every large country like ours, we would have a king on the throne—not rising like a giant among the pigmies, or as an unsupported Maypole in the midst of a level population; but borne up by a splendid aristocracy, and a gradation of ranks shelving downwards to the basement of society. We doubt if the other monarchy could stand; or if France with its citizen king, amid a mighty and ever increasing swarm of smaller and smaller agrarians, can maintain its present economy for a single generation." Within ten months of the death of Dr. Chalmers, this sagacious doubt was verified by the throne of the citizen king being tumbled in the dust.

Dr. Chalmers then enters on his favorite condemnation of a legal relief for the poor, and warmly advocates popular education.

In the Appendix he shews the fallacy of Ricardo's Theory of Rent. "It is a signal error in a recent theory of rent, that the difference of quality in soils is the efficient cause of it. * *

In affirming that it is the existence of this inferior land which originates the rent, there is a total misapprehension of what may be termed the real Dynamics of the subject;" and at p. 330, he quotes with just approbation, from General Thompson, "The error of the Ricardo system of Political Economy on the subject of rent has been well characterised by Mr. T. Perronet Thompson as the fallacy of inversion. It confounds the effect with the cause. It is not because of the existence of inferior soils that the superior pay a rent, but it is because the superior pay a rent, that the inferior are taken into occupation!" This is perfectly just, and coincides with what we said under RENT.

Dr. Chalmers had as strong an abhorrence of the Funding system, as of a legal assessment for the poor. He conceived the extraordinary idea that by contracting public debts, the nation paid for the advance twice over. He maintained that the contraction of a loan raised the prices of commodities to an equal amount, which taxed the public within the year to an equal amount, and then besides that, they had to pay the annual interest on it. By this means he says the public paid for every loan twice over. In consequence of this, he maintained that all loans should be prohibited, and all expenditure raised by taxation within the year. Of this extraordinary paradox we have said something under FUNDS and TAXATION.

The supreme importance of a right moral to a right economical state of the country.

Connection between the extension of the Church and the extinction of pauperism.

Vol. XXI.

The sufficiency of a parochial system without a poor rate for the right management of the poor.

On the application of Statistics to moral and economical questions.

Dr. Chalmers also contributed some articles to the early numbers of the *North British Review*, which was founded by the Free Church party. They were in:—

No. I. *On the Corn Laws.*

No. II. *On the Political Economy of the Bible.*

No. IV. *On the Poor Laws of Scotland.*

No. VI. *On Savings Banks.*

No. XI. *On Stirling's Philosophy of Trade.*

No. XIII. *On the Political Economy of a Famine.*

CHALONER, WILLIAM, had an undoubted right to be heard on the subject he wrote upon, as he was one of the most extensive coiners and forgers of his day. He was the son of a Warwickshire weaver, and was apprenticed to a nailer in Birmingham, from whom he learnt to coin Birmingham groats. Being of a turbulent disposition he ran off from him and went to London, where he fell into company with a japanner, who taught him to gild. These arts he combined and turned to practical use, for he immediately began to coin false guineas and pistoles, which he got into circulation to a large extent. One of his accomplices was taken, and denounced him. This made him abscond for a short time, but the man being executed, he escaped. He then exercised his ingenuity in getting up false Jacobite plots, and two men were convicted and executed on his testimony.

Chaloner then, like a miniature Oates, rose high in public favor, and immediately recommenced his practices of coining, and to ward off suspicion he presented to Parliament proposals to prevent clipping and coining. Another of his accomplices was taken, and informed against him, but he was executed, and our hero escaped again.

He then obtained £1,000 from the Bank of England on a forged security, and not satisfied with such small game as guineas, he forged the £100 notes of the Bank. A person he employed to marble the paper informed against him, and he immediately hastened to give up all the notes and denounce all his accomplices. For this the Bank forbore prosecution.

He then had the audacity to charge Sir Isaac Newton, then Warden of the Mint, and his officers, with frauds and malversations. The House of Commons appointed a committee to investigate the matter, who of course dismissed the charge with ignominy.

He then took to forging malt-tickets, but his good luck deserted him. He was taken and tried. His previous forgeries were proved, he was convicted, and hanged at Tyburn, 22nd March, 1699.

The defect of the Mint, and how to coin money so that it cannot be counterfeited. London, 1690.

The defects of the present constitution of the Mint. London, 1693.

Proposals for passing an Act to prevent clipping and counterfeiting of money. London, 1695.

Reasons humbly offered against passing an Act to make good the deficiency of the clipped money. London, 1695.

CHAMBERLAIN, AYLING.

A treatise on the Commercial System and Stamp Laws of Great Britain. London, 1841.

CHAMBERLAIN, HUGH, M.D. This person, whose name is also spelt *Chamberlen* or *Chamberlyn*, was a member of a medical family, who were physicians to the Court for upwards of a century, from James I. to Anne. He was born in 1664, and educated at Trinity College, Cambridge, where he graduated in 1683, and took the degree of M.D. in 1690. He himself adopted the obstetric branch of the profession, and was physician to Charles II. The family were celebrated for the invention of a forceps, which saved the life of the infant in many cases where it had previously been sacrificed. This instrument, with some improvements, is still in high repute. He introduced its use into Paris, but being unfortunate in one case, he was obliged to leave. He went to Holland, where he was more fortunate, and realized a considerable fortune, besides selling the secret of his instrument to two Dutch physicians for a large sum. He then returned to England and obtained a very large practice.

That was a period when multitudes of projects for Banks were floating in men's minds. Amongst the busiest of these schemers was Chamberlain, who conceived a visionary scheme of turning all the land of the country into a paper currency. He selected Scotland as the scene of his experiment, and presented a plan to the Scotch Parliament in 1693, but it came to nothing. In 1694 the Bank of England was founded, and this gave great encouragement to Chamberlain. He

associated some members of the House of Commons with him, Asgill and Briscoe, and got a committee to report favorably upon it. Nothing however followed till 1696, when the government being in great straits for money, listened favorably to the project of the Land Bank. How miserably it failed is told under LAND BANK, aggravating the public distress it was meant to alleviate.

The next trace we have of Chamberlain is at Edinburgh, in 1700, when he again published a pamphlet to advance his scheme. In 1705, it was brought before the Scotch Parliament, under the patronage of a party called the *Squadron*, but it was rejected. He must then have been in poor circumstances, for the Parliament was obliged to pass a resolution to protect him from his creditors while laying his plan before them. His history after that is somewhat obscure. He attended Atterbury in the Tower, in 1723, and died June 17th, 1728, in Covent Garden.

Of all schemes of paper currency, Chamberlain's was the most insane. John Law's, which has always produced a catastrophe where it has been introduced, was merely to create a paper currency to the amount of the value of the land at twenty years' purchase. But Chamberlain argued that the land was good security to the amount of its annual revenue to any amount. Thus he argued, that if an estate of £150 a year were pledged for 150 years, it was a good security for £22,500 of paper currency. Now considering that land being worth 20 years' purchase at that time, the value of the perpetuity was only £3,000, it follows that the value of such land, pledged for 150 years, was $7\frac{1}{2}$ times that of the perpetuity! But according to this argument, a pledge of the land for a million of years was a good security for a paper credit of a million times the annual revenue. How such nonsense as this could ever be believed in by sane men, is almost incomprehensible, but yet many were taken in by it. (LAND BANK.)

CHAPTAL, JEAN ANTOINE. Count de Chanteloup, was born 4th June, 1756, at Nogaret. He studied at Mende, Montpellier, and Paris. He early devoted himself to practical chemistry and in 1781 the State of Languedoc created a chair of Chemistry for him. Inheriting a large fortune, he established large chemical works, and introduced several new products into French commerce. In 1793, he was summoned to Paris to superintend the manufacture of saltpetre. A large establishment was formed at Grenelle, which supplied 3,500 pounds a day. Without being a brilliant discoverer in Chemistry, he was very successful in its application to art. However, we must pass over his merits as a chemist. He was one of the first professors of the Polytechnic School. Napoleon made him minister of the Interior, which office he held for four years, and he devoted much of his time to advance the manufacturing interests. He established Chambers of Commerce in many places, the School of Arts, and the Conservatory. He was made a member of the conservative senate in 1805, and director general of commerce on Napoleon's return from Elba. On the restoration, he retired into private life, but was afterwards nominated a Peer of France. He died at Paris in July, 1832.

CHEQUE. A cheque is an order on a Banker to pay a definite sum of money to a certain person on demand.

It is one of the varieties of one of the two great divisions of instruments of credit, **ORDERS** to pay. It is in form a Bill of Exchange payable on demand.

When a customer places money at his banker's the property in the money passes to the banker, and in lieu or exchange for it he creates a credit in his customer's favor in his books. That **CREDIT** is called a **DEPOSIT**.

So also when a Banker buys a Bill of Exchange from a customer, he does it by creating a credit in his favor in his books, and that **CREDIT** so created is called a **DEPOSIT**.

Thus all banking advances are made in the first instance by **CREATING LIABILITIES**, or **CREDITS**, which are called **DEPOSITS**.

These deposits are what were called *Moneta di Banco*, or Bank Money, in the great foreign Banks of Deposit, at Venice, Amsterdam, Hamburg, &c., and payments were made by transferring them from one account to another. They were, however, payable in specie on demand at the will of the parties.

The essence of banking consists in creating these credits. When a bank receives nothing

but bullion and money, and creates only an equal amount of credit to what it receives as money, it is called a Bank of Deposit. Such a bank of course manifestly creates no increase of the currency.

But when a bank buys, or discounts, bills of exchange the case is different. Because as a bill of exchange is credit, and a banker buys a bill of exchange by creating credit, it is manifest that that is an augmentation of the Currency.

It used to be the custom in London for banks to buy bills of exchange with their own promissory notes payable to bearer on demand, and hence they were called *Banks of Issue*. About 1772 they changed the form of creating credit, they gave their customers credit in their books, they created *DEPOSITS*, and gave their customers authority to draw orders upon them payable on demand.

Now it is clear that the effect on the currency was just the same, whichever form of creating credit they adopted. And it is clear that banks which discount bills by creating deposits, are substantially Banks of Issue.

Cheques, or Drafts on Bankers, were certainly used by the Romans. The Latin name of a cheque is *attributio* or *prescriptio*. Whether they were only payable to a single person named, or whether they were transferable from hand to hand, and payable to bearer, we have never seen discussed.

Their use in modern times seems to have been revived by the Dutch, sometime in the 17th century. Malynes, who wrote in the middle of the 17th century, says that merchants who wished to transfer a part of their credit at their banker's to another customer, used to go at the end of each day and tell him what transfers were to be made. A great improvement on this plan was for the merchant to give a draft, or cheque, on his banker; and John Law, who is certainly an authority on these points, says that this was the custom of the Dutch in the early part of the 18th century, and strongly advocates their introduction into England.

So late as the renewal of the Bank Charter in 1742, the English bankers do not seem to have used cheques, but only bank notes. And the legal definitions of banking as used in the various Bank Charter Acts, only describe the issue of notes. And at that time it was fully understood that the essence of banking consisted in the issue of notes. Thus *The General Evening Post*, February 10th, 1737, says, "As the time approaches when the original fund of the Bank will be redeemable by Parliament, viz: upon one year's notice after the 1st August, 1742 (which is in less than seven years), and consequently their privilege of Banking, or issuing out *Cash Notes*, exclusively of all other corporations, will cease."

So late as 1759 certainly, London bankers continued to issue notes. But within the next ten years or so, they discontinued the issue of notes, and adopted the method of creating *DEPOSITS* or *Credits* in their books, and giving their customers cheque books. This change in the manner of doing business seems probably extremely unimportant, and yet it is of very great historical interest, as it was entirely owing to this little change that the monopoly of the Bank of England was undermined, and the Joint Stock Banks of

London were able to be founded. The words creating a monopoly only contemplated banking in the form of issuing notes, and made no provision against it in the form of deposits and cheques. (*BANKING IN ENGLAND*.)

The slightest reflection will shew that there is no real difference in the *nature* of Banking, whether it is done by means of bank notes, or deposits and cheques. It is only in the form. Banking equally creates credit now to what it did formerly.

This shews the enormous error of those who think that the private bankers and the Joint Stock Banks of London are only Banks of Deposit, and still more of those who think the Currency Principle is carried out by the Bank Act of 1844, or that it is possible to do so in any Bank of Discount. (*BANK; BANK NOTE; CREDIT; CURRENCY; CURRENCY PRINCIPLE; DEPOSIT; DISCOUNT*.)

CHERBULIEZ, ANTOINE ELISEE, born in 1797, at Geneva, where he practised as an advocate. He was then appointed a magistrate, and professor of law in succession to Rossi in 1833. In 1835 he was appointed Professor in Political Economy. He was a member of the different legislatures of the canton, from 1831 to 1846. After the revolution of 1848 he removed to Paris.

A new defence of tithes. London, 1832.

CHEVALIER, MICHEL. The most distinguished economist on the Continent, was born at Limoges, 13th January, 1806. His father was engaged in commerce. At 18 he entered the *Ecole Polytechnique*, and afterwards the School of Mines, and was attached to the department of the Nord. Like many other young men of brilliant talent and ardent imagination, he joined the followers of St. Simon, and in September, 1830, he addressed two letters to their paper, *Le Globe*, of such extraordinary power, that he was immediately made editor of it, which position he held till the schism between Bazard and Enfantin.

M. Chevalier adhered to *Enfantin*, who was called the *père suprême*. In July, 1832, the government deeming the sect dangerous, instituted a prosecution against them, and the *père suprême* was sentenced to two years' imprisonment, and M. Chevalier, one of his *cardinaux*, to twelve months. He was, however, released at the end of six months, and reflection made him change his sentiments, and soon after his liberation he formally disavowed the obnoxious doctrines.

In 1833, M. Thiers sent him on a mission to the United States, to report upon their internal communications by canal and railway. He addressed a series of very remarkable letters to the *Journal des Débats*, describing his travels, which were afterwards republished in two volumes. In 1836, he was commissioned to visit London during the commercial crisis.

In 1838, he was nominated chevalier of the Legion of Honor, a *conseiller d'état*, a member of the *conseil supérieur de commerce*, and in 1840, was appointed successor to Rossi in the chair of Political Economy in the Collège de France. In 1845-46 he sat a short time in the Chamber of Deputies for Aveyron. He ardently espoused Free Trade doctrines, and accompanied Bastiat in his free trade campaign, in the autumn of 1847, through the departments, in the attempt to form a league on the model of the English Anti-Corn-Law League. The attempt, however, did not succeed. (BASTIAT.)

The revolution of 1848 threw him out of all his offices and employments, especially that of his Professorship at the Collège de France. He then vigorously combated the socialist doctrines. He had been for sometime the president of the *Conseil général* of the Herault, which under his auspices has distinguished itself for the advocacy of Free Trade principles. Being an anti-republican in principle, he declared in favor of the *coup d'état* of the 2nd December, 1851. In September, 1852, he was restored to his chair of Political Economy in the Collège de France.

In 1851, he was elected as the successor of M. Villermé in the Academy of Moral and Political Sciences, section Political Economy. He has recently been created a Senator by Napoleon III. and has taken a warm part in negotiating the recent treaty of commerce with England, as a step in the direction of Free Trade.

Lettres sur l'inauguration du chemin de fer de Strasbourg à Bâle. Paris, 1841.

Cours d'économie politique fait au Collège de France. Paris, 1842-50. 2nd Edit. 1855.

This was the course of Political Economy delivered by M. Chevalier in his capacity of Professor during twelve seasons. At the beginning of each of these he gave an opening address, and these discourses are placed at the beginning of the first volume, of the second edition. The first address in 1840, is on the greatness and the weakness of modern industry. The second in 1841, discusses the increasing importance of Political Economy. The third in 1842, is upon the necessity of society

increasing its productive power, especially by improving its means of transport. The fourth in 1843, is on industrial credit. The fifth in 1844, is on public credit. The sixth in 1845, is on the necessity of professional instruction. The seventh in 1846, is on the question of population. The eighth in 1847, is on the freedom of labor. The ninth in 1848, on the opposition between Political Economy and Socialism. The tenth in 1849, is on the agreement between Political Economy and morality. The eleventh in 1850, is on the desire of well being. The twelfth in 1851, is on progress.

The first lecture examines the relations between the progress of industry and liberty. The second shows that the elevation of all classes is intimately connected with the development of productive power, and that this has vastly increased in modern times.

This lecture is of importance. M. Chevalier shows that there are several sorts of productive labor, and he shows the comparative progress that has been made in them. He says, in four centuries the increase of the production of iron has increased in the ratio of 25 or 30 to 1. That of flour in that of 144 to 1, since the days of Homer. In 70 years the increase of the cotton manufacture has been in the ratio of 320 to 1, and that of linen as 240 to 1. And as the last instance of productive labor he cites that of *transport*.

Thus we see that M. Chevalier classes transport as productive labor, and, therefore, he who causes anything to be transported from one place to another where it is wanted, is a *productive laborer*. Thus Adam Smith classes retail shopkeepers as productive laborers, and consequently the transport of merchandise from the wholesale warehouse to the retail dealer's shop where it is sold to the customer, is one species of *Production*.

Now it is just on this point that the modern doctrines of credit are so much at fault. Many writers laugh at the notion that credit conduces to production. But by *production* they evidently mean increase of *quantity*. Now nobody ever said that credit could make one ear of corn into two. They allow that money is productive capital. But money cannot make one ear of corn into two. The species of production to which money is subservient, is that of *exchange* or *transport*. The industry of exchange and transport is productive labor, and whatever sets that in motion is productive capital—just as money is. When we say that credit is productive capital, it is to this species of production that we allude.

When some writers say that credit only transfers capital from one person to another, we say that is all that money does, and, therefore, those who allow money to be productive capital, must, by their own arguments, allow that credit is the same, which performs the same functions. (CREDIT; PRODUCTION.)

The third lecture examines objections that have been made against the doctrine, that the interests of society demand the increase of production. The fourth and fifth lectures treat of machinery and its utility, as well as the objections that have been made to it. The sixth treats of the temporary injury done to some laborers by the introduction of machinery. The four next treat of the means of communication. And the three last on the charges and fares on canals and

railways. An appendix treats of the changes made in the railway service.

The first eight lectures of the second volume treat of public works, and the interference of government in their construction and the guarantee of a minimum rate of interest. The ten following ones then consider the question of the application of the army in different countries to productive employment. The nineteenth discusses the influence of government over education. The three next examine whether it is possible to apply the principles of organisation to industry. The remaining lectures treat of cheapness and its advantages.

VOL. III. *La Monnaie*. This work investigates the nature of money—The prices of things—The coinage—The sources whence the supplies of the precious metals are derived, and the quantity produced—The causes which produce an export or import of bullion, and the probability of an approaching fall in the value of the precious metals. This subject M. Chevalier has treated of more at length in a subsequent volume.

We are happy to say that in this volume M. Chevalier has given his opinion of the definition and extent of the Currency, which exactly coincides with our own. (CURRENCY.)

De la baisse probable de l'or, des conséquences commerciales et sociales qu'elle peut avoir, et des mesures qu'elle provoque.

This volume examines at greater length, the subject discussed in the last division of the author's book *La Monnaie*. The first two sections contain a résumé of the general principles of money. The third section treats of the production of gold, and the increasing quantity of it coined in recent years. He then shows the greatly diminished coinage of silver during the same period, and argues from thence, justly, that gold has fallen in value compared to silver. The enormous increase of the exports of silver to the East is then noticed. He then says that from the enormous quantity of gold poured in, a more rapid diminution of its value might have been expected, but that the coinage of France had, in fact, acted like a parachute and had prevented its being very visible, until gold had replaced silver. He then notices the various sources of production of gold throughout the world, and says that there seems every likelihood of their continuing to pour forth such quantities of it, that a serious diminution in value is inevitable unless it can find a market proportional to its increased quantity. He then inquires what additional markets may be expected, and if they are proportional to the increased supplies.

Among these he enumerates some countries whose currency consists of paper, such as the United States, Austria and Turkey; the increasing demand for articles of luxury, &c. M. Chevalier considers that all the new markets that can be opened will not be sufficient to take off the increased supplies, and that as a necessary consequence a diminution of its value must ensue. He then considers the effect of the monetary laws of France upon the phenomena of the value of gold, under its different governments. In the sixth section the consequences of a fall in the value of gold are examined; the sufferings and difficulties which will accompany the transition; and the profits which will be made by certain classes of persons. The seventh section considers what means may be taken to obviate the ill effects of the fall. Several valuable documents relating to the coinage of France are appended.

CHILD, JOSIAH, SIR, a very great potentate indeed in his day—and who has not read of his deeds in Macaulay—was born in 1630, the second son of Richard Child, a London merchant. He followed the same profession, and attained great wealth and influence, and became chairman of the East India Company, in which position he was a rival to, if not a greater power than, the king himself. He is said to have written several anonymous treatises in favor of the East India Trade. The only one, however, which he published with his own name, was the one mentioned below, which has been often quoted and referred to, and is therefore entitled to our notice, as one of the earliest in commercial literature. He was made a baronet in 1678, and died in 1699. He was married three times, and his children by each of his wives married into the highest families in the

kingdom. His third wife is said to have been allied to eleven dukes and duchesses, and about fifty great families were thrown into mourning by her death—pretty well for a London merchant.

A new discourse of Trade. London, 1690.

This is the second and enlarged edition of a little work named *Brief observations concerning Trade and the interest of money*, originally published in 1668. It was remarkable for maintaining the extraordinary doctrine, that it was the lowness of the rate of interest which caused the wealth of the nation, and he brought forward as an example the Dutch, whose wealth he said was entirely owing to the lowness of the rate of interest. His work was immediately answered by another called, "The interest of money mistaken, or a treatise proving that the abatement of interest is the effect and not the cause of the riches of a nation." In the new edition, however, of his work, with a new title, Sir Josiah Child most strenuously reaffirms his former doctrine, and replies to his opponents. He well shews the absurdity of diminishing the value of the coin, or raising its denomination, tricks which had been repeatedly tried in Spain and Portugal. He shews that merchants simply raised the price of their goods, in proportion to the depreciation of the coin, as they observed what the intrinsic value of the money was, and not the name it is called by.

This treatise, though it contains error, is nevertheless in many respects very excellent. In the first chapter he ascribes the greatness and prosperity of Holland to fifteen causes. The 1st is their taking great merchants into their state councils; 2ndly, the equal division of property at the death of the parent; 3rdly, their good faith in trade; 4thly, their encouragement of inventors, and introducers of foreign improvements, who always receive a public reward; 5thly, the cheapness of their navigation; 6thly, their frugal mode of life; 7thly, the excellent education they gave their children, male and female, especially in arithmetic; 8thly, the lowness of their customs and excise; 9thly, their careful management and employment of their poor; 10thly, their use of banks; 11thly, their religious toleration; 12thly, the cheapness and speed of their law proceedings; 13thly, their facility in transferring *bills of debt*, the advantage of which, he says, none can know who have not seen it in use; 14thly, the public registers of all real property sold or mortgaged; 15thly, the lowness of the interest of money, which in peace did not exceed 3 per cent, and in the then war, 4 per cent.

In the second chapter he examines the state of pauperism, and points out that the fundamental error in it was leaving it to the care of every Parish to maintain its own poor only, whence the shifting and bandying about of the poor to their last place of abode. This is still one of the crying evils of the English poor-law, and one which the most earnest poor-law reformers have most tried to get rid of, hitherto in vain. (CHADWICK.) He proposed that the whole district within the Bills of Mortality should be united for poor-law purposes, and put under the management of a commission.

Sir Josiah Child then considers the case of merchant companies, and decides that they are injurious to trade, and that a free trade has

always been more prosperous than one confined to a company. The only exception, perhaps, being in such a case as the East Indies, which were barbarous countries, where there was a necessity to maintain forces and forts. In the fourth chapter he approves of the policy of the Navigation Act.

In the fifth chapter he earnestly recommends the advantages of transferring *Bills of Debt*, as Malynes had done before, and he gives such a bill as he would recommend to be passed for the purpose of introducing them. In this chapter he seems quite to negative the idea that is not uncommon, that Cardinal Richelieu invented the indorsement on Bills of Exchange, for he says, p. 129, "Even in our own (country), where we have for many ages had the experience of indorsement on Bills of Exchange," which would be a very incorrect mode of speaking, if Richelieu had only invented it thirty years before.

He strongly advocates the establishment of a Court Merchant, to decide all mercantile disputes, and the granting the utmost facility for naturalization. He shows the impossibility of ascertaining the balance of trade as it was then computed. But though he shows the absurdity of the common opinion about the balance of trade, he did not hit upon the true statement of it.

We thus see that Sir Josiah Child had the true fundamental notion of a *currency*, that it is the representative of debt, and his plan was to make these as transferable as possible. He never once proposes the crazy idea which became so prevalent a few years afterwards, and has continued so to the present day, of turning goods or land into money. (CIESZKOWSKI; LAW.)

CHOSE IN ACTION. A *chose in action*, or, as it is sometimes called, a *chose in suspense*, is a right which a person has to something which is neither in his actual, or constructive possession, and which he cannot obtain possession of, unless by the voluntary cession of the possessor, without an action.

The subject of *chooses in action*, which involves considerable intricacy at law, will demand our special attention, because they contain the great master-subtlety of Political Economy, and a clear apprehension of their nature and several kinds will throw a blaze of light over the whole science, and enable us to pronounce a judgment upon the most disputed and obscure points in the subject.

In ancient times chattels personal consisted entirely of movable goods, visible and tangible in their nature, which were in the possession either of the owner, or of some person on his behalf, which could be identified and taken possession of. In fact, those in which the *property*, or ownership, was specific and certain, and which even if not in the possession of their owner, might be identified.

But though in early times such a thing as an incorporeal chattel personal was not recognized, there existed in many cases a *right of action*, either to recover pecuniary damages for a wrong, or for the nonperformance of a contract, or for the recovery of money due. Such a right was called a *chose in action*.

Now though this *chose in action* was a valuable right, for certain reasons which we need not enlarge upon, it was deprived by the Common Law of one of the usual incidents of personal property, it was not transferable.

Now there is a great and subtle distinction, and one of the most fundamental importance in Political Economy, between a *chose in possession* and *chose in action*.

When a man entrusts any personal chattel, such as a horse, a book, a watch, or a carriage, to the custody of another person, the *property* in that chattel remains in him, although he parts with the *possession* of it for a certain time, and if he sees his chattel in another person's hands he can reclaim the specific thing. Or if he deposits a particular bag of money, which is marked and can be identified, in the custody of some one else, there is but *one* property, although the property and the possession are separated. And he may retake the very horse, or the very book, or the very watch, or the very carriage, or the very bag of money.

But in the case of a simple debt it is quite different. A debt is simply a *right* to demand money, and is not a claim or right to any specific bag of money. And although a man owes me money, that confers no right upon me to put my hand into his purse and take it out, or to seize his goods and chattels of my own authority and sell them.

If I deposit £100 with my banker, that does not give me any right to take away 100 sovereigns or bank notes I may see lying on his counter.

On the contrary, when a debt is incurred it is a mutual transfer of properties. If one man lend, as it is somewhat erroneously called, £100 to another, the absolute property in the money passes to the borrower, and what passes to the lender is a *right*, or property, to demand back an equal

quantity of money at some future time, which, unless prevented by law, may be sold or transferred to any one else.

Hence arises this doctrine which, subtle as it may seem, is one of the great fundamental doctrines of Political Economy, that a *Debt* is itself a separate, independent, and transferable valuable thing, which may be sold and transferred like any article of merchandize, and is as much independent exchangeable property, as any other commodity whatever.

The distinction is extremely apparent. When a man deposits money with his banker, the banker becomes the *debtor*, and not the *bailee*, to his customer. When a man deposits goods in a warehouse, the warehouseman becomes a *bailee*, and not a *debtor*, to his customer. The property in the money passes to the banker, and he may use it as he pleases for his own benefit; on the contrary, no property whatever passes to the warehouseman, and he may not use the goods as he pleases for his own benefit.

These debts then being independent property, formed by far the largest class of what were originally called *chooses in action*, but were not allowed to be transferred by the Common Law, because such a power was supposed to afford too great a temptation to litigation.

Merchants, however, soon saw the amazing advantages and facilities it would give to commerce to be able to transfer debts like other commodities, and this they did by means of Bills of Exchange and Promissory Notes, which we may call by the general name of *INSTRUMENTS OF CREDIT*; and this power of transfer was at length recognized by the Courts of Common Law, and by Statute.

Now from the preceding considerations arises the doctrine which is perfectly well known to every lawyer in the world, which was perfectly well known and acknowledged by merchants, before the doctrine that Labor is the cause of Value gained its pernicious influence over Political Economy, and which even yet struggles through the contradictory views of modern Economists, that *CREDIT*, or *DEBTS*, are separate, exchangeable property over and above commodities and money, and are to be reckoned separately in a catalogue of national property.

Thus Mr. Justice Byles enumerates the Land, Credit, and the Funds as separate property, the correctness of which no one competent to judge will dispute.

Thus is shewn the fundamental distinction, which is one of the most important in Political Economy, between a Bill of Lading or a Dock Warrant, and a Bill of Exchange. Bills of Lading and Dock Warrants are always titles to certain specific goods which are in the possession of some bailee, whose duty it is to deliver them to the owner of the Bill of Lading or the Dock Warrant. And the property in these goods may be transferred a hundred times while they remain in the possession of the bailee.

From this it manifestly appears that there cannot be any more Bills of Lading or Dock Warrants than there is property, and hence these paper documents *REPRESENT*, and are one with the Goods.

But when a merchant buys goods with a Bill of Exchange, all connection between the bill and

the goods is severed. The property in the goods passes to the merchant, and the property in the Bill passes to his creditor, and the goods and the Bill may each be sold and transferred separately, and form two distinct and separate properties.

The owner of the Bill, which is a *chose in action*, probably sells it to his banker, whose business especially consists in buying these *chooses in action*. And he does this by creating another *chose in action*, either in the form of a Bank Note, or by a credit created in his books, called a Deposit, which the merchant can put into circulation, and which may be transferred any number of times.

But it is manifest that the Paper, the Bill, or the Note, is merely the evidence of the right, and is not the right, or the *chose in action* itself, which exists in the person quite independently of any paper document. Hence a debt, or a credit, in any other form whatever, such as a book credit, is of exactly the same nature as a Bill or Note, only it is not in a form so well adapted for circulation, and it is to be treated and classed along with them.

Now the various forms of Credit in this country greatly exceed, at least tenfold probably, all the cash in the country. All estimates of the credit and the cash in the country are necessarily vague, but it is probably not unsafe to say that the credit in this country is not less than £600,000,000; whereas the cash does not probably exceed £70,000,000. And there is no connection between them, there is none of the cash set apart and appropriated to the payment of any of this credit, and, in fact, it is expressly forbidden from being so.

Hence instruments of credit of all sorts do not REPRESENT money at all, in the same sense that Bills of Lading represent goods, but are independent property.

The distinction thus explained between Bills of Lading and Bills of Exchange, may perhaps seem somewhat subtle. It is nevertheless one of the most transcendent importance in human affairs. It lies at the root of the whole theory of the currency (CURRENCY), and it is from a confusion on this very point, that those false theories of currency have proceeded, which have brought such dire calamities on the world. (LAW.)

This is the basis of the theory of credit, which, however, involves several other subtleties, which we cannot enlarge upon here, but are fully developed under CREDIT.

It is also upon the doctrine that Credit is itself separate, independent, and exchangeable property, that the indubitable truth is based, that CREDIT is CAPITAL. Mr. Mill acknowledges that any thing that may be exchanged may be capital. It is only necessary to shew, therefore, that credit may be exchanged, and the doctrine that Credit is Capital follows as a matter of course.

Debts, therefore, were early recognized as personal property of an incorporeal nature, and as they were called *chooses in action*, this name was extended to immense quantities of property of the same nature which have grown up in modern times.

But, nevertheless, there are distinctions of considerable subtlety in the nature of different kinds of *chooses in action* themselves. And this is one of the points on which the legal classification of property is not that which is most suitable for

Political Economy, as we have shewn in the PRELIMINARY DISCOURSE. For all incorporeal property is not called a *chose in action*, nor are all *chooses in action* incorporeal property. Some *chooses in action* are naked, incorporeal, and intangible rights, but others are associated with material and tangible things.

In modern times an immense mass of property of an incorporeal nature has sprung up which was unknown to the common law. Thus the funds, shares in commercial enterprises of all sorts, banks, railways, canals, gas and water companies, insurances, personal annuities of all sorts, are all classed as *chooses in action*. This is all personal property of an incorporeal nature, amounting in value to several thousands of millions in this country. So lottery tickets are *chooses in action*. But we do not know of any instance in which a copyright, or a patent, or the goodwill of a business, has been classed as a *chose in action*. Now all these are incorporeal and separate property.

But there are other *chooses in action* which are not independent and separate incorporeal property, severed from a tangible and visible object.

The first of these are *Mortgage deeds*, which in modern times are classed as *chooses in action*.

In point of strict law a mortgage deed is an absolute conveyance of the property, in land, for instance, from the mortgagor to the mortgagee, who becomes the owner of the property, with the condition that he shall reconvey it on the repayment of the money borrowed at some fixed time. Thus, in point of law, a mortgage on land is not an incorporeal right, but a title to the actual land; and the deed is not a separate property from the land, but goes with it.

Equity, however, took a different view of the matter. It regarded the mortgage as in substance nothing more than as a security for the money borrowed, and regards the mortgagor as in reality the owner of the property, subject to the repayment of the debt. Considered, therefore, as a mere security for money, the mortgage deed is classed as a *chose in action*. But there is this very important distinction between it and an instrument of credit. The mortgage deed and the land go together, they cannot circulate separately and independently. They are, therefore, only one property. And this *chose in action* is material and tangible. Whereas, as we have often said, an instrument of credit, and the money it may ultimately be paid with, if paid with money at all, circulate separately, and are separate properties.

The very same thing is true of Bills of Lading and Dock Warrants deposited as securities for advances, the property in the goods they represent goes together with them, and they cannot be separated.

Another kind of a *chose in action* which is associated with something material and tangible, is a legacy, and it is called an equitable *chose in action* because a legatee can only recover it in a Court of Equity.

The equitable right to the legacy is in the legatee, but the legal possession is in the executor, though not the legal property, because he cannot use it as he pleases. The right to the legacy and the legacy are therefore not two, but only one property, the property being merely separated from the legal possession.

Thus we see that the class of property known as *choses in action* in law, is not a suitable one for the science of Political Economy, and may lead to much error. The fundamental principle of Political Economy is to ascertain what is *separate* property, and the criterion of the subject is that which we have given under *CREDIT*, viz.—

That which can be separately exchanged, is separate property.

Thus credit in all its forms, money, stock, shares, &c., can all be exchanged separately, they are therefore all separate property, and they do not represent property.

A mortgage deed, or any title to land, bills of lading, dock warrants and goods, cannot be exchanged separately, therefore they are *not* separate property, but they represent property.

This at once shews the error which we believe Dr. Chalmers originated, and which has become rather prevalent among Economists, that the funds are analogous to a mortgage on the property of the country. For a refutation of this error see *CAPITAL; CAPPS; FUNDS*.

The considerations in this article may also be useful to call the attention of economists to the existence of incorporeal property, or incorporeal chattels, the almost total neglect and omission of which from most works on Political Economy is one of their most inexplicable and striking defects. For not only does its admission give an immense augmentation to the field of the science, but it also greatly modifies many of its laws and principles which are erroneously supposed to be general. CIBRARIO, LUIGI, an eminent Sardinian writer and statesman, was born at Turin on the 23rd February, 1802. In 1824, he took his degree in civil and canon law, and then devoted himself to historical researches, especially about his native country, and its sovereigns. He has also published several works in general literature.

In 1830, he was elected a member of the Turin Academy of Sciences. He was an intimate friend and adviser of Charles Albert, who sent him on some diplomatic missions in 1832-33, and he was sent as Royal Commissioner to Venice in 1848. After the fatal battle of Novara he resigned this office, and he followed his unfortunate sovereign to Portugal, to endeavour to induce him to return to Turin, but did not succeed. He has filled several

important offices. In 1830 he was sent as plenipotentiary to France, to conclude a treaty of commerce, and a convention on literary property. He was for some time Minister for Foreign Affairs in Count Cavour's cabinet. His works relating to political economy are:—

Delle finanze della Monarchia di Savoia discorsi tre. Torino, 1841.

Della Economia Politica del medio evo. Torino, 1839.

This valuable work is divided into three books, the first of which treats of the political condition of the middle ages; the second, of the moral condition; and the third only, of what is usually designated as political economy by modern economists.

The third book contains eight chapters. The first treats of the effect of the political condition on industry and agriculture. The second is on the police regulations regarding the public health, manufactories, markets, the public safety, games, and prostitutes. The third chapter explains the various tenures of land. The fourth is on population, and a table is appended, exhibiting the ancient and the modern population of sixty towns and villages in the kingdom. The fifth chapter treats of the public treasury and taxation. The sixth is on the monetary system, and gives details of some of the principal coins formerly in use. The seventh is on the relation between ancient and modern money, according to their value in subsistence; several valuable tables are appended, showing the different species of money, and their weights in bullion, and their value in subsistence. The eighth and last chapter treats of maritime law, navigation, commerce, the arts, the theory of credit, interest, and exchange.

In this chapter Cibrario fully bears out what we have said under *BILL OF EXCHANGE*, § 14, that Bills of Exchange were invented by the Italians and not by the Jews. He says p. 527, edit. 1839.—“The principal merit of the Italian towns, besides having renewed in the middle ages the power and the commerce of Carthage and Tyre, was having discovered or renewed the theory of credit, and the incredibly rapid circulation of money by means of Bills of Exchange. Towards the end of the 12th century, as one may gather from the statutes of Susa, there were established in various cities of Italy, banks of loan and exchange, called *casane*. This business was carried on principally by the people of Tuscany, Asti, and Chieri, who carried on the not always innocent business not only of circulating and exchanging money, but also of lending upon pledges. In 1226, we know from the chronicles of Asti, that bankers of that city were introduced into France, where the same business was already carried on by the merchants of Cahors. Thenceforward Italian money lenders greatly multiplied, first being confounded with the Caorsini, then distinguished by the name of Lombards, first caressed, then persecuted by princes, then hunted to death, and always hated by the people. Some of these bankers went to the Courts of England and France, the richest to that of the Pope, and the firms of the Bardi, the Peruzzi, and the Frescobaldi of Florence, the Balardi of Pisa, the Salimbeni of Siena, had nothing to envy in the modern Rothschilds. He says that the firm of Caluccio Balardi had a bank at Paris in the beginning of

the 14th century, and Giovanni Vanno had a bank at Dover and Canterbury at the same time.

He also says, as is stated in *BILL OF EXCHANGE*, that they were greatly used in transmitting the papal revenues.—“The Italian bankers were the first to discover the true laws of the commerce of money, and the world is, in fact, indebted to them for the theory of credit, and bills of exchange. I know, certainly, that some say that the Jews invented Bills of Exchange, but even if that could be proved, the merit of having adopted and extended their use undoubtedly belongs to the Tuscan bankers, who were charged with the duty of collecting the papal revenues in various parts of the Catholic world, and availed themselves of this means of consigning the funds collected, when the papal court had pressing need of money.” Cibrario refers to *Osgierius Alferius. Rer. Italic. XI. 142. Turzanus de Castronovo*, in *M.S. in the Royal Athenæum at Turin*, Vol. II. 344, and to *Muratori, antiqu. Italic. diss. XVI. Mercatura de' Fiorentini, tom. II. 126.*

Cibrario also fully confirms what we have said under *BANK*, that the word *BANK* is synonymous with the Italian *MONTI*. He also uses *BANCO* as synonymous with *MONTI*, and meaning a *public debt or fund*. At p. 530 he says.—“Circa alla teoria del credito, che diasi invenzione di comuni Italiani, è noto che il primo *BANCO*, o *debito pubblico*, fu eretto a Venezia nel 1171. Nel secolo XIII v'ha memoria di carta monetata a Milano. Il credito fu rimborsato. Un *MONTE*, o *debito pubblico*, fu stabilito in Firenze nel 1336.” This fully shews that *banco* and *monte* meant the same thing.

The volume concludes with eight tables, shewing the prices of a great variety of things, as well as the interest of money, in the 13th and 14th centuries.

CICERO, MARCUS TULLIUS. Born at Arpinum, the 3rd of January, 106 B. C., killed on the 7th of December, 43 B. C.

We only cite this eminent person here, to shew the strange influence which ill-considered prejudice held over his mind in commercial subjects, and that he says that no retail dealer can succeed without lying. He says that some means of acquiring wealth are reputable, and others disreputable. Among the latter are tax gatherers and usurers. Those, too, are base in which wages are paid not for *art*, but for *labor*; as well as those who buy from merchants to sell again immediately, for they cannot succeed unless they lie much. *De Officiis* I. 42. This curious prejudice, that men could not make any profit in shopkeeping without cheating, long prevailed.

CIESZKOWSKI, AUGUSTE, Count, was born at Sucha, in Poland, the 12th September, 1814. He has written a considerable number of works of a philosophical and transcendental nature, in German and Polish. He has contributed to the *Journal des Economistes* several articles. He was a member of the Prussian National Assembly in 1848.

Du crédit et de la circulation. Paris, 1839. 2nd Edit. 1847.

Under ordinary circumstances we should have passed over this work without notice, merely lamenting that the author had wasted so much

ingenious labor in bringing forward as new, the doctrines of John Law, which have seduced so many persons. But when we find that several of the ablest economists on the continent have approved of Count Cieszkowski's doctrines, the matter assumes a very different aspect indeed, and is calculated to inspire some alarm, that these pernicious follies should become more popular.

To our inexpressible amazement, economists so well known as M. Joseph Garnier, M. Baudrillard, the associate of M. Chevallier at the Collège de France, and Professor Boccardo, the author of the great Italian Dictionary of Political Economy, have all adopted the doctrines of Cieszkowski.

We must accord one merit to Count Cieszkowski. He tells us very distinctly what he means. He does not envelop his ideas in a cloud of words, out of which the bewildered reader finds it impossible to discover the author's meaning. On the contrary, he tells us exactly what he thinks wrong, and what he thinks right. We therefore know exactly where to hit him. We have only to show that his fundamental conception, as clearly expressed by himself, is nothing but a palpable error, which any lawyer or merchant in the world would immediately detect, and the whole of his superstructure falls to the ground in ruins.

He very justly dwells on the importance of the subject of Credit, and the great evils which a mistaken conception of its nature may produce. He then examines the definition of credit, and he says that it has usually been considered as an anticipation of the future, which he says is a capital error in theory, and only true in a very restricted sense, but eminently false as an ultimate and absolute definition.

He then says, p. 6.—“*Le crédit est la métamorphose des capitaux stables et engagés en capitaux circulants ou dégagés*; c'est à dire, le moyen qui rend disponibles et circulables des capitaux qui ne l'étaient point, et leur permet par conséquent de se porter partout où leur besoin se fait sentir. Cette définition fondamentale nous suffit comme point de départ pour fixer les idées.”

Now the meaning of this is perfectly plain, and is fully illustrated by his subsequent proposals, as well as by the ideas of the authors who have unfortunately followed him. (*BAUDRILLART*; *BOCCARDO*; *GARNIER*.)

Count Cieszkowski conceives an instrument of credit to be one like the title deeds to an estate, or a bill of lading, or a dock warrant, which represents property, and may be passed from hand to hand, with greater facility than the property itself. He imagines that these are similar to bills of exchange, which transfer the right to so much money.

But every lawyer and merchant in the world, who gives a moment's reflection to this idea, will at once perceive its gross fallacy. The title deeds to an estate, a bill of lading, and a dock warrant, are precisely what credit is NOT. They are documents which are expressly bound down and tied to some specific property, and cannot be separated from it.

Now if Count Cieszkowski would inform himself of the first principles of law and commerce, he would know that the fundamental notion of an instrument of credit is that it is *expressly forbidden to be attached to any specific property whatever.*

That is the very circumstance from which it receives its name of *credit*. It circulates merely on the *belief* that it can be exchanged for money. But bills of lading and dock warrants are not *credit* at all, because they are known to be attached to certain things.

The fundamental distinction, then, between bills of lading or dock warrants, and instruments of credit of all sorts, is, that the former are titles to *things*, the latter are universally claims against the *person*. And this is the Pons Asinorum of political economy. (BILL OF EXCHANGE; BANK NOTE; BILL OF LADING; DOCK WARRANT; CREDIT.)

At p. 27 he opens out against the circulation of instruments of credit.—“Mais le crédit de pure circulation, cette fantasmagorie industrielle et financière, qui équivoque des ombres sans corps, et qui pourtant les rend *pesantes*, contradiction physiquement insoluble, et qui l'industrie nous présente néanmoins dans ces valeurs purement *negatives*, qui ne sont que des *charges*, qui n'ont jamais rien produit, et ne peuvent rien produire.” It is curious that M. Cieszkowski has here just hit upon the right expression for credit,—it is *negative*,—but he says this is a physical impossibility. We hope we have shown that the explanation is perfectly possible. (CREDIT.)

At p. 44 he brings forward his own plan:—“Eh bien, des titres de dépôts réels, d'hypothèques engagées, enfin, de gages actuel de toute espèce, émis en circulation sous une forme générale, par une institution *universelle* de crédit (au lieu du papier de banque, qui n'est que *signe*, abstraction faite de ses autres défauts.”) He then compares them to warrants:—“Les warrants-là, dis-je, circuleraient indéfiniment, puisque leur destination n'aboutirait à aucune consommation, comme cela a lieu pour les denrées commerciales; mais qu'au contraire, c'est leur circulation seule qui constituerait leur usage et leur destination. Ce serait donc une monnaie parfaitement analogue à la monnaie métallique, puisqu'elle porterait en elle-même sa garantie *spéciale* et déterminée, n'étant en réalité qu'un fonds réel rendu circulaire.”

Now here we have his plan clearly explained. And we lament to say that Professor Boccardo has fallen into exactly the same error. He in his Elements of Political Economy, says that a warehouse at the docks which gives warrants, is like a bank which issues notes.

This error is of the most fundamental nature, and of most momentous consequence. A dock warehouse and a bank do *not* resemble one another, and the documents issued by them are fundamentally distinct. The former are not credit, the latter are. In a dock warehouse the goods remain the absolute property of the depositor, which he can always identify, or transfer to any one else. The dock master has no property in them. Consequently the document and the goods are one property, and circulate together.

But in a bank the case is totally different. The money in the bank is the absolute property of the banker, and the document of credit only is the property of the depositor, who has no right to any specific money whatever. The consequence is, that the money and the document are two properties, and circulate independently of one another.

The consequences of this are very important. Bills of lading and dock warrants have no value of themselves, but instruments of credit are articles of separate and independent value, like any other exchangeable property. The *value* of all the bills of lading and dock warrants in England is simply *nothing*. The *value* of all the forms of credit cannot be less than £600,000,000, at the lowest computation. And this, as every lawyer knows, is separate, exchangeable property, just like any other.

The bills of lading or dock warrants are in no way auxiliary or subsidiary to the metallic currency, or substitutes for it, whereas credit is always auxiliary or subsidiary to, or a substitute for money.

Consequently the institutions proposed by M. Cieszkowski would not be institutions of credit at all; and the excellent Economist, Professor Boccardo, must have been imitating the father of poetry in one of his nodding fits, when he could suppose that a Dock Warehouse was an institution of credit like a Bank.

Now the documents issued as M. Cieszkowski proposes, must have some value in money expressed on them. It would be impossible for them to circulate unless some attempt were made to fix the value of the property they represented. A title to land would require to have the value of the land expressed upon it, and so on of other things.

But what is this but John Law's identical scheme? His plan was to coin into money all the property in the kingdom, which is exactly M. Cieszkowski's plan, and that of many others. At p. 131, he bestows the highest commendation on Law.

Now what do the excellent Economists mentioned above say to this? They all mention Law with the utmost horror, and yet by approving and adopting M. Cieszkowski's ideas, they are absolutely adopting Law. We earnestly implore of them all to re-consider the fatal doctrines they have so unadvisedly been led to sanction.

CIRCULATING MEDIUM. The term *circulating medium* is used by all Economical writers as synonymous with currency; we therefore refer to the article CURRENCY for a full treatment of the subject.

This term came into common use in the last decade of the last century, as we learn from Mr. Fox, and Mr. Fortune. (FORTUNE.)

We shall not examine here the various opinions which have been held as to the meaning of the word currency, or circulating medium, as that is fully done under the former term. We will only say here that every scientific analogy shews that the term circulating medium, must signify the medium, or means by which the operation of cir-

ulation is effected. What circulation is, we have explained in the following article.

This point deserves attention, because it is by no means uncommon to suppose that circulating medium means the medium which circulates itself, and those who give it that interpretation are apt to confine it to money and Bank notes, because those two agents are more commonly seen in general circulation. This question is by no means of small importance, because there are many other instruments of credit besides Bank Notes, which circulate commodities, but which do not enter into general circulation. And there has arisen a strong division of opinion among recent Economists, whether any other forms of credit besides Bank Notes are to be included under the title currency, or circulating medium.

Now it appears to us that scientific analogy is decisive on this point. In scientific language a medium invariably means something by, or through, which something else is done. Hence we have only to consider the *means* or *agent* which causes circulation, and then we have at once the extent of the circulating medium. Now it is quite clear that other forms of credit besides Bank Notes circulate commodities, and consequently that money and credit in all its forms constitute the circulating medium. The differences in the forms of credit are only differences in *degree*, and not in *kind*.

It will assist us also, to see in what light the French Economists interpret the expression circulating medium. Now they always interpret it by the expression *l'agent de la circulation*, which exactly agrees with what we have said above.

We may also illustrate this view by another case. A newspaper is also called a circulating medium. Of what is it the circulating medium? Of intelligence. And it is not called the circulating medium of news because it circulates itself, but because it *circulates news*. In the indictment against Joseph Gerrald, in one of the famous trials for sedition in 1794, he is charged (Howell's State Trials. Vol. XXIII. p. 815) with making seditious speeches, the substance of which was "published in a newspaper published at Edinburgh, intituled '*The Edinburgh Gazetteer*,' and through that *medium circulated* among the lieges." Here we have the exact analogy. What was the circulating medium? The newspaper. Why was it called so? Because it was the medium through which the seditious matter was circulated among the lieges. Was it called so because it circulated itself? Certainly not; because if it had been posted up on a wall, and had been read by people standing still, it would still have circulated the intelligence, without circulating itself. How it circulated the intelligence was, therefore, a matter of secondary consideration, though it usually happens that newspapers do circulate themselves as well.

It is just the same with the circulating medium of commodities. How it performs its duty is a matter of secondary consideration. It is certainly true that money and bank notes circulate themselves, as well as circulating commodities, a Bill of Exchange in a less degree. But there are also other forms of credit besides these, which circulate commodities without entering into general circulation themselves. And these are book

credits, or book debts. What the amount of these may be is of course beyond any one's power to say. In all probability they exceed the amount of bills and notes in circulation by many times.

Now these book credits are manifestly of the same nature as Bills of Exchange, only they are not put into a form to circulate themselves. But it is clear that they arise out of the transfer of a commodity, just as a Bill of Exchange does, and it follows from the preceding considerations that they form a part of the circulating medium of the country. (CURRENCY.)

CIRCULATION. In its early stages commerce was carried on by a direct exchange of articles which were reciprocally wanted, and in this form it is usually called *BARTER*, or sometimes *EXCHANGE*. The excessive inconvenience of this is too well known to need description here. An intermediate merchandize was then introduced called *money*, and transactions in which money is used are not called *barter*, but *SALES*.

Aristotle long ago pointed out the true character of money. He says (ARISTOTLE) that when a person has done some service, and wants no immediate return for it, he must receive something by way of pledge that he shall receive something in exchange at a future time when he requires it. And that pledge, which is the record and the measure of the service due to him, is called *MONEY*.

A transaction in which any commodity or service is exchanged for money, instead of an equivalent, has been well called by J. B. Say (SAY, J. B.) a *demi-exchange*. And the conveniences of this method of conducting commerce so greatly preponderate over those of direct exchange, or barter, that commerce is now almost entirely resolved into these *demi-exchanges* or sales. (CREDIT; CURRENCY.)

And this is the proper meaning of the word *CIRCULATION*. Barter or Exchange is where two services of any kind are exchanged directly. Sale, or demi-exchange, or circulation, is when any service is exchanged for some intermediate merchandize, which will enable its owner to obtain some service in exchange for it at some future time.

Hence we see the character of money. It is an instrument of *GENERAL CREDIT*. It is taken in exchange for any service because the person who does so believes he can obtain something in exchange for it at a future time, when he pleases. And as it is the instrument, or medium, by which circulation is effected it has also been called *Circulating Medium*. (CIRCULATING MEDIUM.)

Money, we thus see, is general credit. But money is not the only circulating medium. The seller of a service, instead of demanding money for it, may rest contented with the simple *promise* of his debtor to pay him at a future time. This promise, it is clear, is only a pledge from the individual debtor, it is therefore only *particular credit*. But, nevertheless, it is of the same nature as money, only it is a lower degree. The *obligations to pay* may be recorded on paper, and may be exchanged for services, and are capable of circulating commodities.

These obligations to pay are in two forms,

orders to pay, and *promises* to pay, and are of different sorts. But they are known by the general name of instruments of *CREDIT*. The subject of Credit forms a very subtle branch of Law and Political Economy, and is developed under the article *CREDIT*. It is clear from what has been said, that circulation is effected by money and instruments of Credit of all sorts, and therefore money and credit form the circulating medium, or currency. (*CURRENCY*.)

The word *circulation* is also used very improperly, to mean notes issued by a banker. This is an inaccuracy of a similar nature to that by which *currency* is used to signify money. It is not, however, so firmly established yet in common usage as the latter one.

It is one of the most objectionable terms in use. To call the notes which circulate, the circulation, is as gross a confusion of idea as to call a wheel a *rotation*, and, in fact, involves the same error as to confound a force with its effect.

It is clear from what has been stated above, that every transfer of money in commerce calls forth something in exchange for it, and is consequently an act of circulation, and the amount of the total transfers of currency which take place is properly called the *CIRCULATION*. Hence, a single piece of money may add considerably to the circulation, for every time it is transferred, it is an addition to the circulation, though it is no increase of the currency. The words *currency* and *circulation*, therefore, clearly mean different things; the one is the substance itself, and the other is the amount of transfers from hand to hand. It is also clear that the *currency* and the *circulation* do not bear any fixed relation to one another for there may be a large amount of currency in a country, yet if the industrial operations be few, there will be a small circulation. On the other hand, there may be a small amount of currency, yet if the people be active and industrious, it will pass frequently from hand to hand, and there will be large circulation.

The distinction then, between *currency* and *circulation*, is analogous to that between a body in motion, and its momentum, or its weight multiplied by its velocity, which is its *effect*. If a body of 100 pounds weight move with a velocity which we may call 1, its momentum will be 100. Now if we diminish the weight to 50, but can double the velocity, the momentum will still be 100 the same as before. The operation of the *currency* is precisely analogous to this. Its useful effect is the result of its combined amount and rapidity of circulation, which we call the *CIRCULATION*. If two transfers of £50 take place in the same time that one transfer of £100 takes place, the useful effect, or circulation, will be the same. Thus, let us suppose that in any given time A has a transaction with B to the amount of £100, out of which profits arise. Then if during the same time A had a transaction with B to the amount of £50, with a proportional profit, and B had a transaction with C to the amount of £50, with a similar profit, it is clear that the two transfers of the £50 in the same time as the one transfer of the £100, are equally advantageous to the community at large.

The effect of the circulation of money is sometimes apt to be overlooked, because it passes from hand to hand without any record being marked

on the face of it to denote how many transfers it has effected. But when circulation is carried on by means of bills of exchange, its effect is more clearly seen, because it is usual for every one who passes away a bill of exchange, to indorse it. Thus a record is preserved of the number of transfers it has effected.

Now it is held in law that every indorsement is equivalent to a fresh drawing; thus every bill of exchange includes within itself in reality, as many bills as there are indorsements, and this is just what we have explained to mean *CIRCULATION*. The total useful effect of the bill of exchange in commerce, therefore, is estimated by the amount of the bill multiplied by the number of indorsements on it. And it is clear that a bill of exchange of £100, with twenty indorsements on it, has in reality done a duty equivalent to twenty bills for £100, with only one indorsement. Because each of the twenty persons through whose hands the bill passed might have given a new bill instead of passing on the old one. Formerly the whole circulation of Lancashire was carried on by means of bills of exchange, which had sometimes as many as 150 indorsements on them before they were paid. It is clear that these bills had produced the same effect in commerce as 150 separate bills to the same amount. Hence the momentum or useful effect of one bill which passes through 150 transfers is equivalent to that of 150 bills of similar amount which pass through only one transfer.

Now it is clear that the very same arguments apply to money, and that its useful effect, or momentum, or circulation, is measured by its amount multiplied into the number of its transfers. Just as the useful effect of a merchant vessel is measured by the amount of goods she carries, multiplied into the number of voyages she makes. One vessel which makes ten voyages produces the same effect as ten vessels which make one voyage.

These considerations give a simple explanation of the apparent paradox we mentioned under *CAPITAL*, § 100, that *every man's income is paid out of the income of some one else*.

Let us suppose that A has a sum of money and wants something in the way of B's business. He deals with him, and pays him money. Part of the price goes to replace B's capital, and part to form his income. B then having thus made an income from his dealing with A, wants something from C, and pays him for it. That payment goes partly to replace C's capital, and partly to form his income. C thus having made an income by dealing with B, wants something from D, and pays him for it; that payment goes partly to replace D's capital and partly to form an income. D in a similar way deals with E, and E with F, and F with G, and so on, till we come to Z. Then Z wants something from A, and deals with him, and thus the money comes back again to A, and is ready to perform a similar circuit in endless succession; and it is this successive transit of money through the various hands that gives them their income. Thus the proposition is manifest.

This explains how the incomes of the people of this country are paid by comparatively a small sum of money. The incomes of the people are supposed, not to be less than 1,000 millions, and yet there are not supposed to be more than 60 or 70

millions of specie in the country, if so much. How then can 1000 millions of income be paid with 70 millions of specie? Simply by the circulation or transit of the specie from one person to another. The very same pieces of money become income to a hundred persons in succession by the act of circulation. A piece of money that passes through one hundred hands in commerce calls forth a separate article of value on each transfer, and thus calls forth 100 times its own value; and it is out of these successive creations of value that income arises.

Hence the apparent paradox vanishes, and it appears that £1 may call forth £100 of profit in the community by a sufficient rapidity of circulation, and each of these profits may be taxed.

CLARKSON, THOMAS, who may be called the patriarch of negro emancipation, was born at Wisbeach, in 1760. His father was a clergyman and master of the free grammar school there. He was educated at St. Paul's School, London, and St. John's College, Cambridge, where he gained the first prize for a Latin dissertation proposed to the middle bachelors. The next year, in 1785, the subject offered as a prize for senior bachelors was, *Anne liceat invidios in servitutum dare?* Clarkson gained this prize also, and he was so horrified and excited at the atrocities he read of as being perpetrated, that he resolved to devote himself for life to the abolition of the Slave Trade. Seldom has an idea conceived by so humble an individual been followed out with such perse-

vering ardour, and crowned with such glorious success. Having become acquainted with Wilberforce, he made the first motion in the House of Commons in 1787, and after 20 years of agitation, their efforts were rewarded in 1807 by the prohibition of the Slave Trade. After 26 years more, the further triumph was obtained of the total abolition of Slavery in the British dominions. Clarkson had the happiness of living to see this glorious consummation of his labors. He died 26th September, 1846. Probably there is no other instance of a University prize essay having led to such benefits to humanity.

CLEARING HOUSE. Boisguillebert, in his *Dissertation sur la nature des richesses*, a work which well deserves attention from its being one of the ablest of the early treatises against the mercantile theory, mentions the fair at Lyons, where it was customary for the merchants to balance their debts without the payment of money. This custom, we believe, began in the 16th century. There was a great annual fair at Lyons, and the French merchants, instead of making their bills payable every three months or so, by which they would have had to keep a stock of bullion ready to meet them and unemployed, made them payable only at the fair of Lyons. The bills circulated throughout the country, and got, perhaps, covered with indorsements. At a certain period during the fair, the merchants met for a general settlement and adjustment of accounts, and Boisguillebert says that by this means transactions to the amount of 80,000,000 were settled without the use of a sou in money.

The Clearing House of London is instituted to perform the same service to bankers as this custom of the merchants at Lyons.

The first plan of the kind in this country was carried out at Edinburgh. For a considerable period there, the rival banks used to do all they could to injure each other. It was no uncommon thing for them to collect a large quantity of each other's notes and suddenly present them for payment, in the hope of ruining their rivals. At last, however, they became sensible that this undignified conduct was mutually injurious, and they agreed that they should meet twice a week, and adjust their respective claims, and that they should make no demand for money on each other, except at these times. In 1775 the London bankers established a similar daily custom among themselves.

We may explain the advantages and the operation of the Clearing House in somewhat greater detail to our readers.

Every London banker has every morning claims against all, or at least, most, of his neighbours, and of course he has to meet claims from them. It used to be the custom for every banker, the first thing in the morning, to send out a number of clerks to collect the debts which were due to him from his neighbours, who, of course, were obliged to keep cash or notes to meet them. He, in a similar way, was obliged to keep a large amount of cash or notes to meet his neighbours' claims against him. The consequence of this was very manifest—a very useless necessity for a very large quantity of money. To show how this was, let us take an example. Of course as the clerks collected debts due from many bankers, it would be impossible to tell whether the claims of any two were equal until the accounts were brought in. But suppose, for example, that banker A

had a claim against banker B for £10,000; and banker B had a claim against banker A for an exactly equal amount. Now by the method of collecting just detailed, A's clerk would go and get £10,000 from B, and B's clerk would go and get £10,000 from A, consequently there would be nothing but a payment and reception of £10,000 on each side. Consequently to adjust their claims £20,000 in money would be required.

The least observation would show that it would be a much more sensible thing for them to ascertain their mutual claims against each other, before they began to pay: It is clear that in the case supposed above, if they met and found their mutual claims equal, there would be no use for any money at all, and the £20,000 so uselessly kept for the purpose of being marched backwards and forwards between their offices, might be profitably employed in trade, and become a *bonâ fide* augmentation of capital.

If their claims were not mutually equal, of course they might be set off against each other, and only the *balance* paid in cash.

The Clearing House as originally instituted was for this purpose. The clerks, instead of going round to the different bankers, met together in a room and set off their different claims against each other, and the balance was paid according as it happened to be due. It is stated in the Bullion Report that in 1810, there were 46 bankers who cleared, and that the average amount of drafts, passed through the clearing house every day, was about £4,700,000, and that all the balances on this account were settled by £220,000 in Bank Notes.

This institution was confined to the private bankers. The Bank of England was not admitted to it, and is not to the present day. For twenty years after the foundation of Joint Stock Banks, they were jealously excluded from it, until in 1854, the intolerable inconvenience caused to them by the large amount of notes they had to keep idle to meet the "charges," as bankers' claims are called, set a question afloat of organizing a clearing house among themselves. The private bankers then agreed to admit them into the Clearing House.

At the same time the method of doing business was reorganized and improved. The different bankers no longer settle their differences *inter se* with cash, and by the present mode no money or notes at all are used.

The present method of conducting business is as follows:—

Each clearing bank opens an account with the Bank of England, and an officer has been appointed, called the Inspector of the Clearing House, who also has an account with the Bank of England.

The bills and cheques which each banker holds on the other clearing banks are sorted in separate parcels, and at 10.30 a clerk from each bank arrives at the Clearing House. He delivers to each of the other clerks the claims he has against his house, and receives from each the obligations due from his own. When these obligations are interchanged, each clerk returns to his own bank. The same process is repeated at 2.30. Each bank has till 4.45 to decide whether it will honor the drafts upon it; if it does not return any drafts upon it before that hour, it is held to have made

itself liable on them to the Clearing House. At 4.45 the business closes, and the accounts are made up.

Printed lists of the clearing banks are made out for each bank with its own name at the head, with the word "debtor" on one side and "creditor" on the other. The clerk of the Clearing House then makes up the accounts between the banks, and the difference only is entered in the balance sheet according as it is debtor or creditor to each bank in succession. A balance is then struck between the debtor and the creditor columns,

exhibiting the sum due from, or owing to, the bank on the whole of its transactions, and the paper is delivered to the clerk, who takes it back to his own bank.

The balance is not then paid to, or received from, the other banks as formerly, but it is settled with the Inspector of the Clearing House, by means of a species of cheque appropriated to the purpose, called *transfer tickets*.

These transfer tickets are of two colours, white and green. If the bank is debtor on the balance, it gives a

WHITE TICKET.

SETTLEMENT AT THE CLEARING HOUSE.

London, 186

To the Cashier of the Bank of England.

Be pleased to transfer from our account the sum of and place it to the credit of the account of the Clearing Bankers, and allow it to be drawn for by any of them (with the knowledge of either of the Inspectors, signified by his countersigning the drafts.)

£

SETTLEMENT AT THE CLEARING HOUSE.

BANK OF ENGLAND,

186

A TRANSFER for the sum of has this evening been made at the bank from the account of Messrs. to the account of the Clearing Bankers.

For the Bank of England,

£

This Certificate has been seen by me,

Inspector.

If the bank is creditor on the balance it gives a

GREEN TICKET.

SETTLEMENT AT THE CLEARING HOUSE.

London, 186

To the Cashier of the Bank of England.

Be pleased to CREDIT our account the sum of out of the money at the credit of the account of the Clearing Bankers.

Seen by me,

Inspector at the Clearing House.

SETTLEMENT AT THE CLEARING HOUSE.

BANK OF ENGLAND,

186

The account of Messrs. has this evening been CREDITED with the sum of out of the money at the credit of the account of the Clearing Bankers.

For the Bank of England,

£

By this admirable system there is not a single bank note required for the settlement of many millions of money every day.

The two methods which London bankers have of settling their mutual claims which we have described—by collecting the charges in the morning, and by the Clearing House, suggest several important reflections upon the circulating medium, the Bank Act of 1844, and prices. That Act fixed £14,000,000 as the limit below which the requirements of business would probably not permit the internal circulation to fall. But that amount was fixed with reference to a particular method of doing business. If all the London bankers were admitted into the Clearing House, there would be a vast amount of bank notes disengaged from business, and they would either disappear from circulation altogether, or they

might be employed as fresh capital in discounts. On the other hand, supposing the Clearing House dissolved, and the clearing banks to revert to the barbarous method of settling their mutual claims practised by the non-clearing banks, many millions of bank notes would be required for no other purpose but to settle their mutual claims. How many millions would be necessary we cannot say. Many years ago it was stated in evidence before the House of Commons, that the London and Westminster Bank was obliged to keep £150,000 in notes, idle for this very purpose; considering that there were then upwards of 60 banks in London, even supposing that they were on an average obliged to keep half that sum idle, that would make a difference of £4,000,000, required according to the different methods of doing business. And this quantity of notes would have no

effect on prices or business. Consequently we observe that the quantity of bank notes in circulation is no absolute guide to the magnitude of transactions carried on, nor to prices.

At the beginning of 1860, a Clearing House was instituted for country bankers.

CLEIRAC, ESTIENNE, an advocate of Bordeaux, in the 17th century, published a work in which details are given of the Bank of Venice, which we have not been able to see.

COBBET, WILLIAM. This remarkable man was born in March, 1762, the son of a farmer, at Farnham, in Surrey. He is not of sufficient importance in an economical point of view for us to give details of his strange career, but we may mention that in his Political Register, he constantly and strenuously maintained the depreciation of the Bank Notes from the year 1803, during seven years before the appointment of the Bullion Committee, and six years before Ricardo sounded the alarm in the pamphlet which brought him into public notice. This, among other things, made him an object of hostility to a certain party. He also claims to have exposed the fallacy of the sinking fund, which was supposed to have worked such marvels, considerably before Dr. Hamilton, who has usually the credit of it. Cobbett died on the 18th June, 1835.

Paper against Gold; or the history and mystery of the Bank of England, of the Debt, of the Stocks, of the Sinking Fund, and of all the other tricks and contrivances carried on by the means of Paper Money. London, 1828.

This is the reprint of a series of twenty-nine letters Cobbett addressed to the public, from the 30th August, 1810, to the 2nd August, 1811, on the subject of the depreciation of the Bank Note, just after the presentation of the Bullion Report. Though rather tedious and wordy, owing probably to their being in the form of letters published at intervals, they show a very thorough mastery of the subject, except on one or two points, and exhibit all the author's power of pungent reasoning and sarcasm. They contain much interesting and authentic information of the state of things then existing, and should be read by all wishing to form a judgment of that period.

Cobbet's legacy to laborers; or what is the right which the Lords, Baronets, and Squires have to the land of England. London, 1834.

COBDEN, RICHARD. The specious plausibilities of protection to native industry became general throughout Europe in the beginning of the 17th century, and were formally inaugurated by Henry IV. of France, and the Great Sully. (SULLY.) They received a still stronger organisation from the genius of Colbert (COLBERT), and

became the accepted faith of statesmen and governments. Nevertheless, at the close of the century a few sagacious writers began to proclaim their fallacy. From the beginning of the 18th century we find a continuous stream of authors, essayists, and poets, who began to descry afar off the advent of universal Free Trade. As the century rolled on a general reaction against the doctrines of Protection commenced in the minds of the most sagacious philosophers of France, Italy, Spain, and England, and the age gave manifest signs of the birth of a new science. Among an increasing crowd of illustrious writings in western Europe, the most illustrious effort was the *Wealth of Nations*. The first school of economists died out in France, but it recaptured the flame from Adam Smith, and J. B. Say was the worthy founder of a second school of thought in that country.

Notwithstanding these brilliant efforts, the minds of legislators seemed to be impervious to the dawning light, as they usually are. After 1815, economical darkness seemed deeper than ever. But at last, in 1820, when the system of Protection seemed to be strained to its utmost in this country, it began to break up, and from that time a continual progress in the direction of Free Trade may be dated. (HUSKISSON.)

Nevertheless, the great stronghold of Protection in England, the Corn Laws, seemed unassailable; for though changes might be made in them, the idea that they could ever be got rid of entirely seemed to be the dream of a visionary. It is true that a gallant band kept up the apparently hopeless contest in Parliament, but with no increasing success. It long seemed that the most beneficent truths ever discovered by men, might amuse philosophers, essayists, and poets in their closets, but they might fret in vain against the stolid resistance of prejudice and interest.

The great captain who, without probably discovering any positively new truth himself, by a fortunate conjunction of circumstances, and a happy genius eminently suited to the times, led the array of economists to that renowned victory of peace, which gave practical effect to the discoveries of science, and produced a beneficent revolution in legislation, which is destined to be felt with ever-widening blessings to the remotest ages, was RICHARD COBDEN.

Mr. Cobden was born in 1804, at Dunford, near Midhurst, a small property which belonged to his father, who was of the class of small proprietors, or yeomen farmers, who were formerly more common than at present. His father dying when his son was young, he was left to the care of an uncle who was in business in London. He then entered a calico printing firm in Stockport as a partner, and travelled occasionally on the continent in connection with its business. In 1834 he visited Egypt, Greece, and Turkey. In 1835 the editor of the *Manchester Times* received a series of anonymous letters shewing very remarkable ability. For long he endeavoured to discover their author, but without success. However, he evidently saw that they came from some one who was then probably unknown, but was destined to make a great figure in the world. About the same time a copy of a pamphlet just then published, entitled *England, Ireland, and America*, was put into his hands by a friend, with the words "from

the author," on it. He immediately saw that the handwriting on the pamphlet was the same as that of his unknown correspondent. The authorship of the letters was then plain, it was Mr. Cobden, who was only known as a successful calico printer, whose goods were then beginning to compete with the best London ones.

The subject of the Corn Laws had been stirred a few times in the Manchester Chamber of Commerce and in the House of Commons since the Reform Act, but the general abundance in 1833-34-35, in which the agriculturists suffered much, diverted the attention of the general public from them. The great majority of mankind feeling no present inconvenience, were unwilling to consider the matter, seeing that nothing was to be gained. A few only, among whom was Mr. Cobden, thought that a good opportunity to take measures as far as possible to render that prosperity permanent.

The cycle of plentiful years ended with 1836, and in the autumn of that year the price of corn began to rise. An Anti-Corn Law Association was formed in London, but it did not effect anything. In 1837 Mr. Clay moved the adoption of a 10s. fixed duty, instead of a sliding scale, but it was rejected by a majority of 223 to 89.

During the winter of 1837-8 the distress of the working classes increased considerably in consequence of the inferior harvest. On the 15th March, 1838, Mr. Villiers moved for a committee of the whole house to consider the Act, 9, Geo. IV. c. 60, relating to the importation of corn; Sir William Molesworth seconded the motion, in an able speech, but it was rejected by 300 to 95.

In the summer of 1838 the prospects of the harvest became serious, and increased attention began to be directed to the Corn Laws. Lectures began to be delivered against them. The first that lighted such a candle as has never been put out, deserve especial mention. They were Mr. Paulton and Dr. Bowring, who lectured to crowded audiences in July and August. In the month of September seven men were conversing on the subject, when one of them, Mr. James Howie, proposed the formation of an Anti-Corn Law Association in Manchester. Their names were, Edward Baxter, W. A. Cunningham, Andrew Dalziel, James Howie, James Leslie, Archibald Prentice, and Philip Thompson. The idea was immediately approved of and adopted; in twelve days 100 members joined. In the middle of October a provisional committee was announced, containing thirty-eight names, among whom was Mr. Bright. In the next week thirty-one new members were added, among whom was Mr. Cobden. Lectures were instituted, and attended by crowded and enthusiastic audiences. In December, the Manchester Chamber of Commerce adopted a petition to the House of Commons, urging them to carry out to the fullest extent, both as affects agriculture and manufactures, the true and peaceful principles of *Free Trade*.

In January, 1839, meetings to support the movement were held in several of the principal towns, and petitions were prepared and numerous signed. The association assumed the name of the "Manchester Anti-Corn-Law Association," and its objects were, to attain by all legal and peaceable means the total and imme-

diate repeal of the Corn and Provision Laws. Mr. J. B. Smith was president, and a council of not less than 100 was formed, of whom Mr. Cobden was one. An executive committee of twelve was appointed, of whom Mr. Cobden was also one.

In February a meeting of delegates from all parts of the country was held in Palace Yard. Mr. Villiers was elected their Parliamentary leader, and it was decided at once to place a notice on the books of the House. On the 18th, Mr. Villiers, after presenting a number of petitions, moved that the Corn Laws be referred to a Committee of the whole House. It was seconded by Mr. Strutt, but rejected by a majority of 361 to 172. This repulse only stimulated the delegates to more determined efforts.

On the 12th of March, Mr. Villiers moved that the House resolve itself into a Committee to take into consideration the Acts relating to the importation of foreign corn, but it was rejected by a majority of 342 to 195. The Association then determined to adopt a wider organisation, and to form a national Anti-Corn-Law League for the whole empire, with its head-quarters in Manchester; the Manchester Anti-Corn-Law Association still preserving its independent existence. They also determined to found a paper, and appeal to the public by means of tracts. In pursuance of this resolution, the *Anti-Corn Law Circular* was started, and in a few weeks reached a circulation of 15,000.

The Association had now become so large that it became indispensable to have a building of its own. It curiously happened that St. Peter's field, the scene of the Peterloo massacre in 1819, was in the possession of Mr. Cobden. This was purchased for the site of the Free Trade Hall, and thus, by a strange instance of poetic justice, the Association established its head quarters on the identical ground where a meeting assembled to petition for a repeal of the Corn Laws and Parliamentary Reform, had been brutally attacked and cut down twenty years before. A temporary building, 150 feet by 105 feet, was erected, and in January, 1840, a magnificent banquet, attended by upwards of 4,000 persons, was held, and on the following day another banquet was held by the Working Men's Anti-Corn-Law Association, at which upwards of 5,000 sat down. Both meetings were great successes, and were addressed by Mr. Cobden, and other distinguished speakers.

In March, Mr. Villiers again brought forward his motion to take into consideration the laws affecting the importation of foreign corn, which, having been dropped, was renewed in May, and rejected by 300 to 177. During this year, 1840, 763 petitions, with 175,840 signatures, for a repeal of the Corn Laws, were presented to the House of Commons; and 330,000 copies of the *Anti-Corn Law Circular* circulated.

During this time innumerable meetings were held, and an incessant agitation kept up. A crowd of able speakers perambulated the country, whose names would all deserve honorable mention, but among them all, it gradually became evident that Mr. Cobden, by his business-like, straightforward addresses, by his admirable clearness of style, his thorough comprehension of the nature and modes of thinking of his audiences, and his unrivalled powers of adapting his speeches

to their tastes, was fast rising to the first position. He now became generally recognised as the acknowledged leader of the movement, and there was a very strong desire that he should be placed in Parliament.

The whig Government was then fast dying of sheer exhaustion and inanition, and of course they, as usual, began to look out for something to galvanize their effete popularity. The rising power of the League seemed to supply the desired object. On the 30th April, Lord John Russell surprised the House by giving notice that on the 30th of May, he should move for a Committee of the whole House to consider the Acts relating to the trade in corn. On the 7th of May, he declared his intention to propose in Committee an 8s. fixed duty on wheat, 5s. on rye, 4s. 6d. on barley, and 3s. 4d. on oats, and other extensive reforms in the tariff were proposed.

The increasing power of the League by this time had inspired the Protectionist party with alarm, and counter associations were formed. The sudden adoption of liberal commercial principles roused into active resistance all the great protected interests, and gave the last shock to the feeble ministry. On a motion for admitting slave grown sugar they were defeated on the 18th May, by 317 to 281.

The proposed measures, of course, created the greatest excitement throughout the country. The League was stimulated into immense activity, and though they resolved to rest satisfied eventually with nothing less than total repeal, they determined to accept the offered instalment of reform for the present. Notwithstanding its defeat on the sugar question, the government declared its intention of proceeding with its corn measures. Sir Robert Peel saw that the moment had now come for which he had been so skilfully training the Conservative party for nine years, and he determined to forestall the ministerial proposition, by moving that the Government did not possess the confidence of the House. On the 27th of May this motion was carried by 312 to 311, which of course rendered a dissolution inevitable. It took place on the 23rd of June.

At the new elections the ministry were in an immense minority, but three of the League were returned to parliament, Mr. Scott for Walsall, Dr. Bowring for Bolton, and most important of all, Mr. Cobden, who was now the acknowledged leader of the movement, was returned for Stockport.

In the ministerial programme the Queen recommended the Corn Laws to the attention of the House, with a view to their revision. The Government was defeated in the Lords by 168 to 96.

Great was the curiosity to hear Mr. Cobden. The Protectionists prognosticated his complete failure in the House. He was nothing but a mere platform orator, only fit to speak to mobs of vulgar manufacturers, but quite unfit to address an assembly of gentlemen like the House of Commons. He would soon find his level there. Yes, said his friends, he *would* soon find his level there, and it will be among the best orators in the House. And the expectations of his friends were fully realized. Mr. Cobden's debut in the House was a great success. He spoke on the second night of the debate, and we may quote some re-

marks of his concerning the relation between the price of food and wages:—"He begged to draw the attention of the House to the relation between the price of food and the price of any other article, and the price of labor, when in a wholesome and a natural state. He could understand in the slave-holding states of America or Cuba, that the price of labor might be determined by the price of provisions. The slave-holder sat down and calculated the cost of raising his produce, and he calculated the price of labor accordingly. But he would come to another state of society, he would refer to the agricultural districts, where wages had reached the minimum, and he would ask,—was the rate of wages raised when the price of provisions was increased? They were told that such was the case, and why was it the case? Was it because the high price of food increased the demand for labor? or rather, was not the increase given out of charity, and in the shape of charity, because the wages which labor before brought were reduced to a scale at which the laborer could not support himself and his family? He would come to the state of the labor market in the manufacturing districts. There the rate of wages had no more connection with the price of food than with the changes of the moon. There the rate of wages depended entirely on the demand for labor. There the price of food never became a test of the value of labor." The ministry were defeated by 360 to 269, and of course immediately resigned.

The eyes of the country had long been turned on Sir Robert Peel as the proximate minister. Both parties, the Protectionists and Free Traders, were deeply anxious to discover what course he intended to pursue on the question which now chiefly engrossed the interests of both. He was, however, far too wary to give either his friends or his opponents any clue to discover his plans. His invariable reply was that he was not yet formally called in to the patient, whose previous physicians must be dismissed before he would undertake to prescribe. Such indications, however, as could be gathered from his speeches, were not so decided as to reassure his party of his inflexible adherence to their cause. In fact, he, with his usual caution, in his very first address, took care to leave himself a loophole for a future change of conduct. After a few weeks, Parliament adjourned, and the Ministry had time to prepare their measures for the next spring.

The country was now in the midst of that cycle of bad harvests, which seems to be periodic, and to involve some deep meteorological law, of which some indications present themselves, and will, no doubt, be more carefully investigated in future times. It was now the fourth bad harvest in succession. During the autumn, the distress of the country became more severe and wide-spread, and the exertions of the league were proportionably increased. A crowd of lecturers and speakers spread themselves over the country, and numerous demonstrations took place in the midland and western counties. In fact, the whole island was in a commotion. A meeting of delegates was summoned for February in London, to commence a new Parliamentary campaign, their forces being now increased by the powerful assistance of Mr. Cobden.

Parliament was to meet on the 3rd of February.

The Duke of Buckingham had been taken into the cabinet as the especial representative and organ of the Protectionists. On the Monday previous to the commencement of the session, his party were dismayed, alarmed, and perplexed by his sudden resignation, and it soon became known that it was caused by the determination of the cabinet to propose a change in the Corn Laws, of which he did not approve. The free trade party were rather curious than otherwise to hear what the proposal was to be, as they could never expect that Peel and a Tory government would propose what they were determined to have, namely, total repeal.

During the week there was intense excitement. Delegates to the number of nearly six hundred sat in Palace Yard to support their Parliamentary friends. Peel at length produced his plan. In 1815, 80s. had been considered as the remunerating price, it was now supposed to be 56s. or thereabouts. The highest duty was reduced from 38s. 8d. to 20s. When wheat was at 51s., the duty was to be 20s., and to be reduced by a sliding scale to 1s. when the price was 74s. This new scale was accepted with suppressed mutterings by the Protectionists, lest a worse thing should befall them. The number of delegates had now increased to 700, and they scorned such a small concession, and determined to agitate more fiercely than ever.

On the 14th February, Lord John Russell proposed a fixed duty as preferable to a sliding scale, but his amendment was lost by a majority of 349 to 226. Mr. Villiers then brought forward a motion for total repeal, and was supported in a most powerful speech by Mr. Cobden, but the motion was rejected by 393 to 90. Mr. Milnes, with rather an unfortunate prophecy, described Mr. Villiers as the solitary Robinson Crusoe standing on the barren rock of Corn Law Repeal. The public interest had now increased so much that there were 2,881 petitions with 1,540,755 signatures presented to the House. The second reading passed by 284 to 176, and the third by 229 to 90.

Notwithstanding the reduced scale of duties, the public distress increased greatly during the summer, and was general throughout the agricultural as well as the commercial districts. Numerous deputations waited on the principal ministers, detailing the most heartrending scenes of suffering, which, indeed, Sir Robert Peel said was uncontrollable. Parliament, however, was prorogued without any further alteration in the Corn Law; and in August a general insurrection broke out in the manufacturing districts, and for nearly three weeks the public tranquillity was in the utmost danger. The League determined to extend its operations more into the agricultural districts, and for that purpose England was divided into twelve circuits, to each of which a lecturer and agent were appointed. It was said at one meeting of the League that 2,000 lectures had been delivered, and more than 5,000,000 tracts had been printed and circulated. The expenditure had hitherto been £100 per week. It was now determined to raise it to £1,000 a week, and to raise a fund of £50,000 by January, to expend in lectures and tracts during the next year.

On the 30th of January, 1843, the new Free Trade Hall was opened, and a meeting was held

to announce the result of the £50,000 subscription. Independently of the London contributions, it reached £42,000. Numerous other meetings were held in it previously to the commencement of the Parliamentary campaign.

On the 13th February, Lord Howick moved for a committee to inquire into the distress of the country. Mr. Cobden and Sir Robert Peel each waited for the other to speak, like the Earl of Chatham and Sir Richard Strahan. On the fifth night Mr. Cobden spoke, and made as usual a vigorous attack on the supporters of the obnoxious laws. They were quite unable to answer him on general principles. "No man," said the ministerial paper, "answered these charges of Mr. Cobden. No man attempted to answer them." All Sir Robert Peel did was to protest that Huskisson and Adam Smith were against immediate and precipitate repeal, and in favor of cautious progress. The motion was rejected by 306 to 191.

Between December and March, 136 meetings were held in London, and the subscriptions amounted to £22,000, thus making the total far exceed the £50,000, which it had been said the League would find it impossible to raise.

The league now tried to organise an establishment in London, but they were refused the use of Exeter Hall, and it would have been too expensive to build a Free Trade Hall there, as well as in Manchester. They accordingly engaged Drury Lane Theatre, where immense meetings were held every week during Lent, and a weekly newspaper was established, called the League. At these meetings Mr. Cobden took a prominent part. Among many other eminent speakers, each of them admirable in his own way, Mr. Bright began to take the next most conspicuous place to Mr. Cobden.

It may be a curious problem to the future historian, to discover how far Sir Robert Peel had by this time become a convert to Free Trade doctrines. That he was so in theory, however he may have hesitated to carry them out too rapidly, or been afraid of the clamors of his own party if he attempted to abolish what he was especially put into power to maintain,—his speeches would seem to indicate. On the 25th of April, Mr. Ricardo moved that this country ought not to postpone the remission of her import duties with a view to negotiation for reciprocity. This was a great advance in doctrine, because it was long supposed that Free Trade would be a loss to any country without reciprocity. Mr. Ricardo shewed, in an able speech, that the best theoretical and practical economists had proved that a country should adopt liberal commercial principles, even though others did not imitate her example. He supported this view by most convincing facts, shewing the increased prosperity of countries which had adopted this plan. The motion was supported by Mr. Cobden, but lost by 135 to 61.

On the 9th of May, Mr. Villiers brought forward his motion for the appointment of a committee of the whole House to take the Corn Law into its consideration, with a view to its immediate abolition. On the fifth and last night of the debate Mr. Cobden made a powerful speech. The motion was lost by 381 to 125.

The raising of £60,000 by subscription had placed means of greatly increased power in the

hands of the League, and their operations were proportionably extended. During the spring of 1843, constant meetings were held in the country, especially in the agricultural districts. The efforts of Mr. Cobden were truly gigantic. The very strongholds of the Protectionists were selected for attack, and especially on market days, when the farmers were congregated. Among other places, great meetings were held at Uxbridge, Cambridge, Dorset, Lincoln, Rye, Huntingdon, Bedford, Aylesbury, Maidstone, Guildford, Colchester, Winchester, Lewes, and Bedford, and numerous other districts. At these, Messrs. Cobden, Bright, Moore, and others, addressed the farmers for hours, and with scarcely an exception, Free Trade resolutions were passed either unopposed, or by overwhelming majorities, only a few hands being held up for Protection, amid forests of those for Free Trade.

The Parliamentary strength of the Free Traders received a great accession in July, by the return of Mr. Bright for Durham. This gentleman had gradually risen among the numerous eloquent and able speakers of the League to a position only second to Mr. Cobden; and on a vacancy occurring for Durham, it was determined to put him forward. His opponent was Mr. Purvis, a conservative of great influence and property in the neighbourhood. Mr. Bright entered the town a complete stranger to it, and yet carried the election by 488 to 410. After the prorogation, Messrs. Cobden and Bright had a most successful meeting at Canterbury. In fact, the requisitions for the services of these gentlemen to address meetings all over the country poured in such numbers, that no man could comply with them all. During the year 1843, 9,026,000 tracts and stamped publications, weighing upwards of 100 tons, were distributed by the League, and its expenditure was £47,814.

On the 28th September, the campaign for the ensuing season was commenced by a crowded meeting at Covent Garden Theatre. The success of the £50,000 subscription now emboldened them to larger operations, and for the next year it was determined to raise £100,000. But the cause of the League was immensely advanced by the open accession of Mr. Samuel Jones Loyd, who stood at the head of the money power, and who was certainly the last man to join anything which did not promise success. A vacancy in the representation of the City of London also occurred, and the Free Traders succeeded in carrying their candidate, Mr. Pattison, by a majority of 6,535 to 6,334, over Mr. Baring, the Protectionist. Mr. Marshall, of Leeds, one of the greatest manufacturers in the kingdom, also joined it.

The first day of the year brought them further strength. They already counted the chief of the money and manufacturing interests among them. On the 1st of January, 1844, the Marquis of Westminster, the chief of the landowners, sent in his subscription of £500. A vigorous campaign to raise £100,000 now began, and the movement was extended to Scotland. Crowded meetings were held at Glasgow, Edinburgh, Perth, Greenock, Aberdeen, Leith, Haddington, Linlithgow, Lanark, Galashiels, &c., at all of which large contributions were raised. The League now determined to give up petitioning Parliament, and to direct their whole strength to influence the

constituencies. Before the Parliamentary move of the season, six crowded and enthusiastic meetings were held in Covent Garden Theatre. These were continued during the session, and in them a strong sign of the times was seen; among the most able and effective speakers were several tenant farmers and landlords. Lord Fitzwilliam, Lord Ducie, and others, were also earnest supporters of the movement.

On the 12th of March, Mr. Cobden rose to make the move of the session, it was for the appointment of a Committee to enquire into the effects of Protective duties on the interest of the tenant farmers and laborers of the country. His most able speech was full of details of the miserable state of the population in the agricultural districts. The motion was rejected by 224 to 133, but this showed the progress that was being made in the opinion of the Parliament which was elected expressly to maintain protection.

On the 25th of June, Mr. Villiers moved for the total and immediate repeal of the Corn Laws. The motion was rejected by 328 to 124. These repeated divisions showed good progress, for while in 1842, those who voted for total repeal were only 92 and their opponents 395, in 1844 the free traders had risen to 124, and their opponents had fallen to 330, that is, in two years the majority against them had decreased by about 100. No doubt many of these were secretly convinced of the impracticability of maintaining the corn laws, but not having courage to avow a change of opinion adopted the middle course of staying away.

It would be tedious to relate the same course of agitation and speaking during 1844, as in the preceding year. In the autumn of this year the League adopted a still more efficient method of acting upon the constituencies by creating great numbers of 40s. freeholders in hostile districts. They saw that Sir Robert Peel had pointed out the true scene of the conflict—the registration courts. Great pains were taken with the registrations this year, and the accession to the number of the free trade constituencies was considerable.

The harvest of 1844 was very abundant, and consequently the distress of the people was much mitigated, and the Protectionists began to cry out that the League was exhausted, and would speedily expire. They were, however, very grievously mistaken. It was not working so strenuously, it was true, by open agitation, but it was hard at work, and very successfully too, in the more quiet and effectual mode of acquiring voters. The Queen's speech, at the opening of Parliament, noticed the revival of trade, and commerce, and prosperity. In the debate on the address Lord John Russell showed that he had made considerable progress in free trade doctrines, for he said he was convinced that Protection was not the support but the bane of agriculture, and he said that the present period of prosperity was the best time to consider whether the principles of Free Trade should not be still further extended.

On the 13th of March, Mr. Cobden moved for a committee of inquiry of the effects of the Corn Laws on agriculturists. The majority against him now shewed a very remarkable falling off. The numbers were 121 to 213. Thus the majority in three years had fallen from 303 to 92.

In May, a great bazaar was held in Covent Garden Theatre, which was kept open about

three weeks, and produced upwards of £25,000 of receipts.

On the 26th of May, Lord J. Russell brought forward a series of resolutions, that the present state of prosperity was a favorable time to consider what measures might permanently improve the condition of the laboring classes. In his speech he declared himself in favor of a moderate fixed duty of 4s., 5s., or 6s. His motion was rejected by 182 to 104.

On the 10th of June Mr. Villiers rose to make the last of his annual motions, though no one then foresaw the speedy triumph of his cause. In the course of his speech, Sir Robert Peel said,—“I must say, that I think experience has shown that a high price of corn is not necessarily accompanied with a high rate of wages. But I believe it would be impossible to show that the rate of wages varies with the price of corn; and speaking generally of the industrious classes of this country, I think it impossible to demonstrate that it is to their advantage that there should be permanently a high price of corn.” The motion was rejected by 254 to 122, being the smallest number that had voted against it.

It has long been observed that good and bad seasons occur in cycles. After the terrible series of bad seasons which ended in 1843, it was not unnatural to expect a series of plentiful ones, after the good one of 1844. Parliament was prorogued in 1845, amid the expectations of the Protectionists that the crop would be good, and thus alleviate the sufferings of the people, which caused the clamor for the repeal of the Corn Laws. But in the middle of August, alarming symptoms began to appear in the crops of potatoes, upon which the subsistence of so many millions depended. And as the autumn advanced, they became worse and worse, and, especially in Ireland, the progress of the disease was fearful. Heavy rains set in, in September, and continued for about three weeks. In the beginning of October it became apparent that the wheat crop was greatly deficient both in quality and quantity. Prices accordingly began to rise, but not so much as might have been expected, as it was found that the crop of 1844 had been more abundant than any one had supposed.

The well ascertained scarcity reinvigorated the efforts of the Free Traders. From all parts of the country remonstrances came up to the Government, calling upon them to open the ports, and let in food. The *Times* now joined the cry, a sure symptom of its approaching success. On the 28th October, a great meeting was held in the Free Trade Hall at Manchester, into which 8,000 gained admittance, and hundreds were turned away. Mr. Cobden and Mr. Bright called upon the meeting to demand the government to open the ports.

Repeated meetings of the Cabinet were held. It was well known that most alarming reports were pouring in from Ireland, but on the 7th of November, the *Standard*, the ministerial paper, flung defiance in the face of the Free Traders, and declared that the ports should not be opened, as there was abundance of supplies in the country.

Whatever may have been Sir Robert Peel's own opinion at this time, as to the necessity of abolishing the Corn Laws, and however much he may have been hampered with his party connec-

tions in giving effect to it, his opponent was free from any such trammels. Lord John Russell, now seeing that the tide of free trade opinion was fast becoming irresistible, hastened to take advantage of it. The country was surprised by a letter from him, dated Edinburgh, November 22nd, stating that his opinions on the subject of the Corn Laws had undergone a complete change in twenty years. He used to be of opinion that Corn was an exception to the general rules of Political Economy, but he was now convinced of the contrary. He had formerly proposed a moderate fixed duty as a compromise, but he now saw that was untenable. "It is no longer worth while to contend for a fixed duty. In 1841, the Free Trade party would have agreed to a duty of 6s. a quarter on wheat, and after a lapse of years this duty might have been further reduced, and ultimately abolished. But the imposition of any duty at present, without a provision for its extinction within a short period, would but prolong a contest already sufficiently fruitful of animosity and discontent. * * *

"Let us then unite to put an end to a system which has been proved to be the blight of commerce, the bane of agriculture, the source of bitter divisions among classes, the cause of penury, fever, mortality, and crime among the people."

This letter of course was an additional embarrassment to the Government. Repeated meetings of the cabinet gave notice to the outside world of fierce internal struggles. At last, on the 4th of December, the *Times* astounded the world by announcing that the decision of the Cabinet was no longer a secret. Parliament was to be summoned early in January, and the Duke of Wellington in the Lords, and Sir Robert Peel in the Commons, would propose the total repeal of the Corn Laws. The protectionists were frantic. Contradictions in the coarsest language, and printed in the largest type, of the announcement of the *Times*, were reiterated in their papers. The *Times* simply said that time would prove the truth of its assertion. On the 8th of December, the Ministry resigned, and Lord John Russell was commanded to form another on Free Trade principles. Sir Robert Peel promised his individual support, and full information was given to him of the facts in possession of the Government, but not of its proposed measures. However, after twelve days, Lord John Russell found himself unable to form a government, and on the 20th Sir Robert Peel was commanded to re-assume his position.

At length the success of the seven years' labors of the League seemed certain, and it appeared to some that they need give themselves no further trouble. But not so did it appear to its leaders. They determined to trust to no one but themselves for success, and to renew their efforts with greater vigor than ever. On the 23rd December, an immense meeting was held at Manchester, to support the operations of the League. It was then on the motion of Mr. Henry Ashworth, carried with acclamation, to raise a fund of £250,000, and within an hour and a half the subscriptions reached £60,000. Subscriptions rapidly poured in by hundreds and thousands. Meetings were held in nearly every town of any size in the kingdom, and large sums raised in each.

At length on the 22nd of January, the session of Parliament, which was looked to with such deep anxiety, and which was to inaugurate one of the most memorable revolutions in the annals of the world, commenced. The Queen's speech congratulated the country on the prosperous results which had already attended the increased adoption of Free Trade measures, and advised their further extension, especially with reference to the food of the people.

Lord Francis Egerton, the mover of the address in the House of Commons, avowed that his opinion on the Corn Laws had undergone a complete change, and that he had arrived at the conclusion that restrictions permanently applied to the introduction of foreign commodities should no longer be adopted by the Legislature of this country.

Sir Robert Peel explained the cause of the dissolution of the government, and avowed a change of his opinion on the subject of protection, and that the arguments for the maintenance of the Corn Laws were untenable. One of these arguments was, "that the rate of wages varies with the price of provisions, that high prices implied high wages, and that low wages were the concomitants of low prices. * * * I do not believe, after the experience of the last three years, that the rate of wages varies with the price of food. I do not believe that with high prices, wages will necessarily rise in the same ratio. I do not believe that a low price of food necessarily implies a low rate of wages. * * * Who can deny the fact, that during the three years that preceded the month of October last, prices were comparatively low? There was comparative cheapness and plenty, and yet at no period were the wages of labor higher than during that period. If you take the three preceding years, you will find high prices, and coexistent with high prices you will find low wages. Well, then, I have six years; I have, during the first three years, high prices and low wages; I have, during the last three years, low prices and high wages; and I cannot resist the conclusion that wages do not vary with the price of provisions. They do vary with the increase of capital, with the prosperity of the country, with the increased power to employ labor, but there is no immediate relation between wages and provisions—or if there be a relation, it is in an inverse ratio." He then detailed the triumphant success of his Free Trade measures, and that he could continue the conflict in favor of protection no longer. He explained the nature of the fearful reports the government had received, and claimed for himself, as responsible minister of the Crown, to decide what was best for the public safety.

The new financial and commercial measures of the government were announced for the 27th of January. Expectation was wound up to the highest pitch. Prince Albert for the first time attended a sitting of the House. At half past four, upwards of 400 members were in their places. The strangers' seats below the bar were crowded with peers. Sir Robert Peel rose, amidst breathless silence, to explain the ministerial intentions. Well knowing that the engrossing interest of his audience was fixed on corn, and that if they once knew his intentions on that, they would care comparatively little about any other

alterations, he took care to keep that subject to the last. After keeping the House on tenter-hooks for about an hour and a half, he came to his proposition on corn. In this he determined to follow nobody's plan but his own. He refused immediate and total repeal; he refused a fixed duty. He proposed a temporary continuance of a sliding scale, which was finally to expire on the 1st of February, 1849. Until then, he proposed that there should be a sliding scale, commencing with 10s. when the price was 48s., and diminishing to 4s., being a shilling of diminution of duty for every shilling corn rose in price, till 53s., after which it was to be fixed. Mr. Miles proposed that the House should consider the ministerial measures that day six months. The debate raged for twelve nights, on the last of which Mr. Cobden made one of his usual pointed speeches. The amendment was negatived by 337 to 240. On the 1st of March, Mr. Villiers moved as an amendment, that the repeal should be total and immediate, but this was rejected by 265 to 78. On the 27th of March, the second reading was carried by 302 to 214. After some other futile attempts at obstruction, the bill passed the House of Commons on the 15th of May, by 327 to 229. The Bill passed the Lords by a majority of 211 to 164 on the second reading.

Sir Robert Peel had now safely conducted into harbour his great measure. He had conferred the greatest blessing on his country, but his perfidy to his party was unforgivable. Their thirst for vengeance only sought an opportunity to display itself, and that was soon presented. The government had considered it necessary to introduce a coercion act for Ireland. The discussion of this had been dropped till the great corn measure was secure. When that was effected, the Arms Bill was resumed. Sir William Somerville moved that it be adjourned for six months. On the sixth night of the debate the messengers brought the assent of the Lords to the Corn Bill. The furious Protectionists who had voted for the first reading of the Bill, joined the opposition, and the government was defeated by 292 to 219.

On the 29th of June, a memorable scene was enacted. The greatest minister of modern times, having just achieved the pinnacle of his greatness, came to pay the penalty of his former errors, and to bear perpetual witness of the invincible power of truth. If the Liberals could have carried the Repeal of the Corn Laws, it would probably have strengthened their power for many years. But the government of Sir Robert Peel was founded on a false principle, and when the hour of trial came, it was shattered to pieces. On this solemn occasion, when Sir Robert Peel attained his true greatness, and being emancipated from the thralldom of a party, became the pride of the nation, he did not fail to render the acknowledgment that was due.—“I said truly, that in proposing our measures of commercial policy, I had no wish to rob others of the credit justly due to them, I must say with reference to hon. gentlemen opposite, as I say with reference to ourselves, that neither of us is the party which is justly entitled to the credit of them. There has been a combination of parties generally opposed to each other, and that combination, and the influence of government, have led to their ultimate success; but the name which

ought to be associated with the success of those measures is not the name of the noble lord, the organ of the party of which he is the leader, nor is it mine. The name which ought to be, and will be, associated with the success of those measures, is the name of one who, acting I believe, from pure and disinterested motives, has with untiring energy, made appeals to our reason, and has enforced those appeals with an eloquence the more to be admired because it was unaffected and unadorned; the name which ought to be chiefly associated with the success of those measures, is the name of Richard Cobden.”

Lord Palmerston expressed his satisfaction that Sir Robert Peel had given expression to the unanimous sentiments of the country. He had “well said that the merit of this great commercial measure is not due to hon. Members on this, or on that side of the House; it is, on the contrary, due to the talent, the ability, the perseverance, and firmness of my hon. friend, the Member for Stockport. The right honorable baronet has paid a just and deserved compliment to the name of Richard Cobden. When the house and the country look to the highest point in the history of these events, they will see the name of Richard Cobden, a man distinguished by great zeal and enlightenment in advancing a great and important change in our commercial code.” Lord Grey said in the debate on the second reading in the Lords,—“In his opinion, this country owed a debt of gratitude to the leaders of that body (the League), and more especially to Mr. Cobden. He said that to him, to his genius, and to his indefatigable energy and perseverance—not to Sir Robert Peel, not to that party in Parliament with which he had the honor of being connected, but to his hon. friend, Mr. Cobden, were they indebted for the achievement of what he believed to be one of the most important measures with reference to the future welfare of the British people which ever received the sanction of Parliament. To him the country should feel deeply indebted. He had achieved this triumph by means altogether unexceptionable. There had been no appeal to physical force, no threatening displays of great multitudes of persons collected together, [A noble Lord: Because he could not get them.] The noble lord said, ‘because he could not get them.’ He attributed it, however, to a different cause. He believed it was because Mr. Cobden thought, and thought justly, that the proper way of acting on the opinion of Parliament was through the opinion of the nation. All his efforts had been addressed towards converting the opinion of the nation—towards teaching both farmers and manufacturers what the real interests of the community upon this subject were, and considering the time in which this great change of opinion had been attempted, he must say, that his success appeared to him almost miraculous.”

The eyes of the country were now turned upon the League, and great anxiety was felt to know what it would do, now that its ostensible purpose was accomplished. There had been one, and one only, similar association, that for the repeal of the laws against the Roman Catholics. Mr. Cobden was now in the position of O’Connell. But the Catholic Association had set a baneful example. When its purpose was accomplished it should have been dissolved. But such had not

been the case. For many years its leader had kept the country in continuous turmoil and agitation for an insincere object, the Repeal of the Union. O'Connell's agitation, laudable in its commencement, had degenerated for many years into a hollow hypocrisy, with no real object but to collect an annuity for himself. It was feared that the League might follow this example, and having obtained the repeal of the obnoxious laws, might employ its gigantic power in furthering organic changes in the constitution of the country.

But it lost no time in belying these prognostications, and in indicating its constitutional and disinterested character. On the 2nd July, the final meeting of the council of the league took place at Manchester, and was attended by 500 members from all parts of the Country. The chairman, Mr. George Wilson, gave a sketch of its history, and then Mr. Cobden came forward and in a solemn speech moved the suspension of the active operations of the League, which was seconded by Mr. Bright. Subscribers to the £250,000 fund were released from payment after their first instalment, and the executive Council were empowered to resuscitate it if the Protectionist party should make any serious effort to restore protection. Mr. Cobden then detailed the labors of the chief members of the council, Mr. Wilson, the Chairman, had attended 1361 meetings of the council; Mr. Prentice, 1127, Mr. Samuel Lees, 863, Mr. Rawson, 601, Mr. T. Woolley, 485, Mr. W. Bickham, 474, Mr. W. Evans, 444, Mr. Henry Rawson, 258. Mr. Cobden then said that these gentlemen deserved some testimonial for their services. The Chairman, though first offered £500, and then £1,000 a year, had always refused to receive a farthing of remuneration. He proposed that a sum of not less than £10,000 should be presented to him out of the funds of the League. The motion was carried unanimously, with shouts of applause. A committee was also appointed to consider and decide upon a testimonial to the other gentlemen named by Mr. Cobden. It was resolved that a tea and coffee silver service of 240 ounces, should be presented to each. The chairman then said, "As no other gentleman has anything to address to this meeting, it is now my duty to say that the Anti-Corn-Law League stands conditionally dissolved;" an announcement which was received with solemn silence.

Suitable and well deserved rewards had been presented to the chairman, and several of the most active members of the council. But no mention had been made of the two who were best known to the public, Mr. Cobden and Mr. Bright. A spontaneous subscription among the Free Traders of the country presented Mr. Cobden with £75,000, and Mr. Bright with a valuable library.

Such is a short and very meagre sketch, but unfortunately such a one only is compatible with our limits, of this memorable event. There is scarcely anything more remarkable in the history of this country, or in that of any other, than the rise of this movement in a small room over a stable in Manchester, its rapid progress, the constitutionality and the moderation of its course, its marvellous success, and the transcendent influence it is hereafter destined to exercise over the happiness of nations. Although we have of course been obliged to select the one name which, by universal consent,

stood as the most illustrious of the association, with whom to connect it, there were hosts of others, each admirable in his own way, who bore a conspicuous part in its success. But in the general history of a campaign, where all have done nobly, the names of each individual officer cannot be specified. But the three volumes of the *League* newspaper are an imperishable record of their services. Englishmen are in the habit of regarding with just pride the history of the seven years of the Peninsular War, as recorded by Napier. His volumes no doubt are a glorious monument of the bravery, the firmness, the endurance and the perseverance of the people of this country under overwhelming difficulties. But we will venture to say that the history of the seven years' contest of the League is a monument in every way as well deserving our admiration. As a record of fervent, rational, and convincing eloquence enlisted on behalf of a righteous and beneficent cause, it is one of the noblest monuments of the human race.

It has often been mentioned in detraction of the members of the League, that they were fighting for their own selfish interests. It is scarcely worth while to notice such a flimsy charge. The same thing might be said of every one who struggles to free himself from an unjust oppression. If they had sought to impose restraints on others there might have been good ground for such a charge. But they were only determined to free themselves from burdens imposed by others. The interests of the League were the interests of the human race. And therein lay the secret of their success. It was not the mere eloquence of Cobden, nor the treason of Peel, which insured the triumph of Free Trade. As a mere popular agitator O'Connell was far more formidable than Cobden, and yet, when his eloquence was employed on behalf of a hollow cause, it sank beneath general contempt. But the success of the League is a memorable example of the innate power of truth, when allowed the inestimable advantage of free discussion, to win its way against the most powerful prejudices and interests. And every one knows that the removal of protection has been of the greatest possible benefit to agriculture itself. Never at any time has agriculture made such progress as since the repeal of the corn laws. The dismal forebodings of the protectionists have been completely falsified. Instead of capital being withdrawn from farming, it has rapidly poured into it. Nor is it only in a commercial view that Free Trade has been beneficial. There can be little doubt that if the continental revolutions of 1848 had come upon us with the corn laws unrepealed, the 10th of April of that year would have ended in a very different way to what it did.

The superhuman exertions of Mr. Cobden rendered considerable repose necessary after the exciting scenes of the great Corn Law victory. He then made a tour in France, Spain, and Italy. It was more like a triumphal progress than anything else; every great town invited him to a public banquet. At the dissolution of 1847, he was returned spontaneously by the West Riding of Yorkshire, for which he sat till 1857. He then retired from public life for a year or two, and was elected for Rochdale in May, 1859.

Mr. Cobden has recently been engaged on the part of England in negotiating a commercial treaty with France, which will for ever break

down the barriers of its prohibitive policy, and though no doubt not so liberal as might be desired, is yet an immense stride in the direction of Free Trade.

We may perhaps be permitted to remark that the repeal of the Corn Laws in 1846, ought to mark an era, not only in the history of the world, but in the science of Political Economy. It is often supposed that the establishment of Free Trade is the whole end and object of the Science of Political Economy. But that is a very great mistake indeed. It, in fact, only clears the ground and removes obstructions from the erection of the Science.

It would be a very interesting inquiry to determine what the real effect of Adam Smith's work has been in the repeal of the Corn Laws? Is it not within the range of possibility that the League might have existed, and procured the establishment of Free Trade, without Adam Smith having written at all? Is it not possible that the practical evils of the Corn Laws would have forced themselves upon the keen-eyed manufacturers without any teaching? At all events, the repeal of the Corn Laws is the Mausoleum of the *Wealth of Nations*. If the repeal of the Corn Laws be really due to that work, then no doubt Adam Smith will rank as one of the greatest benefactors to the human race. But it is not permitted to any man, however illustrious, to arrest the tide of science. During the heat, the turmoil, and the dust of the battle, to establish a great practical principle, there is little time to attend to the niceties of language, and the exact expressions of science. But now that the great victory is won, and men are enabled to sit down in a quiet, inquiring spirit, the time has come for a complete, calm, and deliberate resurvey of the whole science. The destruction of protection is the first fruits of the struggles of the infant science, and not its termination. The definition of the science which has received the sanction of the highest authorities of modern times is, that it is the science which treats of the *exchangeable relations of quantities*, in which a state of free exchange is presupposed.

Now every one who has studied the science knows perfectly well, that though economists of all schools are thoroughly united in the doctrine of Free Trade, yet that the science itself is in a most lamentable state. There is not a single definition, or general law in it, which is not the subject of the warmest controversies; and there are scarcely any in which any two economists agree. Is this a creditable state of things? Is it inevitable, and inherent in the nature of the thing itself? We answer, certainly not. We say that it is as certainly possible to settle the definitions and axioms of Political Economy, as those of any other science whatever. But it is necessary to set about it in the same way. The immortal discoverers and founders of the different physical sciences have left us sure and certain models to guide us how a science should be formed. There is no one conversant with their early history who can fail to see that their early progress was beset with controversies, presenting the most striking analogies to those which now unhappily divide Economists. And we say that there is no controversy now existing among economists regarding the definitions and axioms of their science, which

cannot be conclusively settled by the analogy of some controversy in some physical science.

The time has now come, then, for the birth of a new science of Political Economy, in which all its definitions and all its axioms shall be successively subjected to the searching and well settled laws of Inductive Logic, and it will then take rank as an exact science.

When this is done it will be found that much of what passes current in books as established truth is mere delusion, and much that is supposed to be paradoxical will be shewn to be undoubted truth.

COINAGE.

Decimal Coinage; a short and easy method of changing the present currency into the decimal system. London, 1854.

Decimal Coinage; what it ought, and what it ought not to be. London, 1854.

COINAGE. Most nations, even the rudest, have felt the advantage of employing some substance to perform the functions of a currency. Under the article **CURRENCY**, we have noticed most of the substances which have been used for this purpose by different nations. A metal, however, of some sort has been found to possess the greatest advantages, and of these, gold, silver, and copper, have been chiefly preferred.

Gold and silver, however, in a perfectly pure state are too soft to be used for this purpose, and it is necessary to mix some other metal with them to harden them, which is called alloy. By a chemical law, whenever two metals are mixed together, the compound is harder than either of them in a pure state.

2. When gold and silver are in the mass, they are called **BULLION**, which, of course, may be of different degrees of fineness. But as the laws of all countries in which bullion is coined into money define the quantity of alloy to be mixed with the pure metal, we shall in this article use the word **Bullion** to mean gold, or silver, in the mass, mixed with such a proportion of alloy as is ordered by law, so as to be fit to be coined.

3. Some nations have used **Bullion** as a circulating medium; but the merchants of those nations were obliged to carry about with them scales and weights to weigh out the bullion on each occasion. This was usual among the Jews. In some countries it is necessary both to weigh and assay the bullion at each operation, which of course is a great impediment to commerce.

Other nations adopt a more convenient practice. They divide the bullion into pieces of a certain definite weight, and affix some public stamp upon it to certify to the public that these pieces are of a certain fixed weight and fineness, and they give them certain names, by which they are commonly known.

These pieces of bullion with a public stamp upon them to certify their weight and fineness, and called by a publicly recognized name, and intended to be used for the purposes of commerce without further examination, are called **COINS**.

4. It may almost appear superfluous to remark that this stamp, or certificate, in no way affects the value of the metal, or the quantity of things it will exchange for. Its only object is to save the trouble of weighing and assaying the bullion in commercial transactions. Nor can the name of the coin in any way affect its value. Values, it is

true, are estimated in the number of these pieces of bullion or coins, but it is perfectly clear that it is necessarily implied in the bargain that these coins contain a certain definite quantity of bullion.

5. Nevertheless, although this seems so perfectly clear, it is a confusion on this point, which is at the root of all the extravagancies of the currency question, which have so long vexed the public ear. They almost all arise from confounding the name, or denomination of a coin, with its value, its name with its purchasing power; and from supposing that if the legislature chose to call a *shilling* a *pound*, that therefore a shilling would have the value of a pound. Any one who will brand on his mind the simple principle, that although the stamp gives the coin currency, it is the weight of bullion alone which gives it value, will be able to steer his course safely through all the shoals and quicksands of monetary controversies.

We shall see a little further on, that calling the reader's attention to these self-evident truths, is not so superfluous as it may appear at present.

6. It is also perfectly evident that if this process of stamping bullion, and so turning it into coin, is done free of all expense, at the will of any one who chooses to present bullion and demand to have it stamped, and also without any delay, the value of the metal as bullion must be exactly the same as the value of the metal as coin.

If, however, a charge is made for the workmanship, or if any tax is levied on changing the metal from one form into the other, or if a delay takes place in doing so, there will be a difference between the value of the metal as bullion and as coin, and this difference will manifestly be the charge for the workmanship, the amount of the tax, and quantity of interest accruing during the period of delay.

These, however, are all fixed, or constant quantities, which may be ascertained, and they form the limits of the variation of the value of the metal in one form, from its value in the other.

7. In the following remarks we shall assume that there is no charge for the workmanship of coining, no tax upon it, and no delay in doing it, no obstruction in short of any sort to changing the metal from one form to another.

If in any particular cases obstructions should occur, of course the necessary corrections must be made throughout the course of the following reasonings.

Upon the assumptions, then, above stated, we have this fundamental principle of the coinage:—

Any quantity of metal in the form of Bullion must be exactly of the same value as the same quantity of metal in the form of coin.

8. Now, as the very purpose of coining is to certify that the pieces of bullion are of a certain definite weight and fineness, it is evident that any fixed quantity of bullion, as a pound weight, must always be divided into a fixed number of coins.

The number of coins into which a given quantity of Bullion is divided, is called the MINT PRICE of that quantity of Bullion.

9. It is perfectly clear, then, that the Mint Price of Bullion is a fixed quantity, it can by no possibility vary, until the same quantity of bullion is coined into a different number of coins.

To alter the Mint Price of Bullion is merely an expression which means an alteration in the standard weight of the coinage.

10. To suppose that the Mint Price of Bullion could vary is manifestly as great an error as to suppose that a hundred-weight of sugar can be a different weight from 112 separate pounds weight of sugar, or that any quantity of wine in a hog-head could be different in quantity from the same quantity of wine in bottles, or that a loaf of bread could alter its weight by being cut up into slices.

11. Now the original measure of value in France, England, and Scotland, was the pound weight of silver bullion. No coin, however, of this actual weight was ever struck. But the pound weight of bullion was divided into 240 coins called pence. Twelve of these pence were called a shilling or solidus, and therefore twenty shillings or solidi, made a pound. These 240 pence actually weighed a pound of bullion.

Now let us denote the pound weight of metal in the form of bullion by the symbol — lb., and the pound weight of metal in the form of coin by the symbol — £. Then we have:—

240 pence = 20 shillings = 1 £ = 1 lb.

Now it is perfectly clear that if the pound weight of bullion were divided into a greater number of pieces than 240, that greater number would still be equal to the pound weight, and if we denoted by the symbol £, 240 pieces, or pence, irrespective of their weight, we should have the 1 lb. equal to 1 £, + the number of pieces above 240.

12. Now this is what has been done in the coinage of all the three countries above mentioned. The sovereigns of these countries were frequently in want of money to pursue their various extravagancies, and as they could not make more money, they adopted the fraudulent and surreptitious plan of cutting the pound weight of bullion into a greater number of pieces, but they still called them by the same name. By this means they gained an illusory augmentation of wealth. As they could not multiply the quantity of the metal, they at various periods *falsified the certificate*. While they still called their coins by the same name, they diminished the quantity of bullion in them, and so coined more than the original number of pence out of a pound weight of bullion.

The consequence of this was very manifest. As 240 pence were still called *a pound* or £, in money, whatever their weight was, and as more than 240 pence were coined out of a pound of bullion, the £, or pound of money, began to vary from the lb., or pound of bullion. This falsification of the certificate increased till the time of Elizabeth, when instead of 240 pence, or 20 shillings, being coined out of the pound weight of bullion, no less than 62 shillings, or 744 pence, were coined out of it. Then we have manifestly

744 pence = 62 shillings = £3 2s = 1 lb.

Now as there are 12 ounces in one pound weight of bullion, it is evident that each ounce of bullion was coined into 62 pence, and hence, as the value of bullion is measured by the ounce, the Mint Price of silver was said to be 5s. 2d. the ounce.

13. Afterwards gold was used as a measure of value, concurrently with silver, and gold pieces were struck and made to pass current as nearly as could be done at the value corresponding to the market values of gold and silver. Thus there was for a considerable time a double standard.

14. The celebrated Locke, however, had pointed out (Locke), that a double standard was improper, and that there ought to be only one standard in a country. Sir Isaac Newton also pointed out in 1717, (Newton) that the coins were then improperly rated according to the market value of gold and silver, and that the effect of this would necessarily be to drive silver out of circulation. In consequence of his representations, the value of the gold coin was reduced, but not to a sufficient extent, and the consequence which he predicted took place. In consequence of gold, in coin, being still overrated in comparison with its relative market value to silver, merchants during the course of the last century adopted the universal custom of paying their bills in gold coin in preference to silver, and thus gold became gradually to be considered as *the* measure of value in England.

15. In 1816, this custom was adopted as the law, and gold was declared to be the only legal measure of value, and the pound, the legal tender or measure of value, became the equivalent in gold of 20s. in silver.

The pound weight of gold bullion was ordered to be cut into 46 pieces of the value of 20s. or £1 each, with a piece over, equal to 14-20ths and 6-12ths of 1-20th, or the Mint Price of 1 lb. of gold was fixed at £46 14s. 6d.

But as the value of gold is estimated by the ounce, the Mint Price of gold is fixed at £3 17s. 10½d. per ounce, and as long as the coins are ordered to be coined of the same weight, the Mint Price cannot vary.

16. Until recent times, when more attention has been paid to the state of the coinage, these coins might circulate for a considerable time in a country, and lose much of their weight, without losing their value. People were so accustomed to attach a certain value to the sight of a particular coin, that unless they were money dealers they did not stop to inquire too curiously whether it was exactly of the proper weight or not. In fact, when a coinage has been some time in use, few people know what the legal weights of the coins are. Many, for instance, do not associate the idea of a pound with any particular weight of bullion, and thus, in exchange for commodities and services, coins may pass at their nominal value for a considerable time after they have lost much of their weight. Thus Shakespeare says, (*Cymbeline*, Act v., Sc. iv.)

"Tween man and man, they weigh not every stamp,
Though light, take pieces for the figure's sake."

When coin has been some time in circulation, it must necessarily lose much of its weight from the wear and tear of circulation, even if it be not subjected to any bad practices, such as clipping, which used to proceed to a great extent in this country formerly, as will be shewn a little further on. So late as 1816, when the last great reformation of the coinage took place in England, the greater part of the metallic circulating medium was nothing but a thin wafer of silver, from which all traces of an impression had long since vanished, and it was reduced to scarcely more than half its legal weight.

17. Coins might circulate in a country for some time after they had lost some of their weight, without any perceptible change in their value with respect to ordinary commerce. But when they

were given in exchange for bullion the case would be different. As the value of bullion is measured weight for weight with the coins, it is clear that if the coins have lost their weight, a greater number of them must be given to purchase any amount of bullion than if they are of full weight. Thus if the Mint Price of silver bullion be 5s. 2d. per ounce, or if that be the quantity of coin into which an ounce of silver bullion is cut, then if the coins have lost their proper weight from any cause, it is clear that more than 5s. 2d. must be given to purchase an ounce of bullion. It may perhaps require 6s. or even more, to buy an ounce of bullion.

18. Now the quantity of coin at its full legal weight, which is equal to a given weight of bullion, is called its *MINT PRICE*, but the quantity of the current coin which is equal to it in weight is called the *MARKET PRICE*; and as, if the coins are diminished in weight, more of them must be given than if they are of full weight, the *Market Price* will apparently be higher than the *Mint Price*, and this is called a *rise of the Market Price above the Mint Price*.

This expression, however, has given rise to much error. The plain meaning of it clearly is, that six of the current coins are only equal to what 5s. 2d. ought to be, which merely means, that the current coinage is deficient by 1-6th of its legal weight. Thus, in reality, we see that it is perfectly clear that the rise of the market price is due to the *DEPRECIATION* of the coinage.

Hence we obtain this fundamental law of the coinage.—*When the Market Price of Bullion rises above the Mint Price, the excess is the proof and the measure of the depreciation of the coinage.*

19. In fact, this apparent rise of the market price is due to just the same cause as has made the Mint Price of silver bullion apparently rise from £1 in the days of William the Conqueror, to £3 2s. in the present day. It is merely that the same quantity of bullion is cut into a greater number of pieces, and consequently each piece must be proportionably diminished in weight, or depreciated.

20. The market price of bullion could never fall below the mint price, unless there was more bullion in the coins than there ought to be, and of course in such a case, the difference of the market price below the mint price, would be the proof and the measure of the excess of the coin, above their legal weight.

If the coinage of a country fall into a degraded state from long wear and tear, and a new coinage of full weight be issued, and allowed to circulate along with it, one of two effects must inevitably follow. Either those persons who have commodities to sell will make a difference in the nominal prices of articles, according as they are paid in the full weighted, or the degraded coin, that is, the degraded coin will be at a discount as compared to the heavy coin; or if there be a law to prevent this, and to make both pass at the same value, bullion dealers will immediately collect all the full weighted coins they can, and melt them down into bullion, or export them; so that the new coinage will quickly disappear from circulation.

21. If persons in selling their goods are paid in light coin, as they wish to secure a certain weight of bullion in exchange for them, they would of

course require a larger number of the light pieces than of the heavy ones, so that prices would apparently rise if paid in light money. In such a state of things the prices of goods are, in a certain sense, fictitious—a number of light pieces are presumed to have the same value as the same number of heavy ones. The weight of bullion given in exchange for commodities is expressed in a greater number of figures than it ought to be, and if the law prevents any difference being made between heavy and light pieces, the same number of heavy pieces will purchase no more. This is as great an anomaly in commerce as it would be to say in arithmetic that three were equal to four. But the consequence is very plain. If four pieces of coin will only purchase as many commodities as three ought to do, no one will turn bullion into coin at so great a disadvantage. On the contrary, as bullion would diminish so much in value, it would be sent to other countries, where it would purchase a greater amount of commodities. Moreover, as every one would try to pay his debts in the cheapest medium, or at the least expense to himself, it is evident that he would always try to pay them in the worst coins in circulation, and he would either hoard the good coins, or send them to foreign countries.

22. These considerations lead us to a fundamental and universal law in Political Economy, which has been found to be true in all countries and ages—*That bad money drives out good money from circulation.* Or as it is expressed in an anonymous pamphlet, *A reply to the Defence of the Bank, setting forth the unreasonableness of their slow payments.* London, 1696. (*BANKING WORKS*, p. 154):—

“*When two sorts of coin are current in the same nation of like value by denomination, but not intrinsically, that which has the least value will be current, and the other as much as possible will be hoarded,*” or exported, we may add.

The fact of the disappearance of good coin in the presence of bad was noticed by Aristophanes, (*ARISTOPHANES*) and was long the puzzle of financiers and statesmen, who continued to issue good coin from the Mint, and were greatly perplexed by its immediate disappearance; till Sir Thomas Gresham explained the cause (*GRESHAM*), whence we have called it Gresham's Law of the Currency.

23. The very same principle applies, and is the real objection to a double standard, or a coinage in which two metals, such as gold and silver, are equally adopted as legal tender to an unlimited amount. The relative value of the coins may be accurately fixed at any one time according to the market values of gold and silver, but as the market values of these metals vary, like any other commodities, the relative Mint values of the coins are sure to get out of adjustment with the relative market values of the metals, and when that is the case the one which is *underrated* is sure to disappear from circulation, and the other remain. It was this cause that made gold become the usual medium of payments in England, and silver the usual medium of payments in France during the last century, as may be seen further on in this article.

24. It is also from the same principle that a paper currency is invariably found to expel a metallic currency of the same denomination from

circulation. And to show the generality of the principle, we have seen (*BANKING IN AMERICA*, § 391) that when a depreciated paper currency had driven coin out of circulation, and a still more depreciated paper currency was issued, the more depreciated drove out the less depreciated from circulation. (*CURRENCY, PAPER*).

25. It may perhaps be worth while to advert to an error, which is by no means unfrequent. Some writers contend against *fixing* the price of gold, as it is called. It is now acknowledged by every one that it is a great economical error to attempt to fix the price of any articles. Some writers contend that it is an equal error to *fix* the price of gold. But those who do so overlook a very important consideration. The word "price," except in the single instance "Mint Price," always denotes the quantity of one article which is used as a measure which is given for another article of a *different* nature. Thus we say that the price of a bushel of corn is 6s., when the silver, the substance of which shillings are composed, is of a different nature from corn. But in the expression *Mint Price* of bullion, it always means the value of bullion expressed in coin of the same metal. Thus the *Mint Price* of gold bullion means its price expressed in *gold* coin, and the *Mint Price* of silver bullion means its price expressed in *silver* coin.

26. These considerations shew that so long as the coins retain their full legal weight, the *Market Price* of bullion can by no possibility vary from its *Mint Price*. If the law requires an ounce of gold to be coined into £3 17s. 10½d., so long as the coins contain their proper weight, it can make no difference in the *Market Price* whether gold becomes as plentiful as iron, or as scarce as diamonds. For the money always continues of the same weight, whatever be the abundance or the scarcity of bullion. The value of gold may vary with respect to other things; it may purchase more or less bread, or meat, or clothes, or anything else at one time than another, but it is absolutely impossible that its value in bullion can differ from its value in coin. To suppose that it could, would be as irrational as to suppose that because bread became very abundant or very scarce, a loaf of bread could differ from itself in weight when cut up into slices, or a cask of wine differ from itself when drawn off into bottles.

27. As, however, gold and silver vary in value with respect to each other, and this variation may proceed, nominally at least, either from a diminution in value of one metal (*DIMINUTION IN VALUE*), or from a depreciation of the coinage (*DEPRECIATION*), we are enabled to devise a test by which to decide to which of these circumstances it is due. Thus in the reign of William III., guineas rose to 28s. and 30s., and silver bullion rose at the same time to 7s. an ounce, one party stontly contended that this was due to the scarcity of silver. Now this argument was absurd on the face of it, because if silver had been extremely scarce as compared to gold, it is perfectly clear that silver would have risen as compared to gold and not fallen. That is, guineas would have sold for less than 22s. and not more. From the figures given above, this argument was manifestly self-contradictory, because as compared with gold, silver had apparently *fallen* in

value, and as compared with silver money, it had apparently *risen* in value.

28. Now it is quite clear that a *diminution in value* of the coin cannot be followed by any difference between the *Market* and the *Mint Price* of bullion. By the meaning of the words "Mint Price," however plentiful, or however scarce, gold may be, an ounce of it in coin must always be equal in value to an ounce of it in bullion. On the other hand, a *depreciation* of the coinage must inevitably be attended by a rise in the *Market Price* above the *Mint Price* of bullion, because, however plentiful or scarce gold is, three-quarters of an ounce of it in coin can never be equal in value to one ounce of it in bullion. The case may be shortly stated thus:—Guineas may rise to 26s. in silver, either from a *depreciation* of the silver coinage, or from a *diminution in value* of silver. What is the test? It is to be found in the *Market Price* of silver. If the silver coinage is debased, the *Market Price* of silver will rise above the *Mint Price*; if it is diminished in value, it will not.

29. The preceding considerations contain, we believe, what may be called the theory of the coinage. They, however, only relate to the coinage of one country. The relation between the coinages of two or more countries is called the *Exchange* between them. The theory of the *Exchanges* is, however, entirely founded on the principles explained above. It will be found under the title *EXCHANGE*. The same principles also contain the theory of the *Paper Currency*, to which we must also refer.

30. In concluding this part, we need only observe that its principles are, of course, subject to great modifications when obstacles are interposed to the conversion of bullion into coin. And that in several instances the value of bullion has differed immensely from the same quantity in coin. In the Eastern Archipelago, for instance, Spanish pillar dollars had long an almost exclusive currency. The people had such confidence in them, and were so accustomed to their use, that they would take nothing but them, and as, of course, they were only coined in Spain, when the supply of them was deficient in the East, bullion fell to an immense discount as compared with the dollars. The very same thing happened in the Australian Colonies soon after the gold discoveries, before Mints were established there. Sovereigns could only be coined in England, and there was no means of converting the gold into currency without sending it to England to be coined. Gold, consequently, fell to an immense discount as compared with sovereigns. After some time, however, Mints were erected in several of the colonies, and a plan was adopted of issuing notes in exchange for bullion, and this difference was immediately rectified.

We may also observe that the preceding remarks only apply to the variations of the value of the coinage and bullion *inter se*. They in no way refer to the variations in value between the precious metals and commodities in general; which are altogether beyond the scope of this article.

On the Coinages of several countries.

31. The history of the coinage is an essential part of the Political Economy of any country. Moreover, the invention of coinage has exercised

such an important influence over the prosperity of mankind, and the various tamperings with, and alterations of, its quality and weight, have produced so much misery among nations, that an economist will naturally take some interest in the history of its invention, and its use in different countries.

32. When nations discontinued the practice of direct barter, and adopted the precious metals as a measure of value, the expedient of cutting the metal into pieces of definite weight and fineness seems so obvious, that we should naturally expect that coining was invented by those nations which first adopted the precious metals as money.

Strange as it may appear, however, it is certain that this was not the case. Silver and gold were used as measures of value for ages before coining was thought of; and there is every reason to believe that coining was invented by a people who, up to the time of inventing it, did not use silver and gold as money, and coining was practised by them for centuries before it was introduced among nations who had used the precious metals as money for ages.

33. The earliest instance we have recorded of silver being used as money in commerce, is the passage in Genesis xxiii., 15, 16, where it is said that Abraham bought the field of Macphelah from Ephron:—"And Abraham hearkened unto Ephron, and Abraham weighed to Ephron the silver which he had named in the audience of the sons of Heth, four hundred shekels of silver, current money with the merchant." It need scarcely be remarked, that the word *money* here has been inserted by the translators, and may lead some to think that it means coins like our money. This, however, would be an error. The silver was probably formed into small ingots or rings, and weighed out, and we know that the Jewish merchants, as was the custom all over the East, carried scales and weights about with them for the purpose of weighing out the price of commodities. The Jews, up to the time of the captivity, had no coined money at all.

34. In Genesis xxxiii., 19, it is said in our translation of the Bible, that Jacob purchased a field from the children of Hamor for a hundred pieces of money. In the Septuagint, however, the word is translated "lamb," which is also given as a marginal reading in many editions of the Bible. And that is the usual meaning of the Hebrew word *Kesitah*, which is used in the original. The true meaning of this word, says Goguet, *Origin des Arts*, i. 290, has greatly perplexed the interpreters. Almost all, says he, are of opinion that Moses means a sum of money here. But was it coined with the figure of a lamb upon it? The greater number think that it means money stamped with the figure of a lamb. Others again think that it really meant lambs. But as, in Acts vii. 16, it is expressly said that the price was a sum of money, the latter opinion seems inadmissible.

Others again, perplexed with the word *Kesitah*, which occurs only in two other places of Scripture, in Joshua xxiv. 32, referring also to this transaction, and in Job xlii. 11, where it says every man gave him a piece of money, or "lamb," and unwilling to believe that coined money existed in those times, think that it means a piece of money of the value of a lamb.

35. Such are the various opinions of commentators on passages which are of some interest in the history of the coinage, and which have never, hitherto, received a satisfactory explanation, so far as we are aware. We think, however, that the recent discoveries of Sir Gardiner Wilkinson in Egypt, and Mr. Layard in Assyria, have thrown quite a new light on the matter, and shewn that none of the commentators have hit on the right meaning.

36. In Wilkinson's *Ancient Egyptians*, edit. 1836, vol. ii. p. 11, and also in his *Popular Account of the Ancient Egyptians*, 1854, vol. ii. p. 149, and also in Mr. Layard's *Discoveries in the Ruins of Nineveh and Babylon*, 1853. p. 600, we find pictures copied, which shew Egyptians and Assyrians weighing out the precious metals in ring-ingots, with weights in the form of lambs, antelopes, bulls' heads, lions, and other animals. Specimens of these kinds of weights, made of stone, in the form of a duck, have actually been discovered in Nineveh, and are now in the British Museum. By an inscription on one of them, in cuneiform characters, which Dr. Hincks has deciphered, it appears that it weighed thirty mana, or half a Babylonian talent, and being weighed at the mint, was found to weigh 40 lbs. 4 oz. 4 dwts. 4 grns. Several bronze lions have been found which were also weights.

37. We think there can be little reasonable doubt but that we have here the clue to the interpretation of these passages, and that the quantity of money was weighed out with *weights in the form of a lamb*, that, of course, being some well known and definite amount, though how much it was has not been ascertained. In Genesis xx. 16; xxxvii. 28; xlv. 22, where pieces of silver are mentioned, they were, no doubt, ring-ingots of bullion, as we see depicted in Wilkinson and Layard. In the latter two passages, where our version reads "silver," the Septuagint has "gold."

38. The first mention we have of coined money in Scripture is in 1 Chron., xxix. 7; Ezra, ii. 69; Nehem., vii. 70, 71, 72, where our version speaks of *drams*, which is a mis-translation for Darics, which were famous Persian gold coins, which are mentioned afterwards. These books were written after the captivity, when the Jews used the coins current in Persia.

39. The term used by the Jews to denote buying always involved the idea of weighing. Thus in Isaiah, lv. 2, where we read in our version:—"Wherefore do ye spend money for that which is not bread," the word in the original means to weigh. And indeed, the essential idea of value always means weight; the quantity of one thing weighed against another. So in *Henry viii.*, Act v. sc. 1, Cranmer says:—

"Will triumph o'er my person, which I weigh not:—
i.e., value not.

The first native coinage of the Jews was struck in the time of the Maccabean princes, when Antiochus permitted them to have money of their own. 1 Macc., xv. 16.

40. The Assyrians are said by Mr. Layard not to have used any coins. Nor had the Egyptians any coinage of their own, but they seem to have been the first to use gold as a currency, which they did before silver, which Sir G. Wilkinson says they called "white gold." The

precious metals were made up in the form of rings, and were weighed out in all transactions, with weights of different forms; and this clumsy method of weighing out the price of every commodity continued so late as the time of the Ptolemies, and was only gradually superseded by the use of Grecian coins. The use of the ring money continues to the present day in Sennaar and the neighbouring countries.

An attempt to introduce a silver coinage was made by Aryandes, the Persian governor of Egypt, under Cambyzes and Darius, but it did not succeed. Of this something more is said below.

41. Julius Pollux, ix. 83, says that coining was attributed to various persons, to Pheidon of Argos by some, to Lycus and Erichthonius of Athens by others; by Xenophanes to the Lydians, and by Aglosthenes to the Naxians. It is curious, however, that he does not quote a well known passage in Herodotus, which is commonly supposed to assign it to the Lydians. Plutarch also says in his life of Theseus, § 25:—"He coined money too, and stamped it with the figure of an ox, either in remembrance of the Marathonian bull, or of the general of Minos, or to admonish the citizens to follow agriculture. And from this coin, it is said, that the expression, worth 100 oxen, or ten oxen, is derived." We quote this passage, because many ancient writers affirmed that there was a coin called a *βοῦς* in very ancient times, which was alluded to in the passages of Homer mentioned below, and even some modern economists have held the same notion. But we have little doubt that this coinage is as mythical as Theseus himself, and those who believe in one may believe in the other. We might just as well accept it as an historical fact that Ulysses offered Silenus coin, because Euripides says, *Cyclops*, 160:—

Πρὸς τῷδε μέντοι καὶ νόμισμα δόσομεν.

It has, indeed been disputed whether money, or coin, was in use in Homer's day, some contending that coins were meant in the passages quoted below. But all critics of authority are now, we believe, agreed that there is no allusion to money either in Homer or Hesiod. We ourselves, having gone over the *Iliad* for the express purpose, are satisfied that there is not the faintest allusion to anything like money in it.

42. The practice of barter is very clearly described in *Iliad*, vii. 468; when the vessels from Lemnos came to the camp of the Greeks freighted with wine, they purchased it with copper and iron, leather, oxen, and slaves.

Νῆες δ' ἐκ Λήμνου παρέσταν, οἶνον ἀγοῦσαι

Ἐθεν δρ' οἰνίζοντο κάρη κομώντες Ἀχαιοί,

Ἄλλοι μὲν χαλκῷ, ἄλλοι δ' αἰθωνι σιδήρῳ,

Ἄλλοι δὲ ῥινοῖς, ἄλλοι δ' αὐτῇσι βόεσσιν,

Ἄλλοι δ' ἀνδραπόδεσι.

Not only do we find no allusion to money in Homer, but the words significative of wealth give no preference to the precious metals above other things; on the contrary, they are comparatively seldom mentioned. The Homeric words expressive of wealth most frequently refer to cattle, or horses, or agriculture. Thus we have *πολύρρην*, *πολυβούτης*, *πολύϊππος*, *φιλοκτέανος*,

πολυκάμων, *ἄφνειος*, *πολυκτῆμων*, *πολυλήϊος*. In *Iliad* vii. 180, and xi. 46, are almost the only instances in which gold is especially alluded to as wealth, *πολυχρύσοιο Μυκῆνης*. When the Greek and Trojan leaders send spies to discover the plans of the enemy, neither of them promises money as a reward. Nestor, *Iliad* x. 215, promises to the successful spy a black ewe with its young, a matchless gift; and Hector, x. 305, promises on his side a chariot and a pair of horses.

43. The Greeks however, in that early age sometimes referred to cattle as a measure of value. Thus in *Iliad* ii. 448, Minerva's shield, the *Ægis*, had 100 tassels, each of the value of 100 oxen:—

Τῆς ἑκατὸν θύσανοι παγχρύσοιοι ἡερέθονται
Πάντες ἐνπλεκέες, ἑκατόμβιος δὲ ἕκαστος.

Homer, *Iliad* vi. 234, laughs at the folly of Glaucus, who exchanged his golden armour for the copper armour of Diomedes:—

Ἐνθ' αὖτε Γλαῦκω Κρονίδης φρένας ἐξέλετο Ζεὺς
Ὅς πρὸς Τυδείδῃν Διομήδεα τεύχε' ἄμειβε,
Χρῦσα χαλκείων, ἑκατόμβοι' ἐννεαβόων.

So in *Iliad* xxiii. 703, Achilles offers as a prize to the conqueror in the funeral games in honor of Patroclus, a large tripod, which the Greeks valued among themselves at twelve oxen, and to the loser a female slave, which they valued at four oxen:—

Τῷ μὲν νικήσαντι μέγαν τρίποδ' ἱμπυριβήτην
Τὸν δὲ δυωδεκάβοιον ἐνὶ σφίσι τῶν Ἀχαιοί·
Ἄνδρ' δὲ νικηθέντι γυναῖκ' ἐς μέσσον ἔθηκε,
Πολλὰ δ' ἐπίστατο ἔργα, τῶν δὲ ἑτεσπαράβοιον.

So also in *Iliad* xxiii. 885, Achilles stakes a spear and a caldron worth an ox:—

Καδ' δὲ λέβητ' ἄπυρον βοδὸς ἄξιον ἀνθεμόεντα
Θῆκ' ἐς ἀγῶνα φέρων.

Now Julius Pollux says that there was a coinage in early times in Attica bearing the figure of an ox, and he says that some suppose that these coins are meant here, and not oxen; an opinion, however, which he does not say he adopts, as some suppose he does. J. B. Say, however, adopts that opinion from M. Garnier, and others have done the same.

44. Every critic of authority, however, has rejected this opinion, and when we examine the internal probability of the thing, we can, we think, come to no other conclusion. Athens, at the time of the Homeric poems, was a state of no great importance. And how was it likely that the coinage of so small a place should be the recognised measure of value throughout the Greek states of Asia Minor?

Moreover, if we come to examine the values of the different articles mentioned above, by such a measure, they will at once be seen to be ridiculously small. The quantity of silver in the *βοῦς*, supposing it to have been an early name for the Attic drachma, did not exceed that of a modern shilling. Now the purpose of the tassels in Minerva's shield was to strike terror into her enemies. It is ludicrous to suppose that these terrible tassels should only have had as much metal in them as there is in five sovereigns.

Again, it is ludicrous to suppose that the golden armour of Glaucus should only have been worth five sovereigns, or even the copper armour of Diomedes worth nine shillings. It is also absurd to suppose that the tripod proposed as a prize by Achilles should only have been worth twelve shillings, or a skilful female slave worth only four shillings; or that Achilles should stake a caldron worth only a shilling. Directly we look at it in this view, it seems to us that the values assigned to the articles are absurd, but as soon as we consider them as really oxen, they become something rational.

45. This, however, in no way disproves the assertion of Pollux, that there was an early coinage at Athens stamped with the figure of an ox, and called a *βοῦς*, as we shall see below, that it was quite common for cities to stamp their coinage with the devices of animals of different sorts, and not unfrequently the coin itself was called by the name of the device it bore.

46. The Homeric poems were probably written, according to the best authorities, about the beginning of the ninth century, B.C. At that period, therefore, we have seen that there was no money of any sort in Greece, nor even were gold and silver used as measures of value. But soon after this, though how long we cannot say, a currency of a curious nature came into use throughout Greece. They used large iron and copper nails, called *ὀβελίσκοι*, of such a size that six of them made a handful, and when silver was substituted, the standard silver coin of the Greeks derived its name from the fact that it was of the value of a handful of these nails. They are mentioned by Plutarch in his life of Lysander, § 17. He says that Lysander sent a quantity of gold and silver money to Sparta, by Gylippus, who stole a part of it, and this being discovered, made the chief Spartans demand that all the gold and silver should be sent away as a foreign nuisance, and that they should use nothing but their own national coin, which was of iron, and tempered with vinegar, so as to render it useless for any other purpose. And he says—"Probably all the money in former times was of this kind, for they used iron skewers as money, and some used copper ones. Whence it comes that even now a quantity of small coin is called *obolus*, and a *drachma* is six oboli, because the hand can grasp that number." We shall see below that Pheidon, who introduced a silver coinage into Greece, collected a number of these skewers, and laid them up in the Temple of Juno at Argos, as a curiosity.

47. Although Pollux says that the invention of coining was by different writers attributed to four different persons, or peoples, the claimants for this honour are practically but two—Pheidon of Argos, and the Lydians. The majority of ancient authorities attribute it to Pheidon, king of Argos. Thus the historian, Ephorus, is quoted in two places by Strabo. In VIII. 6. he says,

"Εφορος ἐν Αἰγίνῃ ἀργυρον πρῶτον κοπῆναι φησιν ὑπὸ Φεῖδωνος" Ἐμπόρειον γὰρ γενέσθαι παρὰ τὴν λυκρῶτητα τῆς χώρας τῶν ἀνθρώπων θαλασσοπορευόντων ἐμπορικῶς."

"Ephorus says that silver was first coined in Ægina by Pheidon. For the island became a commercial port, as the inhabitants were obliged

to betake themselves to maritime commerce, in consequence of the sterility of the land." Also in VIII. 3 :—

"Καὶ μέτρα ἐξέτυρε τὰ Φεῖδωνεῖα καλούμενα, καὶ σταθμούς, καὶ νόμισμα κεχαραγμένον τὸ τε ἄλλο καὶ τὸ ἀργυροῦν."

"And he invented the measures, called the Pheidonian ones, and weights, and coined money of silver, and other kinds."

The *Etymologicum Magnum*, under the title 'ὀβελίσκος, says—

"Πάντων δὲ πρῶτος Φεῖδων Ἀργεῖος νόμισμα ἔκοψεν ἐν Αἰγίνῃ, καὶ δοὺς τὸ νόμισμα καὶ ἀναλάβων τοὺς ὀβελίσκους, ἀνέθηκε τῇ ἐν Ἀργεὶ Ἡρᾷ."

"And Pheidon of Argos was the first who ever coined money, which he did at Ægina, and he both put money into circulation, and withdrew the skewers, and laid them up in the temple of Juno at Argos."

And in accordance with this, Ælian says, *Var. Hist. XII. 10. De Æginetia* :—

"Καὶ πρῶτοι νόμισμα ἔκοψαντο, καὶ ἐξ αὐτῶν ἐκλήθη νόμισμα Αἰγιναιῶν."

"And they were the first who coined money, which, too, is from them called Æginæan money."

So also the Parian Marble says, *Clinton's Fast. Hellen. I. 247* :—

"Ἀφ' οὗ Φ . . . δων ὁ Ἀργεῖος ἐδήμευσ . . . ε . . . νεσκεῖασι, καὶ νόμισμα ἀργυροῦν ἐν Αἰγίνῃ ἐποίησεν."

All these authorities, therefore, are perfectly clear that Pheidon of Argos was the first who coined money, which he did at Ægina; and the reason why he set up his mint at Ægina, is very plainly given by Ephorus, as quoted above, because it was a great commercial port, and, therefore, it was most wanted there for the convenience of commerce.

48. The period at which Pheidon lived has been a subject of much dispute. For while some carry it back so far as 865, B.C., others bring it down to 783-744, B.C. The question is fully discussed in the first Appendix to the first Volume of Mr. Clinton's *Fasti Hellenici*; and in his opinion, the latter is the true date. And in this decision all scholars now acquiesce. We may, therefore, place the introduction of coined money by Pheidon in the first half of the 8th century, B.C. And there is a very probable reason why he should have invented it. At this period he was by far the most powerful sovereign in Greece. Argos was the metropolis not only of the Peloponnesian Dorians, but also of the Asiatic Dorian colonies. The Dorians carried on a very large commerce with the Phœnicians, and it was from them that Pheidon adopted his system of weights. From time immemorial there had been two standard weights used in Assyria, the Babylonian and the Euboic talent. The Dorians traded with the Phœnicians, and adopted the Babylonian talent. The Ionic Greeks adopted the Euboic talent. As Ægina was the great commercial depôt, this talent was afterwards called the Æginæan talent. The Assyrians at this period had no coinage. And Pheidon introducing the system of Babylonian weights into Greece,

seems to have invented a system of measures of his own, which were called after him, and also a silver coinage, to supersede the clumsy iron and copper nails, or skewers, then used as currency. The Spartans, however, who at this period were a subordinate, but independent tribe of Dorians, steadily refused the new invention of a silver coinage, probably from jealousy, and adhered to the old iron skewers. They retained this iron money to a comparatively recent period. (CURRENCY).

49. The account of the invention of coinage just given, seems to be natural and probable. There is, however, a passage in Herodotus which seems to contradict it. He says, I. 94, speaking of the Lydians,

“Πρώτοι δὲ ἀνθρώπων, τῶν ἡμεῖς ἴδμεν, νόμισμα χρυσοῦ καὶ ἀργύρου κοψάμενοι ἐχρήσαντο.”

“And they were the first men, we know of, who coined and used gold and silver money.” This has always been supposed to mean that the Lydians were the first who invented coining, and that they used a double standard, as it is called, of gold coins and silver coins. If this be the case, the authority of Herodotus is against the claim of Pheidon, and we have observed above that though it is somewhat singular that Julius Pollux does not mention this passage, he says that Xenophanes of Colophon assigns the invention to them.

50. It occurs to us, however, that there may be a means of reconciling the apparent contradiction between Herodotus, and the writers already cited as attributing it to Pheidon. It seems to us that the passage will bear a different construction from that invariably put upon it. For in Greek when καὶ is used to connect two qualities, it means that the thing spoken of partakes of both these qualities at once. Thus, as the month began in the middle of a day, the last day of a month was called ἔνη καὶ νέα the new-and-old day, because it belonged partly to one month, and partly to another. So there are many other examples. Now if we apply this principle to the passage in question, it would mean not that the Lydians were the first to coin gold money and silver money in separate coins, but that they were the first who struck a coinage of a mixture of gold and silver.

51. Now we find that this rendering of the passage, which is the genuine Greek idiom, exactly tallies with the fact. The Lydians had a coinage of ἤλεκτρον, or electrum, which is a mixture of gold and silver, in different proportions, but usually three parts of gold to one part of silver. And this material was generally adopted throughout the western states of Asia Minor for their coins. (*Encyclo. Brit. Art. Numismatics.*) Several of these coins are in the British Museum.

52. Such is the solution of this apparent contradiction, which we offer to our readers for them to consider its probability. We offer it with the greatest diffidence, because it seems to us that if it be the true solution, it is so simple and obvious that it could hardly have escaped the notice of the many able and acute critics and writers, both on Herodotus and Numismatics.

53. We have now to notice another very celebrated coin of antiquity, which has also given rise to much controversy—the Persian Darics.

We have said above that they are the coins meant by the word *drams* in Chronicles and Ezra.

From the passage in Herodotus IV. 166, quoted below, the greater number of authors have supposed that the Daric was first coined by Darius Hystaspes, who reigned 521-484, B.C., and some even have supposed that he was the first who introduced a coinage into Persia.

Harpocration, however, says that the name was derived from an earlier king, and several modern writers have considered that it is derived from a Persian word *Dara*, signifying a king in general. (*Smith's Dict. of Gk. and Rom. Ant. Art. Daricus. Kitto's Bibl. Cyclo. Art. Adarconim.*)

Mr. Grote, (*Hist. of Greece. III. 319.*) affirms that this Darius was the first to introduce a coinage of gold and silver at all into Persia. And Heeren and Baehr consider that Darius did not issue these Darics as coins, but only as medals in commemoration of himself, and that their use as money grew up gradually afterwards.

54. But the plain meaning of the words seems to us to be repugnant to such a construction. Herodotus says, IV. 166 :—

“Ἰδὼν Δαρεῖον ἐπιθυμῶντα μνημοσύνην ἑωυτοῦ λιπέσθαι, τοῦτο τὸ μὴ ἄλλω εἰη βασιλεῖ καταργασμένον, ἐμμέτερο τούτου.” * Δαρεῖος μὲν γὰρ χρυσὸν καθαρῶτατον ἀπεψήσας ἐς τὸ δυνατότατον, νόμισμα ἐκόψατο.”

Which Mr. Rawlinson translates, “Aware by his own eyesight, that Darius wished to leave a memorial of himself, such as no king had ever left before, Aryandes resolved to follow his example. . . . Darius had refined gold to the last perfection of purity, in order to have coins struck of it.”

55. Now, it is quite clear from the very expression that Darius meant them to be used as money, νόμισμα. But the questions arise :—

1. What was the nature of this proceeding of Darius?
2. Was this the first coinage of the Persian Empire?
3. What was the thing Darius considered so peculiarly illustrious, as to rank above what any other king had done?
4. Do the Darics derive their name from this Darius?

Now taken by themselves the words are not decisive one way or the other, as to whether this was the first coinage in Persia, or not. We must, therefore, search for any other passages which may guide us. And it happens that in III. 96, and 130, we have two, which throw some light upon the subject.

56. In III. 96, Herodotus says that the tribute gold and silver was sent up to Babylon, and melted, and laid by in pots, and whenever any money is wanted he (the king) coins as much as is necessary each time.

“Ἐπεὰν δὲ δεῖσθῃ χρημάτων, κατακόπτει τοσοῦτο ὅσον ἂν ἐκάστοτε δεῖται.”

Now Mr. Grote (*History of Greece. IV. 320*), translates κατακόπτει “cuts off,” thereby implying that it was used in bullion. But Mr. Rawlinson translates it “coins,” which is manifestly right, for it is one of the technical words

for coining; as Cyrus says in Xenophon, *Hellenics* I. 5. 3., if money failed him—

“Καὶ τὸν θρόνον κατακόψειν ἐφ’ οὗ ἐκάθητο.”

“He would coin the very throne on which he sat.”

57. Again in III. 130, when Democedes had cured the king of the sprain in his ankle, he was sent to receive a reward from the king's wives, who each took a saucer full of gold coins—στάρηρας—from a chest of gold, and gave them to him, and his servant even grew rich by picking up those which fell out. Now this was in the beginning of Darius's reign, when he was still a young man, as we see in c. 134, Atossa reproaches him for want of enterprise, unbecoming a young man. From these passages, it is quite clear that coining and coined money were in use in Persia, in the beginning of Darius's reign.

58. Now it is true that Herodotus does not mention the period in Darius's reign, when he reformed the coinage, but there seems every probability that it was done after the period alluded to in the last mentioned passages, as it is mentioned long after them in the narrative. A reformation of the coinage is not a thing likely to occur to a young man, it is much more likely to be thought of by a man of mature age.

59. But we have also traces of a coinage in Persia earlier than that of Darius. A passage in Plutarch, if authentic, goes to shew that there was gold money in Persia in the time of Cyrus the Elder. He says, *De Mulier. Virtut.* p. 246, that when Cyrus's soldiers misbehaved in battle on one occasion, the Persian women of a town shamed them into fighting, and they won the victory. In commemoration of this, he made a law that whenever the king entered the country every woman should be presented with a piece of *gold money*. Nor was this a mere obscure tradition, but a well recognized law, and was one reason, he says, why the kings so seldom visited their native country. He also says that the first thing that Alexander did when he entered the country was to comply with this law. (*Life of Alexander* § 69.) Hence we have a well established law relating to money dating for a considerable time before Darius.

Such evidence as we have then, goes, we think, to prove that there was a gold coinage in Persia before Darius Hystaspes.

60. Besides, in what did his doing a thing more glorious than any other king had done consist? Surely not in simply striking a gold coinage, because there were abundance of gold coins in the Greek states of Asia Minor long before the time of Darius. Hence it was no novelty at all. But the remarkable thing manifestly was the extraordinary purity of the metal. The staters of the Asiatic states were of very different weights, and some were much alloyed with silver. Now Darius evidently placed his glory in coining them of absolute purity, or as nearly so as the state of the art in his day would permit. And in this Aryandes imitated him, and Herodotus says that the Aryandic silver was the purest in existence in his day. (IV. 166).

61. And we think the narrative of Herodotus confirms this view of the case. For while in the earlier passage, III. 130, he simply speaks of Staters, in VII. 28, he says that Pythias of

Celænae was worth among other things 3,993,000 of *Daric* Staters, evidently alluding to the reformed Staters of Darius. And after this period the Persian Staters were always called *Daric* Staters. So Thucydides VIII. 28, speaks of *Daric* Staters, and Diodorus Siculus says that Alexander found in the treasury immense quantities of gold and silver bullion, and 9,000 talents of gold, χαράκτῃρα Δαρεικὸν ἔχοντα, of the coinage of Darius. So Julius Pollux, IX, 84, speaks of Cræsean, Philippic, and *Daric* Staters. And he also says, III. 87, speaking of the most highly esteemed gold:—

“Εὐδόκιμος δὲ ὁ Γύγαδας χρυσὸς καὶ οἱ Κροισεῖοι στέρηρες,” and manifestly alluding to the reformation of the coinage by Darius, “καὶ οἱ Δαρεικοὶ ἀπὸ Δαρείου, ὡς ἔπει’ ἐκείνου ἀκριβοθέστες εἰς κάθαρσιν τοῦ χρυσοῦ.” And that very pure silver was called Aryandic silver. He also says, IX. 84, that there was a Persian coin called Danaces, which was perhaps the one superseded by the *Daric*.

62. It seems then that there was gold coin in Persia for a considerable time before Darius, though how long it is impossible to say, and that they were more or less impure. That Darius resolved to signalise himself by issuing a coinage of as great purity as possible, and that it was these reformed coins which were called *Daric* Staters, just as there were Cræsean Staters and Philippic Staters, and Alexandrian Staters, (*Pollux*, IX. 59.) The assertion of Harpocration, which is copied word for word by Suidas, seems to us to be of no weight at all, especially as he cites no authority for it. And in reply to the assertion of modern writers that the word *Darics* is derived from *Dara*, a Persian word for a king, Mr. Rawlinson says that there is no such word at all in old Persian. The common opinion then seems to us to be correct, that these *Darics* were called after Darius Hystaspes, just as many coins in ancient, as well as in modern times, have been called after their issuers. We have already mentioned some ancient ones, in modern times we have the louis d'or and the napoleon.

63. We learn from Herodotus III. 96, that there were two standard weights in use in the Assyrian Empire, the Babylonian talent for silver, and the Euboic talent for gold. The Dorian Greeks who traded with Phœnicia, introduced the Babylonian weight, which when adopted in Greece was called the *Æginæan* standard. The Ionic Greeks adopted the other standard, which was known by the name of the Euboic, a name probably derived from the people who adopted it, like as the *Æginæan* was named from those who used it. The Euboic standard was adopted at Athens, and the standard coin of this system had the figure of an ox stamped upon it, whence it was called a *βοῦς*, as stated by Pollux and others. The existence of this coin has been doubted, but Montesquieu says (*Esprit des Loix*, XXII. 2.) that he saw one in the collection of the Earl of Pembroke, and it is stated (*Smith's Dict. of Gr. and Rom. Ant. Art. Nummus*, 2nd edit.) that other specimens exist. The relation between the *Æginæan*, or Babylonian talent, and the Euboic talent, was that of 72 to 60, or 6 to 5.

64. Solon effected a remarkable change in the Athenian currency. The whole state was thrown

into confusion and misery by the indebtedness of the people to the monied classes. Their lands were mortgaged, and multitudes who had no land to pledge, were sold into hopeless slavery. By universal consent Solon was appointed sole arbitrator to redress this state of things. The measures he adopted are related in Plutarch, one of them was of a very singular nature. Plutarch says that he made the mina, which contained 73 drachmæ, pass for 100. The meaning of this, however, obviously is that out of the same quantity of silver as there was previously in 73 drachmæ, he coined 100. And he changed the stamp; for whereas before his time it was the figure of an ox, and the coin was called βούς, he stamped his new drachmæ on the obverse with the head of Pallas, and on the reverse with an owl, the favorite bird of Pallas, hence the coin was called κόρη, the Virgin, from the head of Pallas, and sometimes γλαυξ, the owl. The reason why Solon adopted such a strange relation as that between 73 to 100 long puzzled the critics, and some supposed that he meant to reduce the coinage by one-fourth, but by clumsy workmanship, an error was made, by which the reduction was 27 per cent., instead of 25 per cent. But the opinion now adopted by the best scholars is that Solon intended to bring the new Attic Currency into the definite ratio of 3 to 5 with the Æginæan standard, which was in general use throughout the rest of Greece. It seems, however, that Plutarch was not quite accurate in saying that Solon reduced the standard in the ratio of 73 to 100. The investigations of modern scholars have shewn that it is in reality 72 to 100, and we have as the relation between the three systems of Greek currency the following definite ratios:—

Æginæan	:	Euhoic	=	6	:	5
Æginæan	:	Solonian	=	5	:	3
Euhoic	:	Solonian	=	138½	:	100
			=	100	:	72
			=	25	:	18

(*Smith's Dict.: Art. Pondera.*)

65. By Solon's legislation, every creditor received from his debtor as many pieces of money as were due to him, but their weight was reduced by 28 per cent. One would have thought that the nature of the operation was plain enough. It was, in reality, nothing but a bankruptcy, necessitated by the miserable state of the debtors it is true, but still a compromise or bankruptcy. No one could have imagined, it would appear, that when a man received only 72 per cent. of the quantity of silver due to him, that it was, in reality, a payment in full of his claims. Nevertheless, Plutarch's comment on this transaction is most extraordinary. He says:—

“Ὅστι' ἀριθμῷ μὲν ἴσον, δυνάμει δ' ἑλαττον ἀποδιδόντων, ὥφελ' εἶσθαι μὲν τοὺς ἐκτίνοντας μέγала, μηδὲν δὲ βλάπτεσθαι τοὺς κομιζομένους.”

“So that as they paid the same by tale, but less by weight, it was a great relief to those who had to pay large sums, but yet no loss to those who had to receive it!” Here we have the first germ of that astonishing paradox, that it is the *name* and the *stamp* on the coin which give it its *value*, and that the quantity of metal in it is of no consequence. It is this palpable absurdity which

is at the root of almost all the monetary controversies which have distracted the world in recent times. It is precisely the same paradox which deluded the Government, and the House of Commons, and the Bank of England, in 1811, when it was held that a bank note which was called a pound was of the same value when it would exchange for 20s. as when it would for 14s. When the House of Commons voted that a pound note and 1s. were equal to a pound note and 7s., and when they contracted enormous debts in pounds worth 14s., which their unfortunate descendants have to pay in pounds of 20s. (Μυστήρ). This, as we have said above, is the great source of confusion which has given rise to almost all monetary controversies,—confusing the *name* of the coin with its *value*.

66. One other remarkable thing may also be mentioned. Although the exigencies of the case undoubtedly were met on this occasion by a general bankruptcy, and the supposition that one party could be greatly benefited, and the other not injured, cannot possibly be received, yet the operation was never repeated. In Roman history, as we know, the commons were repeatedly plunged into general distress by insolvency, and there were repeated depreciations of the coinage, but this instance of Solon's was the only one in Greek history. As Mr. Grote observes, (*Hist. of Greece, III. 141.*) the Grecian democracy never demanded an agrarian law, or a release from debts, and more than that, the Dicasts, or jurors, who formed the judicial body called the Heliaia, were obliged to take a solemn oath to repudiate all proposals for an abrogation of debts, or a redivision of lands, and many Greek cities fixed a curse upon all such propositions.

67. The Attic drachma as remodelled by Solon, weighed 66.5 grains, of which one-sixtieth part was alloy, which gives 65.4 grains of pure metal. A modern shilling contains 80.7 grains of silver. Hence the drachma was worth 9.72 pence. After the time of Alexander, it was slightly diminished to 63 grains. The Athenians coined pieces of two, three, and four drachmæ, as well as obols, half, and quarter obols, and pieces of two, three, and four obols.

The Persian Daric Stater was of the weight of the Attic didrachma, and of the value of 20 drachmæ.

The mina contained 100 drachmæ, and was therefore equal to £4 1s. 3d., and the talent contained 60 minæ, and was therefore equal to £243 15s.

The Attic standard was used in most of the maritime and commercial states, at Corinth, Acanthus, Cyrene, the northern states of Greece, except Bœotia, and Macedonia, and Sicily.

68. The Æginæan standard was used generally throughout the Peloponnesus, except Corinth, and in Bœotia. The drachma weighed 96 grains, with one thirty-second part of alloy. It, therefore, contained 93 grains of silver, and was worth 1s. 1d. 3-2 farthings. The largest coin of this standard was the didrachma.

69. The Athenians had no gold coinage of their own before the Macedonian Empire. During the distress caused by the Peloponnesian war, they issued on one occasion, B.C. 406, a debased gold coinage (Αἰσχροπράγες), but this was soon withdrawn. Gold was coined in large quantities by

Philip of Macedon, and thus found its way into Greece, and several Greek cities then issued a gold coinage of their own. But the staters of Cyzicus, Phocæa, and the other states of Asia Minor, had considerable currency in Greece. Among the earliest of those known to them, there seem to have been the staters of Cræsus, king of Lydia, which were made of electrum, or a mixture of gold and silver.

70. In Italy, there are obscure traditions of a currency of leather, shells, and iron. But it may be considered as certain, that the Etrurians had a bronze or copper currency of some sort, long before the period of authentic history. Pliny in XXXIV. 1., says that Numa was the first who stamped bronze, or copper money; but at XXXIII. 13., he says that it was Servius Tullius, and Cæsiiodorus mentions the same report. Timæus, according to Pliny, says that before the latter king, the Romans used copper in the mass, as money. He stamped it with the figure of an ox, and hence, says Pliny, XVIII. 3., it was called *pecunia*. Plutarch, (*Life of Publicola*, and in *Quest. Rom.* p. 274.) and Varro (*De Re Rusticâ*, II. 1., and *De Vita Pop. Rom.* I.), say that the earliest Roman coinage was stamped with the figure of cattle; and Columella (*Præf. to VI.*), and also Pliny, XVIII. 3., say that the word *pecunia* comes from the figure stamped on the early coinage. This has recently been called in question, but we cannot see on what sufficient ground, as the names of many coins in ancient times were derived from the figures stamped on them. The early Roman coins were not stamped, but cast in a mould.

71. The unit of value was the As, or the pound weight of copper. But what the Roman pound was has never been exactly settled. The difficulty arises from the difference between the actually existing weights themselves, as well as from the differences in the weights of certain coins which are said to have been certain definite parts of the pound. The calculations made by several eminent archæologists bring out results varying from about 5,053 grains to upwards of 5,200 grains. The most recent authorities, however, seem to incline to the former of these figures. If this be the case, the Roman pound may be considered as something less than twelve ounces avoirdupois weight.

72. It is quite uncertain how long the Roman currency maintained its full weight of a pound. Pliny, XXXIII. 13., says that in the first Punic war, when the Republic could not pay its debts, it reduced the As from one pound to two ounces; thus he says it gained five parts in six, and paid its debts. This was in reality nothing but a bankruptcy. Five years before the first Punic war, in the 485th year of the city, and 269 B.C., silver was coined for the first time. The Denarius was coined to be equal in value to ten Asses, the Quinarus to five, and the Sestertius to two and a-half. This coin afterwards became the unit of value.

In the second Punic war, when Hannibal was pressing hard upon Marcus Minucius, Quintus Fabius Maximus, the dictator, proclaimed a second national bankruptcy, and the As was reduced to one ounce. The denarius, however, was raised to 16 asses, the quinarus to eight, and the sestertius to four. Thus, Pliny says again, the Republic

gained one-half. In the year 191, B.C., the As was still further reduced by the Papirian law to half an ounce. In the year 90, B.C., Lucius Drusus debased the silver currency by an alloy of one-eighth part of copper. The proper weight of the Denarius was 84 to the pound.

73. Such is Pliny's account of the depreciation of the Roman Coinage; we may remark that though he says the state gained by defrauding its creditors, he does not agree with Plutarch's astounding paradox under similar circumstances; he does not say that the creditors suffered no loss. It has also been observed that this account cannot be correct, because Asses have been found of all degrees of depreciation from twelve ounces downwards. Modern Roman historians suppose, therefore, that the depreciation of the currency must have commenced at a very early period, and there must have been many before the one in the first Punic war, mentioned by Pliny. The point has given rise to much discussion, but as no satisfactory result has been arrived at, we need not enlarge upon it.

74. Gold was first coined 62 years after silver; that is, in the 13th year of the second Punic war, or 207, B.C. The lowest gold coin was the *scrupulum*, which was worth twenty sestertii. There were also gold coins of two, three, and four scrupula. Afterwards gold denarii were coined of forty to the pound, which Nero reduced to forty-five. If the aureus was the fortieth part of the pound, it is calculated that it ought to weigh 130.1 grains; but none have been found of that weight. Their average weight is 120 grains, of which one three hundredth part was alloy, so that there remain 119.6 grains of pure metal. A modern sovereign contains 113.12 grains of pure gold. Hence, as compared to the sovereign, the aureus of the republic was worth £1 1s. 1½d. very nearly.

75. Under Alexander Severus, the aureus was called *solidus*, hence by corruption the French *sous*.

76. The Roman unit of value was the sestertius, or the fourth part of the denarius. During the latter part of the Commonwealth, it was about 2d. 5 farthings. A sum of 1,000 sesterties was called a sestertium, and large sums were estimated in *sestertia*. The sestertium was, up to the time of Augustus, equal to about £8 17s. 1d. After Augustus, the sestertius was reduced to 1d., 3.5 farthings, and the sestertium to £7 16s. 3d.

77. The most remarkable circumstance, however, about the Roman coinage is, that every great family had the right of having denarii coined with their own device, so long as the officers of the mint certified that they were of the proper weight and fineness. Abundance of these family denarii exist. *Eckhel. V. 53.*

78. Constantine the Great fixed the aureus at 72 to the pound; and at this standard they remained until the capture of Constantinople by the Crusaders in 1204. The gold coinage of the Byzantine Empire was always guarded with the greatest care, except by a few monarchs, such as Nicephorus II. (963-976 A.D.), Nicephorus III. (1067-1088 A.D.), and Alexius I. (1081-1118 A.D.), who issued very debased coinages. But these frauds created such a public outcry, that they were obliged to be abandoned. These coins, called Bezants, acquired great cele-

brity, and obtained a great circulation in Western Europe, and were commonly current in England in the days of the Anglo-Saxon Monarchy, and for long after the Conquest.

On the Coinage of Britain.

79. The text of Cæsar in which he speaks of the money he found in Britain, is so hopelessly corrupt, that it is not possible to lay much stress upon it. It is, therefore, quite uncertain whether there was gold and silver money in the island at the time of his invasion. The ring money of the Egyptians and Assyrians seems to have spread all over the Celtic nations of the West, and the Scandinavians of the North. When the barbarians invaded Italy and Greece, they carried home with them a knowledge of their coinage and letters, and these gradually spread over the west. The probability seems to be that, at the time of Cæsar's invasion of Britain, the solid discs of the Greek and Roman money were gradually superseding the ring ingots of iron and copper, which the natives originally used. Coins are in existence, which are supposed to be contemporary with the invasion of Cæsar, especially one bearing the legend "*Sego*," which is supposed to denote *Segonax*, one of the four kings of Kent, who were ordered by Cassivellaunus to attack Cæsar. (*De Bell. Gall. V. 22.*) After this period, they are by no means scarce, and Cuneolin, Shakespeare's Cymbeline, who was brought up at Rome under Augustus, took home with him Roman artists to improve his coinage. Many specimens of it exist, bearing his name, as well as the first letters of Camulodunum, or Colchester, the chief town of his kingdom.

80. On the conquest of Britain under Clandius, the native money was abolished, and the Roman substituted, as was usual with the Romans in all their conquests. This continued for 400 years, until the arrival of the Anglo-Saxons, in the fifth century.

81. The Anglo-Saxons introduced a totally new system of money, both in weight, form, and type, to the Roman. But it appears from the specimens that exist, that though each of the kings of the Saxon Octarchy, as it should be called, coined money independently, that they were all of the same weight and fineness, and were, in fact, very nearly the same as the famous Anglo-Saxon penny. They were called *Sceatte*, and some of those of the kings of Kent remain, which were evidently coined before their conversion to Christianity, in the 6th century.

82. When the Island was united under the sway of a single sovereign, the mints were regulated by laws framed by the Wittenagemote, or great council of the nation.

83. The Saxon weight differed considerably from the Roman. It is supposed, with every probability, that they derived it from the Lower Empire. On the Continent it was known by the name of the Cologne pound, and when introduced into this country, it was afterwards called the Pound Tower, because the mint was established in the Tower. We have already seen examples, similar to this, of foreign weights being introduced into countries, and receiving new names from some place in the country. Thus, the two standard weights of the Assyrians, when introduced into Greece, were called the *Æginaean*, and the *Euhoic talents*, because they were first intro-

duced into Greece by the people of *Ægina*, and *Eubœa*. Thus the Greek pound, when adopted in Germany, became the Cologne pound, and when further extended to Britain, became the Pound Tower. Some, however, suppose that the Greeks and the Saxons both derived the weight from a common origin, which they suspect to be Egypt, the great fountain of science.

84. The Pound Tower continued to be the weight used for money till the 18th Henry VIII., who substituted the Pound Troy, which was used in France. The Pound Tower weighed 5,400 grains, the Pound Troy weighs 5,760 grains, being three-fourths of an ounce heavier.

85. The *Sceatte* were the earliest Anglo-Saxon money. There appear to have been coins of different weights of this name, but whether designedly so, or from mere rudeness of workmanship, is not determined. In the time of Athelstan (924-940 A.D.), 80,000 *sceattes* were declared equal to 120 pounds. An equal number of pennies make 125 pounds; so that the *sceatta* was one twenty-fifth part less than the penny.

86. After some time the penny superseded the *sceatta*. The etymology of this word is much disputed. It was the 240th part of the pound weight of silver, and for a thousand years was the standard coin of this country, until successive kings so diminished and debased it, that it has fallen to its present low estate. The high value of silver in the days of Athelstan may be judged of, when we find that an ox was sold for thirty pennies, and a sheep for five pennies, or one shilling. Half-pennies and farthings were also coined, but even these were too great for general use, when the value of silver was so high. Half-farthings were, therefore, coined in brass, and called *stycas*.

87. These were the only coins struck by the Anglo-Saxons. Some antiquaries maintained they had a gold coinage, but this opinion is now abandoned.

88. They had, however, names for specific sums of money, or money of account, as it is usually called. There was the *mancus*, which many supposed to be an actual coin, but the best opinion seems to be that it was only a sum of thirty pennies. The *mark* was a Danish mode of computation, and was probably introduced in the time of Alfred; it contained 100 pennies, but this was afterwards increased to 160, or thirteen shillings and four-pence, which was its value so long as it continued to be a legal fine.

89. The next species of money of account was the *Scill*, or *Scilling*, the name of which appears as early as the seventh century. The origin of this word is also much disputed, some even making it come from the Jewish *Shekel*. Some have also supposed that it was an actual coin, but this opinion is not now considered right. The *scilling* originally denoted five pennies, but afterwards it was reduced to four. William I. settled the English shilling at four-pence, and the Norman at twelve pence.

90. There was also the *Thrimsa* of three pennies, and the *Ora*, which was in some cases twenty pennies, and in others only sixteen. All rents to the crown were paid in the *ora* of twenty pennies; rents due to private persons seem to have been paid in the *ora* of sixteen pennies.

91. Up to the time of Athelstan (924-940 A.D.), the Archbishops, and many of the Bishops, exercised, or usurped, the right of having a distinct coinage. That monarch, however, in a great council, to which all the noble and wise men were summoned, ordained that there should be but one money throughout the kingdom. But while all subjects were forbidden to mint independently, many of them received grants from the crown to mint on its behalf, and there were in early times instances of royal, episcopal, and abbatial mints, all existing at the same time in the same town. Thus, when the Synod abolished the right of private coining, it was ordained that there should be seven moneyers in Canterbury,—four for the king, two for the bishop, and one for the abbot. And this was the case at several other places, and the privilege was not wholly abolished till the middle of the 16th century.

92. It may be mentioned that the quality of the bullion of the Anglo-Saxon money was 11 ounces 2 dwts. fine, and 18 dwts. alloy. This was called the "Old right standard of England." For a comparatively short period it was debased by some of our kings, but it was soon restored, and is that in use at the present day, as it has been proved by experience to confer the greatest amount of durability on the metal.

On the Coinage of England since the Conquest.

93. The Duke of Normandy acquired, or in the language of the law *conquered*, the Crown of England in 1066. As he claimed the crown as the lawful heir of the Confessor, he took care to make the change as little felt as he could. No change was made in the coinage, either in weight, fineness, or denomination. The names of about 238 of his moneyers have been preserved, and he had mints in nearly every town in the kingdom of any size. William established the Saxon shilling at five pennies, and the Norman at twelve, thus making it nominally correspond with the *solidus*, the French money of account into which the pound was divided, and which has been corrupted into the modern *sou*.

94. About this time it is generally supposed that the term *Sterling* began to be applied to English money, by which it was distinguished on the Continent, as it still is. The etymologies given for this word are so numerous and conflicting, that it would only be waste of time to enumerate them. This word *Sterling* was applied not only to the quality of the coin, but was also specifically appropriated as a name of the English penny, or standard coin.

95. No change was made in the Coinage by William II., but a heavy tax called *moneyage* is supposed by some to have been instituted by him. This tax was levied every three years, and was a fine paid that the money should not be altered. Henry I. (1100), found it so unpopular that he thought it politic to abolish it. Severe punishments were enacted against those on whom counterfeit coins were found, and all falsifiers of money were condemned to lose a hand, without redemption. This severe punishment was, however, ineffectual, and in 1106, the loss of sight and other mutilations were added. Nevertheless in three years the coin was so debased, that a recoinage became necessary. Notwithstanding the penalties denounced, the coinage continued so debased, that in 1123 it was thought advisable to call in

the aid of the church, and at a council held at Rome, that year, under Calixtus II., several ancient statutes were revived, which excommunicated all makers or passers of false money. Ecclesiastical censures, however, were as unavailing as temporal laws, and in 1125, it was determined to make a terrible example of them. The Bishop of Salisbury was ordered to summon all the moneyers in England to meet at Winchester by Christmas day. They came to the number of 94, and all but three were found guilty, and horribly mutilated according to the law, and then expelled from the country. To the three honest ones was committed the charge of recoinage all the money in England.

96. Stephen (1135) being soon immersed in civil war, and the treasures which had been accumulated by Henry I. being spent in the support of his armies, he had recourse to the expedient of debasing the coinage. Fortresses and feudal castles sprung up everywhere during these troubles, and each had its mint, so that in a short time the country was deluged with base coin, which contained scarcely one tenth part of silver. At length, in 1153, Stephen concluded a treaty at Wallingford, by which he recognized Henry as his successor, and it was agreed that these castles to the number of 1,115 should be destroyed, and their mints suppressed; and that the coin should be restored to its just standard and made uniform throughout the kingdom. This he was unwilling or unable to do.

97. Henry II. (1154) immediately carried into effect the treaty of Wallingford which Stephen had left unfulfilled. The castles were destroyed and their mints suppressed. In 1156, a new coinage was issued, and several of the moneyers were mutilated according to law. In 1180, it was again found necessary to have a recoinage. It is quite uncertain whether Richard I. coined money during his short reign. If he did, no specimens of it are known to exist.

98. On Richard's death, 1199, his brother John seized upon the throne. In 1205, proclamation was made that no one after the feast of St. Hilary in the next year, should receive or keep clipped money. All such money found in anyone's possession should be seized, bored through, and forfeited to the king. An assize was ordered for the examination of the money. All that wanted more than 2s. 6d. in the pound was to be declared illegal, and withdrawn from circulation. In order to test the weight of the coin, legal weights were delivered at the Mint to all applicants. If any of the pennies issued after Christmas, should be found clipped in anyone's possession, they were to be bored through, and the owner of them was to be treated as a thief. It was declared that the penny should be made of the just standard, and if any should be found clipped, the person who did so, should forfeit his goods to the king. Thus we see that in this reign, the utmost attention was paid to the weight of the coin.

99. Henry III. (1216) succeeded at the age of nine. It is supposed that in the beginning of his reign, round half-pence and farthings were first coined. For up to this time no coins had been coined smaller than the penny, which was much too large for general use. It had, therefore, been usual to break it in halves and quarters, being stamped with the figure of a cross, to serve as

small change. In 1227, a parliament was held at London, in which it was enacted that the English groat should be coined at a certain weight, with the king's image on one side, and on the other, a cross as large as the groat, to prevent clipping. In 1229, the payment of the papal tithes was enforced with great severity, and the people were obliged to borrow money of the Cahorsini, who then came into England for the first time, along with Stephen, the Pope's nuncio. It was the remission of this tribute which, we have every reason to believe, gave rise to the invention of Bills of Exchange, (*BILL OF EXCHANGE; CIBRARIO*) which is often, without any authority, attributed to the Jews. In 1247, the money was so clipped, during the troubles of the kingdom, that the whole of the letters were cut away, and even the inner circle was not entire. This had been done chiefly by the merchants of the countries nearest England, especially the Flemings. The evil was now so great, that a general council of all the nobles, lay and ecclesiastical, was held by the king at Oxford, and it was debated whether it was not expedient to alter the form or the fineness of the money. It was decided that as the matter, and not the form of the money, had been debased, it would be better to depreciate the standard, as had repeatedly been done in France and other countries. In 1248, the coins were so clipped and debased, that neither the English nor their foreign customers could endure it any longer. Proclamations were made in all cities, boroughs, fairs, and markets, throughout the kingdom, that no one should pass or receive money not of lawful weight, or not round. Repeated proclamations of this nature were issued, and all found to be ineffectual. At last a new coinage was rendered indispensable on account of the public distress. But the process of the new coinage was almost as burdensome as the bad money. In consequence of the old money being cried down, wheat rose to 20s. a quarter. Very few exchanges for giving new money instead of old were established, not only did the people only receive an equal weight of new money for their old, but a tax of 13d. in the pound was laid on for exchanging it, so that they received scarcely 20s. instead of 30s. The coinage, however, was of the proper weight and fineness.

100. In 1257, the 41st of his reign, he issued a gold coinage, the first in this kingdom. It was also called a penny, and weighed two sterlings, or silver pennies, and was ordered to be current for 20 pence. Thus it bore exactly the same relation to the silver penny, that the Persian Darics did to the Attic drachma. They were declared to be legal tender in London at that rate, but on the citizens remonstrating, a new proclamation was issued, permitting the citizens to take them or not as they pleased. In 1265, the value of the gold penny was raised to 24 pence. This coin was also termed a ryal, and was the first of the kind in Europe. It, however, soon disappeared from circulation, and in a few years ceased to be coined.

101. In 1265, it is said by some authorities that the statute of weights and measures was passed, by which the penny sterling was ordered to be of the weight of 32 grains of wheat, round and dry, and taken from the middle of the ear; the oz. to weigh 20 pence, and the pound 12 ounces.

102. The coinage had never been so debased and corrupted as during the troubled years of Henry III. It was clipped down to half its weight, prices rose immensely, and foreign merchants refused to trade. Immense quantities of base coin were imported from foreign countries, to the great distress of the people. One of the first things Edward I. (1272) found it necessary to attend to, was the state of the coinage. In 1275, severe punishments were inflicted upon persons accused of clipping and debasing the money. In 1278, upon pretence of having diminished the coin, all the Jews in England were seized on the same day, their property was confiscated to the crown, and multitudes of them hanged. In 1279, a proclamation was issued forbidding the currency of clipped money and exchanges were appointed, where every one, might obtain new money for the old, on paying 14d. a pound for moneyage. New half-pennies and farthings were issued, and in a short time the clipped money entirely ceased to circulate. Edward, however, in 1280, set the first example of diminishing the weight of the coin. He ordered that the pound of silver should pass for 20s. 3d. The ounce was to weigh 20 pence, and the penny 24 grains, which were as much as 32 grains of wheat. He also coined groats, or pieces of four sterlings, or pennies. He issued very severe proclamations against persons who imported base coin from foreign countries, and he appointed persons to examine and seize all who did so. In consequence of his measures upwards of 300 persons were convicted and executed. Notwithstanding all his proclamations and punishments, vast quantities of base foreign coin, called *lano niger*, *pollards*, *crochards*, *scaldings*, *brabants*, *eagles*, *leonines*, *sleepings*, were current. In fact, there was a positive necessity for smaller coins than the silver penny, and nothing could prevent the circulation of such small coins, except a proper legal one, such as the present copper money.

103. In the 28th year of his reign, Edward reduced the penny, which since the Conquest had weighed 24 grains tower, to 23.7073 grains tower. Up to this time the pound of silver money was a pound both in weight and tale. It was now cut into 20 shillings and 3 pence, and the diminution of the standard was 1 19-81 per cent.

104. An anonymous author quoted by Ruding, (*Annals of the Coinage*, Vol. I. p. 206,) says that Edward used leather money, bearing his name, stamp, and figure, in the building of Carnarvon, Beaumaris, and Conway Castles, specimens of which were preserved in one of the towers of Carnarvon Castle. This author wrote in 1622.

105. Edward II. (1307) found it necessary to continue the circulation of the debased coin, which had caused so much distress in his father's life. In 1310, the House of Commons stated to the king that the money was clipped down to one half. In 1311, fresh proclamations were issued against the importation of base money from abroad. In 1319 and 1320, these proclamations were renewed, with no good effect, and in 1321, persons were appointed to search all the ports and other places for clipped and base money.

106. Edward III. (1327) found the coinage in a dreadful state, from the feeble and incapable reign of his father, and it was one of the first abuses he was called on to remedy. In 1331, the state of

the coinage was brought before Parliament, and a committee was appointed to do what they thought requisite. The exportation of good money was forbidden on pain of death. Good money was forbidden to be melted upon pain of forfeiture. All black money was to cease to be current one month after the proclamation. But good coin continued to be very scarce, and its scarcity, together with an abundant harvest in 1337, caused the price of a quarter of wheat to fall to 2s., and that of a fat ox to 6s. 8d. Proclamation after proclamation was issued, all of them perfectly ineffectual. The state of the currency was in fact a chronic disease, from the financiers of the age not having discovered its fundamental principle—that good and bad coin cannot circulate together, but the bad drives out the good.

107. This constant debasement and corruption of the currency repeatedly attracted the notice of Parliament, and they endeavoured to provide a remedy. But their plans never went further than making laws to prevent the exportation of good money and importation of bad, denouncing heavy penalties on those who did so, and offering rewards to those who discovered the culprits. Merchants were obliged to give security that for every sack of wool they exported, they should bring back two marks of silver. In 1343, the state of the currency was taken into consideration by Parliament, who called in the advice of certain merchants, goldsmiths, and moneyers, who were charged to devise means to prevent the export of good money, and the import of base money. A statute relating to the silver money was passed as the result of these deliberations. But as the persons who framed it had no scientific knowledge of the subject, we cannot be surprised that it was no avail.

108. One important measure, however, was adopted. It was determined to issue a gold coinage to supply the scarcity of the silver. This coinage was to supersede all the foreign gold coins then in circulation, and was to be legal tender between merchant and merchant, and between any others that chose to accept it. The permanent restoration of gold as a substance of currency took place in 1344, none having been coined since 1257. Three sorts of gold money were to be issued. One with two leopards, or lions, to be current at 6s., and to be equal in weight to two petit florins of Florence of full weight. Smaller coins of the value of 3s. and 1s. 6d. were also coined. These gold coins were called florins, maille florins, and farthing florins. This money was rated too high, and the merchants consequently refused to receive it, and it was recalled. A new coinage was issued, called nobles, maille nobles, and ferling nobles. The noble was 6s. 8d., and the others in proportion. The pound weight of standard gold was coined into 39½ nobles. The pound weight of silver was coined into £1 2s. 2d. It was ordered that the money should be publicly assayed in presence of the king's council, before it was given to the merchant. The new coins were ordered to be received in payment of sums of 20s. and upwards. They received their name from the noble nature of the metal of which they were made. They were considered to be the most pure, valuable, and beautifully executed coins of their day, and

indeed so much so, that even men of sense so late as the days of Elizabeth, were not ashamed to repeat that they were produced by the famous charlatan and alchemist, Raymond Lully, in the Tower, though he died about twenty years before the date of them.

109. In 1346, the evil practice of tampering with the coinage was resumed. The noble was diminished by 10 grains, that is, the pound weight of standard gold was coined into 42 nobles, at 6s. 8d.; at the same time the penny was reduced to 20 grains, or the pound weight of silver cut into 22s. 6d. In this year the Commons petitioned against the importation of foreign base coins called *Lushebournes*, which were worth only 8s. the pound; they had obtained very extensive circulation, to the great detriment of those who could not distinguish them. They also petitioned that in consequence of the great scarcity of good coins in the realm, the king would order frequent coinages, and that the mints should be kept open in all places where they used to be. Fresh quantities of the *lushebournes* being imported, the Commons again petitioned in 1347, and several merchants were drawn and hanged.

110. In 1352, the coinage was still further diminished in weight. The pound weight of gold was cut into fifteen pounds, and the pound weight of silver into 25 shillings, or 300 pennies or sterlings. Thus it was already diminished by one-fourth, since the conquest. This reduction in the weight of the coinage, caused great public dissatisfaction, and the Bishop of Winchester, the Treasurer of the kingdom, who was supposed to have advised it, became very unpopular. In 1354, the Commons again urged upon the king to reform the coinage, and that the sterling should be restored to its former value. But the king paid no attention to their complaints. The money of Scotland, which had hitherto been of the same weight and alloy as that of England, was now still more depreciated than the English money, and in 1355, was forbidden to be current as it had been up to that time. But the ancient coins of Scotland were allowed to be current as heretofore. During several years repeated proclamations were issued against the currency of the Scotch money, which was becoming rapidly debased.

111. Richard II. (1377) succeeded at the age of 11. In the next year the Commons again complained of the export of the good coin, and of the clipping and bad state of the currency. No gold and silver, they said, were brought into the realm. In consequence of this, every merchant was ordered to bring bullion of gold or silver to the value of 12 sterlings, for every pound of cloth of gold he imported.

112. In 1381, the Commons again called the attention of the king to the miserable state of the kingdom, in consequence of the bad state of the currency. The gold coin current was deficient in weight to the amount of 13s. 4d. in the pound, and even more. The officers of the mint also complained that no money of gold or silver was made there. They were accordingly summoned to give their advice. But they had nothing to propose, except what had been tried repeatedly and failed.

113. The reign of Henry IV. (1399-1413) calls for no special remark. The same complaints, the same useless remedies tried, can give no

variety to the same monotonous story. In 1411, Parliament at length weary of the same grievance, tried the remedy which a certain set of persons have always clamoured for under similar circumstances—a reduction of the standard of the coinage. The pound weight of gold was ordered to be coined into 50 nobles, and the pound weight of silver into 30s. of sterlings.

114. Henry V. (1413) turned his attention to the coinage immediately he mounted the throne. The statutes against the practices against the coin were ordered to be strictly enforced, and the diminution of the standard weight adopted.

The reign of Henry VI. (1422) presents us with nothing but the same story.

115. In the 4th year of Edward IV. (1464) a new coinage was ordered, and the standard still further diminished. The pound of gold was coined into £20 16s. 8d., that is, out of each pound weight, fifty nobles were cut, and out of each pound of silver, 37s. 6d. In the next year the gold standard was still further reduced, and £22 10s. were coined out of the pound. In the 17th year of his reign, 1477, fresh statutes were made against the debasement of the coin.

116. There is nothing in the reigns of Edward V. or Richard III. to detain us. Henry VII. (1485) was the first to coin gold pieces of the value of 20s. In 1489, which were called sovereigns, or pounds, from being equal to twenty nominal shillings. The pound weight of gold was cut into 22½ of these sovereigns, which therefore weighed 240 grains of pure gold. We should express this in modern terms by saying that the Mint price of gold was £22 10s. per pound. A modern sovereign contains 113.12 grains of gold, consequently the sovereign of Henry VII. was equivalent to £2 2s. 6d. of our money.

117. The 19th year of his reign, 1504, is also remarkable for a great recoinage, and on this occasion, the old Saxon money of account, the shilling, was first reduced to an actual coin. It contained 144 grains of pure silver, and as a modern shilling contains 80.7 grains, it was worth 9.408 of our money.

118. Henry VIII. (1509) succeeded to an immense treasure accumulated by the avarice of his father, which he soon wasted. In his eighteenth year, 1526, he determined to abolish the Cologne or Tower weight, which had been introduced by the Saxons, and to substitute the Troy weight, which was used on the Continent, and is three-quarters of an oz. greater. Thus the pound Tower contains 5,400 grains, the pound Troy, 5,760 grains. The pound Troy of gold was ordered to be cut into 27 pounds, and the pound Troy of silver to be cut into 45 shillings.

119. A new standard of the fineness of gold was also adopted. Different gold coins had been coined of gold of different standards. In this year the standard was ordered to be 22 carats fine and 2 carats alloy; and a pound weight of this new standard was ordered to be cut into £25 2s. 6d.

120. In 1543, he set the first example of debasing the standard of silver. It was reduced to 10 oz. fine and 2 oz. alloy, and a pound weight of this was ordered to be cut into 48 shillings. The next year it was reduced to 6 oz. fine and 6 oz. alloy. In 1544, he still further debased the standard both of gold and silver. Gold was reduced to

20 carats fine and 4 alloy, and silver was debased to 4 oz. fine and 8 of alloy. The coins continued of the same nominal weight, but in consequence of this debasement, the pound weight of gold was worth £36, and the pound weight of silver 144 shillings. The issuing of these debased coins gave rise to much distress and public complaint.

121. The baseness of the coinage at the accession of Edward VI., (1546), called forth many epigrams, but the indentures for the new coinage in the first year of his reign provided that it should be of the same base quality which his father had reduced it to. In 1549, the quality of the coins was somewhat improved, but they were further reduced in weight. The pound of gold of 22 carats fine and 2 carats alloy, was to be coined into 34 pounds by tale; the pound weight of silver of 6 carats fine and 6 alloy, was to be coined into 72 shillings. The shameful state of the coinage was strongly animadverted upon by the straightforward preacher Latimer, which gave his enemies excuse to charge him with disloyalty, which he ingeniously turned off by showing that the prophet Isaiah had denounced the bad silver of Jerusalem. He said in one sermon,—“I chaunced in my last sermon to speake a mery word of the new shillyng (to refresh my auditors), how I was lyke to put away my new shillyng for an olde groat. I was herein noted to speake seditiously. Yet I can comfort myself in one thing, that I am not alone, and that I have a fellow—a companion of sedition, and wot ye who is my fellow? Esay, the prophet. I speake but of a little preaty shillyng, but he speaketh to Hierusalem after an other sort, and was so bold as to meddle with their coins. Thou proud, thou couetous, thou hantie citie of Hierusalem! *Argentum tuum versum est in scoriam*. Thy silver is turned into, what? into testoons? *Scoriam*, into dross. Ah! seditious wretch, what had he to do with the mint? Why should not he have left that matter to some master of policie to reprove? Thy silver is drosse, it is not fine, it is counterfeit; thy silver is turned, thou haddest good silver. What pertained that to Esay? Mary, he espied a peece of diuinitie in that polysie, he threateneth them with God's vengeance for it * * * He imputeth it to them as a great crime. He may be called a master of sedition indeed. Was not this a seditious harlot to tell them this to their beards? to their face?”

In 1550, the old standard of gold 23 carats 3½ grains fine, and half a grain alloy was restored, and a pound weight of this gold was coined into £28 16s.

122. At last the evils of the corrupt and base state of the coinage became intolerable. In 1551, it was solemnly determined to have a great reform of the coinage, and to bring it back to its old standard. On the 30th of April, a proclamation was issued, stating that king Henry VIII. had on account of his wars, debased the coins, and had set forth to be current amongst his subjects testoons at twelve pence, and groats equally base at four pence; and that his present majesty perceiving that such coins were, by reason of their baseness, counterfeited, both abroad and at home, had caused other coins, denominated likewise shillings and groats, to be made of the value of twelve pence, and four pence; and it having appeared that those shillings and groats were also

counterfeited, by persons who used such counterfeits in buying up victuals and merchandize, giving they cared not what for the same to the great enhancement of the price of all things. His majesty, therefore, sensible of the great benefits that would arise from bringing back the coin to its old standard, had determined to reform the same. Preparatory to this, it was ordered that after the last day of August, the current coins should only pass for their worth in silver, shillings were reduced to nine pence, and groats to three pence. The natural consequence immediately followed, prices everywhere rose. A most extraordinary plan was adopted. In order to prepare the way for an amendment of the coinage, one still more debased was issued, containing only three ounces of silver to nine of alloy, in order that the debts of the realm might be paid, and £160,000 gained to make the reformed coinage. The people were in the utmost state of confusion at this meddling with the money. No one knew where the debasement would stop. The prices of all things rose excessively. To put a stop to this, a severe proclamation was issued, forbidding any one to invent, speak, mutter, or devise any manner of tale, news, or report, either touching the abusing of the said coin, or in disparagement of the king, or the proceedings of his council, on pain of fine, imprisonment, and mutilation. Nevertheless within a month, the value of the coin was still further diminished. The testoon was cried down from ninepence to sixpence, and the groat from threepence to twopence. The writers of the day notice the terrible sufferings of the poor from these repeated tamperings with the coinage. Cowper, afterwards Bishop of Winchester, says, "the richer sort partly by friendship, understanding the King beforehand, did put away that kind of money, partly knowing the baseness of the coin, kept in store none but good gold and silver, that could not bring any loss." Thus we see the *fact* noticed, that in a depreciated state of the currency, all the good coin vanishes from circulation, and is hoarded or exported, although the time was not yet come when men could discover that it was a great and fundamental law of the currency. The derangement of the usual relations between the coin and bullion was so great that bullion rose to 12s. the ounce, and the old angels which were coined to represent 6s. 8d., rose to 21s. The evident meaning of which was that there was only an ounce of silver in 12s. of coin, and that the silver coinage was so debased that 20s. of the debased money was only equal to 6s. 8d. of the good. These are the identical phenomena which afterwards excited so much controversy in the reign of William III., and in the great currency controversies of 1811, and subsequent years, when the Bank note exhibited exactly the same phenomena of depreciation as the debased metallic currency. The relative values of the precious metals were so little understood, that while silver was rated at 12s. the ounce, gold was only valued at 60s., or five times the value of pure silver, and at one time it was further reduced to 48s.

The council of Edward VI. was so thoroughly impressed with the frightful disorders of this monetary anarchy, that the measures for the complete reformation of the coinage were nearly completed, when the sickly boy died. Mary

found on her accession (1553), the coinage nearly reformed, and she resolved to take advantage of the popularity attending the reformation, at the same time intending to debase it. She issued a proclamation setting forth her intention to coin the money of silver of the standard fineness, but by her indentures with the mint master, the silver was reduced to eleven ounces fine, that is one dwt. less than the last of Edward VI., and two dwts. less than sterling. During this short reign, the usual proclamations were issued against importing counterfeit and base coin from abroad, and exporting good coin, and the usual complaints were made of persons, both natives and foreigners, buying up the good coins at higher rates than they were rated at, and melting them for exportation.

123. No sooner had Elizabeth mounted the throne (1558), than she turned her attention to complete the great reform of the coinage, begun by her brother Edward VI., being moved thereto by the illustrious Gresham, who has the great merit of being the first, as far as we can discover, who discerned the great fundamental law of the currency, that good and bad money cannot circulate together. The facts had been repeatedly observed before, but no one, that we are aware of, had discovered their necessary relation, before Sir Thomas Gresham. This eminent merchant was presented to the Queen, three days after her accession, by Cecil, and she immediately employed him to negotiate a loan, which was necessary in the exhausted state of the treasury left by Mary. Before leaving for Flanders, he wrote a letter of advice to the Queen, explaining how, among other things, all the fine money had disappeared from circulation. The cause of this he attributed to the *debasement of the coinage by Henry VIII.* Thus he seems to have been the first to declare that the issue of the base money was the *cause* of the disappearance of the good. Hence we may justly call it *Gresham's Law of the Currency*. He earnestly recommended the Queen to bring back the currency to its former purity, and in accordance with his advice, she soon set about it in earnest.

124. On the 27th September, 1560, a proclamation was issued, stating the evils of the debased money; that the estimation England had been held in was vanished away—that great quantities of forged and counterfeit coins were imported, and all the good old silver and gold ones were exported, and the prices of all things greatly raised. She therefore reduced the value of these base coins as nearly as possible to their true worth, the base penny to three farthings, and the others in proportion. Some testoons were however so grossly adulterated, as to be unfit for circulation at all, they were allowed to be current for four months only, at two-pence farthing. For relief of the holders of this base coinage, they were allowed to exchange it at the mint, during the space of four months, for good new money at that rate. This sudden reduction of the value of the money in their possession made many complaints among the people, and to remove these, another proclamation was issued stating the reasons for it. It is said that in former days England was held in high honour among nations, because she tolerated no money but gold and silver, whereas all other countries in Christendom, Germany, France, Spain, Flanders, Scotland, had

issued great quantities of base money in recent times, and had thereby brought on themselves much infamy and reproach. That England was now exposed to similar obloquy, and that the Queen was determined to remove this reproach, and as it would be a great burden and expense to herself, every good subject ought to be content, though it brought some loss upon himself. That in consequence of the base state of the coinage, vast quantities of counterfeit coin had been imported from foreign countries, and had been uttered at the rate of twelve-pence the testoon, when it was not in reality worth two-pence. That although great quantities of gold and silver had been coined in the latter end of the reign of Edward VI., as well as in the time of Mary, and even in her own reign, yet no part of it was seen commonly current, but part of it was exported, and part of it hoarded. That although the harvests had been plentiful, and there had been no such scarcity as that of former times, in which many hundreds and thousands of people had died, yet the prices of all sorts of commodities and food had risen immeasurably, and were daily rising, for which no remedy could be devised except causing the base money to be current at its true value. For every man of the least understanding, by one means or other, knew that a testoon was not worth sixpence, nor the piece of two-pence worth so much, and therefore no man would give the thing which was, and even had been worth sixpence, for a testoon, but would rather require two testoons; and so a thing being worth sixpence, was bought and sold either for two testoons, or one and a half, which was in reckoning twelve, and ninepence, and now every testoon being brought to the just value, it must needs follow that one shall buy of another hereafter for fourpence half-penny, which was wont to cost sixpence.

125. In future, nothing but fine money was to be issued, whence all poor persons who lived by daily wages, all poor gentlemen who lived upon pensions and stipends, all soldiers, and serving men, should have their payments made in good and fine money, and thus buy more necessities than they could before, by at least a fourth part.

By the reform also of the coinage, the foreign exchanges which had been much depressed, would be brought to their proper level, and foreign commodities reduced in price.

For these and other reasons every man ought to thank Almighty God that he had lived to see the honor of his country restored, silver in the place of copper, the prices of things lowered, and all people able to live more comfortably on their wages, and free from being robbed by forgers.

126. By the mint indentures of the 8th of November, of the same year, it was provided that the gold and silver should be of the old standard. The pound weight of gold, 23 carats $3\frac{1}{4}$ grains fine, was to be coined into 36 pounds by tale, a pound weight of crown gold, 22 carats fine, was to be coined into 33 pounds by tale. And a pound weight of silver of the old sterling standard was to be coined into 3 pounds, or 60s. by tale.

A medal was struck to commemorate the event. On the obverse was the Queen's bust, with the inscription *ET ANGLIÆ GLORIA*, and on the reverse, Justice seated, bearing the sword and balance, with the legend *ÆNE CONSTITUTA ÆM NUMARIA*.

PART V. VOL. I.

This great reform gave much public satisfaction, and was greatly commended by contemporary historians. Repeated proclamations were issued against the base monies, which still circulated, and in order to encourage people to bring them to the mint, it was spread abroad that something more than their true value would be allowed for them, and in order to accelerate the new coinage which the Queen had so much at heart, she went publicly to the mint, and coined certain pieces of gold herself, which she gave away to those about her. For the public convenience, coins of a small denomination were struck of sterling silver. It was further ordered that no foreign coins, except the French and Flemish crowns, should be any longer current in the kingdom, but every one who had foreign coins of gold or silver might bring them to the mint, and receive in exchange their full value in the coin of the realm.

127. In 1560, the mill and screw were introduced in the mint by a Frenchman, who was allowed to coin milled money in the tower.

128. Notwithstanding the great reform in the coinage, the old mischiefs began to re-appear, and many proclamations were issued against clippers and counterfeits. Great complaints also arose of the scarcity of money in 1569. The Queen borrowed money of her subjects at 6 per cent., to supply the general want. About this time, too, the want of small change was felt so strongly that numbers of tradesmen were obliged to issue private tokens for half-pence and farthings. They were made of lead, tin, latten, and even leather. The Queen was much annoyed at this, and sought to remedy it. But it was represented to her that if the farthings were coined of silver, there would only be two grains in them, which would be a coin too small for general use, and if they were increased by alloy to six grains, which was the smallest that it would be convenient to coin, they would be so easily counterfeited, as if they were copper. But if they were made of copper, they might faithfully be the weight of one penny-weight, and could not be counterfeited. The Queen approved the suggestion, and a proclamation was drawn up to make them current. But it was never issued, and the coins were not struck. But the Queen granted a license to the city of Bristol to coin copper tokens, which were to be current for small change in the city and 10 miles round.

129. In 1587, the old evils of clipping were strongly felt; a proclamation warned people against receiving or passing any clipped or counterfeit money, and all to whom any such was offered were authorized to refuse them, and to bore them, and cut them into pieces, and give them back to the owner. And in order to enable any one to judge of the proper weight of the coins, the warden of the mint was ordered to prepare balances exhibiting the true weight of each coin, and sell them to the public at reasonable prices. And every city, borough, and town corporate was ordered to have at least one of such balances, to settle disputes among the subjects. The "remedy," or loss of weight, allowed on the different coins, was for the piece of 30s. not more than $4\frac{1}{2}$ grains; for that of 20s., 3 grains; for that of 15s., $2\frac{1}{2}$ grains; for that of 10s., 2 grains; for 5s., 1 grain; and for 2s. 6d., $\frac{1}{2}$ grain. The prices of the balances were also regulated.

DD

130. In 1593, the pound weight of crown gold was ordered to be coined into 33 pounds by tale. In 1601, the weight of the coinage, both gold and silver, was diminished. The pound weight of crown gold was coined into £33 10s. by tale; and the pound weight of silver into £3 2s. by tale.

131. James VI. (1603) issued a proclamation making the money of Scotland current in England at its proportionate value. The price of six pounds was found to be equivalent to, and made current at, 10s., and the mark for 13½d. In the same year he continued the bad practice of diminishing the weight of the coin. The pound weight of crown gold was ordered to be coined into £37 4s. by tale. The silver to be as in the last coinage of the Queen.

132. In the same year he determined to issue a uniform coinage for Great Britain. New coins of gold and silver were struck,—the unit of gold of the value of 20s. sterling, others of the value of 10s., 5s., and 4s. A new silver coinage was also struck, and tables prepared shewing the relative weights of English and Scotch money. This was done to facilitate the union of the kingdoms, which, however, he was unable to effect.

133. It was soon afterwards found that the gold coin was underrated in comparison to the market price of gold and silver in foreign countries. It was, therefore, exported in large quantities. To remedy this, the unit was raised in value to 22s., and the other coins in proportion. In order to induce merchants to import bullion, the king gave notice that foreign coins should be bought at the mint at fixed rates.

134. In 1613, an attempt was made to put down the circulation of lead tokens, which were required in the dearth of small change. The extent to which these were issued may be imagined, when Sir Robert Cotton says, that in London alone there were above 3,000 tradesmen, who issued, on an average, five pounds a piece of leaden farthings. And the number throughout the country was proportional to that in London. A proclamation acknowledged the necessity for tolerating such small money in times past, but it said that it had also its inconveniences, as the issuers of them often died or removed, and those who held these tokens lost thereby. The king, therefore, covenanted with Lord Exeter, to coin a sufficient quantity of copper farthings for the use of those who liked to receive them. No one, however, was to be compelled to take them against his will. The issue of leaden tokens was then forbidden. The new farthings were very unpopular, and were got into circulation with great difficulty. Throughout the reign the usual proclamations continued to be issued against malpractices and exportation of the coinage, but with the usual intility.

135. Charles I. (1625) found the same complaints of the scarcity of money, rife on his accession, as had been common for centuries. A commission was directed to Lord Mandevill, to inquire into the causes of the great scarcity of money, and the means by which coin and bullion might be brought into the country more plentifully, and also be preserved from exportation. They were to inquire what native commodities of the kingdom were of that necessary usefulness

to neighbouring nations, as that they might fitly return home a proportion of coin and bullion for a supply of treasure. The financiers of that and all preceding ages were unfortunately ignorant that the evils they complained of, were caused by the condition of the currency itself, and until that was amended, everything else was futile. A patent was granted to the Duchess of Richmond and Sir Francis Crane for 17 years, to have the exclusive right of coining farthing tokens of copper, and the issue of all private ones was forbidden.

136. In 1627, strong complaints were made that the goldsmiths culled out all the more weighty coins for the purpose of melting and exporting them. This was caused by the liberty which certain goldsmiths had usurped of acting as exchangers, contrary to law. To remedy this, the Earl of Holland was appointed sole exchanger, and every one else forbidden to buy or sell bullion or coin, under heavy penalties. A proclamation was issued forbidding the exportation of the coin; commanding that no goldsmith, finer, &c., should melt, &c., any coins, or cull for the purpose of melting, exporting, or altering the coins; and that no one should take for exchange more than the prices allowed at the mint in exchange. Every goldsmith upon a sale, was to give a ticket, with his name and mark on it, to his customer, stating the value in bullion, and the value of the workmanship separately, so that the buyer might know what to demand for the same at the King's mint or exchange. All money deficient in weight beyond the quantity already allowed, was to be decried and rendered uncurrent, and if any was offered in payment, the person to whom it was offered might bore it, and return it to the offerer. All gold and silver plate were ordered to be of the fineness of the money of England.

137. In 1632, a change had been going on in the relative values of gold and silver, and gold became so plentiful, and silver so scarce, that drovers and farmers who brought their cattle to Smithfield, commonly made their bargain to be paid in silver, and not in gold. Silver rose to a premium of two-pence in the pound, to get twenty shillings in silver for the exchange of a twenty shilling piece of full weight. People in London and Westminster commonly carried gold scales about with them to weigh gold on all occasions. Repeated proclamations were issued against the quantities of counterfeit farthing tokens in circulation, and none were allowed to pass except those issued by the late and present kings. In 1637, informations were exhibited in the Star-chamber against twelve persons for melting and exporting the coin, and culling out the heaviest coins, and selling them above the mint price. They were fined or imprisoned. In 1640, the exportation of the gold coin was strongly complained of in Parliament. In the same year, the king suddenly seized the merchants' money and bullion in the mint, which they used as a species of bank of deposit. After some difficulty they got it back, but the credit of the mint was gone, and they were obliged to keep it at home, until they began to entrust it to the goldsmiths, who thus became the first private bankers in England.

138. The king was now so distressed for money that it was solemnly debated at the council to

coin £300,000 of base money. After several days' debate the plan was rejected, chiefly in consequence of the able and powerful opposition of Sir Thomas Rowe, whose speech is given at length in Rushworth, and well deserves reading. In December, the Commons presented a remonstrance to the king, strongly upbraiding him for the violation of public faith, and private interest, in seizing the merchants' bullion and cash in the Tower, and for the abominable project of the brass money, by which the whole kingdom was to be robbed at once.

139. It may be stated to the honor both of the King and the Parliament, that neither of them debased the coins during the unhappy civil war. The Parliament carefully used the royal dies in their coins, so that they should freely pass current throughout the kingdom, and the King set up a mint in New Inn Hall, at Oxford. The workmanship of the pieces he caused to be struck was of the rudest description, but the purity of the standard was maintained.

140. The Parliament of the Commonwealth, 1649, ordered gold coins of the value of 20s., and of the weight of 5 dwts. 20 grains 10 mites, and pieces of 10s. and 5s. of proportionate weight, to be struck, and silver pieces of 5s., of the weight of 19 dwts. 8 grains 10 mites 8 droits., and smaller coins in similar proportions, but all of the standard fineness, to be struck, and current throughout the Commonwealth. Cromwell issued a small coinage of the same weight and denominations as that of the Commonwealth, but it never became generally current to any extent.

141. Charles II. (1660) found it necessary to issue the usual proclamations against clipping, melting, and exporting the coin. On the 10th of June, 1661, it was said that there was a great scarcity of money, occasioned by the illegal and promiscuous buying and selling all sorts of gold and silver at higher rates than ever his Majesty, or any of his royal progenitors, had allowed at their mints. All the old statutes against such practices were revived, and ordered to be strictly enforced. Notwithstanding all these proclamations, it was observed that the gold money was exported in such quantities, as to be far more common in foreign countries than in England. A consultation of the privy council was held to consider this evil, and having called in the officers of the mint and the most experienced goldsmiths, they came to the conclusion that it arose from the great profits made by the merchants by exporting gold coin, which bore a higher value compared to silver abroad than it did at home. To cure this, it was determined to raise the value of the gold coin at home, to correspond with its market price abroad. The unit which had been struck to represent 20s., and had been raised to 22s., was now further raised to 23s. 6d., and the other gold coins in proportion. It was also repeated that all pieces below the remedy allowed, should be refused in payment. The money struck during the time of the Commonwealth was called in, and exchanged for new money, according to its weight.

The year 1663 is remarkable for the first issue of the famous guineas. They were made of the gold imported by the African Company. As an encouragement to bring over gold to be coined, the Company were allowed by charter to have their stamp of an elephant on the coins made of

the guinea gold. They were struck to represent 20s., and to take the place of the units of James I., Charles I., and the Commonwealth, which were now called broad-pieces.

142. An important change now took place in the laws relating to the export of bullion, which shewed some dawning of the truths of Political Economy. The utter uselessness of the laws against exporting bullion, began at last to be perceived by statesmen. The Act, Statute 1663, c. 7, 12, says, "Forasmuch as several considerable and advantageous trades cannot be conveniently driven and carried on without the species of money and bullion, and that it is found by experience that they are carried in greatest abundance (as to a common market) to such places as give free liberty for exporting the same, and the better to keep in and increase the current coin of this kingdom," and it was then permitted to anyone to import and export all foreign coin and bullion with absolute freedom. What a pity it was that the Economical light thus admitted did not still further enlighten the legislature as to the mischief of interfering with other branches of trade.

143. In 1666, another act for the encouragement of coinage was passed, which is still in force. By this it was declared that all persons might bring bullion to the mint, and receive the full weight of it in current coin, without any deduction whatever. Since this time the whole expense of the mint has been borne by the public. The policy of this measure has given rise to much difference of opinion. (SEIGNORAGE.)

144. In 1670, the pound weight of crown gold was ordered to be coined into £44 10s. by tale; viz., into pieces to be current at 10s., 20s., 40s., and £5 each; and the pound weight of silver of the old standard into £3 2s. by tale. The 20s. gold pieces or pounds were called guineas, and their weight continued the same as long as they were struck.

In this reign the old national coin of England, the silver penny, ceased to be struck.

145. From some fatality they seemed to be always incapable at the English mint of ascertaining the true value of gold and silver according to their market rates. The guinea was soon found to be underrated, and accordingly the old practices of clipping, melting, and exporting were soon in full operation, and the scarcity of money was complained of in Parliament. Towards the end of this reign the coinage was much deteriorated, and all these bad practices flourished still more during the short reign of James II. (1684-1688.) That king had no time during his troubles to debase the English coinage, but his debasement of the Irish coinage is mentioned below. (COINAGE OF IRELAND.)

146. William III. and Mary (1688) continued the coinage in all respects as during the last reign. In April, 1690, the great scarcity of silver coins occasioned great public inconvenience. The goldsmiths complained to the House of Commons, that they had ascertained that immense quantities of silver bullion and dollars had been exported. That many Jews and merchants had recently bought up vast quantities of silver to carry out of the kingdom, and had given three half-pence an ounce above its regulated value. That this had encouraged the melting down of much plate

and milled money, whereby for six months past no bullion had been brought to the mint to be coined. The House appointed a committee who verified these allegations. It was shown that the profit of melting down the milled money for exportation was above £25 per £1,000, and that the mint price of silver was 5s. 2d. per ounce, but it was generally sold for 5s. 3½d. The House in consequence passed one of their useless laws against exporting bullion.

147. The state of the currency now became every day more disgraceful. Quantities of base and counterfeit coin were thrown into circulation. The House of Commons addressed the king to abolish the right of private coinages of half-pence and farthings. The current coins had been for many years clipped and adulterated, which in 1694 reached such a height, that the silver coins current had lost nearly half their value, while a great part of the current money was only iron, brass, or copper plated.

148. As this state of matters gave rise to the first great currency debate of modern times, and brought about a great monetary crisis, we may dwell upon it rather fully.

During 1694, the silver coinage became worse daily, and by the end of the year, guineas which had originally been coined to represent 20s., gradually rose, till they reached 30s. The exchange with Holland fell 25 per cent., and it would have fallen still lower, only it was shown that the real exchange was in favor of England. The exchange with Ireland fell so much that £70 there was worth £100 in England.

149. The evils of clipping the coin reached so great a height at the end of 1694, that Mr. Fleetwood, the Chaplain-in-ordinary to the king and queen, being selected to preach before the Lord Mayor and Aldermen on the 16th December, 1694, made it the subject of his sermon on the text, Gen. XXIII. 16. In an admirable sermon, or rather politico-economical discourse, he denounced the fraud and wickedness of clipping and debasing the coinage. He said (p. 19), that the money was clipped down nearly one-half. He shewed that he understood the subject a great deal better than many men a century later. He shewed that if the money generally were clipped, all the good and weighty money that remained must be exported. "The merchant that exports more goods from home than he imports from abroad, must unavoidably discharge the overbalance with good money; this he can never do with clipped, for it is not *Cæsar's face and titles*, but *weight and goodness* that procure credit. And if a foreigner import more of his country goods than he carries away of ours, the overbalance must be paid in weighty money, for the clipped will not go abroad. Now if the exportation of our weighty money (which is only now the milled) be a mischief to the nation, we see it is occasioned chiefly by the clipping."

150. The disgraceful state of the coinage could no longer be overlooked by Parliament. On the 8th of January, 1695, a committee was appointed to consider the subject. At this time, says the Parliamentary History, Vol. V. p. 955. "The difficulty lay so heavy upon the government, that a stop was almost put to trade and taxes. The current silver coin had for many years begun to be clipped and adulterated; and the mischief of

late had been so secretly carried on by a combination of all people concerned in the receipt of money, and so industriously promoted by the enemies of the government, that all pieces were so far diminished and debased, as that five pounds in silver specie was scarce worth 40s., according to the standard; besides an infinite deal of iron, brass, or copper washed over or plated." The committee recommended that the money should be recoined into milled money. It estimated the expence at one million. That the new money should be of the same weight and fineness as the old. That the crown piece should be current at 5s. 6d. That various penalties should be imposed for offences against the coins. An Act was passed, Statute 1695, c. 17, to prevent counterfeiting and clipping the coin of the kingdom. This statute averred that it was notorious that the current coin had been greatly diminished by clipping, rounding, filing, and melting, and that many false and counterfeit coins had been clipped, for the better disguising thereof, and that these practices had been much occasioned by those who drove a trade of exchanging broad money for clipped money, and other arts and devices. It, therefore, prohibited any person from exchanging, lending, selling, borrowing, buying, receiving, or paying any broad or unclipped silver money for more in tale, benefit, profit, or advantage than the same was coined for, and ought by law to pass for, under a penalty of 10s. for every 20s. so illegally trafficked with. It also enacted that whoever should buy or sell, or knowingly have in his possession, any clippings or filings of the coin, should forfeit them, as well as a penalty of £500, and be branded on the right cheek with a hot iron. It forbade any one but a trading goldsmith, or refiner of silver, to buy or sell bullion, under pain of imprisonment, and enacted numerous other vexatious penalties and regulations respecting the export of bullion. All these absurd cruelties were wholly ineffectual, and while multitudes of miserable wretches were dangling on the gibbets, clipping and counterfeiting were as rife as ever. Guineas which had originally been coined to be equal to 20s., had progressively risen as the silver got worse, till at this time they were current at 30s. of the base trash, which passed by the name of silver coin.

151. It is of very great importance in the theory of the currency to ascertain the exact period when the silver coin was so debased and corrupted, that guineas passed at 30s. We shall, therefore, make some extracts from contemporary pamphlets. It says in one (*Some remarks on a Report containing an Essay for the Amendment of the silver Coins*, by Mr. W. Lowndes. London, 1695.), after speaking of the gradual deterioration of the coinage, p. 6,—"And so by degrees as the silver coin was diminished and debased in itself, so it fell in the estimation of the people, and in proportion gold advanced, and also bullion, (that is, not in itself, but in proportion to the bad money,) not that bullion became worth 6s. 5d. an ounce, or gold 30s. a guinea in good money, that is, in weighty standard money, but in clipped and counterfeit money, whereof 6s. 5d. was not of the true or esteemed value of 5s. 2d. And as we ourselves grew sensible of the want of value in money that passed, so did Foreigners likewise, and the foreign exchanges soon altered accordingly, so that it cannot

properly be said that bullion is advanced much, or that gold is advanced much, or commodities are advanced much, but that the money that is exchanged for them is of much less value than it was, and the new coining of our money will not, as I apprehend, alter the value of bullion, gold, &c., but it will bring silver in coin to its due value."

152. After enforcing and illustrating these views at considerable length, he observes that Mr. Lowndes hoped that the exchange with Holland, which was then 25 per cent. against England, might be prevented falling lower; and says, p. 16,—"If guineas continue current at 30s. a piece, the exchange will continue about the rate it does, except the common and ordinary variation which many sudden drafts and remittances occasion, and if the silver coin is redressed, guineas will fall."

153. Also in *A letter from an English Merchant at Amsterdam to his friend in London*, 1695, it says, p. 2.—"The occasion of the advance of gold and guineas, I observed to you, was from the badness of your silver coin, that is current amongst you, and from whence that mischief had its rise, that as I hear a hundred pounds in silver weighs now generally but 14 or 18 lbs. instead of 32 lbs., which it ought to weigh, and this you have suffered insensibly to steal upon you, growing every day and from one year to another, clipping it by degrees three or four times over, till at last it came to this that it can hardly be clipped any more, and this evil was carried on in city and country by all men, and encouraged by some goldsmiths, refiners, and others. This brought upon you the rise of gold and guineas." He also says the exchanges were 20 to 25 per cent. against England. He estimates the loss upon a new coinage at 8s. 6d. per guinea, and points out the futility of the juggle of altering the standard. "You have an instance with Ireland very plain, £100 in England used to be worth £110 to £115 in Ireland, now they write me thence that they give but £80 to £83 in Ireland for £100 in England."

"It is reported here, that you are upon a project of lessening the weight of your money by making it 20 per cent., or anything what you will, less in weight than you formerly coined it, and to stamp 4s. and call it, and make it pass for 5s. Surely this fallacy can never pass upon Englishmen that have seen and known the folly of such devices in Spain and Portugal."

154. In February, 1696, several petitions were presented to the House of Commons, (*Commons Journals*. Vol. XI. p. 445.) The graziers, butchers, and others connected with Smithfield Market, said that £40,000 a week passed through their hands for cattle, which for almost twelve months past had been paid in guineas at 30s. a piece, for want of current silver. There are besides, abundance of pamphlets in existence which prove that guineas were commonly current for 30s. in the spring of 1695.

155. The frightful disorder of the currency may be judged of by the following facts. In the months of May, June, and July, 1695, 572 bags of silver coin, each of £100, were brought into the Exchequer, whose aggregate weight, according to the standard ought to have been 18,451 lbs., 6 oz., 16 dwts., 8 grs.: their actual weight was 9,480 lbs., 11 oz., 5 dwts., making a deficiency of

8,970 lbs., 7 oz., 11 dwts., 8 grs., shewing a deficiency in the weight of the current coins in the ratio of 10 to 22. One writer says, (*An Essay for regulating of the coin*. By A. V. Sept. 2, 1695.)

—"Upon trial, I have found that 5s. of milled money hath weighed 8s. of the present current money, and 3s. of the 8s. was not clipped, only worn. Again, I have found 10s. in milled money to weigh 21s. of the clipped money. Again, 20s. of milled money to weigh 43s. of our now current money."

"I have gone to several goldsmiths in London, and have got them to take out of their counters a bag of £100 as came to hand, which upon trial, I have found at one place to weigh,

	Oz.	Dwt.	Gr.
A bag of £100	230	13	6
Another place £100 Weighed ...	222	0	15
Another place	198	17	0
Another place	190	0	0
Another place	182	8	0
Another place	174	11	20

1,198 5 17

"The £600 weighing in all 1,198 oz., 5 dwts., 17 grs., and is no more than what £310 in milled money will weigh."

"I am informed the money paid into the Exchequer doth weigh from 15 (and seldom the £100 reacheth) to 20 lbs. weight. So that the very best brought in there, doth not weigh two thirds of what it ought to do, and the money paid into the Exchequer is supposed, a great part of it, to come from the country."

"But as it's believed that the money in the country is generally not the one half so bad as it's in and near London, I have procured an account to be sent me from the following cities, from whence I am informed that £100 doth weigh on trial of two bags in each place, to be viz:—

	Oz.	Dwt.	Gr.
In the City of Bristol, one bag of £100 weighed	240	0	0
Another weighed	227	15	0
In the City of Cambridge, a bag of £100 weighed	208	5	10
Another weighed	211	0	19
In the City of Exon, one bag of £100 weighed	180	7	0
Another weighed	192	8	0
In the City of Oxford, £100 in half-crowns weighed	218	10	0
£100 in shillings	198	0	15
	1,669	1	20

The £800 weighing not more than £431 15s. of milled money will weigh, and but a very small difference between the weight of the money in London and the country."

156. This disgraceful state of the money gave rise to the greatest public confusion and distress, and a warm controversy arose whether the new money which should be coined, should be of the old standard in weight, fineness, and denomination, or whether it should be depreciated, or raised in value, as it was absurdly called. This controversy was keenly disputed then, and we may pay some considerable attention to it, because it was revived under another form 116 years later, when the notes of the Bank of England were depreciated, and a strong party maintained that the standard of the coin should be depreciated to the level of the depreciated notes.

157. Mr. William Lowndes, the Secretary to the Treasury, was ordered by them to make a Report on the subject of the coin. This he did in *A Report containing an Essay for the Amendment of the Silver Coins*. London, 1695. In this he enters into a long, and at that time, valuable investigation of the history of the coinage, and its successive depreciations in weight and fineness. After giving the details of every mint indenture for four hundred years, he says, p. 56, "By the careful observing of which deduction here made, from the Indenture of the Mint for above 400 years past (many of which are yet extant, and have been seen and examined by me), it doth evidently appear, that it has been a policy constantly practised in the mints in England (the like having indeed been done in all foreign mints belonging to other governments), to raise the value of the coin in its extrinsic denomination from time to time, as any exigence or occasion required; and more especially to encourage the bringing in of bullion into the realm to be coined, (though sometimes when the desired end was obtained, the value has been suffered to fall again,) so that in the whole number of years from the 28th Edward I., until this time, the extrinsic value or denomination of the silver is raised in about a triple proportion." Here we cannot fail to observe the utter confusion of idea that Mr. Lowndes, and too many after his time, labor under. They manifestly suppose that by raising the *name* of the coin, they raise its *value*. The extrinsic value of the coin can by no possibility mean anything else but the quantity of things it will *exchange for*. And to call the quantity of things it will exchange for its *denomination*, is a most pitiable confusion of idea. Mr. Lowndes then says, "The which being premised, and every project for debasing the money (by the reason before given) being rejected as dangerous, dishonourable, and needless. It remains that our nation in its present exigence, may avail itself, by raising the value of its coins, and this may be effected either by making the respective pieces called crowns, half-crowns, shillings, and to be lesser in weight, or by continuing the same weight or bigness, which is at present, in the unclipped moneys, and ordaining at the same time that every such piece shall be current at a higher price in tale.

"But before I proceed to give my opinion on this subject, it seems necessary for me to assert and prove an hypothesis, which is this, namely, *That making the pieces less, or ordaining the respective pieces (of the present weight) to be current at a higher rate, may equally raise the Value of Silver in our Coins.*"

158. Mr. Lowndes then enters into an argument to prove that sixty-pence are equal to seventy-five-pence—a wild goose chase in which we decline to follow him.

159. His proposal was then, that all the existing unclipped silver money should be raised in denomination to 6s. 3d. the crown, and other coins in proportion, so that the shilling would pass for fifteen pence instead of twelve. That new coins should be struck at the increased denominations. These coins he proposed to christen by new names. The reasons he alleges for this proceeding are—
"1. The value of the silver in the coin ought to be raised to the foot of 6s. 3d. in every crown,

because the price of standard silver in bullion is risen (from divers necessary and unnecessary causes, producing at length a great scarcity thereof in England,) to 6s. 5d. an ounce. This reason (which I humbly conceive will appear irrefragable) is grounded chiefly upon a truth so apparent, that it may well be compared to an Axiom, even in mathematical reasoning, to wit,—That whensoever the extrinsic value of silver in the coin hath been, or shall be, less than the price of silver in bullion, the coin hath been, and will be melted down."

160. He then enters into some objections against this proposal, and says, p. 76—"That everything having any value or worth whatsoever, when it becomes scarce, grows dear, or (which is the same thing) it riseth in price, and consequently it will serve to pay more debts, or it will buy greater quantities of other goods of value, or in anything else it will go further than it did before. That silver in England being grown scarce as aforesaid, is consequently grown dearer. That it is risen in price from 5s. 2d. to 6s. 5d. an ounce; and by daily experience 19 3-10 dwts. in sterling silver (equal to the weight of a crown piece) in England, doth and will purchase more coined money than 5s. by tale, (though the latter be delivered *bona fide* in unclipped shillings, or in a good bill,) and consequently doth and will purchase and acquire more goods, or necessaries, or pay more debts in England, or (being delivered here) it fetches more money in any foreign parts by way of exchange, than 5s. by tale, or the sixth part of a guinea by tale, or goods to the value of 5s. in tale only, do or can fetch, purchase, or acquire. That this advanced price of the silver has been growing for some time, and is originally caused by the balance, excess, or difference above mentioned, which naturally and rationally produces such an effect. * * * That the raising the value of the silver in our coins to make it equal to silver in mass, can in no sense be understood to be a cause of making silver scarce. That there can never be proposed any just or reasonable foot upon which the coin should be current, save only the very price of the silver thereof, in case it may be molten in the same place where the coins are made current, or an extrinsic denomination very near that price. It being most evident that if the value of the silver in the coins should (by any extrinsic denomination) be raised above the value or market price of the same silver reduced to bullion, the subject would be proportionably injured and defrauded, as they were formerly in the case of the base monies coined by public authority."

161. He then says the value of the silver in the coin ought to be raised, to encourage the bringing of bullion to the mint to be coined. That this had been repeatedly done both in the English and foreign mints. That raising the value of silver in coin would increase the whole species in tale, and thereby make it more commensurate to the need for it for carrying on the common traffic and commerce of the nation, and to answer the payments on the numerous contracts, securities, and other daily occasions, requiring a large supply of money for that purpose.

He says that at that time guineas passed current for 30s.

He then gives some details of the state of the

coinage, by which he shewed that they were diminished by about half their usual weight.

162. Locke had in 1691 published a treatise (Locke) in which he shewed the utter futility of interfering with the rate of interest by law, and combated the idea that was then becoming prevalent, that the value (as it was called) of the coin should be raised, in order to keep it in the country. He showed that the persons who supported such a plan were confounding the *denomination* with the *value*, its name with the purchasing power, and that all such ideas proceeded from a confusion of terms, and would have no real effect. The arguments of Locke, though by no means absolutely novel, had never been put before so luminously and fully. The proposal of Lowndes, coming from a man holding his official position, demanded a prompt notice and exposure. This Locke did, in *Further considerations concerning raising the value of Money*, in which he exposed the fallacy of Lowndes's arguments.—“Raising of coin is but a specious word to deceive the unwary. It only gives the usual denomination of a greater quantity of silver to a less, (v. g. calling four grains of silver a penny to-day, when five grains of silver made a penny yesterday,) but adds no worth, or real value, to the silver coin, to make amends for its want of silver. That is impossible to be done, for it is only the quantity of silver in it, that is, and eternally will be, the measure of its value, and to convince any one of this, I ask whether he that is forced to receive but 320 ounces of silver under the denomination of £100 (for 400 ounces of silver which he lent under the like denomination of £100) will think these 320 ounces of silver, however denominated, worth those 400 ounces he lent? If any one can be supposed so silly, he need but go to the next market, or shop, to be convinced that men value not money by the denomination, but by the quantity of the silver there is in it. One may as rationally hope to lengthen a foot, by dividing it into 15 parts, instead of twelve, and calling them inches, as to increase the value of the silver that is in a shilling, by dividing it into 15 parts instead of twelve, and calling them pence. This is all that is done when a shilling is raised from 12 to 15 pence.”

“Clipping of money is raising without public authority, the same denomination remaining to the piece, that hath now less silver in it than it had before.

“Altering the standard, by coining pieces under the same denomination with less silver in them than they formerly had, is doing the same thing by public authority. The only odds is that, by clipping, the loss is not forced on any one (for nobody is obliged to receive clipped money); by altering the standard, it is.

“Altering the standard by raising the money, will not get to the public, or bring to the mint to be coined, one ounce of silver: but will defraud the king, the church, the universities and hospitals, and of so much of their settled revenue as the money is raised, v. g. twenty per cent. of the money, (as is proposed) be raised one fifth. It will weaken, if not totally destroy the public faith, when all that have trusted the public, and assisted our present necessities, upon acts of Parliament, in the million lottery, bank act, and other loans, shall be defrauded of twenty per cent. of what those acts of Parliament were security for. And

to conclude, this raising our money will defraud all private men of twenty per cent. in all their debts and settled revenues.” * * *

“Nothing I humbly conceive can put a stop to clipping, now it is grown so universal, and men become so skilful in it, but making it unprofitable.

“Nothing can make clipping unprofitable, but making all light money go only for its weight. This stops clipping in a moment, brings out all the milled and weighty money, deprives us not of any part of our clipped money for the use of trade, and brings it orderly, and by degrees, and without force, into the mint to be recoinced.”

163. He then maintains that there can be but one measure of value in a country.—“Silver, therefore, and silver alone, is the measure of commerce. Two metals, as gold and silver, cannot be the measure of commerce both together in any country; because the measure of commerce must be perpetually the same, invariable, and keeping the same proportion of value in all its parts. But so only one metal does, or can do to itself; so silver is to silver, and gold to gold. An ounce of silver is always of equal value to an ounce of silver, and an ounce of gold to an ounce of gold; and two ounces of the one, or the other, of double the value to an ounce of the same. But gold and silver change their value one to another: for supposing them to be in value as 16 to 1 now; perhaps the next month they may be as 15½ or 15¼ to 1. And one may as well make a measure, v. g. a yard, whose parts lengthen and shrink, as a measure of trade of materials that have not always a settled invariable value to one another.

“One metal, therefore, alone can be the money of account and contract, and the measure of commerce in any country. The fittest for this use of all others is silver, for many reasons which need not here be mentioned. It is enough that the world has agreed in it and made it their common money, and, as the Indians rightly call it, measure. All other metals, gold as well as lead, are but commodities.

“Commodities are moveables, valuable by money, the common measure.

“Gold, though not the money of the world, and the measure of commerce, nor fit to be so, yet may, and ought to be coined to ascertain its weight and fineness; and such coin may safely have a price as well as a stamp set upon it by public authority; so the value set be under the market price. For then such pieces coined will be a commodity as passable as silver money, very little varying in their price: as guineas which were coined at the value of 20s., but passed usually for between 21s. or 22s., according to the current rate. But not having so high a value put on them by the law, nobody could be forced to take them to their loss at 21s. 6d., if the price of gold should happen at any time to be cheaper.

“From what has been said, I think it appears—

“1. That silver is that which mankind have agreed on, to take and give in exchange for all commodities as an equivalent.

“2. That it is by the quantity of silver they give, or take, or contract for, that they estimate the value of other things, and satisfy for them; and thus by its quantity, silver becomes the measure of commerce.

“3. Hence it necessarily follows, that a greater quantity of silver has a greater value; a less

quantity of silver has a less value ; and an equal quantity an equal value.

"4. That money differs from uncoined silver only in this, that the quantity of silver in each piece of money, is ascertained by the stamp it bears ; which is set there to be a public voucher of its weight and fineness.

"5. That gold is treasure, as well as silver, because it decays not in keeping, and never sinks much in value.

"6. That gold is fit to be coined, as well as silver ; to ascertain its quantity to those who have a mind to traffic in it ; but not to be joined with silver as a measure of commerce."

164. Locke then examines Lowndes's doctrine that the value (or denomination) of the silver coin should be raised to 6s. 3d. the ounce, because the price of standard silver had risen to 6s. 5d. the ounce.

"This reason seems to me to labor under several mistakes ; as

"1. That standard silver can rise in respect of itself.

"2. That standard bullion is now, or ever was, worth or sold to the traders in it for 6s. 5d. the ounce, of lawful money of England. For if that matter of fact holds not to be so, that an ounce of sterling bullion is worth 6s. 5d. of our milled weighty money, this reason ceases : and our weighty crown pieces ought not to be raised to 6s. 3d., because our light clipped money will not purchase an ounce of standard bullion, under the rate of 6s. 5d. of that light money. And let me add here, nor for that rate neither. If, therefore, the author means here, that an ounce of standard silver is risen to 6s. 5d. of our clipped money, I grant it him, and higher too. But then that has nothing to do with the raising our lawful coin, which remains unclipped ; unless he will say too, that standard bullion is so risen, as to be worth, and actually to sell for, 6s. 5d. the ounce, of our weighty milled money. This I not only deny, but further add, that it is impossible to be so. For 6s. 5d. of milled money weighs an ounce and a quarter near. Can it, therefore, be possible that one ounce of any commodity should be worth an ounce and a quarter of the self same commodity, and of exactly the same goodness ? for so is standard silver to standard silver. Indeed, one has a mark upon it, which the other has not ; but it is a mark that makes it rather more than less valuable, or if the mark, by hindering its exportation, makes it less valuable for that purpose, the melting pot can easily take it off. * * *

"Those who say bullion is risen, I desire to tell me what they mean by risen ? Any commodity, I think, is properly said to be risen, when the same quantity will exchange for a greater quantity of another thing ; but more particularly of that thing, which is the measure of commerce in the country. And thus corn is said to be risen among the English in Virginia, when a bushel of it will sell or exchange for more pounds of tobacco ; among the Indians, when it will sell for more yards of wampompeak, which is their money ; and among the English here, when it will exchange for a greater quantity of silver than it would before. Rising and falling of commodities are always between several commodities of distinct worths. But nobody can say that tobacco (of the same goodness) is risen in respect

of itself. One pound of the same goodness will never exchange for a pound and a quarter of the same goodness. And so it is in silver : an ounce of silver will always be of equal value to an ounce of silver : nor can it ever rise or fall, in respect of itself : an ounce of standard silver can never be worth an ounce and a quarter of standard silver : nor one ounce of uncoined silver exchange for an ounce and a quarter of coined silver : the stamp cannot so much debase its value. Indeed, the stamp, hindering its free exportation, may make the goldsmith (who profits by the return of his money) give one 120th, or one 60th, or perhaps sometimes one 30th more, that is 5s. 2½d., 5s. 3d., or 5s. 4d. the ounce of coined silver for uncoined, when there is need of sending silver beyond seas ; as there always is, when the balance of trade will not supply our wants, and pay our debts there. But much beyond this the goldsmith will never give for bullion, since he can make it out of coined money at a cheaper rate.

"It is said bullion is risen to 6s. 5d. the ounce, i.e., that an ounce of uncoined silver will exchange for an ounce and a quarter of coined silver. If any one can believe this, I will put this short case to him. He has of bullion, or standard, uncoined silver, two round plates, each of an exact size and weight of a crown piece : he has besides, of the same bullion a round plate of the weight and size of a shilling, and another yet less, of an exact weight and size of a three-pence. The two great plates being of equal weight and fineness, I suppose he will allow to be of equal value, and that the two less, joined to either of them make it one-fifth more worth than the other is by itself, they having all three together one-fifth more silver in them. Let us suppose then, one of the greater, and the two less plates to have received the next moment (by miracle, or by the mill, it matters not how) the mark, or stamp, of our crown, our shilling, and our three-pence : can anybody say, that now they have got the stamp of our mint upon them, they are so fallen in value, or the other unstamped piece so risen, that that unstamped piece, which a moment before was worth only one of the other pieces, is now worth them all three ? Which is to say, that an ounce of uncoined silver is worth an ounce and a quarter of coined. This is what men would persuade us, when they say that bullion is raised to 6s. 5d. (of lawful money) the ounce, which I say is utterly impossible. Let us consider this a little further, in another instance. The present milled crown pieces, say they, will not exchange for an ounce of bullion, without the addition of a shilling, and a three-pence of weighty coin added to it. Coin but that crown piece into 6s. 3d., and then they say it will buy an ounce of bullion, or else they give up their reason and measure of raising the money. Do that which is allowed to be equivalent to coining of a present milled crown-piece into 6s. 3d., viz., call it 75 pence, and then also it must by this rule of raising, buy an ounce of bullion. If this be so, this self-same milled crown-piece will, and will not, exchange for an ounce of bullion. Call it sixty-pence, and it will not : the very next moment call it seventy-five-pence, and it will. I am afraid nobody can think change of denomination has such power."

165. Locke then goes through each of Lowndes's

arguments and proposals one by one, and gives them such a refutation as would have delighted the heart of Chillingworth. Among other things, he says,—“It is true what Mr. Lowndes observes here, the importation of gold, and the going of guineas at 30s., has been a great prejudice and loss to the kingdom. But that has been wholly owing to our clipped money, and not at all to our money being coined at 5s. 2d. the ounce; nor is the coining of our money lighter the cure of it. The only remedy for that mischief, as well as a great many others, is the putting an end to the passing of clipped money by tale, as if it were lawful coin.”

166. To Lowndes's doctrine that raising the coin by making it more in tale, would make it more abundant for general use, Locke says—“Just as the boy cut his leather into five quarters (as he called them) to cover his ball, when cut into four quarters it fell short; but after all his pains, as much of his ball lay bare as before; if the quantity of coined silver employed in England, fall short, the arbitrary denomination of a greater number of pence given to it, or, which is all one, to the several coined pieces of it, will not make it commensurate to the size of our trade, or the greatness of our occasions. This is as certain, as that if the quantity of a board, which is to stop a leak of a ship fifteen inches square, be but twelve inches square, it will not be made to do it, by being measured by a foot which is divided into fifteen inches, instead of twelve, and so having a larger tale, or number of inches in denomination given to it.

“This, indeed, would be a convincing reason if sounds would give weight to silver, and the noise of a greater number of pence (less in quantity proportionably as they are more in number) were a larger supply of money. * * *

“The necessity of trust and bartering is one of the many inconveniences springing from the want of money. This inconvenience the multiplying arbitrary denominations will no more supply, nor any ways make our scarcity of coin commensurate to the need there is of it, than if the cloth which was provided for clothing the army, falling short, one should hope to make it commensurate to that need there is of it, by measuring it by a yard one-fifth shorter than the standard, or changing the standard of the yard, and so getting the full denomination of yards, necessary according to the present measure. For this is all that will be done by raising our coin, as is proposed. All it amounts to is no more but this, viz., That each piece, and consequently our whole stock of money, should be measured and denominated by a penny one-fifth less than the standard. * * *

“The increase of denomination does, or can do nothing in the case, for it is silver by its quantity and not denomination, that is the price of things and measure of commerce; and it is the weight of silver in it, and not the name of the pieces that men estimate commodities by, and exchange them for.

“If this be not so, when the necessity of our affairs abroad, or ill husbandry at home, has carried away half our treasure, and a moiety of our money is gone out of England; it is but to issue a proclamation that a penny shall go for two-pence, sixpence for a shilling, half-a-crown

for a crown, &c., and immediately, without any more ado, we are as rich as before. And when half the remainder is gone, it is but doing the same thing again, and raising the denomination anew, and we are where we were, and so on; whereby supposing the denomination raised 15-16, every man will be as rich with an ounce of silver in his purse, as he was before when he had 16 ounces there, and in as great plenty of money, able to carry on his trade without bartering; his silver, by this short way of raising, being changed into the value of gold: for when silver will buy 16 times as much wine, oil, and bread, &c., to-day, as it would yesterday, (all other things remaining the same, but the denomination) it hath the real worth of gold.

“This, I guess, everybody sees cannot be so, and yet this must be so, if it be true that raising the denomination one fifth, can supply the want, or one jot raise the value of silver in respect of other commodities, i. e., make a less quantity of it to-day, buy a greater quantity of corn, oil, and cloth, and all other commodities than it would yesterday, and thereby remove the necessity of bartering. For if raising the denomination can thus raise the value of coin in exchange for other commodities, one fifth, by the same reason it can raise it two fifths, and afterwards three fifths, and again if need be four fifths, and as much further as you please. So that by this admirable continuance of raising our coin we shall be rich, and as well able to support the charge of the Government, and carry on our trade without bartering, or any other inconvenience for want of money, with 60,000 ounces of coined silver in England, as if we had six, or 60 millions. If this be not so, I desire any one to shew me why the same way of raising the denomination, which can raise the value of money in respect of other commodities, one fifth, cannot when you please, raise it another fifth, and so on? I beg to be told where it must stop, and why at such a degree, without being able to go further.

“It must be here taken notice of, that the raising I speak of here, is the raising of the value of our coin in respect of other commodities (as I call it all along) in contradistinction to raising the denomination. The confounding of these in discourses concerning money, is one great cause, I suspect, that this matter is so little understood, and so often talked of with so little information of the hearers.

“A penny is a denomination no more belonging to eight than to eighty, or to one single grain of silver: and so it is not necessary that there should be 60 such pence, no more nor less, in an ounce of silver, i. e. twelve in a piece called a shilling, and sixty in a piece called a crown: such like divisions being only extrinsic denominations, are everywhere perfectly arbitrary. For here in England there might as well have been twelve shillings in a penny, as twelve pence in a shilling, i. e. the denomination of the less pence might have been a shilling, and of the bigger a penny. Again, the shilling might have been coined ten times as big as the penny, and the crown ten times as big as the shilling; whereby the shilling would have but tenpence in it, and the crown an hundred. But this, however ordered, alters not one jot the value of the ounce of silver, in respect of other things, any more than it does its weight. This

raising being but giving of names at pleasure to aliquot parts of any piece, viz.: that now the 60th part of an ounce of silver shall be called a penny, and to-morrow that the 75th part of an ounce shall be called a penny, may be done with what increase you please. And thus it may be ordered by a proclamation, that a shilling shall go for twenty-four pence, and half-crown, for sixty instead of thirty pence, and so of the rest. But that an half-crown should be worth or contain sixty such pence, as the pence were before the change of denomination was made, that no power on earth could do. Nor can any power but that which can make the plenty or scarcity of commodities, raise the value of our money their double in respect of other commodities, and make that the same piece or quantity of silver, under a double denomination, shall purchase double the quantity of pepper, wine, or lead, an instant after such proclamation, to what it would do an instant before. If this could be, we might, as every one sees, raise silver to the value of gold, and make ourselves as rich as we pleased. But it is but going to market with an ounce of silver of one hundred and twenty pence, to be convinced that it will purchase no more than an ounce of silver of sixty pence; and the ringing of the piece will as soon purchase more commodities, as its change of denomination, and the multiplied name of pence, when it is called six score instead of sixty."

167. It may, perhaps, appear to some that the arguments put forward by Locke, are so simple and convincing, that it is almost a waste of ingenuity and labor to dwell on them at such length. But unfortunately this is not so. The confusion of idea between the *name* and the *value* of a coin, is one which is but too prevalent even at the present day. It seems almost incredible that an able man like Mr. Lowndes could perceive that debasing the standard of the coin, by putting less silver and more alloy, was a public fraud, and an injury to all creditors, and yet that he should be totally incapable of perceiving that raising the denomination of the coin, was exactly the same thing in principle as debasing the standard. In each case the quantity of pure silver in a crown or a shilling was diminished. Nevertheless this fallacy is deeply seated even at the present day. It was, moreover, exactly the same fallacy, under another form, which blinded and deluded the Bank of England, the Government, and the House of Commons in 1811, into their insane vote on the doctrine of the Bullion Report, that the Bank Note was depreciated. But alas! Instead of a Montague willing to learn wisdom from the counsels of a Locke, there was only a Vansittart, who refused to listen to Horner and Canning, and we are still smarting for his infatuation.

168. The Bank of England had been founded in 1694 (*BANKING IN ENGLAND*), and in the summer of 1695, was in great credit and prosperity. We have a pamphlet written by Mr. Michael Godfrey, the Deputy Governor, in June, 1695, which is of considerable importance in regard to the theory of the currency, and some allegations of the Bullion Report (*BULLION REPORT*). William III. had found his resources so much strengthened by the foundation of the Bank, that he was able to assume the offensive in the war which was then raging with France. In July, 1695, he undertook the siege of Namur, and Mr. Godfrey went

over to him to arrange some matters of business. During a heavy cannonade he ventured too near the king, and was killed by his side. His pamphlet is written in a strain of the warmest congratulation on the success of the Bank. We have given an abstract of this pamphlet elsewhere, (*GODFREY*), and we only notice here that he asserts that in June, 1695, the Bank notes were all payable on demand. At this period, and for some time before, we have already seen that guineas were current at 30s. each, and the exchange with Holland was twenty-five per cent. against England, both of which circumstances all contemporary writers, except a very few, attributed to the *badness of the silver coin*, and to that only. There are volumes of pamphlets in the Board of Trade, which we have read, and they all prove the fact of the depreciation of the silver money, or the apparent rise in guineas, to have occurred in the spring of 1695, and not one ever makes the slightest allusion to the notion that it was caused by the issues of the Bank of England.

169. There is one point, however, on which there are many concurring assertions:—That the bad state of the coinage was greatly owing to the bad practices of the goldsmith-bankers. It is charged again and again against them, that they were in the habit of clipping the money deposited with them by their customers, and putting it into circulation again. We might hesitate to believe this of men of such respectability as our modern bankers generally are, but we must reflect that generally speaking, the bankers of these days were not so eminent as those of our own, and we see that so respectable an authority as Mr. Godfrey specifically charges them with it. (*GODFREY*.)

170. Burnet says, (*History of his own Times*, vol. iv., p. 252, *edit.* 1823,) that there was a party in the country who were moved with great jealousy by the credit of the Bank, and did all they could to ruin it, but their machinations were rejected with indignation by both houses. He says that at the same period there were two sets of money, one milled, which could not be practised upon, the other not so, which was clipped, and so much so, that at last it was diminished to less than half its proper weight. When this had gone on for some time, the king was advised to issue a proclamation to make it current by weight, and not by tale, but it was strongly opposed in the council. The badness of the money was then very visible; guineas, which were equal in value to 21s. 6d. in silver, rose to 30s. that is to say, 30s. sank to 21s. 6d. As the deterioration became worse, Lord Somers again proposed that a proclamation should be issued, to make money current by weight and not by tale. The king was also of that opinion, but the rest of the council were unanimously against it; and so this proposition was laid aside, which would have saved the nation above a million of money, for when people saw that Parliament would receive the clipped money by tale, the clipping went on worse than ever.

171. Parliament met in November, 1695, and in the speech from the throne, the king called the attention of the House to the bad state of the coin, and requested them to devise a remedy.

On the 30th of November, the subject was debated. On the 1st of that month, Montague (afterwards Lord Halifax) had been appointed Chancellor of the Exchequer. The House in acknow-

ledgment of the paragraph in the king's speech, respecting the ill state of the coinage, appointed a Committee to consider of a fund to make good the deficiency of the clipped money. Montague brought before the House the question whether it was necessary or expedient to recoin the silver money? The country party, in the hopes of embarrassing the Government, held the negative. The Chancellor of the Exchequer maintained that, in consequence of the bad state of the coinage, the foreign exchanges were heavily against the country. That, by reason of this, the supplies raised to maintain the army were curtailed in consequence of the adverse exchange. That from the badness of the coin guineas had risen to 30s., and foreign gold in proportion. That in consequence of this great quantities of foreign gold were imported, which could not be exported at the same price. The government carried that the money should be recoined by a majority of sixty.

172. The next question was, whether the several denominations of the new money should have the same weight and fineness as the old? or whether the standard should be raised? This question produced many debates. The opposition adopted Lowndes's ideas, that the price of an ounce of silver bullion had risen to 6s. 3d., and therefore, the standard of the coin should be raised accordingly—that raising the standard would prevent exportation, and melting it down, and would encourage people to bring plate and bullion to the mint to be coined.

The government replied, using the arguments so admirably set forth by Locke, of which we have given a few extracts above, in order that it may be clearly seen to whom their merit is due. We need not encroach on our space, and the reader's patience, by repeating them. The Chancellor concluded by moving that in coining the new money, the House would not depart from the ancient standard either in weight, fineness, or denomination. This resolution was also carried by 224 to 114.

173. The next question was—Who was to bear the loss attending the new coinage? Many urged, and with some plausibility, that the holders of the money should bear the loss, as had frequently been done before. It was resolved, however, that the public should bear it, and as the debased state of the coinage was due to the negligence of the government, it was right that the loss should fall on the public. The sum of £1,200,000 was appropriated for the purpose, and in order to meet it; a window tax was devised, which has been the fruitful source of misery, disease, and death, and has only been abolished within the last few years.

174. The House addressed the King to issue a proclamation forbidding the circulation of clipped money after certain dates. The king assented, and on the 20th December it was ordered that after the 1st of January, 1696, clipped crowns and half-crowns should not be taken by any one except the collectors of taxes, and after a short time, they were not to be taken in London, or within forty miles. The other coins were also called in in a similar manner.

The time named in the proclamation for receiving the clipped money was so short, that all trades were thrown into confusion. People refused to

take the clipped money for fear it might be left on their hands. The different qualities of the coins current together added much to the confusion, for while the hammered money, and pieces not clipped within the ring, were allowed to pass, no one was willing to make payments in new money, and therefore as fast as it issued from the Mints and Exchequer, it was hoarded up by the first receivers. Much of it was exported to purchase gold, which at this time was very profitable. Some Acts were passed regulating the coin, which were not of much avail.

175. Evelyn says in his Diary; "1695-6. 12 Jan. Great confusion and distraction by reason of the clipped money, and the difficulty found in reforming it.—23. They now began to coin new money."

176. Having provided for the recoinage, the House of Commons then began a most useless and ineffectual meddling with the price of guineas. As long as the silver coinage continued in its debased state, no human power could lower the price of guineas; as soon as the silver coin was reformed, no human power could prevent them falling. Several petitions were presented to the House against their interference with the price of guineas. (*Commons Journals*, Vol. XI. p. 445). It is strange that Montague should so far have deserted the lessons of his great master Locke. If an Act of Parliament could alter the price of guineas—where was the use of the coinage? If the coinage would effect the purpose, where was the use of the Act of Parliament? It was carried by a majority of 162 to 131, on the 15th February, 1696, that guineas should not pass for more than 28s. On the 28th, it was resolved, by a majority of 194 to 140, that after the 26th March, they should be reduced to 26s. On the 26th March, it was voted by a majority of 180 to 135, that after the 10th of April, they should be reduced to 22s., and heavy penalties were enacted against all who should deal in them at higher rates after that date. It was further ordered that clipped money should be received in payment of taxes till the 4th of May, in advances to government till the 1st July, and after the 1st February, 1697, should cease to be current at all. At this time, although both gold and silver were legal tender, yet the silver coin was considered the standard currency, and gold only as subsidiary. Debts were considered to be contracted in silver, and when this great disarrangement of the relative value of the gold and silver took place, it was considered a great public grievance. All the heavier pieces were culled out, and sent to Holland, where guineas and bullion might be bought for 22s., which passed for 30s. in England, the consequence was a steady drain of silver from England, and a continued influx of gold. The Act of Charles II. gave every one the right to have his bullion coined at the Mint free of expense, and many persons had availed themselves of that privilege. By a return presented to the Commons, it appeared that since Lady-day, 1695, up to February, 1696, guineas to the amount of £721,280 had been coined for 149 persons. An Act was passed to take off this privilege, and to prohibit the importation of guineas and half-guineas. Statute, 1696. c. 13.

177. The success of the Bank of England raised up a host of enemies, who tried all they

could to ruin it. During this period, the shares had fallen from £107 to £85. The difficulties of the recoinage enabled its enemies to concert a conspiracy against it, which was successful. All this time it had received the degraded coin at its nominal value. Its notes were payable to bearer on demand. As soon as the new coin came out they were bound to pay them in full weighted money. That is, for every seven ounces of gold they had received they were bound to pay twelve. Moreover the pressing necessities of the king had unfortunately induced him to listen to the promises of the schemers who got up the Land Bank, and an Act for establishing it passed in April. This was justly considered as a serious blow to the Bank of England.

178. The Act limited the 4th of May, as the last day for receiving the clipped money in payment of taxes. Multitudes of course flocked in at the last day to pay in their clipped money. The new money had scarcely begun to come out, and what had been issued, had by the unfortunate permission given to the good and bad coin to circulate together, been hoarded or exported. The goldsmiths and bankers, and other enemies of the Bank, saw a great opportunity to injure it. They collected its notes from all quarters. One goldsmith alone had £30,000. On the 5th of May, between 12 and 1 o'clock, they marched in a body to the Bank, and demanded payment of them on the spot. The Directors, seeing the nature of the proceeding, refused payment, and left the holders of their notes to their remedy at law. They, however, continued the payment of the usual trade demands. This, however, could not continue. They were soon unable to cash even the notes presented in the ordinary course of business. They then made a call of 20 per cent. on their proprietors, and were obliged to adopt a partial suspension of cash payments. They gave notice they could only pay 10 per cent. on their notes once a fortnight. During the first week they paid £15,000 in broad and milled money. The treasury did all it could to assist them, and large sums were coined and paid into the Bank. The Bank advanced the rate of interest allowed on their bills, from 2d. to 3d. a day. They borrowed £240,000 from their own proprietors, for six months at 6 per cent., and drew bills for £100,000 upon the Bank of Amsterdam.

179. Evelyn says, "13th May, 1696. Money still continuing exceedingly scarce, so that none was paid or received, but all was on trust, the Mint not supplying for common necessities.

"11th June. Want of current money to carry on the smallest concerns, even for daily provisions in the markets. Guineas lowered to 22s., and great sums daily transported to Holland, where it yields more, and other treasure sent to pay the armies, and nothing considerable coined of the new, and now only current stamp, cause such a scarcity that tumults are every day feared, nobody paying or receiving money. Banks and lotteries every day set up.

"26th July. So little money in the nation that Exchequer tallies on the best fund in England, the Post Office, nobody would take at 30 per cent. discount.

"3rd August. The Bank lending the £200,000 to pay the army in Flanders, that done, nothing against the enemy had so exhausted the treasure

of the nation, that one could not have borrowed money under 14 or 15 per cent. on bills (i.e., Bank of England Notes) or on Exchequer tallies under 30 per cent."

180. It is said in Narcissus Luttrell's diary that between the 17th of January and the 24th of June, there were brought into the Exchequer in clipped money £4,706,003 18s. 6½d.

181. We have not been able to find when Bank Notes first fell to a discount. But in Luttrell's diary it is said that on the 28th of July, they were at a discount of £10 per cent. On the 25th of August, he says that they were at £15 per cent. discount. On the 12th of September, at £18 per cent. discount.

182. Mints had been set up at various towns in the country to hasten the substitution of good money for bad. During the summer, these had been constantly at work, and by the autumn a considerable supply had been circulated. The natural effect followed the restoration of the medium of payment to its proper standard. The exchanges which had been 25 per cent. against England, immediately turned in her favor. Luttrell says, on the 8th of October, "The price of most foreign commodities here begins to fall in expectation of a peace, and whereas sometime since we gave £25 per cent. to remit money to Holland, they now give us £4 per cent. for money in England; so 'tis plain the balance is on our side."

Luttrell says that on the 12th of October, Bank Bills were discounted at £12 per cent. discount for ready money, and the Bank allowed 6 per cent. for six months for all sealed bills of £100.

183. It is not for us to tell here how miserably the Land Bank failed to supply the king with the resources it had promised, and its ruinous effects on public credit. We are precluded from entering upon the political history of the period, and shewing how the fortunes of the nation were affected by the state of the coinage. All this is set forth with matchless skill in Macaulay, whose account of the years 1695, 1696, and 1697 should be read in connection with the preceding details. The monetary difficulties of England were so great that the eyes of all Europe were turned upon her, with the fear, or the hope, that the great alliance against France must be dissolved.

184. It was no doubt one of the greatest crises that this country has gone through, but fortunately for her, there were men at the head of affairs who were found equal to the occasion. Parliament met on the 20th of October, 1696, and the king congratulated the nation upon having passed through the year without any disorders at home, or reverses abroad, considering the great disappointment in the funds voted at their last meeting, and the difficulties arising from the recoinage of the money. Their enemies had hoped that these misfortunes would have proved fatal to them, but though negotiations had been talked of for a general peace, the only way to treat with France was sword in hand. The king then brought to their notice the frightful state of public credit, and earnestly entreated Parliament to take measures to restore it.

185. The hopes of the enemies of England were scattered to the winds. The statesmen and the parliaments of that period are not now held

in any very high estimation, yet on that day they set such an example as might be envied by the greatest assembly of any age or country. Notwithstanding the terrible internal sufferings produced by eight years' war, and the bad state of the coinage, they unanimously voted that they would support the king and his government against all his enemies, both at home and abroad, and would effectually assist him in carrying on the war with France.

186. They then voted without a division:—That they would not alter the standard of the gold and silver in fineness, weight, or denomination, and that they would make good all parliamentary funds since his Majesty's accession to the crown that have been made credits for loan from the subject. They also repealed the absurd laws against the importation of guineas and the coining of gold.

187. It was indeed a great day for England, and one that may well put to shame the conduct of her parliament 116 years later. In the next session the amount of arrears in every branch in the public service was laid before them, in consequence of the total failure of some, and the partial failure of other funds appropriated to them. It was a frightful sum—£6,000,459—more than all the current coin in the kingdom was supposed to be—more, probably, at that period than £70,000,000 would be at the present day. Exchequer tallies were at forty, fifty, and sixty per cent. discount. But directly the House of Commons pledged itself to maintain their faith with the public creditor, they began to rise.

188. The country had passed through the agony of its crisis. As soon as the vote was passed, the new milled money came forth from thousands of hoards. Bank notes, which had been at eighteen per cent. discount the day before the meeting of parliament, rose to twelve discount, and its shares rose too. The exchanges, as we have already seen above, as well as by the evidence of Mr. Cary (CARY), were now in favor of this country, in consequence of the medium of payment being restored to its true standard.

189. On the 27th October, the House resolved that all hammered money should pass current at 5s. 2d. per ounce; that until the 1st of January, it should be purchased at all the mints, and received in payment of taxes, at 5s. 8d. per ounce. They then anxiously debated the state of credit. On the 12th November, they voted that the Bank of England should continue for the eleven years, for which it was originally established, and that no other Bank should be established by Parliament during that period. This was carried by 200 to 124. By the beginning of December, the five country mints had already coined £200,000, and they had £400,000 in clipped money and plate waiting to be coined. The House ordered a bill to be brought in to establish bills of credit, that for goods bought under £10, the buyer should give his note of hand for payment, which should be transferable from hand to hand, during the scarcity of money. This plan had long been advocated by Sir Josiah Child. (CHILD.) On December 26, Bank notes were at £17 per cent. discount. On the 1st of February, 1697, they were at £19 per cent. discount.

190. Negotiations had been going on between the House and the Bank of England for restoring its credit. At last, on the 3rd of February, 1697,

the House agreed that the Bank might increase its capital stock by an amount not exceeding five millions, of which one fifth might be paid in their own notes, and four-fifths in Exchequer tallies. Several other provisions were also made for preventing the recurrence of such a calamity as the failure of the Land Bank had caused. (BANKING IN ENGLAND.) In pursuance of this Act, the capital stock of the Bank was increased by the sum of £1,001,171 10s. of which £200,000 were paid in its own depreciated notes, taken at their full value, and £800,000 in depreciated Exchequer tallies. On the 19th February, 1697, Bank Notes were at £21 discount, and on the 20th, at £24 discount. On the 23rd of March, they were at £23 10s. discount.

191. The Act for increasing the capital of the Bank received the royal assent on the 1st of April, and the value of its notes immediately rose to £18 discount, at which they continued till the beginning of June, when they rose to £13 discount. On the 26th of July, they were at £10 10s. discount. On the 3rd of August, they were at £7 discount, and the shares rose from 60 to 72. On the 26th of August, the notes were at £3 10s. discount, and the shares rose to 83. On the 28th notes were at £2 discount, and the stock at 92. On the 18th September, the notes were at £1 discount, and bank stock at 96. And on the 30th November, the notes were at par. By this time upwards of £7,000,000 of money had been coined at the various mints in the country.

192. Such is the history of this great monetary crisis, and whoever will take the trouble to compare it with the account of it given in the Bullion Report, will at once perceive what an astonishing mass of chronological errors the framers of that Report have fallen into. (BULLION REPORT.) The Bullion Report says that the details given in it are all very fully mentioned in authentic tracts published at the time. We, having read scores of tracts published at the time, make bold to say that there is not one single tract published at the time which will countenance the assertions of the Report. We also observe that Bank Notes were received in payment of the new subscription to the Bank; thus its own depreciated notes which were CREDIT, were thus turned into permanent CAPITAL, an operation which is wholly inexplicable according to the current notions on the subject of Credit, but which is fully explained under CREDIT.

193. The political benefits which followed this great restoration of the coinage are beyond the purpose of this work. In 1707, the union of the kingdoms necessitated a new coinage. At the same time the relative value of the gold and silver coins began to differ from the market value of the two metals, and as silver was underrated, it became very scarce. It is much to be lamented that the government, having adopted Locke's arguments in favour of the maintenance of the standard, did not also adopt his argument with respect to the necessity of there being only one standard of value. It was perfectly conclusive, and the evils, which he had shewn must necessarily follow from this economic error of having two measures of value, manifestly displayed themselves. In 1708, the government offered a premium of 2½d. per ounce, to every one who brought foreign silver coin, or plate of any sort,

of standard fineness, to the Mint to be coined. This, however, was quite ineffectual, and as matters grew worse every day, the government referred the matter to Sir Isaac Newton, who had for many years been at the head of the Mint, to report upon.

194. Sir Isaac Newton said in his Report, (*Parl. Hist. VII. 526*), "That a pound weight Troy, of gold, 11 ozs. fine, and 1 oz. alloy, is cut into 44½ guineas; and a pound weight of silver, 11 ozs. 2 dwts. fine, and 18 dwts. alloy, is cut into 62 shillings; and, according to this rate, a pound weight of fine gold is worth 15 pounds weight 6 ozs. 17 dwts. and 5 grns. of fine silver, reckoning a guinea at £1 1s. 6d. in silver money. But silver in bullion, exportable, is usually worth 2d. or 3d. per ounce more than in coin; and if as a medium such bullion of standard alloy be valued at 5s. 4½d. per ounce, a pound weight of fine gold will be worth but 14 lbs. 11 ozs. 12 dwts. 9 grs. of fine silver in bullion; and, at this rate, a guinea is worth but so much silver as would make 20s. 8d. When ships are lading for the East Indies, the demand of silver for exportation raises the price to 5s. 6d. or 5s. 8d. per ounce, or above; but I consider not these extraordinary cases.

"A Spanish pistole was coined for thirty-two rials, or four pieces of eight rials, usually called pieces of eight, and is of equal alloy, and the sixteenth part of the weight thereof; and a Doppio Moeda of Portugal was coined for ten crusados of silver, and is of equal alloy, and the sixteenth part of the weight thereof. Gold is therefore in Spain and Portugal, of sixteen times more value than silver of equal weight and alloy; according to the standard of those kingdoms; at which rate a guinea is worth 22s. 1d.: but this high price keeps their gold at home in good plenty, and carries away the Spanish silver into all Europe; so that at home they make their payments in gold, and will not pay in silver without a premium: upon the coming in of a Plate fleet the premium ceases or is but small; but as their silver goes away and becomes scarce, the premium increases, and is most commonly about six per cent., which being abated, a guinea becomes worth about 20s. 9d. in Spain or Portugal.

"In France, a pound weight of fine gold is reckoned worth fifteen pounds weight of fine silver; in raising or falling their money, their kings' edicts have sometimes varied a little from this proportion, a little in excess or defect; but the variations have been so little, that I do not here consider them. By the edict of May, 1709, a new pistole was coined for four new louis, and is of equal alloy, and the fifteenth part of the weight thereof, except the errors of their mints; and by the same edict, fine gold is valued at fifteen times its weight of fine silver; and at this rate a guinea is worth 20s. 8½d. * * *

"The ducats of Holland and Hungary, and the Empire, were lately current in Holland among the common people, in their markets and ordinary affairs, at five guilders in specie, and five stivers; and commonly changed for so much silver moneys in three-guilder pieces and guilder pieces, as guineas are with us for 21s. 6d. sterling; at which rate a guinea is worth 20s. 7½d.

"According to the rates of gold to silver in Italy, Germany, Poland, Denmark, and Sweden,

a guinea is worth about 20s. and 7d., 6d., 5d., or 4d., for the proportion varies a little within the several governments in these countries. In Sweden, gold is lowest in proportion to silver, and this hath made that kingdom, which formerly was content with copper money, abound of late with silver, sent thither (I suspect) for naval stores.

"In the end of King William's reign, and the first year of the late queen, when foreign coins abounded in England, I caused a great many of them to be assayed in the Mint, and found by the assays, that fine gold was to fine silver in Spain, Portugal, France, Holland, Italy, Germany, and the northern kingdoms, in the proportion above mentioned, errors of the mint excepted.

"In China and Japan, one pound weight of fine gold is worth but 9 or 10 pounds weight of fine silver; and in East India it may be worth 12; and this low price of gold in proportion to silver, carries away the silver from all Europe.

"So then by the course of trade and exchange between nation and nation in all Europe, fine gold is to fine silver as 14 4-5, or 15 to one; and a guinea at the same rate is worth between 20s. 5d. and 20s. 8½d.; except in extraordinary cases, as when a Plate fleet is just arrived in Spain, or ships are lading here for the East Indies; which cases I do not here consider. And it appears by experience as well as by reason, that silver flows from those places where its value is lowest in proportion to gold, as from Spain to all Europe, and from all Europe to the East Indies, China, and Japan; and that gold is most plentiful in those places in which its value is highest in proportion to silver, as in Spain and England.

"It is the demand for exportation which hath raised the price of exportable silver about 2d. or 3d. in the ounce above that of silver in coin, and hath thereby created a temptation to export, or melt down, the silver coin rather than give 2d. or 3d. more for foreign silver; and the demand for exportation arises from the higher price of silver in other places than in England, in proportion to gold; that is, from the higher price of gold in England than in other places in proportion to silver, and therefore may be diminished by lowering the value of gold in proportion to silver. If gold in England, or silver in East India, could be brought down so low as to bear the same proportion to one another in both places, there would be here no greater demand for silver than for gold to be exported to India. And if gold were lowered only so as to have the same proportion to the silver money in England, which it hath to silver in the rest of Europe, there would be no temptation to export silver rather than gold to any other part of Europe. And to compass this last, there seems nothing more requisite than to take off about 10d. or 12d. from the guinea; so that gold may bear the same proportion to the silver money in England, which it ought to do by the course of trade and exchange in Europe. But if only 6d. were taken off at present, it would diminish the temptation to export, or melt down the silver coin. And by the effects, would show hereafter better than can appear at present, what further reduction would be most convenient for the public.

"In the last year of King William, the dollars of Scotland, worth about 4s. 6½d., were put away

in the North of England for 5s., and at this price began to flow in upon us. I gave notice thereof to the Lords Commissioners of the Treasury, and they ordered the collectors of taxes to forbear taking them, and thereby put a stop to the mischief.

"At the same time, the louis-d'ors of France, which were worth but 17s. 3d. a piece, passed in England at 17s. 6d. I gave notice thereof to the Lords Commissioners of the Treasury; and his late Majesty put out a proclamation that they should go but at 17s.; and thereupon they came to the Mint, and £1,400,000 were coined out of them: and if the advantage of 5½d. in a louis-d'or, sufficed at that time to bring into England so great a quantity of French money, and the advantage of three farthings in a louis-d'or to bring it to the mint, the advantage of 9½d. in a guinea, or above, may have been sufficient to bring the great quantity of gold which hath been coined in these last fifteen years, without any foreign silver.

"Some years ago, the Portugal moedors were received in the West of England at 28s. a piece. Upon notice from the Mint, that they were worth only about 27s. 7d., the Lords Commissioners of the Treasury ordered their receivers of taxes to take them at no more than 27s. 6d. Afterwards many gentlemen in the west sent up to the Treasury a petition, that the receivers might take them again at 28s., and promised to get returns for money at that rate; alleging that when they went at 28s., their country was full of gold, which they wanted very much. But the Commissioners of the Treasury, considering that at 28s. the nation would lose 5d. a piece, rejected the petition. And if an advantage of 5d. in the 28s. did pour that money in upon us, much more hath an advantage to the merchant of 9½d. in a guinea, or above, been able to bring into the Mint great quantities of gold, without any foreign silver, and may be able to do so still, till the cause be removed.

"If things be let alone till silver money be a little scarcer, the gold will fall of itself; for people are already backward to give silver for gold, and will in a little time refuse to make payments in silver without a premium, as they do in Spain; and this premium will be an abatement of the value of the gold; and so the question is, whether gold shall be lowered by the government, or let alone till it falls of itself, by the want of silver money.

"It may be said, that there are great quantities of silver in plate, and if the plate were coined, there would be no want of silver money. But I reckon that silver is safer from exportation in the form of plate than in the form of money, because of the greater value of the silver and fashion together; and therefore I am not for coining the plate, till the temptation to export the silver money, which is a profit of 2d. or 3d. an ounce, be diminished; for as often as men are necessitated to send away money for answering debts abroad, there will be a temptation to send away silver rather than gold, because of the profit, which is almost 4 per cent.; and for the same reason foreigners will choose to send hither their gold rather than their silver."

196. Mr. Aislachie, the Chamcellor of the Exchequer, brought the subject of the great scarcity of silver coin before the House on the 21st of

December, 1717, and was seconded by Mr. Caswall, who gave details of the different relative values gold and silver coin had borne with respect to each other, according to the plenty or scarcity of each, and said that the over-valuation of gold in the current coins of Great Britain, had caused the exportation of great quantities of silver specie. To prove this, he laid open a clandestine trade which had been carried on for many years by the Dutch, Hamburgers, and other foreigners, in concert with the Jews and other traders here, which consisted in exporting silver coins, and importing gold in lieu thereof, which being coined into guineas at the Tower, near 15d. was got by every guinea, which amounted to about 5 per cent., and as these returns might be got five or six times in the year, considerable profits were made by it. In his opinion the only way of checking this, was to lower the price of guineas and other gold specie.

197. Sir Isaac Newton had shewn that the true value of the guinea, according to the market values of gold and silver at that time, was 20s. 8d. The House, however, did not adopt his recommendation to its full extent, but they addressed the Crown to issue a proclamation to make guineas current at 21s. In accordance with this, the king issued a proclamation on the 22nd December, 1717, making guineas current at 21s., and reducing the other gold coins for 23s. 6d. and 25s. 6d. to 23s. and 25s. each.

198. This was the last alteration made in the relative values of gold and silver coin, and now, in the language of the Mint, the price of gold was fixed at £3 17s. 10½d. an ounce, which is so sore a puzzle to many persons. This alteration in the value of guineas created some alarm that it might be further reduced, and caused considerable confusion in trade, but in January, 1718, both Houses of Parliament passed resolutions that they would not alter the standard of the gold and silver coins of the kingdom in fineness, weight, or denomination.

199. By the reduction of the price of the guinea, the value of gold to silver was fixed at $15\frac{1250}{65000}$ to 1, but as in Holland and France the rate was 14½ to 1, a profit still remained on exporting silver and importing gold. Thus gold became the cheapest medium in which to make payments, and by this means during the course of the last century, it became gradually an understood thing in commerce that gold was the standard of value. This custom was finally adopted as law in 1816.

200. Up to 1792, a considerable quantity of the old hammered gold pieces of James I., Charles I., and Charles II., had been current along with the guineas. These were the old units originally struck to represent 20s., but which were now current at 25s. All this old gold was now called in at the rate of £4 1s. per ounce, troy. Many of the coins of Edward VI. were still in circulation. These were all called in at the same rate. By these measures all the old hammered money was finally withdrawn from circulation.

201. But the old evils of clipping and counterfeiting were not put down. The introduction of the mill had given a more accurate circular form to the coin, but it was executed in such a manner, that it was still possible to file away about 9 or 12 grains of metal without much danger of dis-

covery, from the distance at which the letters were placed from the edge. The Rev. Peter Vallavine, Vicar of Monkton, says in his *Observations on the Current Coin of this Kingdom, 1742*, that the shillings were deficient from 6 to 11 per cent., and the sixpences from 11 to more than 22 per cent., and besides that, were extremely scarce.

202. It may seem somewhat remarkable that after the experience the government had had of the miseries inflicted upon the nation by suffering the coinage to fall into a degraded state, they continued to pay no attention to it. On the accession of George III., in 1763, the gold and silver money was found to be in a very bad state. The crown pieces entirely disappeared, though upwards of a million and a half of pounds had been coined since the time of William III. The half-crowns were extremely scarce, although during the same period there had been coined to the value of £2,329,370. The shillings and sixpences were in a shameful state, and had lost from a sixth to a fourth of their value. All signs of the impression on them had vanished. All the good coins had been exported, or melted, in consequence of the erroneous valuation of the gold and silver coin, and no bullion was brought to the Mint to be coined, because it would have been a great loss to do so, even although it was coined for nothing. The gold coinage was also becoming much depreciated. It was very much clipped and filed. The only remedy tried for some time, was the old futile one of issuing a proclamation against the practice. The state of the coinage continually got worse. In 1771, it was said that three-fourths of the silver in circulation was base. The guineas were sent over to Holland to be filed, and then returned and put into circulation. Even the copper coinage was as bad. A statute was passed to make counterfeiting the copper coinage felony. The sums allowed for prosecuting offences against the coinage were trebled. In 1773, it was enacted, statute 1773, c. 52, that any person to whom gold coin should be tendered which he should suspect to be counterfeit, might cut, break, or deface such piece. If it was bad, the offerer should bear the loss, if not, the person who defaced it must take it at the rate it was coined for. All the officers of the Treasury were ordered to destroy all gold coins offered them in payment, which were below a certain weight. At the same time the Bank gave notice that it would buy any quantity of such defaced coin, in parcels of not less than fifty guineas, at £3 17s. 10½d. the ounce. In 1774, an Act was passed to prevent the importation of debased and depreciated silver coins.

203. It was further enacted that no tender of the silver coin of the realm of any sum exceeding £25 at any one time, should be legal tender within Great Britain or Ireland, for more than its value by weight at the rate of 5s. 2d. per ounce. The Act was to endure till the 1st day of May 1776, and to the end of the then next session of Parliament.

204. The state of the gold coinage could no longer be overlooked. The government proposed that all the deficient gold coin should be called in and recoined. That a compensation should be made to the holders of such deficient gold coin under certain regulations; and that after the recoinage, the currency of the gold coin should in future be regulated by weight as well as by tale,

in accordance with the ancient laws of the kingdom, and that the several pieces should not be legal tender, if they were diminished by any means below that weight. The king having approved the plan, recommended to Parliament the consideration of the state of the gold coinage in very earnest terms. He said that the diminution which that coin had suffered, and the rapid progress the mischief was daily making, was truly alarming, and that it was essentially necessary for the credit and commerce of the country, that the gold coinage should be put on a good footing. Every one agreed that a re-coinage was indispensable, and had long been required to prevent the fraudulent diminution of the gold coin, which had been carried to a greater excess than had ever been known before. But it was by no means equally agreed upon whom the loss attending it should fall. According to the Act, the loss fell upon the immediate possessors of the gold coin, and these were chiefly the great money holders and bankers, and consequently it entailed a great loss on these individuals. They of course organised a strong resistance, and declared that as they were obliged to hold money for others, and had received it at its nominal value, upon the public faith, and under the sanction of government, it was oppressive and unjust to make the whole loss fall upon them, to make good to the public the immense loss they had sustained through the remissness of government, in not enforcing the laws, until the enormity reached so great a height as to be thought beyond their control.

The Minister, however, thought otherwise. The extent of the evil and the necessity for a new coinage were undeniable. The charge of injustice he did not admit. He said the loss had fallen where it could best be borne, upon those who had been gainers by the situation, and who always profited by the public money. That it was in truth a tax upon property, and upon that species of property which was exempt from many others. That if a general tax had been laid on to make good the deficiency, it would have been a very heavy charge to the public, and opened the door for innumerable frauds, as had happened in the reign of William III., on calling in and re-coining the silver money.

205. On the 13th of May, a conference was held between the two Houses of Parliament, upon the subject of the new coinage, in which they agreed, and resolved to address the King.

They agreed to advise the king that all guineas weighing less than 5 dwts., 8 grains., all half-guineas weighing less than 2 dwts. 16 grains, and all quarter guineas weighing less than 1 dwt. 8 grains should be called in and received according to the standard of the Mint, both in weight and fineness, as quickly as could be done. That the public should bear the loss arising from the deficiency and recoinage of the said guineas, provided it did not exceed the rates settled by the commissioners of the Treasury, and provided they should be offered in payment to the receivers and collectors of the public revenues, or should be brought to such places as the king might appoint for the exchange of them, within certain times. They advised the king to issue a proclamation to limit a time when such coins as were more deficient than the quantity stated should cease to be current. An Act was passed in accordance with

this address, by which all receivers of crown revenues were ordered to receive all guineas tendered to them at the value they were coined at, provided their weight did not fall below the quantity named in the proclamation. It was further resolved, that the public should bear the loss arising from the recoinage, and the Commons voted £250,000 for this purpose.

206. On the 24th of June, a proclamation was issued prohibiting all guineas under 5 dwts. 8 grs. to be current, and other gold coins in proportion. Officers were appointed at a considerable number of the principal towns, to exchange the deficient money for other money of the legal weight. The officers of the mint were ordered to prepare weights exhibiting the standard weights of the coins, and to stamp all weights brought to them, which should be found in conformity with the standard ones. This plan was immediately carried into execution, and was attended with perfect success, and no more complaints of deficient guineas were heard until the suspension of cash payments by the Bank, in 1797. The total expense, however, considerably exceeded the estimate. In 1774, £250,000 were granted for the expenses of the recoinage; in 1775, £69,770; in 1776, £92,421; and in 1778, £105,227, making £517,320 in all. Gold being now the medium of payment, the same phenomenon was exhibited as in the recoinage of the silver money in the reign of William III. The foreign exchanges had been unfavourable in consequence of the deterioration of the gold coinage. As soon as that was restored to its standard weight, the foreign exchanges became favourable.

207. From want of a clear apprehension of the great principle that good and bad coin cannot circulate together, but that the good will be exported, Adam Smith has misunderstood the real cause of the drain experienced by the Bank of England during this period. He says, (*Wealth of Nations*, B. II., C. II., *On Metallic and Paper Money*).—"By issuing too great a quantity of paper, of which the excess was constantly returning, in order to be exchanged for gold and silver, the Bank of England was, for many years together, obliged to coin gold to the extent of between £800,000 and £1,000,000 a year, or at an average, about £850,000. For this great coinage, the bank (in consequence of the worn and degraded state into which the gold coin had fallen a few years ago) was frequently obliged to purchase gold bullion at the high price of £4 an ounce, which it soon after issued in coin at £3 17s. 10½d. an ounce, losing in this manner between 2½ and 3 per cent. upon the coinage of so very large a sum. Though the bank therefore paid no seignorage, though the Government was properly at the expense of the coinage, this liberality of Government did not prevent altogether the expense of the bank.

"The Scotch banks, in consequence of an excess of the same kind, were all obliged to employ constantly agents at London to collect money for them, at an expense which was seldom below 1½ and 2 per cent. This money was sent down by the wagon, and insured by the carriers at an additional expense of ½ per cent., or 15s. in the £100. These agents were not always able to replenish the coffers of their employers so fast as they were emptied. In this case the resource of the banks was to draw upon their correspondents

in London, bills of exchange to the extent of the sum which they wanted. When these correspondents afterwards drew upon them for the payment of this sum, together with the interest and commission, some of these banks, from the distress into which their excessive circulation had thrown them, had sometimes no other means of satisfying this draught, but by drawing a second set of bills, either upon the same or upon some other correspondents in London, and the same sum, or rather bills for the same sum, would in this manner make sometimes more than two or three journeys; the debtor bank paying always the interest and commission upon the whole accumulated sum. Even these Scotch banks, which never distinguished themselves by their extreme imprudence, were sometimes obliged to employ this ruinous resource.

"The gold coin which was paid out either by the Bank of England, or by the Scotch banks, in exchange for that part of their paper which was over and above what could be employed in the circulation of the country, being likewise over and above what could be employed in that circulation, was sometimes sent abroad in the shape of coin, sometimes melted down and sold to the Bank of England at the high price of £4 an ounce. It was the newest, the heaviest, and the best pieces only, which were carefully picked out of the whole coin, and either sent abroad, or melted down at home. And while they remained in the shape of coin, these heavy pieces were of no more value than the light; but they were of more value abroad, or when melted down into bullion, at home. The Bank of England, notwithstanding their great annual coinage, found to their astonishment, that there was every year the same scarcity of coin as there had been the year before; and that notwithstanding the great quantity of good and new coin which was every year issued from the bank, the state of the coin instead of growing better and better, became every year worse and worse. Every year they found themselves under the necessity of coining nearly the same quantity of gold as they had coined the year before, and from the continual rise in the price of gold bullion, in consequence of the continual wearing and clipping of the coin, the expense of this great annual coinage became every year greater and greater. The Bank of England, it is to be observed, by supplying its own coffers with coin, is indirectly obliged to supply the whole kingdom, into which coin is continually flowing from these coffers in a great variety of ways. Whatever coin therefore was wanted to support this excessive circulation both of Scotch and English paper money, whatever vacuities this excessive circulation occasioned in the necessary coin of the kingdom, the Bank of England was obliged to supply them. The Scotch banks, no doubt, paid all of them very dearly for their own imprudence and inattention. But the Bank of England paid very dearly, not only for its own imprudence, but for the much greater imprudence of almost all the Scotch banks."

208. Whatever may have been the case with the Scotch banks at this period, Adam Smith has most clearly misunderstood the phenomena respecting the Bank of England. There is no ground whatever given for the assertion that he commences with, that the bank issued too great

an excess of paper. Whatever quantity of paper it issued, much or little, it *must* have been constantly returning upon it for payment in gold, during such a state of the coinage. When men could pay in deficient coin at its full nominal value, and obtain notes from it payable on demand in full weighted coin, which might be immediately melted down and resold to it at the rate of £4 per ounce, the simplest knowledge of economic science would shew that it must have suffered a constant drain of gold, which *must* have gone on constantly increasing, until it would certainly in the end have caused the bank to stop payment. The longer continued the efforts of the bank were to supply gold coin, the more surely was it bringing on its own ruin. The true explanation of the phenomena described by Adam Smith is to be found not in hypothetical excessive issues of paper by the bank, but in the state of the gold coinage.

209. In 1780, all Acts dating from Henry VIII. forbidding the carrying of the gold and silver coin into Ireland, were repealed.

210. Although the gold coinage had been amended, the silver still continued in a very bad state. In 1787, a new issue was begun, but suspended after about £80,000 had been coined. At this time the sixpences were deficient by about one-third; the shillings by about one-fourth; the half-crowns by about one-eighth; and crowns less so, and great quantities of counterfeit copper were in circulation. This continued to get worse, and in 1796, a new copper coinage became necessary. In the following year the Government contracted with the celebrated firm of Boulton and Watt, at Soho, near Birmingham, to coin 500 tons of copper pennies, each coin to weigh an ounce. Many specimens of this coinage are still in circulation.

211. In 1797, there being a great deficiency of silver money, Spanish dollars were issued with a small stamp on them, but having been wrongly rated, great quantities were imported and stamped surreptitiously. The bank then called them all in, and was obliged to pay the forged as well as the true ones. In 1798, large quantities of light gold being in circulation, the bank repeated their advice by public advertisement, that the public should weigh each coin presented to them, as none but money of full weight could be received at the bank.

212. On the 10th of February, 1798, a committee of the Privy Council was appointed to take into consideration the state of the coinage, and the constitution of the Mint, and to report to the King such improvements in each as they might think desirable. This committee referred it to Mr. Henry Cavendish, and Mr. Hatchett, to examine whether coin made of soft and ductile gold, or of gold as hard as is compatible with the purposes of coinage, suffers the most by wear, and also whether coin of a flat, smooth, and broad surface, wears less than coin which has protuberant parts, raised above the ground of the pieces.

213. A detailed account of the experiments instituted to settle these questions is given in the *Philosophical Transactions* for 1803. The experiments were begun in the latter end of 1798, and completed in April, 1801. Various alloys of gold were tried—with arsenic, antimony, zinc, cobalt, nickel, manganese, bismuth, lead, tin, iron, emery,

copper, and silver. The result shewed that silver and copper were the only alloys fit to form gold coin. All the others injured the ductility of the metal. The effects of various alloys on the specific gravity of gold were very remarkable. The quantity of gold being taken at 18 dwts. 10 grs., with 1 dwt. 14 grs. of various alloys, made the specific gravity of the compound vary from 19.277 to 16.627. Experiments were also made to ascertain which alloy was the best, and it was fully proved that the alloy of one-twelfth of copper was the best. The wear also was greater upon raised or embossed surfaces than upon flat and plain ones.

214. The *Treatise on the Coins of the Realm*, which Lord Liverpool afterwards published in a separate form as a letter to the King, was intended to be offered to this committee as a draft report.

In this letter, Lord Liverpool, after stating the deficient condition of the gold money in 1774, and its recoinage, says that the difficulty attending the improvement of the silver coin was, that the two metals were estimated at a different value at the Mint than they were generally sold for in the market. That so long as this continued, only that metal which is estimated at the lowest value with reference to the other would be brought to the Mint to be coined. A constant traffic in the coins would go on, greatly to the loss of the public, in consequence of every one being allowed to bring any quantity of each metal to the Mint to be coined free of expense.

215. Lord Liverpool then enforces the doctrine of Sir William Petty, Locke, Harris, and other eminent writers, that the standard coinage of the country should be made of one metal only, and that coins of this metal should be legal tender without limitation. Subsidiary coins, however, might be made of other metals for the convenience of traffic, but these should be legal tender only to a limited amount. He then gives a sketch of the history of the coinage of the country, with the different relative values of gold and silver. Locke had recommended silver as the legal standard, but Lord Liverpool explained the circumstances which had caused gold to become in common usage the standard of payment during the preceding century. He says, that since 1717 to the end of the century, no more than £584,764 17s. 5½d. in tale of silver had been coined, and from 1760 to 1800, a period of 40 years, not more than £63,983 15s. 5d.

216. He recommended that gold should be made the standard metal of coinage, with silver and copper as subsidiary ones. That the gold coinage should be legal tender to an unlimited amount, and silver only for all sums below the gold unit. Similarly copper should be legal tender for sums only below the silver unit. The charge of workmanship should be taken out of the inferior coins, because they would pass in payment at their nominal rate, or value, provided their value in metal and workmanship was equal to such nominal value. By taking the charge of workmanship out of these silver coins they would be retained in the country for the purposes of internal traffic, for no foreign merchant would take his balance in such coins in payment of any sum greater than they were made legal tender for, as their value in foreign countries would be less than their nominal value. There could be no conflict

between coins made of different metals, nor would they be melted down for the purpose of being converted into plate, as had frequently happened during the course of the last century, whenever the price of either gold or silver bullion in the market rose above the Mint price.

217. This we may observe would be true only as long as the difference in the market values of the two metals did not become greater than the sum charged for the workmanship of the silver coinage. If, for instance, the value of gold, as metal, were to fall in comparison to that of silver, to an extent greater than 6 per cent., which is as nearly as possible the difference between the market value of the silver and the nominal value of the silver coinage, the same phenomena would reappear, and demand a further reduction of the quantity of silver in the shilling.

218. Lord Liverpool then gives some notions on the paper currency, which we have considered under the word *CURRENCY*, and many other most valuable and interesting details relating to the coinage.

By experiments, it was found that the depreciation of the coinage by wear and tear had considerably increased since 1787. The deficiency in the crown pieces now amounted to about $3\frac{1}{2}$ per cent.; in the half-crowns to about 11 per cent.; in the shillings to about 30 per cent.; and in the sixpences to about 42 per cent. Acts were passed, statutes 1798, c. 59 and 1799, c. 75, to prohibit the importation of light silver coin of the realm. The bank again found it necessary to caution the public against light gold, and to weigh all that was offered in payment, in consequence of the depreciated state of the coinage.

The Bank of England had issued Spanish dollars stamped with a small king's head, at somewhat above their market value, in consequence of which numbers were imported, and the stamp counterfeited. In 1804, they tried another device, but this was easily forged, and they attempted to withdraw these dollars from circulation, but great difficulty arose from the clerks not being able to distinguish the true from the false. Nay, even the clerks at the Mint and the bank differed in their opinion as to which were forged and which were genuine. A new issue was made, stamped at Mr. Boulton's mint.

219. In 1809 and 1810, the gigantic commercial speculations which were set afloat, and greatly fostered by the extravagant issues of the Bank of England and the country banks, produced that sudden rise in the market, or paper, price of gold, and the disappearance of guineas, which gave rise to the appointment of the Bullion Committee, and the famous report which produced such interesting discussions in 1811. A full analysis of the report is given under *BULLION REPORT*.

220. Few men of common sense can read these debates, and think upon the vote of the House of Commons now without shame. To the best of our belief it stands unique in the annals of legislative folly. Other legislatures have made severe laws and enacted cruel punishments against those who made a difference between paper and gold, but not one that we are aware of, ever came to the solemn resolution that a £1 note and one shilling were the same thing as a £1 note and seven shillings.

221. On the 6th of May, 1811, Mr. Horner

opened the debate on the Bullion Report, in a speech which raised him to the greatest eminence in public estimation. It abounded in valuable details, though not free from some errors. He concluded by moving the following resolutions:—

1. "That the only money which can be legally tendered in Great Britain, for any sum above 12 pence in the whole, is made either of gold or silver; and that the weight, standard, or denomination, at which any such money is authorized to pass current, is fixed under His Majesty's prerogative, according to law.

2. "That since the 43rd year of the reign of Queen Elizabeth, the Indentures of His Majesty's Mint have uniformly directed that all silver used for coin should consist of 11 oz. 2 dwts. of fine silver, and 18 dwts. of alloy in each pound troy; and that the said pound troy should be divided into 62 shillings, or into other coins in that proportion.

3. "That since the 15th year of the reign of King Charles the Second, the Indentures of His Majesty's Mint have uniformly directed that all gold used for coin should consist of 11 oz. of pure gold, and 1 oz. of alloy in each pound troy; and that the said pound troy should be divided and coined into 44 guineas and one half guinea, or into other coins in that proportion.

4. "That by a proclamation of the 4th year of the reign of King George the First, it was ordered and directed, that guineas and the several other gold coins therein named, should be current at the rates and values then set upon them; viz., the guinea at the rate of 21 shillings, and other gold coins in the same proportion; thereby establishing, that the gold and silver coins of the realm should be a legal tender in all money payments, and a standard measure for ascertaining the value of all contracts for the payment of money, in the relative proportion of 15 ⁶⁰⁰⁰/₁₀₀₀₀ pounds weight of sterling silver to one pound of sterling gold.

5. "That by a statute of the 14th year of the reign of His present Majesty, subsequently revived, and made perpetual by a statute of the 39th year of his reign, it is enacted, that no tender of payment in money made in the silver coin of this realm of any sum exceeding the sum of £25, at any one time, shall be reputed in law, or allowed to be legal tender within Great Britain or Ireland, for more than according to its value by weight, after the rate of 5s. 2d. for each ounce of silver.

6. "That by a proclamation of the 16th year of the reign of his present Majesty, confirmed by several subsequent proclamations, it was ordered and directed that if the weight of any guinea shall be less than 5 dwts. 8 grs., such guinea shall cease to be a legal tender for the payment of any money within Great Britain or Ireland, and so in the same proportion for any other gold coin.

7 "That under these laws (which constitute the established policy of this realm in regard to money,) no contract or undertaking for the payment of money stipulated to be paid in pounds sterling, or in good and lawful money of Great Britain, can be legally satisfied and discharged in gold coin, unless the coin tendered shall weigh in the proportion of 20-21 parts of 5 dwts. 8 grs. standard gold for each pound sterling specified in the said contract; nor in silver coin, for a sum ex-

ceeding £25, unless such coin shall weigh in the proportion of 20-62 of a pound troy of standard silver, for each pound sterling specified in the contract.

8. "That the promissory notes of the Bank of England are stipulations to pay, on demand, the sum in pounds sterling respectively specified in each of the said notes.

9. "That when it was enacted by the authority of Parliament, that the payment of the promissory notes of the Bank of England in cash, should, for a time, be suspended, it was not the intention of Parliament that any alteration whatsoever should take place in the value of such promissory notes.

10. "That it appears that the actual value of the promissory notes of the Bank of England (measuring such value by weight of standard gold and silver as aforesaid) has been for a considerable period of time, and still is, considerably less than what is established by the laws of the realm to be the legal tender in payment of any money contract or stipulation.

11. "That the fall which has thus taken place in the value of the promissory notes of the Bank of England, and in that of the country bank paper, which is exchangeable for it, has been occasioned by too abundant issue of paper currency, both by the Bank of England and by the country banks; and that this excess has originated from the want of that check and control on the issues of the Bank of England, which existed before the suspension of cash payments.

12. "That it appears that the exchanges with foreign parts have, for a considerable period of time, been unfavourable to this country in an extraordinary degree.

13. "That, although the adverse circumstances of our trade, together with the large amount of our military expenditure abroad, may have contributed to render our exchanges with the continent of Europe unfavourable, yet the extraordinary degree in which the exchanges have been depressed for so long a period, has been, in a great measure, occasioned by the depreciation which has taken place in the relative value of the currency of this country, as compared with the money of foreign countries.

14. "That during the continuance of the suspension of cash payments, it is the duty of the Directors of the Bank of England to advert to the state of the foreign exchanges, as well as to the price of bullion, with a view to regulate the amount of their issues.

15. "That the only certain and adequate security to be provided against an excess of paper currency, and for maintaining the relative value of the circulating medium of the realm, is the legal convertibility on demand of all paper currency into lawful coin of the realm.

16. "That in order to revert gradually to this security, and to enforce meanwhile a due limitation of the paper of the Bank of England, as well as of all the other bank paper of the country, it is expedient to amend the Act which suspends the cash payments of the bank, by altering the time till which the suspension shall continue, from six months after the ratification of a definitive treaty of peace, to that of two years from the present time."

222. One would imagine that the first 15 of these resolutions are so perfectly conformable to

the facts, which were patent to all the world, that it would have been impossible to controvert them. It may, therefore, excite our curiosity to know what were the arguments alleged against them. It was this, that there never was any standard legal weight of the coinage at all! Mr. Vansittart said (*Hans. Parl. Deb. Vol. XIX. p. 924-5*)—"We are told that our standard is changed or lost, and triumphantly asked, where shall we now find it? One should suppose the standard was something visible and tangible, which had been accidentally mislaid, and that we ought to offer a reward for bringing it back again. But I affirm that a standard, in the sense used by these gentlemen, namely, *a fixed and invariable weight of the precious metals, as a measure of value, never existed in this country.*" The mode in which he proved this astounding assertion was, that a debt of £25 might be legally paid in crowns, half-crowns, shillings or sixpences, each species of coin being of a different degree of deterioration, and therefore the quantity of each necessary to discharge the debt being of different weights. And which of these, he asked, was the true standard? He said that he did not conceive himself "bound either to admit or to deny that bank notes have lost a value which they never possessed, and which the legal coin of the country never possessed, namely, a value estimated by a fixed weight of gold or silver bullion. They never had any other than a current value founded on the public confidence in the bank, and this value, I firmly believe, they possess as much as ever." Mr. Horner's first resolution was negatived by a majority of 151 to 75; the 14 following ones were negatived without a division, and the last was rejected by 180 to 45.

223. The government, if they had been wise, would have been satisfied with their triumph. But not content with that they moved a series of counter resolutions. But as the voice of every competent judge since that time has condemned them, and Parliament itself a very few years afterwards reversed them, we need not encumber our pages with them. The third only may be quoted.

"That the promissory notes of the said company (i.e. the bank) have hitherto been, and are at this time, held in public estimation to be equivalent to the legal coin of the realm, and generally accepted as such in all pecuniary transactions to which such coin is legally applicable."

224. Mr. Canning poured forth upon this resolution all the powers of his sarcasm and wit. Many members had shown that it was a notorious falsehood that bank notes and guineas were equal in public estimation. From their own knowledge they stated that a £1 bank note, and from 5s. to 7s. in silver, were given for a guinea, and that there were two prices for things, according as they were paid for in guineas or bank notes. He shewed that such a resolution was as futile as the dogma of the Inquisition against the discoveries of Galileo. He said that those reverend fathers, indeed, had the advantage of being able to call in the aid of the secular arm to enforce the acceptance of their doctrines, and he feared that the advocates of that resolution had some thoughts of employing similar means of proserity. There was something ominous in that mixture of law and opinion that pervaded the resolution. The business of the law was with con-

duct; but when it was put forward to influence opinion, pains and penalties were not far behind. Some convictions had recently taken place under a law passed in a period of monetary convulsion, in the reign of Edward VI., when the coin had been debased upwards of 200 per cent. in the space of three years, and when, consequently, merchants and traders had increased the prices of all their commodities in a similar proportion. To counteract this, laws were passed regulating the prices of all things, and inflicting penalties on those who should exchange any coined gold, or silver, at a greater value than the king's proclamation had ordered it to be current for. Such was the law now brought forward for use at the present time. Bad, however, as it was, it was not so absurd as to declare the state of public opinion. To find the most approved method of applying the operation of law to the reformation of speculative opinion, we must descend a few years later, from the reign of Edward the VI., to that of Mary.

225. Even in such times, however, there were some shrewder spirits, who saw the errors into which the English government was running, and determined to guard against their effects in their own case. In 1529, Gavin Dunbar, Bishop of Aberdeen, in a contract with William Sutherland, of Duffus, stipulated that if it should happen that the money of Scotland, or of any other kingdom which passes in Scotland, be raised to a higher price than it is now taken in payment for, whereby the reverend father, his heirs or assigns, be made poorer or in worse condition, he, the said William Sutherland, should pay to the possessors (whoever they may be) of the annual rent reserved therein, for every mark of 32 pennies, one ounce of pure silver of a certain fineness, or else its true value in the usual money of the kingdom of Scotland." If the doctrines of the third resolution were sanctioned by Parliament, it required no great sagacity to foresee that men would ere long seek to guard themselves against the effect of such a system, by resorting to contracts of a similar nature.

Notwithstanding all the arguments against it, the resolution was carried by 76 to 24, and all amendments to the government resolution were negatived. The paper currency became still more rapidly depreciated, as may be seen by the table appended to the article CURRENCY, PAPER, until the great mercantile catastrophes of 1815 and 1816, when by the destruction of many country banks, and the removal of their worthless paper, the value of the remainder was raised almost to par.

226. We have been led to notice here what some might think perhaps more properly belonged to paper currency, because the bank notes were, in fact, during this period, substantially a portion of the coinage. Upon looking back to that dark era, we can now scarcely credit the palpable fallacies which deceived so many men. And yet when we have seen that the rise of the market price of bullion, and a fall of the foreign exchanges from a depreciated currency, were so well understood by the merchants and statesmen of 1696-97, and the Economists of the last century, it may be interesting to inquire what was the fallacy which so long imposed upon men of undoubted ability, and who held their convictions in perfect good

falth? What was the cause of the great degeneracy in sound doctrine between 1696 and 1811, so that it became necessary to argue the question from its very foundations? It was this, that the men of 1696 could see that the coinage did not contain much more than half its proper weight of bullion. But the men of 1811 failed to see that the bank note could only preserve its value by maintaining a certain proportion with the metallic currency. That an excess of the *quantity* of the notes diminished their value relatively to gold, and that this diminution in the value of the promise compared to what it professed to represent, was exactly identical in principle with a debasement of the coinage by alloy, or a depreciation of it from deficiency in weight of bullion. When bank notes became the measure of value, it was imperatively necessary that they should be able to purchase in the market the weight of bullion they professed to represent. When bullion rose to £5 10s., when bought in bank notes, they were exactly in the same predicament as the coinage was under William III., when it had lost 25 per cent. of its weight. Guinea rose to 30s., because the silver coinage was deficient about 30 per cent. in weight. The diminution in the weight of the coinage was palpable to the senses; the diminution in the value of the "promise to pay" was only perceptible to the eye of reason and intelligence, and long escaped the observation of men who conscientiously disbelieved it.

227. This, to a certain extent, might be excusable. But what was utterly inexcusable, was the astonishing assertion that there never had been in the country a certain legal measure of value of a certain weight of bullion. There were abundance of laws to disprove this. The doctrine they maintained was, that it was the stamp alone which gave the money value, and that the quantity of bullion in it was wholly immaterial. Consequently they drew the conclusion that if a piece of paper had the word "pound" written on it, it could not be depreciated. It is scarcely worth while, however, to argue more about what not one sane man now believes in.

228. Immediately after the cessation of the war, the government took in hand the great work of a complete recoinage. The great principle so earnestly enforced by Locke, of having only one metal as a standard measure of value, was at length adopted. During the course of the last century, merchants had universally adopted the custom of paying their debts in gold, because, from the misrating of the Mint, it was the cheapest medium of payment. All contracts had consequently come to be considered as payable in gold, and this was now adopted as the sole legal tender. At the end of the 18th century the relative value of gold and silver had undergone a perceptible change in the markets of the world. Hence, the valuation that had been made of the two metals in 1717, no longer corresponded to the market value of the two metals, and if a silver coinage had been issued of the former denomination and weight, the very same effects would have followed which had been so often experienced before. It would immediately have disappeared from circulation. In order to guard against this, the power of private persons to have silver coined was taken away, and the pound weight of silver was ordered to be cut into 66 shillings instead of 62. But of

these, four are kept back for expenses of coinage, and by way of seignorage, and only 62 are issued, but they are declared to be equal to £3 2s. in tale. The result of this is, that the present shillings pass current for rather more than 6 per cent. above their real value. In order to prevent any injustice to individuals from this depreciation of the coinage, it was enacted that no tender of payment in silver above 40s. at any one time should be legal, either by tale or by weight. This arrangement of the English coinage has this great merit, that it allows a very considerable change to take place in the market value of gold and silver without causing any disturbance in the currency. In France, where silver is the legal tender of the state, gold and silver are coined according to their relative market value, and in consequence of the prodigious supplies of gold from Australia and California, silver has nearly disappeared from circulation. Gold has almost entirely superseded silver in France, for exactly the same reason as it did in England in the reign of William III. and during the 18th century, namely, that it was overrated in comparison to silver. This cannot take place in England until the difference in their relative values exceeds the artificial difference in the English coinage. The amazing quantities of gold poured into Europe, greater than had ever before occurred in so short a time, created great apprehensions in many persons minds that gold was going to undergo a rapid diminution in value, similar to what had happened in the 16th century. If this were the case, it would become necessary to consider what should be done with the British coinage. It is not likely that Parliament would ever sanction any alteration in the weight of the measure of value, or in other words, alter the mint price of gold. If such a diminution in the value of gold should take place, of which there does not appear, as far as can be conjectured on no doubtful a point, any very great likelihood, the probable plan adopted would be to diminish the weight of the shilling to the 70th part of the pound.

229. The last coinage of guineas took place in 1813. We have seen that when they were first coined, they were intended to be equivalent to 20s. in silver, or a pound, and it was owing to an error in their rating that they passed for 21s. On the 1st July, 1817, a new gold coin was made current by proclamation of the value of 20s., which was ordered to be called a sovereign, in imitation of the coin of that name by Henry VII. It was ordered to be of the weight of 5 dwts, 3.274 grains of standard gold. And thus it has become the British pound. When persons ask,—What is a pound? the answer is very simple. It is 5 dwts. 3.274 grains of gold, 22 carats fine, and 2 carats alloy. A bank note that promises to pay so many pounds, is a promise to pay so many multiples of that unit, and nothing else. Since this last reformation of the coinage, no alteration that requires notice has been introduced except the striking of 2s. pieces, called florins, to pave the way for the decimal division of the currency. But a change of this magnitude, enlisting no party passions in its favour, however beneficial it might ultimately be, involving as it would a temporary derangement in affairs of such magnitude, will not be easily effected in this country. The utility of the change

has been much contested by high mercantile authorities; and what will still more impede, if possible, its introduction, is that its supporters are by no means unanimous in the plans they recommend. (COINAGE, DECIMAL.) So what between strong opposition from opponents, and divided councils among its supporters, the adoption of this change will most probably be postponed for a very long period, if ever adopted at all.

On the Coinage of Scotland.

230. Great obscurity envelops the origin of the Scottish coinage. The latest writer on the subject, Mr. Lindsay, states that he is in possession of three coins found about the year 1842, in Ireland, which he thinks are in all probability to be attributed to Somerled, the famous king of the Western Islands, contemporary with Ethelred II.

231. No coin had hitherto been certainly known to exist of any prince on the mainland before William the Lion, but the last mentioned writer says that there is one now existing, which may with confidence be referred to Malcolm III., (1066). He has also appropriated several to Alexander I., (1107); and he says that several specimens of those of David I. (1124,) exist, weighing from 20 to 23 grs. It is doubtful whether any of Malcolm IV. (1153,) exist. Some of William the Lion were known to exist previously, but in 1780, a workman digging a foundation to enlarge the church of Dyke, near Inverness, came upon a very large quantity of them. With the assistance of his wife he managed to secure the whole of them, and soon became a considerable farmer. Great numbers of the coins were melted by the silversmiths, but considerable numbers were rescued. They weigh from 21 to 23 grs.

232. There is nothing of an economical interest to detain us in regard to the coinage of Alexander II., (1214,) or Alexander III., (1249,) or Baliol, (1292.) Although numismatists have been somewhat perplexed to arrange them, they all maintained the proper standard of weight and fineness. Edward I., in 1300, was the first to set the bad example of diminishing the weight of the English coinage, and Robert Bruce followed it in Scotland. How much he diminished them is not certain, as specimens of different weights exist. They were now about 21 to 19 grs. He also coined half-pennies and farthings. The pound tale thus began to vary from the pound weight. He coined 252 pennies out of the pound weight. David II. (1329,) still further reduced the weight of the coins. He coined pennies, half-pennies and far-

things. He also introduced groats, and half-groats in imitation of the English Coinage. The groats weighed 72 grs. In 1366, the money was ordered to be of the weight and fineness of English money, which made 25s. to the pound weight. In 1367, however, the standard was reduced to 20s. 4d. the pound weight, which made the groat 61 grs. He also coined gold pieces in imitation of the nobles which were recently introduced into England.

233. Robert II. (1371,) at first continued the coinage at the same weight as he found it. But it was soon depreciated. In 1373, the Commons of England petitioned that the four-pence Scotch should go for no more than three-pence English. In 1382, it was so depreciated that the English Statute of that year ordered that all Scotch and foreign money should only pass as bullion.

In 1385, it was ordered that the noble of gold should be current for 7s. 8d.; the scutum or *ecu* of France for 47d.; the franc for 42d.; the *ecu* of Flanders for 47½d.; and the mouton of France for 50d.

234. Robert III. (1390,) caused an important Act to be passed regarding the coinage. In 1393, it was enacted that the money of gold and silver should be coined by Bonachius, of Florence. That out of 6 ounces of pure silver, troy, 21 shillings should be made. This was the first Act ordering a gold coinage. It ordered that a *lion*, or *St. Andrew*, should be coined to be current at 5s. The noble of good gold and good weight was to be current at 9s. 6d.; and the Flemish noble at 9s. 6d., and no other nobles to be current. The scutum was reduced to 4s. The weight of the *St. Andrews* was about 60 grs.

235. The Scotch money had now become greatly more degraded than the English. The groats of Robert III. seldom exceed 45 grs. and are often less than 40, while those of England were still 72. In consequence of this the Scotch money was reduced to half its nominal value in England.

236. During the captivity of James I. (1406-1424) the coinage was still further diminished, the groat now weighed only from 30 to 36 grs. In 1424, Parliament desired the King to mend his money, when he thought fit, and to strike it of the same weight and fineness as that of England. Of course this was never done. About 38 lbs. weight of gold was coined.

237. In the reign of James II. (1438,) there was great confusion of the coinage. Not only the weights of the coin were altered, but their denominations. In 1451, an Act directed a new coinage to be struck equal in weight to that of England, at the rate of eight groats to the ounce. Each new groat should pass for eight-pence, with half-groats, pennies, half-pennies, and farthings, in proportion. The English groat was to pass at a similar value. The gold lions were to be of the same weight as the half-nobles, and pass for 6s. 8d. In 1456, the new groat was ordered to pass for twelve-pence. Thus by the Act of 1451, the pound weight was made equal to £3 4s. in tale; and by the Act of 1456, to £4 16s.

238. These tamperings with the denomination of the coin continued in the reign of James III. (1460.) In 1467 the old English groat was raised to sixteen-pence; the new groat to twelve-pence; the English penny to three-pence. In 1467-8,

Jan. 12, the Scotch groat of the crown was raised to fourteen-pence, and the old English penny to four-pence. The pound weight was thus £5 12s. in tale. In 1475, groats of 12 to the ounce, to pass for twelve-pence, were coined, which brought the pound weight to £7 4s. in tale. In 1483, groats of 10 to the ounce, to pass for fourteen-pence, were coined, making the pound weight £7 in tale.

239. Similar tamperings took place with the denomination of the gold coinage. In 1475, the *demy* or Scottish crown was raised to 13s. 4d. In 1483, the penny of gold was ordered to be of the weight and fineness of the rose noble, and to be equal to 30 groats at fourteen-pence each.

240. James IV. (1488,) made no alteration in the coinage.

241. With James V. (1514,) an alteration in the fineness of the coinage took place. Up to this time it had always been the same as the English, namely, 11 dwts. 2 grs. fine. It was now reduced to 10 dwts. 2 grs. fine. In 1525, eleven groats were ordered to go to the ounce, and pass for eighteen-pence each; and in 1527, the king entered into a contract with Joachimus Hochstetter for a new coinage. Out of the pound of pure silver, there were to be coined 176 silver coins, to be of the value of eighteen pence, of the fineness of 10 dwts. 2 grains. They might also coin pieces of twelve-pence, and six-pence. The obscurity hanging over these frequent changes in weight and denomination has rendered it impossible to ascertain what tale the pound weight had become, different authorities making it vary from £9 12s. to £11 17s.

242. After this reign the groat disappears, which had been the largest coin struck hitherto in Scotland. It originally was of the same weight and nominal value as the English groat, but it was now reduced to about 3-5ths of its weight, and yet passed for between four and five times its first value.

243. About the tenth year of the reign of the unhappy Mary (1544), pieces called testoons were coined, weighing about 66 or 68 grs. It is not known what value they passed for, but as they were seven to the ounce, they may probably have been about 3s.

During her marriage with the Dauphin, testoons and half testoons were coined, of 92 and 96 grs. weight; but the authorities cannot tell us their nominal value. Similar coins were struck during her widowhood. On her marriage with Darnley, in 1565, a much larger and more magnificent coinage was struck. It was enacted, December 22, 1565, that there should be coined a penny of silver, called the *Mary Ryall*, of the fineness of 11 dwts. fine, and of the weight of one ounce troy, and to have course for 30s., and proportionate coins for 20s. and 10s. Repeated tamperings with the nominal value took place. In 1544, the pound weight passed for £9 12s. in tale; in 1556, for £13; and in 1565, for £18.

244. According to the usual fortune of the House of Stuart, James VI. succeeded to the throne as an infant (1567). Orders were given by the Council to coin pennies of silver, to be called the *James Ryall*, of similar weight as the *Mary Ryall*, and to pass at the same rate. In 1579, the king, with the advice of his three estates of Parliament, ordered that a penny of gold should

be coined, 21 carats fine, at the rate of 10 to the ounce, to be current for 40s. Scots, and that the mint price of pure gold should be £21 the ounce, and other gold in proportion to its fineness. At the same time a penny of silver was to be coined, 11 dwts. fine, weighing 17 dwts. 11 grs., to be current at 26s. 8d., Scots, to be called the two-mark piece. The mint price of pure silver was to be 36s., and other silver in proportion to its fineness.

245. In 1580, the money was again altered. The Paris ounce of silver was to be coined into 44s., and gold coins were to be struck at the rate of five to the Paris ounce, 21 carats fine, to be current at £4 4s. In 1581, this coinage being found to be misrated, it was called in, and ordered to be recoined, in 10s. pieces, 11 dwts. fine, containing four to the ounce. In 1584, it was found that the gold coinage was all disappearing, and foreign coins introduced; and it was ordered that new gold coins should be struck, six pieces to the ounce, 21½ carats fine, to be current at £3 15s., and others at nine to the ounce, to pass for 50s. In 1593, the gold was ordered to be 22 carats fine, and to be rated at thirty pounds Scots to the ounce; and five pound pieces to be struck at six to the ounce. In 1598, in order to drive out the foreign coins, they were ordered to pass only at £28 16s. to the ounce, 22 carats fine. The thistle noble was ordered to pass for £7 16s.; the hat piece for £4 9s.; and the lion at £5. The great scarcity of coined money being much complained of, and the prices of all sorts of gold and silver money, foreign as well as domestic, having risen to a great height above the legal rates, to the confusion of the people, the ounce of silver was ordered to pass for 50s., and the old 30s. pieces to be raised to that rate, and the new ones, being ¾ of an ounce, to 37s. 6d. In 1601, the gold was ordered to be 22 carats fine, and to be rated at £36 the ounce, to be coined in pieces at six to the ounce, to pass for £6. The in-bringer of bullion was to receive 33 pounds for every ounce.

After the accession of James to the throne of England, he coined very little Scotch money, either of gold or silver. It is all of the English standard, and nearly similar to it in type, weight, and denomination. By an Act of 1603, the Scottish gold coins were declared current in England in the proportion of 1 to 12, and English coins were made current in Scotland in 1619, at the same rate.

246. Charles I. (1625) was the last king who coined gold money for Scotland during this century. He coined the sovereign, or sceptre, at 154 grains, which was called the £12 piece, but must have been worth about £13 13s. Scots, the ounce of gold being raised to £41 in tale. He also coined a considerable amount of silver money.

247. Charles II. (1660) coined 4, 2, 1, and ½ mark pieces in silver, the first of these weighing 16½ to 17 dwts., and the others in proportion. In 1675, he coined dollars of about the same weight as the four mark piece, to pass for 56s. Scots, and its subdivisions in proportion. James VII., during his short reign, coined 40s. and 10s. pieces, the former weighing 280 to 285 grains.

248. William and Mary (1688) coined 60s., 40s., 20s., 10s., and 5s. pieces, of the same weight

as those of the preceding reigns. In 1701, a small coinage of gold took place from the metal sent over from the disastrous colony of Darien. The coins were called pistoles and half-pistoles, the former weighing 106 grains. It is not certain what they were rated at.

249. Anne (1701) coined only 10s. and 5s. pieces in silver, weighing 70 and 35 grains. By the treaty of Union (1706), it was provided that the coinage of Scotland should be assimilated to that of England, and all losses sustained by private persons by this operation were to be made good out of the equivalent fund. The English shilling passed for 13d. in Scotland, and as this was to be reduced to the same value as in England, it became necessary to compensate the holders of English money in Scotland, and at the same time to do it so quickly that no time should be given to import more English money in order to reap the benefit of the compensation. The measures were prepared secretly, and on a given day, all the holders of English money were suddenly ordered to bring it to certain places, where the money was told off, sealed up, and returned the same day, with a certificate entitling the proprietor to be paid out of the equivalent fund. There was also £150,000 in foreign money brought in to be exchanged. But the measures were so well taken, that new English money was issued in great quantities from the Mint, and no disturbance of trade took place, and Scotch money finally ceased to be current in September, 1708.

Numismata Scotiæ; or a series of the Scottish Coinage from the reign of William the Lion to the Union. By Adam de Cardonnel. Edinburgh, 1786.

A view of the silver coins of Scotland. By T. Snelling. London, 1763.

A view of the Coinage of Scotland. By John Lindsay. Cork, 1845.

On the Coinage of Ireland.

250. The origin of coining in Ireland is lost in the ages of fable. The national mythologists boldly claim the honour of coining for Eadner Deagh, who was about contemporary with Solon. But safely dismissing these myths with the credit they deserve, it is certain that Ireland was comparatively a wealthy and enlightened country during the deepest ages of European darkness. The Danish historians relate that the Scandinavian pirates in the ninth century invaded Ireland, defeated the king, and sacked his treasury at Dublin, and carried off such quantities of money, that every man had as much as he could carry away.

251. Payments, offerings, and ransoms were paid also in bullion measured by the ounce. In 1004, Brian Boroiame offered 20 ounces of gold on the altar of St. Patrick at Armagh; in 1154, Tridelvos O'Connor, king of Ireland, received 60 ounces of gold as the ransom of the chief of the people of Munster, whom he had defeated, and many other instances might be mentioned. Moriortagh O'Loughlin, king of Ireland, let some land to the monastery of Ardraccan in perpetuity, at a yearly rent of three ounces of gold. Thus it appears that it was customary to stipulate for payments in weight as well as by tale, as it was also in France and England at the same period. Abundance of Irish coins of the 9th

and 10th centuries exist, but it is impossible to ascertain their dates. Their weights vary from 25 to 10½ grains, and consequently supposing them to be called by the same name, and to pass for the same nominal value, it is clearly seen that it was a necessary precaution to stipulate that payment should be made by weight, and not by tale.

252. No evidence exists to shew that Henry II. coined money in Ireland. But in 1177, John being then 11 years of age, was declared Lord of Ireland, and money was struck in his name, of the same standard as the English money. The Irish money consisted of halfpennies of 11 grains. In 1210, in the 11th year of his reign, John again visited Ireland, and appointed John de Grey, Bishop of Norwich, Lord Justice, and ordered him to coin pennies, half-pence, and farthings, of the same standard as those of England, which were to be current in both countries.

253. The coinage continued to be the same in the two countries, and was afflicted with the like disorders of clipping and forgery, during the long and feeble reign of Henry III. In 1272, five or six sorts of base money were in circulation. The first thing Edward I. did, was to reform the coinage. He ordered Gregory Rockley, Lord Mayor of London and Master of the Mint, to make his silver 11 oz. 2 dwts. 6 grs. fine, and out of the pound of twelve ounces to coin 243 pence, of the weight of 24½ grains. In 1279, he coined groats, half-pence, and farthings, to be current in England and Ireland. In 1300, crocards, pollards, and the other foreign base coin were decreed in Ireland as well as in England.

254. In 1326, Edward III. cut the ounce into twenty-six pennies. In 1336, he reduced the fineness of the bullion to 10 ounces, and cut the ounce into 21 pennies, so that the mint price of silver was now 21d. the ounce. The Irish pennies were thus a larger coin than the English, for they weighed 21½ grains, the English only 19. In 1338, the circulation of the base money called Turneys was prohibited, as soon as sterling money should be issued to replace them.

255. Nothing calling for special remark occurred till 1465, when in the 5th year of the reign of Edward IV. a Parliament was held at Trim, before Thomas Earl of Desmond, deputy to George Duke of Clarence. Up to this time the coins had always been rated at the same value both in England and Ireland, but in this Parliament they were ordered to pass for a higher rating in Ireland than in England. The noble, which passed in England for 8s. 4d., was ordered to pass for 10s. in Ireland, and the half and quarter nobles in proportion. And from this time all money coined in or for Ireland was of less value than the English generally by one fourth part, so that from thenceforth the Irish shilling was worth only ninepence. Light money was not to be received. In 1467, however, it was enacted that light gold money might be current, but the deficiency was to be made up in silver. The rating of the noble was raised to 10s. in England at this time.

256. In 1467, a great tampering with the coinage took place. An act was passed that a silver coin should be struck, called a *double*, to pass in Ireland for eight pence. The pound weight of silver should be cut into 120 such pieces. Groats of four pence, and half-groats of

two pence, deniers, half-pennies, and farthings, were to be coined in similar proportions. These coins were to be struck at Dublin, Trim, Waterford, Limerick, Drogheda, Galway, and Carlingford. For every ounce of bullion brought by a merchant to be coined, he was to receive back six shillings at this tale, and the king was to receive the remainder for seignorage, out of which he was to pay the expense of coining. After the following Easter this money only was to be current, all other was decreed, and paying or receiving it was made felony. According to this Act, the double or eight-penny piece weighed only 44 19-24 grains Troy, and, therefore, the penny 5½ grs. nearly, being less than one-fourth part of its original weight, and being an immediate reduction of one-half. This great fraud produced its inevitable consequences. A prodigious rise took place in the prices of all necessaries and provisions, and everything was thrown into confusion. In the next Parliament, held in Dublin in 1470, it was recited in an Act, that in consequence of this new coinage the people had been greatly impoverished, many of them had given up their houses and left the country. All merchandise and provisions had grown extremely dear, from which many people were like to die of want. To remedy this, it was enacted that the master of the Mint should coin at Dublin, Trim, and Drogheda, five sorts of silver coins, of the fineness of those struck at London, of the same names as before, the groats to be cut at the rate of 132 groats to the pound weight, and to pass for four deniers. This groat, therefore, weighed 43 84-132 grains. The English groat at the same time weighed 46½ grains. The money struck in terms of the former Act, was reduced to the same rating as the new coinage. By this Act the pound of bullion was cut into 132 groats, or 44 shillings in Ireland, while in England it was cut into 112½ groats, or 37s. 6d., being a difference of 6s. 6d., or 17½ per cent. in the pound of silver. The fraudulent mint masters, however, coined money of less than the legal weight. In 1462, Germyn Lynch, Master of the Mints in Ireland, was indicted for coining forty-eight shillings out of the pound, instead of forty-four. In 1472, the groat of full weight was rated at five pennies, the gold noble at 10s., the crown at 5s., the quadrant at 2s. 6d.; whatever they might be deficient in weight was to be made up in current silver. In 1473, the ounce of silver was ordered to be cut into 14 groats, to pass at four pence each, and other coins in proportion. The seignorage was to be 3d. per ounce in groats, and 4d. on other coins. Thus the mint price of silver was now 56s. per pound, or 4s. 8d. the ounce. The weight of the groat was thirty-two grains, or little more than two-thirds of the English groat.

257. In 1475, the groats of Edward III., Richard II., Henry IV., Henry V. and Henry VI., not clipped, were raised to sixpence, and the English groats of the present king, at five pence, and all the money struck in Ireland at its current rating. All the Mints, except those of Dublin, Waterford, and Drogheda were suppressed. In 1476, the silver money coined at Cork, Youghall, Limerick, and other places in Munster, except Waterford, was found to be light and base, and was decreed. The gold royals were ordered to be current in Ireland at 13s. 4d.; the gold angel at 8s. 4d.;

the gold noble at 12s., and the smaller coins at proportionate rates; any deficiency in weight to be made good in current silver. Several species of foreign money were also legalized; the rider, the ducat, the lyon, the crown, the crusade, the salut, for five shillings, and the Burgundy noble for ten shillings.

258. In 1478, fresh alterations in the coinage took place. Germyn Lynch had been convicted of coining light money, but he was pardoned, and restored to his office. In this year he was allowed to coin money at the rate of 4s. 10d. per ounce, giving back to the merchant 4s. 4d., and retaining four pence for the king.

259. In 1483, the first thing the Parliament of Richard III. did, was to turn Germyn Lynch out of his office of mint master, for having resumed his old malpractices during the last three years of the last reign. The silver pound was ordered to be cut into 225 groats, at four pennies each. The groat was then reduced to 25 15-twenty-fifths grains. The difference between the English and Irish groat was now about 60 per cent. For many years after this, the current coin was so clipped that the greatest inconvenience arose. In 1491, a law was passed to prohibit the receiving or paying clipped or counterfeit money, and it was forbidden to be imported into England above the value of 3d. About this time the difference between the English and Irish coinage was about one-third, as appears from a letter from Octavian, Archbishop of Armagh, to the king in 1487, recommending Arthur Magennis for the bishoprick of Dromore, wherein he says the revenue of the diocese is not worth above forty pounds of the coin of Ireland, which is less by the third part than the coin sterling. This debasement of the coinage was so great at the beginning of Henry VIII.'s reign, that the Earl of Surrey, Lord Lient. of Ireland, requested to be recalled, as for want of money and supplies from England, he was unable to carry on the war against the rebels. It appears too that in 1530, payments were made by weight in consequence of the bad state of the coinage, as Archbishop Allan states that he was obliged to redeem the Archbishop's cross, which had been pledged, at his own expense, and it cost him near an hundred ounces of silver. In 1530, there was a new coinage, but to what extent is uncertain. In 1541, Henry VIII. was proclaimed king of Ireland, on which occasion new groats were struck. They weighed about 40 grains each, but the metal was considerably debased, being 9 oz. 6 dwts. fine, and 2 oz. 14 dwts. alloy; for which reason an act was passed to prohibit their importation into England, under forfeiture of treble their value. In 1544, the coinage was still further debased to 8 oz. fine and 4 oz. alloy, and six-penny pieces at the rate of 144 to the pound, which was the weight of the four-penny pieces in England. In 1546, the king having wasted all his resources by his wars with Scotland and France, ordered brass money to be coined, and pass current for good and lawful money in all parts of Ireland.

260. In 1551, the 4th of Edward VI., an indenture was made with Martyn Piri to coin groats of 4 pence, at the rate of 144 to the pound. They weighed therefore 40 grains. But the metal seems to have been as much debased as

ever, as in the last year of his reign, the groats were cried down to 2 pence.

261. In 1553, Queen Mary, in order to ingratiate herself with her English subjects, forbade the currency of base money, and ordered the standard of gold and silver to be restored. But Ireland was particularly excepted from the proclamation. She made no improvement in the standard, but ordered shillings, groats, and two-penny pieces to be coined. Forty shillings went to the pound, and weighed 144 grains. The other coins were in proportion. In 1554, Sir Edmund Peckham, treasurer of the mint of England, and others, were empowered to make £10,000 worth of base money for Ireland, 3 oz. fine, and 9 oz. alloy, of the same weight as the preceding. In 1557, they were empowered to coin another quantity of £7,000 worth of similar base money, and in the following year, £5,500 more.

262. Elizabeth ordered the pound of silver to be coined into 60 shillings, and carried out the reform of the English coinage which had been determined on by Edward VI., and begun by Mary. As a mode of getting rid of the base coin in England, she gave a commission to Sir Edmund Peckham and others, to convert it into harp shillings, and groats, for the use of Ireland. Out of four thousand pounds of this base coin, eight thousand pounds of harp groats and shillings were to be coined 3 oz. fine, and 9 oz. alloy. The shillings to be 40 to the pound weight. Accordingly no sooner was the base money decried in England than it was imported in vast quantities into Ireland. In 1560, however, the coinage of Ireland was restored to the same purity as that of England. Whereupon the popular joy found vent in the following doggrel:—

"Let bonfires shine in every place,
Sing, and ring the bells apace,
And pray that long may live her grace,
To be the good Queen of Ireland.

The gold and silver which was so base,
That no man could endure it, scarce,
Is now new coyned with her own face,
And made go current in Ireland."

But the Queen seemed unable to carry out her plan to its proper conclusion. Shillings of the value of ninepence English were coined, and ordered to pass current in Ireland for 12 pence. They were cut at 82 to the pound, and weighed 70½ grains.

263. In 1598, the Queen returned to the old fraud of debasing the coinage. She made an indenture with Sir John Martin and his son, the master workers of the mint in the Tower, to coin shillings, half and quarter shillings, pennies, and half-pennies for Ireland, of metal only 3 oz. fine to 9 oz. brass. In 1601, the metal was still further debased to 2 oz. 18 dwt. fine, and 9 oz. 2 dwt. alloy. Copper pennies, and half-pennies, were also coined 190½ pennies to the pound. This was during Tyrone's rebellion. The Queen caused immense quantities of base money to be coined in the Tower, and sent over to Ireland, to pay the army, and at the same time by proclamation, declared this base money to be the lawful and current money of the country, and ordered it to be received in all payments whatever, at its full nominal value, shilling for shilling, under penalties for refusal. In order to facilitate the currency of the base money, all the good was cried

down, and ordered to be considered only as bullion. The policy of this measure, Camden says, was much debated at the Council, many of the members as well as the Queen being against it as likely to be prejudicial to the interest of her subjects, distasteful to the army, and inoperative so far as regarded its intended effects against the rebels, and very damaging to the credit of the Queen. But the Lord Treasurer Buckhurst, after much persuasion, prevailed that it should be tried for a short time, and afterwards the money should be restored to its full value. This foolish plan of course produced all the evil, and none of the good expected from it. Provisions and all things immediately doubled in price. Loud complaints rose from the army, and the Lord Deputy himself said in his letter to Cecil, 10th November, 1601, that his private estate could no longer support the expense at which he was forced to live. Commerce was thrown into confusion, and a great outcry was raised against the merchants for raising the prices of their commodities, whereas it was clear they could not help doing so when they were now obliged to pay 60 pounds Irish, for what they could formerly get for £15 in the foreign markets. The same rule applied to every article in succession in commerce.

264. James I., (1603,) finding the rebellion suppressed, issued a proclamation regulating the currency of the Queen's base money. He ordered the standard to be brought back to 9 oz. fine, and 3 oz. alloy, as was the old Irish standard, and the base mixed money of 3 oz. fine was reduced to its value in silver. The base shilling was reduced to four-pence, and the others in proportion. In 1605, the base shilling was reduced to three-pence, and the others in proportion. In 1607, English shillings were made current in Ireland at sixteen-pence, and afterwards all English money was made current at one-third above its rating in England. The exchange between Dublin and London was at 20s. Irish for 15s. English. In the first ten years of the reign of James I., there were coined of Irish sterling money £166,273 11s.

265. Charles I., (1625,) had granted a patent to the Dowager Duchess of Richmond and Sir Francis Crane, to coin copper farthings, to be current in England and Ireland. These were made in such quantities that, in 1634, a proclamation was obliged to be made that no one should be obliged to take them, and no one should pay more than two-pence in farthings at once. In the same year the exportation of all the good gold and silver coin from the country, in consequence probably of the bad state of the coinage, attracted the attention of Parliament, and both houses, after many debates, agreed to petition the King for the re-establishment of the Mint at Dublin. The King agreed to this, and it was ordered that it should be done, and money struck of the same weight and fineness as that of England. But, from the troubles that broke out soon afterwards, it was never carried out. In 1637, it was ordered that the name of Irish, or harp-money, should be abolished, and all accounts, receipts, and payments reduced to sterling, and made in English money, to the great simplification of business.

266. Cromwell coined no money for Ireland. During the commonwealth many persons in Dublin and other places issued brass or

copper tokens, with their names and places of abode upon them, which passed for a penny each in their neighbourhoods, and among their customers. This expedient was frequently repeated during the following reigns. In 1651, several persons in London sent over great quantities of clipped and base money, which they issued by means of agents, several of whom were caught and executed. The clipped money was ordered to pass by weight only. The base half-crowns were so bad that they were not really worth more than two-pence. Some Peru pieces current for 4s. 6d. were not really worth more than 2s. 4d. Out of pieces of this kind in circulation to the amount of £635, it was found on assay that they were not really worth more than £401 in sterling money. The council repeated the request to have a mint in Dublin, but it was never done.

267. In 1660, Charles II., in order to put an end to the disorders arising from the base coin, found it expedient to legalise and regulate the value of several kinds of foreign coins; by this proclamation we ascertain the names of those in circulation. They were,—

and their halves and quarters in similar proportions.

All persons were forbidden to make and issue tokens without licence from the king. But the want of small change continuing, these tokens were as abundant as ever in 1672. In the following year the exportation of gold and silver specie of all sorts, caused no doubt by the bad state of the coinage, was so common that it was forbidden by proclamation, and another attempt was made to suppress the tokens. Plans were discussed for supplying copper money to replace them; but nothing was done till 1680, when a patent for 21 years was granted to Sir Thomas Armstrong and Colonel George Legg, to make copper halfpence to weigh 110 grains Troy. These were declared to be current coin, and all tokens were forbidden under severe penalties. No one, however, was bound to receive payment in these halfpence of more than 5s. in any one sum of £100. And in case traders had more than they could employ of them, the patentees were ordered to be ready at all times to exchange 21s. in halfpence for 20s. in gold or silver. These coins were the best copper money yet struck for Ireland. The foreign coins current in the country were somewhat raised in rating in 1683.

268. In March, 1689, the king, being driven out of England, arrived in Dublin, and immediately raised the rating of the foreign gold and

silver coins. The guinea was ordered to pass for 24s., and the shilling at 13d. This rating continued till 1826, and was the origin of the expression used with regard to the Irish exchange, that it was at par when at 8½, which simply meant that £108 6s. 8d. Irish was equal to £100 sterling. This raising of the denomination was done under the delusive idea that the money could be retained in the kingdom, as merchants were beginning to leave it, with their effects, in consequence of the civil war they evidently foresaw. Such expedients, however, were futile. The king then determined to seize the coining presses of Sir John Knox, to whom Armstrong's patent had been transferred four years before, and coin brass and copper mixed metal money. This was ordered to be received in all payments whatever as of equal value with gold and silver. Some old brass guns in the castle yard were sent to the Mint to be turned into this money, and the collectors of the revenue were ordered to collect all the copper and brass they could in their respective districts, and send it to the Mint. Several proclamations were issued, regulating the currency of this brass money. In 1690, pennies were struck of a mixture of lead and tin, and crown pieces of white mixed metal. In June, the half-crowns were called in, and re-issued as crowns. People were forbidden to give more than 30s. in brass or copper money for the French louis of gold, or for any guinea more than 38s., under pain of death and forfeiture. Counterfeiting this coin was declared high treason.

269. The metal of which this money was made was a mixture of old guns, broken bells, copper, brass, pewter, and the refuse of metals, melted down together, and in reality was worth about 3d. or 4d. the pound, but by the last issue it was made to be current at about £10 sterling the pound. In twelve months time there was coined in weight of metal 389,724 pounds, to be current at the nominal value of £1,596,799, and from the subsequent raising of the half-crowns to crowns, the nominal value was increased to upwards of two millions. When the king was finally driven out of Ireland, only £22,489 was left in the Mint. Immediately after the battle of the Boyne, King William issued a proclamation reducing this base money to its real value as metal. The crown pieces were reduced to one penny, and the shillings to a farthing. In 1693, it was totally abolished, and a proper coinage issued instead. In 1696, the disorders of the English coinage extended to Ireland, and guineas were raised to 26s., and the shilling to 1s. 2d. In 1697, much forged and base coin was imported from Scotland, and much counterfeited gold and silver money was in circulation. In 1701, the values of the foreign gold and silver coin were reduced to their former rates.

270. Anne coined no money for Ireland, but issued some regulations regarding the current foreign coins. They were to be received, if light, upon paying two-pence for every grain deficient in gold, and 1½d. for every ¼ dwt. in silver. In 1718, the lord justices ordered that gold and silver money should only pass by weight.

271. In 1722, George I. granted an exclusive patent for fourteen years to a Mr. Wood to coin halfpence and farthings for the use of Ireland; the whole quantity for that space of time to be

limited to 360 tons of copper, a pound of copper to be coined into 2s. 6d. One hundred tons were to be issued during the first year, and twenty during each of the remaining thirteen. A rent of £800 per annum was to be paid to the king, and £200 to his clerk comptrollers. If the whole quantity of copper had been coined, the 360 tons, at 2s. 6d. per pound, would have amounted to £100,800 in current value. But according to the report of Sir Isaac Newton, the copper was not worth in the market above 12d. or 13d. the pound, and might be purchased in Bristol for £40,320, and consequently the difference in favor of the patentee would have been £60,480, out of which, deducting the reserved rent of £14,000, the profit of the patentee would have been £46,480. But the coins were not even struck of their stipulated weight, and consequently the loss to Ireland would have been much greater. It was found that their weight varied from 120 to 96 grains, so that the loss upon some sorts was 30 per cent. more than even allowed by the patent.

272. Be that as it may, however, it is certain that the coinage was very much wanted, and there is no doubt that it was extremely well executed. Wood himself, though contemptuously designated as a low mechanic, and a hardware man, in the controversy we must now notice, was in fact a great proprietor and renter of iron mines, and he was the lessee of the mines in the crownlands in thirty-nine counties. He owned, besides, several large iron and copper works. There was, consequently, no impropriety in his executing the work, any more than in Boulton and Watt executing the copper coinage of England in 1797. Under other circumstances, the new coinage would probably have been received with favor.

273. But there was at this time in Ireland, a man of turbulent and discontented spirit, Swift, the Dean of St. Patrick's, of a bitter and malignant temper, beyond even the usual bitterness of malignancy of the factions of those days. Hating with all the hatred of a renegade the party in power, seeing his hopes of advancement for ever blasted by the utter destruction of the party he had adopted, its leaders proscribed and in exile, and doomed to live among a people he despised, and in a country he detested, he had long been seizing every opportunity to inflame the minds of the Irish against England. Already, in 1720, he had, with his powerful invective and satire, quashed the project for establishing a National Bank in Dublin. The imaginary grievance of Wood's half-pence gave him the opportunity of inflaming the minds of the people to the verge of civil war. He had written a pamphlet in 1720 to excite the Irish to use nothing but home manufactures, for which the printer was prosecuted, and the jury overawed into giving a verdict for the Crown by the Chief Justice. There were some circumstances, however, to lay hold of in Wood's patent. It had been passed without consulting the Lord Lieutenant or Privy Council of Ireland. The chief Whig family, the Brodericks, were in an ill humour with Walpole, and opposed the grant, and Carteret fomented the opposition to embarrass his rival in the cabinet. The Parliament was thus easily persuaded to consider itself insulted, and addressed the Crown to stop

the coinage, as involving a mark of subjection to England. The Dean was not slow to seize the opportunity. Three letters appeared in the papers, signed M. B. Drapier, attacking the new coinage as regarded its value and weight. There was nothing in these papers but the most legitimate objections, expressed in so cutting and masterly a style, that every one knew that the *Drapier* could be no other but one man. The most prodigious ferment immediately arose. The tradesmen to whom the new coins were consigned gave public notice that they would have nothing to do with them. Associations were formed to refuse them. Apprentices and errand boys told their employers they would not take these drossy half-pence, "for they could get neither news, ale, tobacco, or brandy for such cursed stuff." Swift preached openly against the new half-pence, as well as writing. He poured out a perfect fire storm of ballads, satires, squibs, and libels, which were propagated by hawkers. Riotous processions burnt Wood in effigy. No man's life was safe who was supposed to favor him. The most treasonable and libellous pamphlets circulated freely, without the Government daring to notice them, so long as they contained some mention of Wood's half-pence. It was quite clear that an attempt to enforce their circulation would produce a civil war.

274. Walpole, at last thoroughly alarmed at the state of things, tried to back out gradually from his position, without too manifest a confession of the defeat of the government. It was proposed that the issue should be reduced to £40,000. This, however, did not pacify the people. By a stroke of policy, the minister determined to send Carteret, who embarrassed him in the cabinet, and who for that purpose had fomented the opposition, as Lord Lieutenant of Ireland. The people being now thoroughly roused, the Dean, in a fourth letter, threw off the mask, and asserted the independence of Ireland. Carteret was obliged to offer a reward of £300 for the discovery of the author, whom every one knew. The printer, Harding, was seized and imprisoned, and a crown prosecution begun against him. One day, at a levee, the Dean, to the consternation of the courtiers, burst through them, and demanded of the Lord Lieutenant, in a boisterous tone, why a poor tradesman, who had done nothing but publish three letters for the good of his country, was thus treated. Carteret, who must have been laughing in his sleeve at the solemn comedy, replied with dexterous urbanity,

"Res dura, et regni novitas, me talia cogunt Moliri."

to the infinite relief of the bystanders.

275. The grand jury ignored the bill, notwithstanding all the browbeating of the Chief Justice, who had been just barely successful a few years before in getting a verdict against the printer of one of Swift's former pamphlets on trade. The next grand jury of the county and city of Dublin presented Wood's scheme as a fraud and a cheat, and expressed their gratitude to the patriots who had exposed it. The Drapier now was more treasonable than ever, and the remaining letters are more political than economical. At last, seeing that the scheme was hopeless, Wood was

obliged to surrender his patent, and received a pension of £3,000 a year for 12 years.

276. Factitious as the Dean's outcry against the halfpence was in the main, he had one strong point at least in his favor. The manner in which Wood's patent was carried through was certainly a slight to the country. The former patents had been passed under the great seal of Ireland; and besides that, the patentees had always been obliged to buy back their own coin on demand in gold and silver, which indeed was the reason why they abandoned them as unprofitable. Wood's patent contained no such stipulation.

277. In 1725, a proclamation was issued to make the new gold coin of Portugal current in Ireland. It was of the weight of 18 dwts. 9 grns., and made current at £4, and its subdivisions in proportion. The complaints of the want of small change were as loud as ever, and the usual consequence had followed, namely the issue of tokens by private persons. Numerous persons in the north and other parts of the kingdom, made copper and silver tokens, which they passed as promissory notes among their workmen, customers and neighbours, those of copper for twopence, and those of silver for threepence. The copper ones had on them, *I promise to pay the bearer twopence*, and the silver ones, *I promise to pay the bearer threepence*, and each had the name and address of the person who issued them. In Dublin they were even higher. One Maculla, a brazier, issued a neat copper penny and half-penny, having on one side, *I promise to pay the bearer on demand twentypence for these*, and on the reverse, *Cash notes val. received, 1729, James Maculla, 1d. or ½d.* In order to remedy these inconveniences, the government, in 1736, ordered 50 tons of copper to be coined five sixths into halfpence, at the rate of 52 halfpence, and the remaining one sixth into farthings at the rate of 104 farthings to the pound weight. The cost of this to be borne by the crown, and any profits above the expense of coining to go to the nation. This was done, and the new coinage was issued for circulation in April, 1737, and was considered a very fine specimen of coinage.

278. The disproportion between the values of the gold and silver coins, compared to the value of the metals in the markets of the world, produced their usual consequences. Gold was over-rated by about 2½ per cent., and the silver coin was melted down, and exported in large quantities, in defiance of all the laws and penalties to the contrary. To remedy this many plans were suggested, and many pamphlets written. The government adopted the plan of lowering the rating of the gold coin. The guinea was rated at 22s. 9d.; the moidore at 29s. 3d.; the quadruple pistole at £3 13s.; the Louis d'or at 22s.; and the Portugal gold coin at £3 17s. 8d. But Simon says the government mistook the remedy. The guineas were generally light, so that any one who had 100 of them, instead of having £113 15s. of real value as he ought to have, had not in fact more than £106 5s. at a moderate medium. The owner of 100 moidores of full weight had before the reduction 150 pounds, or, £144 11s. 8d., if according to Newton, they were worth 27s. 9d. English, which was 29s. 11d. Irish. By the proclamation they were reduced to 29s. 3d., and therefore the loss upon 100, would be £5 8s. 4d.,

whereas the loss upon 100 light guineas would be £7 10s. Upon £150 of the current English shillings and sixpences, there was, on an average, a deficiency of £34 12s. 3d. Simon says that the silver ought to have been raised to an equality with the gold, which would have prevented the melting and exportation of the silver coinage, which, in 1737, was so scarce that a well preserved half-crown was a great rarity even among the curious. They disappeared as soon as they were issued. The only current silver money was English shillings, not worth more than 9d. or 10d., and sixpences not worth a groat. The reason of this was that silver was sold at 5s. 6d. the ounce in England, and 5s. 9d. the ounce in Ireland, making a profit of about £7 1s. 9d. per cent. on exporting it.

279. Nothing requiring particular remark occurred till 1804, when the coinage of Ireland was again in a most disgraceful state. The best description of coins was silver, but so light that 21s. were not really worth more than 9s. The total disappearance of the good money was greatly caused by the extravagant over-issues of the Bank of Ireland, and gave rise to the appointment of the Committee of the House of Commons on

Irish Exchanges, whose report is fully noticed under BANKING IN IRELAND (§ 342.) An attempt was made by some of the members of this committee to procure an Act to assimilate the Irish and English money of account; but it did not succeed until 1825, when an Act (Statute 1825, c. 79) was passed to assimilate the currency and monies of account throughout the United Kingdom of Great Britain and Ireland. By this it was enacted that all payments of every description, contracted to be made in Irish currency before the passing of the Act, should be satisfied by payment of 12-13ths of the amount in British currency. Provisions were made for changing all sorts of sums from Irish into English currency. The Irish copper coinage was then called in, and exchanged for British copper money; and all bankers were to call in their notes payable in Irish currency, and re-issue them payable in British currency.

Essay on Irish Coins, and the Currency of Foreign Monies in Ireland. By James Simon, with Mr. Snelling's supplement. Dublin, 1810.

A view of the Coinage of Ireland. By John Lindsay. Cork, 1839.

Table shewing the successive depreciations of the Gold and Silver Coinages of England and Scotland, from the Conquest to the present time.

On the Coinage of France.

280. In order to render the history of the coinage of France intelligible to the reader, we prefix the measures of weight and fineness formerly in use.

The fineness of gold was measured as in England by the *Carat*, or the 1-24th part.

The fineness of silver was measured by the *Denier*, which was the 1-12th part. The *Denier* was divided into 24 grains, and each grain into halves, quarters, and eighths.

The measure of weight first used was the *Livre* or *Pound*, of 12 ounces, which were rather larger than the Roman ounce. The *Marc* of 8 ounces was, however, afterwards substituted for it, and the divisions of the *Marc* were,

The Marc was divided into	8 ounces.
The Ounce	" 8 gros.
The Gros	" 8 deniers.
The Denier	" 24 grains.

The *Denier* and the *Grain* were thus both measures of weight, as well as fineness.

281. The Romans established mints at Treves, Lyons, and Arles, at which they coined both gold and silver; and when the Franks conquered the country, they adopted and continued the coinage already existing. The gold coinage consisted of Sols, Demi Sols, and Tiers de Sol. The Sol was coined at the rate of 72 to the pound, and weighed 96 grains, or 6 to the ounce. These ounces were, however, 1-9th lighter than the French ounces subsequently adopted. The Roman pound of 12 ounces was only equal to 10½ French ounces. The sols, therefore, weighed 85½ grains, *poids de marc*. The half sols weighed 42½, and the tiers de sol 28 4-9th grains. The sol continued to be the general name for the gold coin until the Capetian dynasty, when the *Florin* was adopted.

282. Gold coins were ordered to be made of pure gold, but some portion of alloy was sometimes mixed with them. In order, probably, to guard against this, the Roman Emperors since Valentinian, had adopted the practice already spoken of, §56, as being in use by the Babylonian kings, of melting all the money received as tribute, and keeping it in masses of bullion in their treasuries, and coining it as required, or even paying it away in ingots. The kings of France adopted this practice, as did many of the French nobility, until Philip le Bel. In contracts and laws, payments and fines were directed to be paid in pounds, or marcs of gold and silver.

283. The Salic law proves that the sol of gold was equal to 40 deniers of silver, (Tit. 1. § 5. Tit. 40. § 13), and the demi-sol, and tiers de sol in proportion. These deniers were of silver, 11 den. 12 grns. fine, and weighed 21 grains. From these pieces it appears that silver was to gold, as 1 to 10.

284. Money of copper, and base metal, of the Merovingian race is also in existence, but so worn that it is not possible to ascertain its weight, value, or denomination.

285. Besides these there was the sol of silver of 12 deniers. It has been much disputed whether this was an actual coin, or only money of account. Some writers affirm that there were actual coins of that denomination; but none have ever been found. It would certainly appear more

probable that, like the shilling in England, until coined by Henry VII., it was merely money of account. If they had been coins, they would have weighed 345 grains; and it does not appear that any coin of that weight is known to have been struck in those times. The sol of 12 deniers is first mentioned in the 2nd Canon of the Council held in the palace of Estines, near Binche, in Hainault, by order of Carloman, son of Charles Martel, 1st March, 744. By this, all military men who held possessions from religious bodies were ordered to pay every year a sol of 12 deniers to the church, or monastery, whose tenants they were (*Le Blanc*, p. 41.). Hincmar, Bishop of Reims, speaks of the sols mentioned in the will of St. Remy, which were of gold and worth 40 deniers. It would seem, therefore, that from these different sols being specified on different occasions, that they were distinct, although some writers have maintained the contrary, saying that the same sols were sometimes worth 40, and at other times worth 12 deniers. It appears from the Capitularies of Charlemagne, that Pepin had commuted the penalties fixed in the Salic law at gold sols of 40 deniers, to silver sols of 12 deniers, and this commutation was confirmed by Charlemagne by the 41st Canon of the Council of Reims in 813, and subsequently by Louis le Debonnaire. It is also said in the Capitularies of the Council of Aix-la-Chapelle in 797, that 12 deniers made a sol of silver.

286. The quantity of silver, however, in these sols is not known. Pepin ordered that not more than 22 should be cut out of the pound weight, from which we should infer that it had previously been cut into a greater number. If, then, the sol contained 12 deniers at 21 grains, it would have weighed 252 grains.

287. Pepin, the first of the second, or Carolingian race, was elected king in 751. In a Parliament held at Verneuil in 755, he ordered that the pound weight of silver should be cut into 22 sols, of which the moneyer might retain 1 as payment for his trouble, and he was to give the remaining 21 to the person who brought the silver. By this ordinance, the earliest existing respecting the French coinage, the denier was to weigh 23½ grains, which would bring the weight of the sol to 279 grains.

288. This probably accounts for the increased weight of the gold sol, under the Carolingian race. The specimens of it which exist are much heavier than those of the first dynasty, and, according to Le Blanc, weigh 132 grains. Now, as the gold sol was rated at 40 deniers, it was clearly necessary that it should be increased in weight, if the silver deniers were. This seems to have escaped the notice of that excellent writer, who supposes, p. 89, that the proportion of gold to silver had changed to 11 to 1.

289. This retention of 1 sol out of 22 by the moneyer, seems to have been the first instance of the duty, or charge, afterwards so extravagantly abused, of *seignorage*, as it was clearly much greater than was necessary for the mere expense of coining. It was wholly unknown to the ancients. The Romans did not even take the expense of coinage, which was done at the charge of the State, as at the English Mint, since Charles II. Any private person might take

his bullion to the Mint, and receive back weight for weight in coins. Hence gold and silver in bullion were exactly of the same value as gold and silver in coin. It appears that this seignorage, or tax, was considerably increased by subsequent kings, and formed an important part of their revenue. Louis le Debonnaire granted the right of coining to the monastery of St. Medard, at Soissons, and of retaining the seignorage, to be appropriated to the services performed by them in honor of St. Sebastian. Charles the Bald granted the same privileges to the Bishops of Langres. Charles the Simple granted to the Chapel of St. Clement the 19th part of the moneyage or the tax upon the money coined at the Palace of Compiègne. Henry I. granted to St. Magloire the tenth of all the revenues of the port, except that on money, which he had already given to some one else. Philip Augustus, in 1202, in granting a lease of the Mint at Tournay, reserved to himself the third part of the moneyage levied. The private lords, too, who had the right of coining, were allowed to levy this tax. But its amount is not known from the time of Pepin, who took the 22nd part of 12 ounces, to St. Louis, who coined the marc into 58 sols, and kept back 3 sols 5 deniers for charges of coining and seignorage. This was the 16th part. A proportionate tax was levied on coining gold. The seignorage was given up by several succeeding kings, such as Philip of Valois, John, and Louis XIII.

290. This seignorage or moneyage, indeed, was one of the principal sources of revenue which the kings derived from their domain. Conjoined with the right of debasing their coin, which was expressly asserted by Philip le Bel to be an undoubted privilege of the French kings, it was exactly similar to the extravagant abuses of paper money in modern times. Charles VI., as we shall see subsequently, declared that it was his only resource to resist the damnable invasion of the English. The necessities of Charles VII. were so great that he kept back three-fourths of the marc of silver, and still more of the marc of gold. The grievances and confusion caused by this to the people were so great that they formally agreed with him to pay him *tailles* and aids in consideration of his giving up this right. Thus *tailles* and aids originated in France as a commutation of the right of debasing and tampering with the coinage, as we have already seen that in England a tax was levied in commutation of moneyage, which was attempted to be introduced after the Norman Conquest. Under Louis VII. and Philippe Augustus, towns and whole provinces agreed to a triennial tax in consideration of the king abandoning this alleged right.

291. Charlemagne introduced a change of great importance in the coinage of France, which was adopted throughout Europe, though at what time is not certain. It appears from the Chronicle of St. Gal that in 779, which was the eleventh year of his reign, there was a severe famine in France. To appease the wrath of Heaven, prayers, fasts, and alms were ordered. A council royal was held at Heristal, and its orders are inserted in the Capitularies. Every bishop and abbé, and abness who could, were ordered to give a pound weight of silver, or its value; the less rich ones, half a pound, and the poor ones, 5 sols.

The rich counts were to give one pound weight, and the poorer ones half a pound. The king's vassals who held 200 houses, were to give half a pound; those who held 100 houses, 5 sols; those who held 50 houses, an ounce and a half of silver. Besides that, they and their households were to fast two days, or to commute it, the rich for three ounces of silver, the middling ones for 30 deniers, and the poor ones for 15. It thus clearly appears that the livre was divided into 20 sols, and the denier weighed 25 12-20ths grains. Existing specimens fully confirm this calculation. So also 20 deniers weighed an ounce. Le Blanc says that the Roman ounce weighed 576 grains, which were equal to 512 French grains *poids de marc*. The division of the pound weight into 20 sols, and the sol into 12 deniers, at this time, is fully confirmed by contemporary writers.

292. This division is also confirmed by an ordinance of Charlemagne in 805. Those who failed to appear at the muster of the army after the ban or summons was published, were to be fined 30 solidi, or a pound and a half. He also appointed that those guilty of sacrilege should be fined 30 pounds, or 600 solidi, as is stated in a decree of Pope John VIII., which was published at the Council of Troy, in Champagne, in 879.—(*Le Blanc*, p. 95).

293. Other authors might be quoted if necessary to prove this, but the foregoing are enough. From this time, however, the pound weight was divided into 20 solidi, or shillings, which thus became the pound in tale. And thenceforward 20 solidi, or shillings, were called a *pound*, even after the weight of the solidus, or shilling, was greatly diminished from the twentieth part of the pound weight. This has been done in England, Scotland, France, and Italy, and gives the solution of that puzzle, which is so mysterious to many persons—the meaning of the pound sterling, and which so many persons believe to be an inscrutable myth. Le Blanc says, p. 96, that the sols of Charlemagne were equal to 40 sols of his day (1692).

294. Charlemagne not only founded a new epoch in the denomination and weight of the coinage, but it is also clear that he adopted a new standard pound. The Merovingian race used the Roman pound, which had been long established in the country. Charlemagne took the French pound as his standard measure, which was 12 ounces, *poids de marc*, and was heavier than the Roman pound, as 12 ounces of the latter are equal to only 10½ of the former. As a proof of this, le Blanc cites the following circumstances: First, that the existing deniers of Charlemagne, several of which are well preserved, weigh from 27 to 28 grains, and 28 4-5ths grains, were the 20th part of the French ounce used in his day (1692). From the weight of these deniers, the sol should weigh 345½ grains, *poids de marc*, which was very nearly two thirds of the ecu of 60 sols. Besides these, it appears from documentary evidence, that Charlemagne instituted a new pound. In a deed of the church of Osnaburg, he speaks of "Sixty solidi of our weight." In another deed of the Emperor Frederic II. in 1234, a payment is ordered of 100 pounds of the weight of Charles. Arnold of Lubeck speaks of 4,000 marcs, to be measured by the public weight, which Charlemagne instituted.

Grutter gives the figure of a copper weight with the inscription on it, *pondus Caroli*.

295. In 794, Charlemagne issued a regulation respecting his money, it appears that during his perpetual wars, the money had been somewhat debased, either in weight or alloy. Being at Frankfort that year, he ordered that the deniers he had recently struck should be current throughout the whole country, and should be legal tender in all transactions between man and man, so long as they bore his monogram, and were of legal weight and fineness. Any one who resisted his decree, or refused to receive them, should be fined. Forgers and false coiners, however, created much confusion, and to put a stop to this, he issued a decree from Thionville, in 805, that no money should be coined except in his own palace. This decree was repeated in stronger terms in 808, and the money struck there was stamped with the words *Palatina Moneta*. Louis le Debonnaire, however, appears to have allowed mints in several of his great towns.

296. Three regulations concerning the money are preserved in the Capitularies of Louis le Debonnaire, (814). The first of these, made in a parliament held at Aix-la-Chapelle in 819, enacted penalties against all who refused his money, and also was the first which enacted a penalty against false coiners, who, on conviction, were to have a hand cut off. Intendants were sent throughout the provinces to publish and enforce these ordinances. Existing specimens of his money prove that it was of the same weight as that of Charlemagne. His denier weighed 28 4-5ths grains, which, at the rate of 240 to the pound, were exactly 6,912 French grains, or 12 ounces *poids de marc*. The sol, therefore, contained 14 deniers 9 3-5ths grains. But it certainly does not seem probable that any actual coins of this denomination were struck, as in the ordinances of Charlemagne, Louis le Debonnaire, and Charles the Bald, respecting money, nothing but deniers are mentioned.

297. In 823, the coinage seems to have fallen into confusion, probably from clipping and forging, and in a Parliament held at Attigni, all the money previous to his reign was called in and decreed. In 829, the penalties against all who refused good money were republished.

298. Charles the Bald (840) had the territory known as France allotted to him by his father, Louis le Debonnaire. In 854, in a Parliament held at Attigni, commissioners were appointed to travel through the kingdom to examine the state of the coinage and enforce the laws against clip-pers and coiners. These were renewed in 861. A new punishment was added against those who refused to receive good money in payment. They were to be branded with a red-hot penny on their foreheads.

299. In a Parliament held at Piste, in 854, important regulations were made respecting the coinage. Persons of good character were to be appointed under oath in all cities and towns, to watch the state of the coinage, and see that no one refused good money, or was compelled to receive bad. After the feast of St. Martin, all except new and weighty money was decreed, and might be seized if offered in commerce. Money was forbidden to be struck anywhere except at the Palace, at Quentovic, Rouen, Reims, Sens,

Paris, Orleans, Chalons, Mella, and Narbonne. The masters of the respective mints were to engage moneyers under solemn oath to perform their duty faithfully, to coin none but pure and weighty money, to refine honestly all the bullion brought to them, and to give back the true value in good money. Any one suspected of dishonesty was to purge himself by the ordeal of fire or water. Any one convicted of malpractices should lose his hand, as a false coiner. Every one was ordered to bring his money to the mints to be re-coined, or exchanged for new, before the 1st of July, after which it could not be offered in payment under heavy penalties. Any one who offered light or base money might be compelled to say whom he got it from, so as to go back to the person who had coined it, who was to be severely punished. Counts and other officers were to guard vigilantly against false coiners, and if any fled to refuge, they were to be given up on demand. All persons were forbidden to put any alloy into gold or silver, or to sell any except of absolute purity, under the penalty of losing their hands. The pound of the purest gold was ordered to be sold throughout the kingdom for 12 livres of silver, in new deniers; less pure gold might be sold at ten livres. The deniers of Charles the Bald appear to be heavier than those of Charlemagne, for they weigh thirty-two grains, which only gives eighteen to the pound. The remaining feeble princes of the Carlovingian race did not do anything regarding the coinage calling for notice.

300. The Capetian dynasty acceded to the throne in 987. They continued the coinage as they found it existing, and until 1103 it was of absolute purity. The deniers were the standard coins, as smaller ones of alloy were struck for small change. Before 1068, the name of *Sol d'or* was discontinued, and that of francs, or florins adopted. It is not certain when this was done. But the gold coin is spoken of as francs, or florins, in a deed of gift to the monks of Pontoise of that date. This shews that John Villani is in error when he says that they were first struck at Florence, in 1262. Gold florins also are spoken of in the history of Normandy, under the date 1067. By this time great confusion was caused by every considerable proprietor in the country assuming to himself the right of coinage. This had been done in consequence of the weakness of the last Carlovingian kings. Each of these had his own weights and measures, so that there were sols and deniers of Paris, Tours, Mans, Anjou, Poitou, Chartres, Bordeaux, Toulouse, Nevers, and multitudes of others. The Dukes of Paris, however, having become kings of France, the Paris weights were adopted as the royal money. The earliest notice of the Paris sol is in 1060, the first of Philip I. The two most important weights were those of Paris and Tours. There is much obscurity concerning the money until 1103, when it is stated in the Chronicle of Maillezai, that there was great tribulation in that year, and the deniers were struck, debased with copper, instead of silver. The debasement was carried to the extent of one third, or even two thirds of alloy.

301. In the reign of Philip I., sometime between 1073 and 1093, the pound weight of 12 ounces was abolished as the standard, and the

marc of 8 ounces adopted. This is shown by the fact, that up to 1075 the livre is always mentioned in deeds, in 1093 and subsequently it is always the marc.

302. Louis VI. (1108) issued a very debased coinage in 1112; it was half copper and half silver. He did it again in 1120, which made such confusion that he was obliged to promise he would not debase it any further. In 1144, the marc of silver was rated at 40 sols. In 1158 it was rated at 53 sols 4 deniers of Tours. By a decree of the king of England as Duke of Normandy, respecting the exchange of money, in 1158, it appears that the sol of Tours was greatly more diminished than any other. For while the marc of silver was rated at 53s. 4d. of Tours, it was rated at 13s. 4d. sterling. The gold money of Louis VI. and Louis VII., was the *franc d'or*, which weighed 76 grains, and was a remarkably fine coin for that time. It had the beautiful fleur de lis as an emblem. It appears certain, then, that the florin does not originate with the Florentines, as is generally supposed, but they probably adopted it from the French. In 1159, Louis VII. exempted the religious house of St. Magloire from the tax of moneyage, which was levied every three years as a compensation for giving up the right to debase the coinage.

303. Great obscurity hangs over the money of Philip Augustus (1180), and Louis VIII (1229); but we have certain information of that of St. Louis (1226). He restored the coinage to a certain degree of fineness and fixity of weight; and when the following kings produced the greatest misery and confusion by debasing their money, it was always the money of St. Louis that the people demanded, and until the time of Philip of Valois, it was always the standard returned to after every depreciation. Nevertheless we have no direct information of the period, and it was only by the edicts of his successors that we are enabled to ascertain his standard. It appears from these decrees that St. Louis coined gold *deniers à l'agnelet*, which were commonly called *moutons d'or*, from bearing the *agnus dei* as a device. They were made of pure gold, 59 1-6th to the marc, weighed 3 den. 5 grs., and were worth ten Paris sols, or 12 sols 6 den. of Tours, which then were the standard weight. This money became very celebrated throughout Europe, and was continued till Charles VII., and was imitated by several foreign sovereigns.

304. St. Louis also coined the *gros Tournois* of silver, which also became a very celebrated coin. It was the largest silver coin that had yet been struck in France. There were 58 to the marc, and weighed 3 deniers 7³/₄ grains of silver, 11 den. 12 grs. fine. Le Blanc says it was worth 9 sols 8 den. of his time. Out of the 58 coins struck out of the marc, St. Louis ordered that 3 sols 5 deniers Tours, might be retained as seignorage and cost of coining, and the remainder, 54 sols 7 deniers, given back. He also coined deniers of Paris, at 221 to the marc, and deniers of Tours, 220 to the marc. It appears by an ordinance, that one penny sterling was equal to four pennies Tours.

305. Philip le Hardi (1270) continued the money of his father.

Philip le Bel (1285) has had the honor of being singled out by Dante as a false coiner. Par. xix.

"Li si vedrà il duol che sopra Seuna
Induce, falseggiando la moneta."

"There shall be seen the woe that he shall pour
Along the Seine, by uttering coin debased."

Wright's Dante.

He is said to have been the first to adopt the expedient of debasing the coin on account of war. Though how such an extraordinary opinion became current it is not easy to imagine, considering that the coinage was already diminished to about one fourth part of its original weight, and abundance of base money had been issued long before. At all events Philip has an abundance of royal companions. From this reign we have certain information respecting the French coinage. The Registers of the Mint begin from 1293, the 8th year of his reign. Philip coined five species of gold money, the *gros royal*, worth twenty sols of Paris; the *petit royal*, worth eleven sols of Paris, and cut at the rate of seventy to the marc, which was then rated at forty-four pounds. These were of pure gold. The *masse*, or *royal dur*, was of gold, twenty-two carats fine, sometimes also called the *grand florin* by the people; the *agnelet*, worth fifteen sols of Tours; and the *reine*, of which no specimens exist. He coined three sorts of silver coin, the *gros Tournois*, and its half and third parts. The *gros* was cut at the rate of fifty-eight to the marc, 11 den. 12 grs. fine, and worth ten and a half Paris deniers. For the first nine years of his reign, Philip's money was the same as that of St. Louis, but his wars with the English and Flemish exhausted his finances. His debasements began in 1294, when all persons who had less than 6000 livres of rent, were ordered to carry their plate to the Mint, under the penalty of forfeiting half what they concealed. The same ordonnance forbade any one to export gold, silver, or bullion money from the kingdom, and ordered every one to receive the new debased money. In order to obviate the confusion and distress caused by this, he issued letters patent on the 1st May. 1296, pledging all his property, and that of his successors, as well as the revenues of his domain, to indemnify all who would take his base money. The queen was joined in this promise. Nevertheless, this debasement of the coinage produced infinite distress and disorder both in France and neighbouring countries, and says Le Blanc, p. 187, the successors of Philip le Bel followed his example, and by this bad policy ruined commerce, which made the kingdom unable to resist her enemies. The council of the king who advised this, and made a profit out of it, did more to ruin the kingdom than all the attacks of the English. This debasement increased so fast that in 1301, the denier was reduced to the third part of its value.

306. The distress caused by the base money was so intolerable, that in 1303, the bishops offered to give the king two-twentieths of the income of all their benefices, if he would agree for himself and his successors, not to debase their money without an indispensable necessity, which was to be determined by the secret council, and then confirmed by an assembly of barons and bishops. This proposition, however, was refused. As the war with Flanders still continued, all sorts of persons associated and offered the king to equip a certain number during the months of June, July, August and September, on condition

that he would restore his money. He agreed to this, and promised to return to the money of St. Louis within a year. In December, the people again petitioned him to restore the standard of St. Louis. A proclamation in accordance with this prayer was issued, desiring the people to bring in their money, within fifteen days, to the Mint, and have it exchanged for good, at the expense of the king. These promises were renewed in 1304. On the 15th June, the king promised the clergy, that in consequence of their liberality, the good money should be issued at the feast of All Saints next. Pope Benedict XI., in order to conciliate the king with a gift which cost him nothing, gave him one year's revenue of the prebends who died in the kingdom, and the tithes of all the benefices for two years, to help him to restore his money to its ancient standard. The clergy, however, resisted this bill, saying that the king had already pledged his own property to restore the coinage, and indemnify the sufferers. This refusal prevented the restoration of the money, which, in fact, was still further debased, so that the marc of silver, which at the beginning of his reign was rated at fifty-five sols six deniers of Tours, in 1305, was rated at a hundred and seventy sols.

307. At last, however, the king could no longer resist the complaints of the people. The marc of silver was reduced to fifty-five sols six deniers, and *gros tournois* were struck at that rate of the standard of St. Louis. But the base money was allowed to be current along with the good, without reducing it to its proper value, which caused great confusion. For the *gros*, which by the ordonnance of the 3rd May, 1305, was ordered to pass for ten and a half of the new deniers of Paris, was ordered by another ordonnance to pass for thirty-one and a half of the current deniers.

308. The king, however, did not long remain on his good behaviour. Listening to the pernicious advice of two Florentines, Musichati and Bichi, he soon debased it as much as ever, so that the price of the marc soon returned to one hundred and sixty-eight sols. This new fraud gave rise to a horrible sedition in Paris. The people wished to pay in debased money, not being able to obtain the good, except at a considerable loss. The rich demanded payment in good money, not choosing to put up with the loss on the bad. The people reduced to despair, rose and pillaged the house of Stephen Barbette, the master of the Mint, who was supposed to be the author of this measure. They then besieged the Temple where the king resided, knocked over his dinner, and committed many other excesses. The people were with difficulty appeased, and the ringleaders punished.

309. The Estates met at Paris, and by their advice the king ordained that after the next feast of St. Remy, good money only should be issued, so that the good *gros tournois* which then passed for three base deniers, should only pass for one, and the base ones reduced to their proper value, namely, three for one, and the other money in France should be reduced to its proper value. That the marc of silver should be brought back from one hundred and sixty-eight sols, to fifty-five sols six deniers, and that the marc of gold should remain as before, at forty-four livres tournois.

Thus good money was restored from the 8th September to January, 1311. In 1308, all foreign money was decried, and forbidden to be current. In 1309, this order was renewed, and particularly the sterling or pennies of England, and the florins of Florence were decried. In 1310, the gold *reines* were decried, and the *masses*, or *roiaux durs* coined out of them. The king gave 154 marcs of the best coined of these as the dowry of Isabella of France, on her marriage with Edward II. of England.

310. In 1311, the king began debasing his money again, to the great dissatisfaction of the people. Great quantities of counterfeit money were soon in circulation. By an ordonnance of June 1313, several of the current coins were altered in their rating, and many others cried down, by which many merchants were ruined. He was then forced to return to the standard of St. Louis, but this only lasted till August 1314, when he began a fourth debasement of the money. This debasement, as well as the repeated changes in the rating of the coins, so enraged the people, that the king, on his return from Flanders, found the whole country full of sedition and uproar, caused by the new taxes and the base money. On the 2nd October, the king ordered all the chief cities of the kingdom to send two or three notables to Paris by the 1st of November, to remedy the disorders in the coinage. The king, however, died on the 24th November, and the advice of the meeting was not followed. The king, however, was so sensible of the evils of debasing the coinage, that in his will, he above all things most earnestly recommended his son to coin none but good money.

311. Louis Hutin (1324) to his great indignation, found the treasury empty, and angrily asked the ministers of his father what had become of all the tithes collected by his father, and the profits on debasing the money. The empty state of his treasury not only prevented him restoring the money according to his father's injunctions, but made him debase it still more. This, together with some new taxes, caused a nearly general revolt throughout the kingdom. Charles of Valois was sent to pacify the people, and he persuaded them to state their grievances in writing, and he promised to obtain redress for them. The cahiers of grievances sent in by the States, unanimously demanded the restoration of the money to the standard of St. Louis. The king was obliged to promise this restoration, and began by compelling the barons and bishops to reform their money, which was as bad as his own.

312. It was at this time suggested to the king, to bring the money issued by the barons and prelates under his own control, and forbid them to coin any except of a certain regulated weight and fineness, and that each should bear a peculiar mark. The king approving of the idea, but seeing the difficulty of putting down the frauds committed by them, determined to deprive them of the right of coining altogether. But the opposition was too strong for him, and he was obliged to content himself with fixing their weight, fineness, and mark. An ordonnance to this effect was issued in 1315. Le Blanc, p. 198, gives the names of thirty-one of these barons and prelates who were allowed to coin, and the regulations affecting their money. There were, however,

several others who enjoyed this right, not mentioned in the ordonnance. It is remarkable that different degrees of fineness, as well as different weights, were prescribed for different persons, as well as the rate their money should exchange for with the royal money. The king then, on the 15th of January, 1316, issued a proclamation carefully regulating his own money according to the standard of St. Louis. The coins that were to be current were named, and all others, whether of gold or silver, or bullion, were decried and ordered to be brought into the royal Mints within one month. All remaining out after that was to be forfeited, and in order to increase the quantity of money, no person was to make any vessel of silver for two years. It was forbidden to give more than the mint price for gold or silver. After having wrought this good work, Louis Hutin died 5th June, 1316, leaving a posthumous son, who died a few days after his birth.

313. Philip le Long (1316) coined no gold but the *moutons* of the same weight and fineness as those of St. Louis, and his brother Louis Hutin. On the 23rd June, 1317, he issued a proclamation stating that in consequence of the barons and prelates having disobeyed the ordonnance of Louis Hutin, regarding the amendment of their money, some having greatly debased theirs, and counterfeited that of the king, the people were pillaged, prices raised, and trade stopped. To stop these disorders, the king sent bailiffs to seize all the money of the barons and prelates, and send it to Paris to be assayed. They were forbidden to coin any more till further orders. The king of England himself was not exempted. By a commission of December 13th, 1320, Peter of Cahors, master of the Mint, was ordered to go to Bordeaux, and other places in Guyenne, and seize the coins struck by the king of England.

314. The evils of the private Mints were so intolerable, that the king determined to buy them up. In May 1319, he bought up the Mints of his uncle Charles of Valois, at Chartres and Anjou, for 50,000 livres. In 1321, he bought up from Louis of Clairmont, Baron of Bourbon, and Grand Chamberlain of France, his Mints at Clairmont and Bourbon, for 15,000 livres. He had fully determined that there should be in France only one currency, one weight, and one measure. But this wise purpose was frustrated by the king's death, in January 1322.

315. Charles le Bel (1322) coined gold *moutons* of the same weight as his predecessors, till 1325, when he returned to double roials of pure gold, and of the same weight as the *moutons*. He continued the *gros tournois*. All gold money except the agnel was decried, and money changers were appointed to exchange the current coins for the new ones at fixed rates. The war with the English in Guyenne led him to abandon his good intentions respecting the coinage. In 1324, he followed the example of his father, Philip le Bel, in debasing his money. The *gros tournois* rose from twelve to twenty Paris deniers. Charles le Bel died 1st February, 1328.

316. Philip of Valois succeeded in April, 1328. He coined more gold money of different kinds than any of his predecessors. They were the *parisis*, worth a Paris pound, or twenty Paris sols; the *escu*, of fine gold, from 1336 to 1347, and then twenty-three carats fine, and then further reduced

to twenty-one carats. This money became very celebrated, and more was coined of it than of any other. There were also the *lions*, the *pavillons*, the *couronnes*, the *dobles*, and the *anges*, which only continued for a very short time. By an ordonnance in 1329, the silver money was ordered to be brought back to the standard of St. Louis, and this was done in 1330. To encourage people to bring their money to be coined, and to gain the esteem of God and the people, he gave up all profit on the coinage. In 1332, every one was ordered to bring the third part of his plate to the Mint to be coined, and nothing but the cost of coinage was to be charged, so that sixty gros tournois being coined out of the marc, only two were retained for cost of coinage.

317. But this fair promise was soon disappointed. In 1336, he began to debase his money, and this was carried to such an extravagant length, that the marc of gold, which in the beginning of his reign was cut into 41 livres 13 sols, in 1342, was cut into 117 livres, and the marc of silver, which was cut into 58 sols in 1342, was cut into 270 sols.

318. In 1343, he was obliged to return to good money. But in 1350, he began to debase it again. But the restoration in 1343, was not equal to the original standard of St. Louis, as the *gros tournois*, which was then equal to 12 deniers, was declared in 1343, to be worth fifteen. And this commenced a permanent depreciation.

319. Matthew Villani says, that this depreciation of the money alienated from him the affection of his subjects. It ruined many of the merchants, and drove trade away from the kingdom. It also impoverished the barons and burghers, so that it seemed like a judgment of God, that having such numbers of barons and cavaliers who had previously been distinguished above all the world of deeds of arms, they now never met the English without dishonor. Philip, by an ordonnance of the 17th January, 1347, expressly claimed for the crown the undoubted right of regulating the moneys throughout his kingdom, and to fix their price as he pleased.

320. Notwithstanding this strenuous assertion of right, when in 1350, he determined to debase the coinage, he imposed on the officers and workmen of the Mint, a solemn oath that they would not reveal the debasement, so that merchants might not find it out.

321. The changes in the coinage are far too numerous for us to recount here. In the table annexed to this article, will be found the variations in the rating of the marc of gold and silver. When people found that the silver coins were never the same for a year together, they left off contracting in livres and sols, and adopted the gold coins, because they were not so frequently tampered with. By an ordonnance of the 22nd August, 1343, it was strictly forbidden that any one should be daring enough to contract in anything but livres and sols, under pain of forfeiting the merchandize, and being at the king's mercy.

322. John succeeded in 1350. He began by coining *escus* of gold, 21 carats fine. In 1351, he coined florins of pure gold at the rate of fifty to the marc. The usual result followed, they were immediately hoarded, and consequently the coinage of them was discontinued within a month

after it was begun. Gold *escus* were then coined, 18 carats fine. In 1354, *moutons* of fine gold were coined at the rate of 52 to the marc, weighing 3 den. 16 grs., and rated at 25 sols. During the rest of this reign the gold coins were always pure. In 1360, he coined *francs* of gold, which weighed a dram. They were rated at 20 sols, and thence also called *livres*. These coins became very celebrated, and, in fact, their dwarfed silver progeny is still the standard coinage of France. Le Blanc says, that the franc which then was rated at 20 sols, was rated at 140 in his day (1692.)

323. The misfortunes of this reign produced such derangements of the coinage, as have scarcely ever been equalled in any country either before or since. The rating of the money was changed sometimes every week, sometimes oftener! He also tried sometimes to conceal the debasement from the public by swearing the workers of the Mint to secrecy, about as sensible a proceeding as that of the ostrich. The king, however, promised to return to *tres forte monnaie*, that is, to the money of St. Louis, as soon as the war ceased.

324. But the misfortunes of the kingdom were brought to a climax by the capture of the king at the battle of Poitiers, the 19th September, 1356. The money was then more debased than ever, so that on the 21st March, 1360, the marc of silver was rated at 102 livres, or 2,040 sols! Great tumults took place at Paris, in consequence of the debased money issued by the regent, to appease which, it was necessary to summon the estates of the realm. At their meeting the bishop of Laon strongly enforced the necessity of restoring the money, on which condition they promised the regent 30,000 men. The dauphin renewed the promise of his father to coin good money, and not to change it again. In consequence of the intolerable evils of base money, he promised to coin *moutons* or *florins* of pure gold, 52 to the marc, to pass for 30 sols tournois. The estates of Languedoc having voted the king a considerable subsidy, demanded a restoration of the coinage, which was granted on the 23rd November, 1356. In accordance with this, new gros were coined at the Mints of Figeac, Toulouse, Agen, and Montpellier. But this good money was one-half alloy, and passed for 12 deniers tournois. This money, base as it was, was still one half better than the money in the other provinces, which was only four deniers fine. In January 1358, the estates met at Paris, and authorized the regent to coin debased money, and retain one-fifth of the profits for the expenses of the war. On the 30th August, 1358, the rating of the marc was reduced from 13 livres 10 sols, to 6 livres 15 sols. The misery caused by the war was so great, that they endeavoured to palliate it by depreciating the coinage, so that in March 1360, the marc of silver was rated at 102 livres, and the gold *escu* at 11 livres. In that month, however, they suddenly returned to *forte monnaie*, the silver marc was reduced to 11 livres, and the star groats which passed for 30 deniers, were reduced to two.

325. On his return from captivity, John determined to restore the coinage. On the 5th December, 1360, he issued an ordonnance from Compiègne, that new money of fine gold was to be coined at the rate of 63 to the marc, of which three were retained for seignorage. They were to be called *francs*, and to pass for 20 sols.

Gros of fine silver were coined at 84 to the marc. The marc of silver was rated at five livres, and that of gold at sixty livres; so the proportion of silver to gold was one to twelve.

326. To show how utterly impossible it is for us to convey to our readers an adequate notion of the monetary disorder of France, we may mention that Le Blanc gives a table of the variations in the rating of a single coin, the gold florin during twelve years. From March 1346, to March 1357, it underwent 118 changes of rating, varying from ten sols up to fifty-three. It was frequently changed several times in a month.

327. Charles V. (1364,) coined gold *fleurs de lis*, to pass for 20 sols. They soon came to be called by the name of *francs*, which already denoted a coin of twenty sols. From his experience as dauphin, during the disastrous wars and captivity of his father, he had learnt that the debasement of the coinage had greatly impoverished France, and was partly the cause of the political troubles that had so cruelly torn the country. The wise king having greatly at heart to repair the evils, and restore the country to its ancient grandeur, paid the greatest attention to the state of the coinage. Nicolas Oresme, bishop of Lisieux, who had been his tutor, wrote a treatise against the constant changes in the rating and the debasement of the coinage.

328. Charles VI. (1380) in 1385, coined gold *couronnes*, sixty to the marc, and rated at 22 sols 6 den. tournois each. This money continued to be coined till the time of Louis XIII., and other coins which were not continued beyond his reign. He also coined silver gros at twenty deniers, and others at fifteen deniers. But the good custom of his father was abandoned, and the weight and fineness of the silver coinage was often changed, but never the rating. At the beginning of his reign the gold marc was rated at 63 livres 17 sols 6 deniers, and the silver marc at 5 livres 16 sols. This continued till the chronic pest of France, the wars with the English, caused them to try again the ineffectual remedy of debasing the coin. In 1420, the gold marc was rated at 171 livres 13 sols 4 den., and the silver marc at 28 livres. This was done, said one ordonnance of the king in 1418, to resist the English enemy, and his damnable invasion, and because he had no other revenue from his domain. Good money was restored in 1421.

329. Charles VII. began his disastrous reign in 1422. He did not coin any new sort of money. But as usual during troubled times, the weight, fineness, and denomination were repeatedly changed, as is sufficiently shown in the table subjoined to this article. The dauphin was declared regent in 1418, in consequence of the incapacity of the king, and he set up his court at Bourges. He resorted to the usual plan of depreciating the coinage to so great an extent, that the marc of silver, which in 1418, was rated at nine livres, was rated at ninety in 1422, and the *gros tournois*, which was at first rated at twenty deniers, and was 5 den. 8 grs. fine, at the rate of eighty to the marc, was reduced to eight grains only fine, and cut at 120 to the marc. Thus the silver marc, which was received at the Mint at ninety livres, were debased there down to 361 livres 10 sols, so that the king retained as seignorage

270 livres 10 sols on each marc." The gold marc was equally debased, it was received at the Mint at 320 livres, and debased to 2,847 livres, the *escu* passing for forty livres. This debasement produced so much confusion and distress, that he was obliged to return to good money in October, 1422. The silver marc was reduced from 90, to 7 livres 10 sols. The gold marc was reduced to 90 livres, and the gold *escu* was reduced from 40 livres to 20 sols. Thus the money was reduced to 1-40th part of its nominal value. This restoration, however, was not preserved, but the debasement was not nearly so bad as at first. The marc of silver rose to 15 or 20 livres, but in 1454, the country was finally delivered from the English, and it was then reduced to 8 livres 15 sols, and the gold marc rated at 100 livres.

330. In 1436, Paris was recovered by her legitimate king, and the famous Jacques Cœur was made master of the Mint. He coined *couronnes* of fine gold, seventy to the marc, and rated at twenty-five sols. The rating of these coins, however, was changed, and what was stranger, was, that they were rated differently in Normandy from the other provinces. For the *escu*, which passed for 27 sols 6 dens. in the rest of France, was rated at 30 sols in Normandy.

331. Louis XI. (1461) coined only *escus*, and half *escus* of gold, 23 1-3rd carats fine. They were of two sorts, the *couronnes* at seventy-one to the marc, and the *soleils* at seventy to the marc. The latter were first coined in 1475, and superseded the *couronnes*. In silver he coined *gros*, 11 den. 12 grs. fine, which weighed a dram, and passed for 2 sols 6 dens. The silver marc was rated at 8 livres 15 sols, and a seignorage of five sols was taken. The marc of gold was rated at 100 livres, and on this a seignorage of 25 sols 5 dens. was taken. A great number of foreign coins were, however, allowed to pass current.

332. In 1473, it was found that the good French coinage was being exported to foreign countries, and after much discussion the rating of the gold and silver marcs was altered to check it. The marc of gold was rated at 110 livres, and that of silver at 10 livres. This, however, not proving successful, in November 1475, the gold marc was raised to 118 livres, and the silver marc left at ten. The gold *escus* were raised from 30 sols 3 dens. to 33 sols. All foreign money was decried, except that of England, and the dukes of Burgundy and Bretagne, which were cried down in 1479, but the king of England having remonstrated against this, his money was again allowed to be current in January 1480.

333. Louis XI. was very jealous of the invasion of his prerogative of coining money. He declared war against the Duc de Bretagne for coining gold money. This war was called that of the *public good*, and was ended by the treaty of the Bois de Vincennes, 1st October, 1465. One of the conditions of the treaty was that the duke might coin gold at his Mint, which might be current throughout the whole kingdom. The king, pressed by his enemies, was obliged to recognise in the treaty, the ancient right of the dukes of Brittany to coin gold, but this was notoriously contrary to historical evidence, for in 1391, Charles VI. had sent the duke of Berry with several of his principal councillors, to complain to the duke of Brittany that he coined gold

and silver, having only the right to coin billon or mixed money. Louis, however, accorded the privilege of coining gold and silver to his brother Charles, whom he persuaded to take Guyenne, and other large districts of country, in exchange for Champagne. He also gave the same privilege to the Prince of Orange.

334. Charles VIII. (1483) coined the same sort of gold money as his father, and in 1488, on the death of the duke of Brittany, pretending that the province belonged to the crown, invaded it, and captured many of the principal towns. The duke had left one daughter, Anna, and to end all disputes about the coinage, and the sovereignty of the province, the king adopted the sensible course of marrying the young duchess in 1491.

335. In 1487, the rating of the good coin was altered in the futile hope of preventing its being exported. The gold *escu* was raised to thirty-five sols, and the other current gold coins in proportion. In 1488, the silver marc was raised from ten to eleven livres, and the silver coins in proportion.

336. Louis XII. (1497) coined gold *escus au soleil* of the same weight and fineness as his father. He is remarkable as being the first to put the date on these coins. This was done perhaps, to mark the year of his marriage with the duchess of Brittany, 1498, as it was not adopted as a custom till Henry II. Up to 1513, he coined *gros* in silver, but in that year he discontinued them, and coined *testons* instead, so called from having his head on them. They were of silver, XI. deniers, 6½ grains fine, and cut at 25½ to the marc, and passed for 10 sols, tournois. The silver marc was rated at 12 livres 10 sols. The *testons* weighed 7 deniers 12½ grains, and were the heaviest money yet coined in France. These coins continued to be struck till Henry III. Louis XII made no change in the rating of the marc, or the money of gold, and only one in that of the marc of silver.

337. Francis I. (1515) at first coined money similar to that of his predecessor, namely *escus* at 70 to the marc. In 1519 their fineness was diminished a quarter of a carat, and their weight three-quarters of a grain. In 1538 their fineness was further diminished 3 carats. In 1541 some *escus* were coined, which were remarkable as being the first on which the date was given; though this was not adopted as a regular practice till the following reign. In order to trace any bad money to its proper source, each mint, in 1539, was ordered to bear a distinguishing letter on its coinage. By this ordonnance it appears that there were then 25 mints in France.

Francis coined only *testons* and *demi-testons* in silver. They were depreciated as well as the gold coinage during this reign. In 1516 their fineness was XI. deniers 18 grains, and they were coined at 25½ to the marc. In 1521 the fineness was reduced to XI. deniers 6 grains. The marc of silver was rated at 14 livres at the end of this reign, and the marc of gold was raised 35 livres 4 sols. 2 dens. It being found that inferior foreign money was imported, and the French exported, the gold *escu*, which passed for 36 sols 3 deniers in 1519, was raised to 40 sols, and in 1532 to 45 sols. The rating of the silver coinage was raised in like proportion. This, however, was found ineffectual; and, says Le Blanc, such plans

always will be useless, unless the currency of foreign money is forbidden, and gold and silver rated proportionably to their value in neighbouring countries. He says that the English always understood these matters better than other nations.

338. Henry II. succeeded his father Francis I. in 1549. He coined gold *escus*, 23 carats fine, and 7 1-16th to the marc. There were also half, quarter, and double *escus*; the latter were called *Heuris*. And in 1549 two novelties were introduced, to the great relief of numismatists, namely the year of the coinage, and the distinguishing number of the king.

A new coinage of *Henris*, however, was ordered. They were 23 carats fine, and 67 to the marc. The workmanship of the coin was greatly improved by means of a new press. In 1549, the price of the marc of gold was raised 6 livres 12 sols 5 dens., and now stood at 172 livres. The gold *escu* was rated at 46 sols. The price of the silver marc was raised to 15 livres, and the *teston* to XI. sols 4 dens. These ratings of bullion and the coinage remained the same till the 17th August, 1561, as the dies of Henry II. were used till that date, notwithstanding the reign of his son Francis II. for 17 months.

339. Charles IX. succeeded his brother Francis II. in December, 1560. In 1561, a new coinage of gold *escus* was struck. Their weight was diminished 1 grain, and their rating raised 4 sols. They were then made current at 50 sols, but as they passed for more than that with the public, they were raised to 54 sols in 1573. The marc of gold was then rated at 200 livres, that of silver at 17 livres, and the *teston* raised to 13 sols.

340. Henry III. succeeded his brother in 1574. He struck no new coins till July, 1575. The first he struck were gold *escus* 23 carats fine, and 72½ to the marc. Double and quadruple *escus* were also struck. In silver he struck *testons* and *demi-testons*, as well as two new species, *francs*, with their halves and quarters, and quarter and half-quarter *escus*. The *francs* were of silver 10 deniers fine, 17½ to the marc, and weighed 11 dens. 1 gr. They passed for 20 sols. They then became the money of account, and have continued so ever since.

The quarter *escus* of silver were struck in October, 1580. They were deniers, fine, 25 1-5 to the marc, and weighed 7 deniers 12 grains, and passed for 15 sols. In 1575 the gold *escu* was rated at 60 sols.

341. The civil disorders under Henry III. were attended with their usual consequence, a great disorder in the coinage. The gold *escus* had been raised to 60 sols, but they passed currently at 68 sols. To remedy this inconvenience many consultations were held with those who were supposed to be most skilful in such affairs. The *Cour des Monnaies* recommended that a general meeting should be summoned of the most experienced persons in the principal towns in the kingdom, to consider what measures should be adopted to remedy these disorders. They also recommended that the subject should be brought before the States General, which were to meet at Blois in December. They presented a memorial to the king, fully and minutely detailing the great public inconvenience of this monetary disorder. The States after considering this remon-

strance, resolved to reduce the gold *escu* to 60 sols. But they were unable to effect this, and they were obliged to fix it temporarily at 65 sols.

The *Cour des Monnaies* pointed out that this would be ineffectual, and further recommended that the mode of computing by sols and livres should be abolished. They pointed out the unfairness to one or other of the contracting parties, when the rating of the coins was changed so frequently, and advised that the mode of reckoning should be changed from livres and sols to *escus*. This proposal was deemed so important that a meeting of all the persons most learned in monetary matters was held at Paris, at the house of the Cardinal de Bourbon. The plan was warmly debated, but the advice of the *Cour des Monnaies* was finally adopted, and an ordonnance issued to that effect, containing all the necessary regulations for adopting this change on the 1st of January, 1578, and for converting all current engagements contracted in livres and sols to their equivalent in *escus*, at the rate of 60 sols to the *escu*.

342. Henry III., died in August, 1589, and the Cardinal de Bourbon was proclaimed king by the faction of the League, by the name of Charles X. He struck money similar to Henry III.

343. Henry IV., the legitimate successor, struck money immediately after the death of Henry III., of the same weight, fineness, and denomination. During the civil war the *escu* had risen in current usage to 64 sols, and even higher. In 1594, when Henry IV. obtained possession of Paris, it was reduced to 60 sols, as fixed by the edict of 1577. The franc was also brought back to 20 sols. In 1602, the mode of accounting by *escus* was abolished, and that by livres restored. At the same time the gold *escu* was raised to 65 sols, and the franc to 21 sols. The marc of gold was rated at 240 livres 10 sols, and that of silver at 20 livres 15 sols. Foreign money was also allowed to be current. The restoration of the mode of counting by livres was not found to have the effects expected. The gold *escu* continued to rise, and in 1609, usually passed current at 72 sols, to the great surprise of those who advised the edict of 1602. Many consultations and discussions were held before the king on this unexpected state of things. But the opinions were so divided that nothing could be done. The only thing they all agreed in was that foreign money should not be allowed to pass. The death of the king on the 14th May, 1610, put an end to the conferences, which were renewed under the Regency, but led to no result.

344. Louis XIII. succeeded his father the 14th May, 1610, but made no change in the coinage till March, 1640, when orders were given to strike a new coin, to be called *Louis d'or*. It was of gold, 22 carats fine, and coined at 36½ to the marc. It thus weighed 5 deniers 6 grns., and was rated at 10 livres. Half and double louisies were also struck.

In 1641, the king ordered a new silver coin to be struck, to be called the *Louis d'argent* of the value of 60 sols. The silver was XI deniers fine, and 8 11-12ths to the marc, and weighed 21 deniers 8 grains. Louisies of 30, 15, and 5 sols were also struck. The louisies of 60 sols were also called *escus blancs*. They were the heaviest and most beautiful silver coins which

had yet been struck. The dies were made by the celebrated Varin. The evil of the rise of the money increased even faster in this reign than before. In the course of 26 years the price of the gold escu had risen 39 sols.

345. The edict of Henry IV. in 1602, permitting the currency of foreign money had caused vast quantities to be imported, and in consequence of the difference of rating, the French money was exported. To remedy this, many conferences were held with the most experienced persons in the chief commercial towns, and they advised that all the different pieces should be reduced to their current market value. The gold escu was raised to 75 sols, and the value of the foreign gold money settled in proportion. The rating of the marc of gold was raised to 278 livres 6 sols. 6 dens, that of silver was 20 livres 5 sols. 4 dens. Thus the proportion of gold to silver was 1 to 13-7-10ths. This ordonnance took effect in 1615. In 1631, further changes were found necessary. In February the gold escu was raised to 80 sols, and in August to 83. In July, 1633, it was raised to 86, in March, 1637, to 94 sols, and in June to 104. The marc of gold was then rated at 384 livres, and that of silver at 25. The silver franc, which Henry III. at struck had 20 sols, was raised to 27. In 1640 the coinage was greatly depreciated by clipping, and it was found necessary to decry all light gold pieces. The clippers then set to work on the silver money; and in 1641 it was found necessary to order that all silver money, both French and foreign, should only be received by weight. In November the light silver money was decryd altogether, and ordered to be coined into silver Louises. It said in the ordonnance, that since the recoinage of the gold 40 millions of livres had been struck. Silver Louises were ordered to be coined XI. dens. fine, and of the value of 60, 30, 15, and 5 sols. The silver marc was rated at 26 livres, 10 sols, and the quarter ecu, which in 1577 was rated at 15 sols, was ordered to pass for 21. These were the most beautiful coins which had been struck since the Greeks and Romans; and this seems to have been the first occasion on which the milled edge was introduced, which prevented their being clipped without detection. The restoration of the coinage was deemed of so great importance, that medals were struck with the inscription LUDOVICO XIII. RESTITUTORI MONETÆ. Le Blanc says that this restoration of the coinage by Varin was attended with this further advantage, that it saved the lives of multitudes of the king's subjects, because they were so beautiful that they could not be forged.

346. Louis XIV. succeeded his father in 1643, and at the beginning of his reign the coinage of his father was continued. In 1646 the coinage of quarter and half-quarter escus was discontinued; and in 1656 that of gold escus, after which *lis d'or* were struck. In the same year, a new coin called *lis d'argent* was struck. The *lis d'or* was 23½ carats fine, and 60½ to the marc, weighing 3 dens. 3½ grs., and rated at 7 livres. The *lis d'argent* was XI. dens. 12 grs., fine, and 30½ to the marc weighed 6 dens. 5 grs., and passed for 20 sols. Half and quarter *lis* were also struck. These pieces, however, were soon discontinued, and the Louises of gold and silver restored.

In 1685, new silver money was coined in honor

of the termination of the war in Flanders. Pieces worth 4, 2, and 1 livres, 10 and 5 sols, were struck, 10 dens. 7 grs. fine. The 4 franc pieces weighed 1 ounce 5 dens. 6 grs.

347. When Louis XIII., in 1641, wished to coin all the foreign money which circulated in France into French money, he summoned all the most expert persons in Paris to consider what proportion should be observed between gold and silver. It was found that at Milan the ratio was 1 to 12; in Flanders and the Low Countries, 1 to 12½; in England 1 to 13 1-5th; in Spain, 1 to 13 1-3rd. It was considered that France being in the midst of these countries should adopt a medium ratio, and consequently the one adopted was 1 to 13½. This proportion was observed for many years, and at the Paris Mint alone, about 300 millions of money was struck in that proportion. In 1655, the proportion was changed to 1 to 14 15-16ths, and *lis d'or* were struck to pass for 7 livres. The rating of the *louis d'or* was increased from 10 to 11 livres. Many changes in the ratio of gold to silver were made after this, to the great derangement of trade. The *Cour des Monnaies*, and the principal merchants addressed strong remonstrances to the government on the subject, but without effect. In 1679, a considerable amount of foreign and light money was in circulation. This was all decryd and ordered to be coined into gold and silver louis. The king ordered that good new money should be given for all the old brought to the Mint, weight for weight, without any deduction. Those who brought bullion received an equal weight of coin in exchange. The marc of silver was now rated at 29 livres 6 sols 11 deniers. This regulation is warmly commended by Le Blanc.

348. In 1689, a new recoinage was ordered, and the *louis d'or* was ordered to pass for 12 livres 10 sols, and the *ecus* for 3 livres 6 sols. It would be tedious to give all the variations in the rating of the *louis*. Between 1689 and 1709, its rating was changed 35 times, the lowest being 11 livres 10 sols, and the highest 15 livres, and the *ecus* a similar number. From 1640 to this year, the *louis* were struck at 36½ to the marc. The *ecus* were 9 to the marc. In May 1709, an edict ordered *louis* of 30 to the marc to be struck at 20 livres. But the same tamperings took place with its rating as before, so that it seldom remained the same for many weeks at a time. To give these at full length would be obviously impossible in this work. They, however, will all be found in *De Bazinghen's Traité des Monnoies*. However, in 1726, these miserable practices came to an end, and nothing farther took place till the Revolution, when the decimalization of the coinage was ordered by the Convention.

349. Beccaria and James Watt had shown the great advantages which would attend the introduction of a decimal system into weights, measures, and coins. But no nation had reduced these ideas into practice until the subject was taken up in 1790, in the Constituent Assembly of France.

The history of the introduction of the decimal system into the French measures, is given by Mr. John Quincy Adams, in his official report on Weights and Measures, prepared in obedience to an order of the Senate of the United States, in 1817. We shall quote his account. He says, p. 69:

"In the year 1790, the present Prince de

Talleyrand, then Bishop of Autun, distributed among the members of the Constituent Assembly of France a proposal, founded upon the confusion of the weights and measures then prevailing all over that country, for the reformation of the system, or rather for the foundation of a new one, upon the principle of a single and universal standard. After referring to the two objects which had previously been suggested by Huyghens and Piccard, the pendulum and the proportional part of the circumference of the earth, he concluded by giving the preference to the former and presented the project of a decree. First, that exact copies of all the different weights and elementary measures used in every town of France should be obtained and sent to Paris. Secondly, that the National Assembly should write a letter to the British Parliament, requesting their concurrence with France in the adoption of a natural standard for weights and measures, for which purpose commissioners, in equal numbers from the French Academy of Sciences and of the British Royal Society, chosen by those learned bodies respectively, should meet at the most suitable place, and ascertain the length of the pendulum at the 45th degree of latitude, and from it an invariable standard for all measures and weights. Thirdly, that after the accomplishment, with all due solemnity, of this operation, the French Academy of Sciences should fix with precision the tables of proportion between the new standard and the weights and measures previously used in the various parts of France, and that every town should be supplied with exact copies of the new standard, with tables of comparison between them and those of which they were to supply the place. This decree, somewhat modified, was adopted by the assembly, and, on the 22nd of August, 1790, sanctioned by Louis XVI. Instead of writing to the British Parliament themselves, the Assembly requested the King to write to the King of Great Britain, inviting him to propose to the Parliament the formation of a joint commission of members of the Royal Society and of the Academy of Sciences, to ascertain the natural standard in the length of the pendulum. Whether the forms of the British constitution, the temper of political animosity then subsisting between the two countries, or the convulsions and wars which soon afterwards ensued, prevented the acceptance and execution of this proposal, it is deeply to be lamented that it was not carried into effect. Had the example once been set of a concerted pursuit of the great common object of *uniformity* of weights and measures by two of the mightiest and most enlightened nations upon earth, the prospects of ultimate success would have been greatly multiplied. By no other means can the uniformity, with reference to the persons using the same system, be expected to prevail beyond the limits of each separate nation. Perhaps when the spirit which urges to the improvement of the social condition of man shall have made further progress against the passions with which it is bound, and by which it is trammelled, then may be the time for reviving and extending that generous and truly benevolent proposal of the Constituent National Assembly of France, and to call for a concert of civilized nations to establish one uniform system of weights and measures for them all.

"The idea of associating the interests and the learning of other nations in this great effort for common improvement, was not confined to the proposal for obtaining the concurrent agency of Great Britain. Spain, Italy, the Netherlands, Denmark, and Switzerland were actually represented in the proceedings of the Academy of Sciences, to accomplish the purposes of the National Assembly. But, in the first instance, a Committee of the Academy of Sciences, consisting of five of the ablest members of the Academy, and most eminent mathematicians of Europe, — Borda, Lagrange, Laplace, Monge, and Condorcet, were chosen under the decree of the Assembly, to report to that body upon the selection of the natural standard, and other principles proper for the accomplishment of the object. Their Report to the Academy was made on the 19th of March, 1791, and immediately transmitted to the National Assembly, by whose orders it was printed. The Committee, after examining three projects of a natural standard, the pendulum beating seconds, a quarter of the equator, and a quarter of the meridian, had a full deliberation, and with great accuracy of judgement, preferred the last; and proposed that its ten-millionth part should be taken as the standard unit of linear measure; that as a second standard of comparison with it, the pendulum vibrating seconds at the 45th degree of latitude should be assumed; and that the weight of distilled water at the point of freezing, measured by a cubical vessel in decimal proportion to the linear standard, should determine the standard of weights and vessels of capacity. * * * * *

"The application of the new metrology to the moneys and coins of France, has been made with considerable success; not, however, with so much of the principle of uniformity as might have been expected, had it originally formed a part of the same project. But the reformation of the coins was separately pursued, as it has been with us; and as the subject is of great complication, it naturally followed that from the separate construction of two intricate systems, the adaptation of each to the other was less correct than it would have been had all the combinations of both been included in the formation of one great masterpiece of machinery. It is to be regretted that in the formation of a system of weights and measures, while such extreme importance was attached to the discovery and assumption of a natural standard of long measure as the link of connection between them all, so little consideration was given to that primitive link of connection between them which had existed in the identity of weights and of silver coins, and of which France, as well as every other nation in Europe, could still perceive the ruins in her monetary system then existing. Her *livre tournois*, like the pound sterling, was a degeneracy, and a much greater one, from a pound weight of silver. But it had scarcely a 70th part of its original value. It was divided into 20 sols, or shillings, and the sol was of 12 deniers or pence. It had become a mere money of account; but the *ecu*, or crown, was a silver coin of 6 livres, nearly equivalent to an ounce in weight; and there were half-crowns and other subdivisions of it; being coins of one-fourth, one-fifth, one-eighth, and one-tenth of the crown. There were also coins of gold, of copper, and of

mixed metal, called billon, in the ordinary circulations of exchange. Shortly after the adoption of the provisional or temporary metre and kilogramme, a law of 16 Vendémiaire II. (17th October, 1793), prescribed that the principal unit, both of gold and silver coins, should be of the weight of 10 grammes. The proportional value of gold to silver was retained, as it had long before been established in France, at $15\frac{1}{2}$ for one; the alloy of both coins was fixed at one-tenth; and the silver franc of that coinage would have been worth about 38 cents, and the gold franc a little short of 6 dollars. This law was never carried into execution. It was superseded by one of 15th August, 1794, (28 Thermidor III.) which reduced the silver franc to 5 grammes; and it was not until after a law of 7 Germinal XI. (28th March, 1803), that gold pieces of 20 and 40 francs were coined at 155 of the former to the kilogramme.

"In the new system, the name of *livre*, or pound, as applied to money or coins, was discarded, but the franc was made the unit both of coins and moneys of account. The franc was a name which had before been in common use as a synonymous denomination of the *livre*. The new franc was of intrinsic value 1-80th more than the *livre*. The franc is decimally divided into decimes of 1-10th, centimes of 1-100th, and millièmes of 1-1000th of the unit; but the smallest copper coin in common use is of five centimes, equivalent to about one of our cents. The silver coins are of one-fourth, one-half, one and two francs, and of five francs; the gold pieces of 20 and 40 francs. The proportional value of copper to silver is 1 to 40, and that of billon to silver of 1 to 4; so that the kilogramme should weigh 5 francs of copper coin, 50 of the billon, 200 of the silver, and 3,100 of the gold coins."

350. It has been found by the most elaborate experiments that the proportion of one part alloy and 11 parts gold or silver, confers the greatest amount of durability upon the metal. The French, however, prefer to sacrifice this advantage to the spirit of uniformity, and the alloy in both gold and silver coinage is fixed at 1 in 10.

351. We have seen that the ancient right of seignorage was on several occasions abandoned by the kings of France. It was, however, subsequently revived, and it is stated in M. Maurice Block's excellent *Dictionnaire de l'Administration Française*, that from 1726 to 1729, it was fixed at 7 5-16ths per cent. for gold, and 5 6-7ths per cent. for silver; but by successive reductions, in 1755 and 1771, it fell to 1 4-5ths for gold, and 1 7-24ths for silver. By the law, however, above quoted, 7 Germinal, XI, Art. 11, it was altogether abolished.

352. The right of *brassage*, or the cost of workmanship is, however, retained. Before 1789, it was 28-10ths per 1000 for gold, and 14 16-10ths per 1000 for silver. By the last-mentioned law it was fixed at 9 francs for the kilogramme of gold, (or 2 28-31ths per 1000) and at 3 francs for the kilogramme of silver, (or 15 per 1000). An ordonnance of Feb. 25th, 1835, reduced these

respectively to 6 francs, and 2 francs. On the 22nd May, 1849, the latter was still further reduced to $1\frac{1}{2}$ francs. There are seven Mints in France, Paris, Marseilles, Bordeaux, Lille, Strasbourg, Lyons, and Rouen. Gold and silver money is, however, almost exclusively struck at Paris, the provincial ones are chiefly employed in re-coining the copper which was ordered in 1852.

353. The inconvenience of a double standard of both metals, at their full nominal value, has been strikingly displayed in the French coinage. The pieces were struck on the decimal system, and had a fixed value. For many years silver was the only money seen in France in common use. Gold was only to be had by paying a premium, and large sums were carried about in unwieldy bags of 5 franc pieces. When the enormous supplies of gold poured in, the gold coinage became depreciated below its mint relation to silver, then the reverse phenomenon took place. The silver all disappeared. Every steamer and diligence from France carried away loads of these same 5 franc pieces, until they had entirely disappeared. Nothing but gold was to be seen, and in 1854 a coinage of 5 franc gold pieces was issued, which were very inconvenient from their small size. These disturbances of the metallic currency clearly shewed the advantage of the English system of making gold the sole legal standard, and coining shillings slightly below their proper weight, to serve as small change. A similar disturbance could not be manifested in English coinage until the diminution in the value of the gold compared to silver, exceeded the difference between the real and the nominal value of the silver coinage.

354. We shall now give the variations of the Mint prices of gold and silver for France, as we have done for England and Scotland. If we are inclined to exclaim against those in our own country, what shall we say to the extraordinary picture presented by those of France? Astonishing as these may seem, they present but a very faint idea of the real confusion in the French coinage. It was bad enough to change the weights of the pieces so often, but that is absolutely a trifle compared to the changes in the *ratings* of the several pieces. To give these would occupy several pages of this work, which renders it quite impossible to insert them. A notion of them however, may be had in § 542 of *BANKING IN FRANCE*, where the changes are given for a short period, and from what we have said above, that the rating of the *louis d'or* was changed no less than 35 times in 37 years. This practice was to a small extent done in Scotland, but never in England, and it is impossible to conceive the confusion into which it must have thrown all the affairs of common life.

COINAGE, DECIMAL. A decimal coinage is one consisting of pieces related to each other in the ratio of 10, or of some power of 10.

2. There are three distinct systems of coinage :—

First. Where the lowest coin of all, or even an imaginary unit, is taken below any existing coin, and all other coins are multiples of that unit. That is, where the coinage proceeds exclusively by multiplication.

Secondly. Where some intermediate coin is taken as the unit, and other coins are struck both as multiples and as subdivisions of that unit. That is, where the coinage is a combination of multiplication and division.

Thirdly. Where the highest coin of all is taken as the unit, and all others are aliquot parts of that unit. That is, where the coinage proceeds exclusively by subdivision.

3. Now, in the first system it is natural that all accounts should proceed by decimal multiples of the unit. And therefore there may be decimal accounts. But that does not necessarily imply a decimal coinage. Thus, from time immemorial the only coin in China has been the *cash*, which is the 1000th part of the ounce of silver. This is the only coin in existence, and all sums are expressed as decimal multiples of that unit. This is attended with very great conveniences, and calculations are very quickly performed, and travellers tell us of the expertness with which mere children can perform long calculations. But the Chinese have not a decimal coinage, as there are no multiples of the cash.

4. The French coinage is an example of the second system. In that the franc is the unit, and there are both multiples and divisions of the franc. The Napoleon is equal to 20 francs, and there are divisions of the franc according to a decimal system. This coinage is decimal so far as the franc, but not further, as the Napoleon is not decimally related to the franc.

5. The English coinage is an example of the third system. In that the unit is the pound sterling, now a gold coin. And all other coins are aliquot parts of the pound sterling. The English coinage, therefore, proceeds exclusively by *sub-division*.

6. Now, the decimal system of accounts having been applied with great success to the first system, and a decimal system of accounts and coins having been adopted with more or less success in the second system, a pretty strong feeling has been excited, especially among scientific men, to apply the decimal system to the English coinage. That is, to make the different pieces of the coinage related to each other in a decimal ratio.

7. At first sight such a scheme appears to have a great many advantages. It is much easier to cast up accounts decimally, than by our present plan. And it seems a very plausible thing to say, that as the integers proceed on the denary scale, so should the subdivisions. That is, if it be multiplied decimally, why should it not be divided decimally?

8. This idea, however plausible it may seem, is utterly erroneous. It is founded on the idea that integers expressed in the denary scale and decimal fractions are correlative systems. People see the figures on one side of the decimal point

increase by powers of 10, and on the other decrease by powers of 10, and they jump at the conclusion that they proceed on the same principles. Nevertheless this is an entire fallacy, and it is quite easy to shew it. Thus, if we multiply 1 by 3, we have 3 an exact answer; but if we divide 1 by 3, do we have $\cdot 3$ an exact answer? If we multiply 1 by 2, we have 2; but if we divide 1 by 2, we have not $\cdot 2$, but $\cdot 5$. Which shews at once that decimal fractions are different in principle from multiplication of integers.

9. To shew this more clearly, we may multiply an integer by any number we please—2, 3, 4, 5, 6, &c., and we always obtain an exact result which, for the purposes of convenience, we may reckon by groups of 10. It is, therefore, physically possible to multiply any unit by any number whatever, and obtain an exact result.

10. So we may divide an integer by 2, 3, 4, 5, 6, 7, &c., or any number, and obtain an exact result. Hence, division by the ordinary numbers is the correlative of multiplication by them. As we may multiply the unit any number we please, and get an exact result, so we may divide by any number we please, and it is physically possible to obtain an exact result. Therefore, the common fractions are the correlatives of ordinary multiplication in the denary scale.

11. But in decimal fractions that is not so. In these the only divisors allowed are 10, and powers of 10. Hence, while we may multiply by any number whatever, we must only divide by powers of 10. Thus, instead of our divisors being unlimited, like our multipliers, they are restricted to a very small number indeed. And this consequence follows, that it is physically impossible to divide a unit exactly into any aliquot parts which are not some powers of the factors of 10.

That is, a unit cannot be divided exactly in decimals by any number which is not of the form $2^n \times 5^m$.

12. Now, the immense majority of numbers are not of this form at all, and consequently it is a matter of physical impossibility to divide a unit exactly by the immense majority of numbers.

13. To shew how very few they are, we will shew how extremely few there are in the natural numbers up to 1,000, by which a unit can be exactly divided by decimal fractions.

Taking powers of 2, we have—

1, 2, 4, 8, 16, 32, 64, 128, 256, 512, 1,024, &c.

Taking powers of 5, we have—

1, 5, 25, 125, 625, 3,125, 15,625, &c.

Now, a unit cannot be divided exactly in decimals by any number except those in these two series, or those arising from the multiplication of any one in the one series by any one in the other.

To shew how extremely few they are, we have only to see how many there are up to 1,000. We shall find that there are only 28 numbers up to 1,000, in which an exact division is possible. They are, 2, 4, 5, 8, 10, 16, 20, 25, 32, 40, 50, 64, 80, 100, 125, 128, 160, 200, 250, 320, 400, 500, 512, 625, 640, 800, and 1,000.

14. Now, what should we say to a system of multiplication in which it was a physical impossibility to obtain an exact result in the immense majority of cases? What should we say to a system of multiplication in which it was physically impossible to multiply a unit exactly by 3,

6, 7, 9, 11, 12, &c. ? It is clear that such a system could not be tolerated for a day.

15. Now, such a system as that would be the correlative of decimal fractions. It would be one in which we were forbidden to multiply by any numbers except 10, and powers of 10; and therefore no multipliers which were not of the form $2^n \times 5^r$ could bring out an exact answer.

16. Hence we see that the analogy between decimal numbers and decimal fractions entirely fails. In fact, they proceed upon different principles; and it is manifestly the same with any fraction expressed in the radix of the scale of notation.

The unit may be multiplied by any natural number whatever. But it can only be divided by powers of the radix. Consequently, it can be divided exactly by no natural numbers whatever, except those composed of powers of the factors of the radix.

17. Hence we see at once, that there is a fundamental distinction between addition or multiplication in the denary scale, and decimal subdivisions, or decimal fractions. For all cases of addition or multiplication, nothing can be better than decimals, but for all cases of subdivision nothing can be worse.

18. The cases, therefore, of a coinage in which the unit is the lowest possible, and therefore proceeds by multiplication, and that in which the unit is the highest possible, are not only not parallel, but they involve principles which are antagonistic to each other. Where nothing but physical multiplication is wanted, nothing can be better; but where physical division is required, decimal fractions are impracticable.

19. Hence, we see at once, that the analogy between coinages of the third system and those of the first entirely fails, and what is the best in the first is impracticable in the third.

20. We have said that the essential peculiarity of decimal fractions is, that the unit cannot be divided into any aliquot parts, except those proceeding by powers of 10. Now this is a restriction that no people would ever submit to in the common affairs of life. We constantly require to divide things exactly into 3, 6, 7, 9, 11, 12 parts. No one would ever dream of proposing that persons should voluntarily preclude themselves from dividing a quantity into any exact parts under 1,000, but those of the 28 numbers above given. But that is what we should do if we were to adopt decimal subdivisions exclusively. Such a notion is so monstrous, that no one out of Bedlam would propose it. It would be just as rational as to suppose that we should adopt a system of multiplication in which none but these figures should produce exact results.

21. Now it would be the state of greatest perfection if we could imagine the unit of value, such as gold, to be some soft substance like putty, which we could subdivide into any number of parts whenever we pleased. But as that is impossible, the next best thing is to have it divided into that number of pieces which contains the greatest number of divisors possible. Now, 10 is not only not good, but it is extremely bad.

22. Now, considering that the present unit of the English coinage is of gold, and of its existing magnitude, it is quite easy to shew that there is no division of it at all comparable to that of 20,

12, and 4. No other combination within the same compass presents such a richness of factors. For it has no less than 26 factors, namely:—2, 3, 4, 5, 6, 8, 10, 12, 15, 16, 20, 24, 30, 32, 40, 48, 60, 64, 80, 96, 120, 160, 192, 240, 320, 480; whereas 1,000 has but 14 factors—2, 4, 5, 8, 10, 20, 25, 40, 50, 100, 125, 200, 250, 500. Hence the immense superiority of the present division of the pound sterling over that of the millesimal one for all purposes of physical division is manifest.

23. Moreover, every one's daily experience shews that while he naturally uses the decimal scale for multiplication, he never thinks of confining himself to decimal expressions for subdivision. People want, every day, halves and quarters, and half-quarters of things, and they call them so. But if we are to have decimal fractions exclusively, these expressions must be given up. A snuffy old woman in the Highlands wants a quarter of an ounce of snuff: she must no longer ask for that, but she must ask for a 25-100th of an ounce! And so on. A nation of savans might do that, but common humanity never will. We want a half or a quarter of a thing. The eye performs the work instantaneously. But if we go to decimal fractions, we must first of all divide the whole unit into 10, or 100, and then take 5, or 25 of these parts. Such a statement shews the manifest absurdity of such a thing.

24. The fact is, the whole confusion is based upon the supposition that decimal fractions are analogous to decimal integers, which is a complete delusion; and if this distinction in principle had been thought of, the question never would have been agitated at all.

25. Considering, therefore, these fundamental differences of principle between decimal fractions and decimal numbers, and decimal multiplication and decimal division, we may state the following as ascertained principles with respect to a coinage:—

1st. Where the unit of account is the lowest coin in common use between man and man, and the whole coinage consists of multiples of that unit, the decimal system is by far the best.

2ndly. Where the unit of account is a coin of some low magnitude, the decimal system will have some conveniences and some inconveniences. And as the unit becomes larger, the practical inconveniences will constantly increase over the advantages.

3rdly. Where the unit of account is very high, and placed far above the immense majority of transactions, the decimal system, which then becomes one of almost entire subdivision, is an intolerable nuisance, which could never subsist for any time at all.

26. From these considerations we see that it would be practically impossible to adopt any system of decimal coinage in this country so long as the pound sterling is the unit of account, and the coinage is one of pure subdivision.

Other schemes have been proposed, based upon the penny and the farthing. Of these we shall say something hereafter.

27. It is unquestionable that, for matters of account on paper, especially in large numbers, the decimal system affords an immense superiority. It is no doubt true, that it is physically impossible to divide anything into 3, 6, 7, &c. parts, by

decimals. We can, however, carry it as near exactness as we please. The philosopher can afford to balance this inconvenience against the other many advantages, and carry his calculations a few figures further with equanimity, when he knows that the ultimate result will come as nearly true as he pleases. But it is a far different matter with the daily transactions of life, where actual physical subdivision is required, and where the differences which arise from an imperfect division give rise to everlasting and perpetual quarrels. No man who has not studied history can conceive the intolerable practical misery that a depreciated currency causes to a people; and the very same effects are produced by an imperfect system of subdivisions. We shall have ample evidence of the truth of this in the course of this article. We shall now give some historical notices of the adoption of the decimal system of coinage by different nations.

Of the Decimal System of Coinage of the United States.

28. The currency of the various American colonies was originally the same as that of the mother country. But we have shewn, in the article *BANKING IN AMERICA*, that nearly all the States had issued enormous masses of paper currency, the effect of which had been to depreciate the pound in them. In each State, too, the pound had undergone a different degree of depreciation; hence there was, at the time of the Revolution, an immense confusion between the currencies of the different States. The weight of the pound sterling was 1,718½ grains of pure silver; but the pound of Georgia was 1,547 grains; that of Virginia, Connecticut, Rhode Island, Massachusetts, and New Hampshire was 1,289 grains; the pound of Maryland, Delaware, Pennsylvania, and New Jersey was 1,031½ grains; and the pound of North Carolina and New York was 966½ grains.

29. While, therefore, the pound, shilling, and penny had different values in different States, the Spanish dollar had a general circulation throughout all the States, but with a different rating. In the New England States and Virginia, it passed for 72 pence; in New York and North Carolina, for 96 pence; in the Middle States, for 90 pence; and in Georgia and South Carolina, for 56 pence.

30. When the Congress was formed, they found it necessary to issue a paper currency, to carry on the war. If this had been based on the pound, it would have caused intolerable confusion; besides there was no reason why the pound of any particular group of States should be preferred to the others. Congress therefore adopted the plan of basing their paper on the Spanish dollar, which had a general currency throughout the States. And when the national independence was secured, as it was necessary to have a national currency, the dollar was naturally adopted as the national unit in 1785.

31. Mr. Robert Morris, the Financier of the American Revolution, seems to have been the first who brought forward a scheme for a decimal coinage. On the 15th of January, 1782, he laid before Congress an exposition of the plan. He proposed to have an exceedingly *small* unit, and that the coins should be increased in a decimal ratio, so as to afford an easy calculation. This unit need not be a coin, but was to be a quarter of

a grain of pure silver. The lowest silver coin should be 100 of these, and be called a *cent*. To this 2 grains of copper were to be added, so that the coin should weigh 1 dwt. 3 grs. Five of these were to make a *quint*, or 500 units, and 10 to make a *mark*, or 1,000 units. This plan was not carried out, Mr. Morris having resigned, and Mr. Jefferson, to whom the matter was referred in 1784, considering the unit too small. Mr. Morris himself subsequently modified it by adopting a larger unit, which he assumed to be 12s 6d. sterling. This he called a pound, and divided by 10 in a decimal ratio, making the pound 1,000, the shilling 100, the penny 10, and the doit 1. It was found that the currencies of all the different States might be reduced to this common measure. The table of coins proposed in connection with this system, was—the crown, of gold, of 1,200 doits; the half-crown, 600 doits; the dollar, of silver, 300 doits; the shilling, 100 doits; the groat, of 20 doits; and the copper doit. Thus we see that, though the accounts were proposed to be decimal, the coinage was not decimal, but *binary* and *ternary*. In 1786, Congress adopted Mr. Jefferson's plan, and adopted a system of coins of these names: an *eagle*, to contain 246 $\frac{26}{100}$ grs. of fine gold, to be equal to 10 dollars: a *half-eagle* of similar proportions; a *dollar*, of silver, to contain 375 $\frac{64}{100}$ grains fine; *half-dollars* of similar proportions; a *double dime*, of 75 $\frac{120}{1000}$ grs. of silver; *half dimes*, and *cents*, of copper, the 100th part of the dollar, and *half-cents*. Thus, here we see the units divided into *halves*.

32. This report was presented to Congress, but no action was taken on it. In 1790, it was referred to Mr. Alexander Hamilton, the Secretary, and in the next session he presented an elaborate report upon it. He adopted the dollar as the unit, but contended that it should not be attached either to gold or silver exclusively. He proposed that it should correspond to 24½ grs. of pure gold, or 371½ grains of pure silver, each to pass for 1 dollar in the money of account; the alloy of each to be 1-12th, making the unit 27 grs. of standard gold, and 405 grs. of standard silver. These proportions for the coins were adopted, and an Act to establish a mint and regulate the coins was passed in 1792. The alloy was fixed at 1 part in 12 for gold, and for silver 179 parts alloy, and 1,485 fine. This proportion, however, was altered in 1837, when the alloy both of gold and silver was ordered to be 1 part in 10.

33. The introduction of the decimal system into the American coinage was considered as a great triumph of science, and its authors boasted that it had met with the boundless approval of all eminent men in America and Europe. If, therefore, it had been found in practice so very beneficial, we should naturally have expected that, during the period it has been in force, now just 70 years, it would have entirely superseded the former system of pounds, shillings, and pence, and the binary division of halves, quarters, eighths, &c. We should have expected that the existence of the former system would only have been known to professed antiquaries, who might have looked upon it somewhat in the same light as geologists do the extinct races of animals. And as for the common people, they never could have been expected to have heard of it at all.

But is this the fact in practice? It is found not to be so. By law, the dollar is divided into dimes, cents, and mills. But it is found in practice that the cent being taken as the unit, while calculations upwards are reckoned decimally, those *downwards* invariably proceed on the old binary scale; while the law declares that there shall be no division of the cent, except by 10, universal mercantile custom invariably proceeds by halves, quarters, eighths, &c. The mil is utterly ignored. Thus, Mr. Slater placed before the Decimal Coinage Commissioners, as an ordinary specimen of mercantile news, the following extract from a New Orleans Price Current:—"Louisiana sugar, of fair to fully fair quality, is quoted at 7 to 7½ cents per lb.; ginger at 6 to 6½ cents per lb.; tobacco at 7½ and 8½ cents per lb.; (and also, *exceptionally*, among a multitude of quotations exhibiting binary subdivisions, at 7½ and 8½ cents.) Green meat (pork) found purchasers at 7½ cents per lb.; and lard at 9½ to 9½ cents. On cotton, the advance within the week has been fully ½ to ½ cent per lb., whilst freight to Liverpool was taken at ½ to ½ cents this year, against ¼ to ¼ d. in 1855, and ½ to ½ d. in 1854. To Havre, cotton is taken on freight at ½ cents. A ship was taken for Bordeaux at ½ cent, and at Boston at ½ cent." No freights were quoted at decimal rates. Among the articles fluctuating in price by ½ cents, were found almonds, bacon, bagging, coffee, hides, lead, rice, soap, spirits.

34. Thus we see, taking this as a specimen of the mercantile custom in America, that commercial instinct obstinately rejects the decimal division, notwithstanding it is thrust upon them by law. And is it possible to conceive they would not long ago have adopted it without any law at all, if it had really been more suited for their purpose? just as some commercial establishments in this country have adopted decimals in their business, because it answers their purpose, without any law at all. And no wonder, for the binary subdivisions being found to be those most convenient for commercial purposes; 4ths could not be expressed in less than two figures, 8ths in less than three; 16ths in less than four; 32nds in less than five; and 64ths in less than six. Thus, for instance, in the above extract, $\frac{1}{4}$ = .625; $\frac{1}{16}$ = .0625; $\frac{1}{32}$ = .03125. What memory could stand such complexity? In the first place, it would be necessary to recollect that three figures in the quotation meant 8ths; four figures meant 16ths; and five figures meant 32nds; and then all the varieties of these fractions. This example shows that, for physical subdivision, decimals are intolerable.

35. Commercial instinct, therefore, utterly condemns decimal subdivision. But does the common practice of small dealers of all sorts support it any better in common life? The evidence before the Commissioners as decisively disproved that notion. During all this long period of 70 years, it has been found impossible to extirpate the old reckoning by shillings and pence. Professor Kelland, Dean of the University of Edinburgh, travelled extensively through the States, and gave in a most valuable paper to the Commissioners. When a nation

adopts a decimal coinage, it would naturally be expected that they should adopt decimal weights and measures. Indeed, some of the scientific witnesses examined before the Parliamentary Committee and the Commissioners, seemed to think that there was very little use of one without the other. But the Americans have not decimalized their weights and measures; they still retain the old ones they learnt from the mother country. How is this, if decimalization be so good? Still more should we expect that they would have made up their parcels in shops in tens, instead of dozens, to accommodate their money; but they have not decimalized their parcels. Professor Kelland says,—"The decimal system has been the legal system in America for 60 years, and dozens have not yielded a hair's breadth as yet. The same paper from which I quote, contains Valentines, in lots of 144, 36, 24, 18, 12, and 3, but no tens." In a Cincinnati paper, there were advertised for sale, 100 dozen jars, 100 dozen glass, 100 dozen cans. Shillings were the sums charged in Philadelphia, in the hotel bills. This appeared very strongly, too, in the book catalogues. The prices, though expressed in cents, were in reality accommodated to shillings. Some were marked 69 c., which in reality meant 5s. 6d. New York; others 63 c., which meant 5s. New York, the New York shilling being 12½ cents. The New England shilling was 16½ cents. On examining 12 pages of the catalogue, decimal prices were marked in 40 cases, and non-decimals in 117. Among book prices, 38 and 31 cents were most frequent, being remarkable numbers to choose, if there were no particular reason for it. The fact was, the former number meant 3s, and the latter 2s. 6d. New York.

36. Nor was this opinion unsupported by intelligent natives. The Rev. Joshua Leavitt, editor of the *Independent*, of New York, stated to the Committee of the Canadian Assembly, in 1855,—"I have no doubt of the superiority of the decimal system for the purposes of accounts; but for all the purposes of small circulation, in marketing, huckstering, and the like, I am persuaded that a duodecimal currency, like that of England, or like that which formerly prevailed in the city of New York, is far preferable. These small transactions of daily life outnumber the transactions of commerce almost infinitely, and it seems impossible to make a decimal currency as convenient in these as in the old currency. One reason is, that the decimal currency admits of only one aliquot division, that is, into halves." Mr. Leavitt then shows the excessive inconvenience of this want of divisible power. He also said,—"You are aware that in our (*i.e.* New York) marketing, and other small transactions, our business is still done in shillings and pence, the shilling being one-eighth of a dollar, and therefore corresponding exactly in its value to the old Spanish coin of one-eighth. The provincial currency of New York, before the Revolution, was framed upon the reckoning of 8 shillings to a dollar; and when the Federal currency was introduced in matters of coin, the common people still clung to the old shilling as a matter of necessary convenience in their pocket payments; and the experience of *sixty years* has not in the least diminished their attachment to this method of reckoning in

small payments. * * * And not only this, but we find the people of all parts of the country are learning more and more to use the vernacular currency of New York in their daily chaffering, from one end of the United States to the other. You will frequently hear people giving you the price of things in York shillings and York sixpences. I think this experiment is conclusive, and ought to be satisfactory to prove that the duodecimal currency in small transactions is a great public convenience. I am sure it is only this actual and felt convenience which has enabled it to maintain its ground for 60 years. * * *

For myself, I have no idea that we shall ever abandon the shilling currency; the lapse of generations has only fixed it more firmly upon us, and I fully believe that in a few years we shall have a Congress so governed by common sense, and so alive to the convenience and welfare of the people, that they will legalise the York shilling and sixpence, as the eighth and sixteenth of a dollar, and will give us from our own Mint a corresponding coinage." The Committee of the Legislative Assembly of Canada reported that coins representing the eighth and sixteenth of a dollar, were indispensable in small transactions in Canada; these coins being quite incompatible with a decimal coinage.

37. The introduction of a decimal system of coins into France, was easier than almost any other nation. The French coins, like those of Western Europe, were divided into livres, or francs, sols, and deniers. But the successive depreciations had brought the livre, or franc, down to below 10d., the sol was in fact equal to $\frac{1}{4}$ d., and the denier had altogether ceased to exist as a coin. The franc and the sol were therefore all that were wanted. It was only to call it five centimes instead of one sol, and the thing was done. Nevertheless, slight as this change was, it was effected with inconceivable slowness, if indeed it can be said to be done yet. The name of the livre was abolished, but that of franc retained. In order to make it weigh 5 grammes, it was found necessary to increase its weight by 1-80th part. Slight as this difference was, it gave rise to great disturbance. Dr. Gray says, "Even now, at the distance of more than half-a-century, it is by no means universally adopted in France, either in accounts, or still less in the great mass of ordinary retail dealings. As long as the old livres remained in circulation, whenever they were tendered in place of a franc, it became a constant source of contention which party was to be the loser by the bargain; one or the other must be so, as there was no coin to represent the actual difference, and the debate frequently ended in the weaker party giving two centimes, or one fiftieth part instead of one eightieth part over and above the livre, or as a centime was a rarity seldom seen, a livre and a sol were combined to represent a franc, and thus the receiver obtained three and three quarters per cent. beyond the real value of the new coin as compared with the old." Dr. Gray says that even now accounts are still frequently kept in livres, sols, and deniers, in the provinces, and even in Paris itself the prices of most of the common and smaller articles are constantly expressed in sous. *Galignani's Messenger* is marked ten sous, not fifty centimes, or five décimes. In 1856, an ordonnance was issued to prevent people crying

articles in the streets in sous! So long do the old habits of the people on so small a matter continue against all the efforts of a powerful government.

38. The French introduced their decimal system of monies into Sardinia in 1793. The *lira* was diminished to an equality with the franc; 100 old Piedmontese *lire* being coined into 118½ new lire, or francs. The Sardinian money is now in all respects the same as the French, the coins of the two countries passing freely in each other. This change was continued by the restored dynasty, after the overthrow of the French empire. By laws of the 12th August and 7th September, 1816, and 4th and 9th December, 1820, the new lira was declared to be the money of account, and all contracts were ordered to be made in that coin. In 1827, this system was extended to the Duchy of Genoa, and in 1843 to the island of Sardinia.

39. The French introduced the decimal system into Belgium in 1803. It was suppressed in 1816 in favor of the decimal system of the Netherlands, but the French system was restored in 1832. Before 1803, there were four distinct systems of coinage legalised, and in common use; namely, the Flemish livre, containing twenty schillings, each schilling twelve gros, each gros eight penninghens, and each penninghe three myten. This money was used chiefly for calculating the foreign exchanges, especially that upon London, and was continued so late as 1843. The great commercial houses kept their accounts in florins, divided into 20 sous, and each sol into sixteen deniers. This was also used in the exchange on Amsterdam and Hamburg. The Brabant florin, containing twenty sous, and each sol twelve deniers, was the money used in the transactions of daily life. And lastly, the government accounts were kept in livres tournois, divided into twenty sols of France, and each sol into twelve deniers. It is not surprising that the establishment of a single uniform system like the French was found to be a great improvement over such complication. But even here the immense time necessary to change the habits of a people is seen. The higher commercial classes in the cities keep their accounts in francs and centimes, but the old divisions of Brabant-guilders and stivers are still maintained by the small tradesmen and shopkeepers, though these coins have no monetary representatives. In usual life, every man in Belgium is compelled to have constantly at hand his tables of reduction of the various monies, both past and present.

40. Up to 1848, the Swiss coinage was in a state of fearful confusion. Each Canton coined money for itself, which would not pass in the neighbouring ones. Numerous coins from France and Germany also passed current at different denominations. The Federal Constitution of 1848 took away the power of the Cantons to coin money, and placed it in the hands of the Federal authorities, and demanded a monetary reform. In 1850, a new Federal law on coins was passed, which was brought into effect during 1851 and 1852. The moneys of account and usage were assimilated to the French, and all the old ones withdrawn and destroyed. What an enormous improvement this was, may be judged by the answer of M. Trümhler to the Decimal Coinage

Commissioners, who says that before 1850, there were current "all kinds of German dollars, German florins, Austrian zwanzigers, French five-franc pieces, subdivisions of the above, and about 160 different Swiss coins. The legal value of most coins was different in almost every Canton; and the current value differed everywhere from the legal value!" Thus, the same coinage circulates throughout France, Belgium, Switzerland, and Sardinia, and probably very soon the whole monies of the Italian peninsula will be assimilated, to the immense relief of travellers.

41. The late kingdom of the Two Sicilies had a coinage of which the ducat was the unit, divided into 10 carlini, and each carlino into 10 grains, and each grain into 10 calli. But accounts were kept only in ducats and grains. Payments, however, were seldom made in ducats, which was a very rare coin, but in Neapolitan dollars, worth 12 carlini, or 120 grains. And here we have a curious example of a decimal system of accounts, with a duodecimal coinage. For the coins in circulation were the dollar of 12 carlini, or 120 grains; half-dollars of 6 carlini, or 60 grains; pieces of 4 carlini, 3 carlini, 2 carlini, 1 carlino, and half a carlino. Copper coins are in common use, of half a carlino, 4, 3, 2½, 2, 1½, 1 grain, and half a grain.

This is a very strong and striking example of what we said above, that as soon as the unit of money becomes of any magnitude, the practical purposes of life irresistibly demand a *duodecimal* coinage. The very same thing as is manifested in America.

42. The Netherlands, like most other countries, were afflicted with great monetary confusion. The basis of the whole, however, was the florin, containing 20 stivers, or 20 pence English. In 1821, this coin was taken as the unit of the system, and divided into cents and half-cents. In this case we observe the transition was extremely easy. The stiver was already the 20th part of the florin, and its name was simply changed into 5 cents, as in France. Hence nothing new required to be done: it was simply to abolish a number of the old coins.

43. Portugal is an example of a country having a single unit, like that of China, and all the coins being multiples of that unit. The Portuguese unit is the rei, being equal to $\frac{4}{12}$ of a penny. The smallest coin is the 5 reis, or $\frac{1}{12}$ of a penny. But though all the moneys of account were decimal multiples of the rei, the coinage was not so. The coinage consisted of moldores of 4,800 reis; cruzaes, 400 reis; cruzados novos, or pinto, 480 reis; quartinhos, 1,200 reis; testoons, 100 reis; and vintems, 20 reis. This coinage has, however, now been abolished, and it has now been decimalized, as well as the accounts. The change came into operation in 1857.

44. In Russia, the silver ruble is the standard, being about 37 or 39 pence. This is divided into 100 copecks, and the copeck is divided into halves and quarters. The silver ruble was established as the unit of money in 1840, in place of the ruble of assignation, to which the issues of depreciated paper had reduced the Russian standard. The silver ruble was equal to 3½ paper rubles, but the subdivisions of the latter were the same. And here we perceive that as soon as it went below cents, the binary division was found necessary.

45. In Greece the drachma is the unit, being in value about 8½d. this is divided into 100 lepta, the latter being about $\frac{1}{3}$ of a farthing. The drachma, however, is an imaginary coin, and foreign coins of gold and silver are current at a regulated value. The only Greek coinage is copper. Hence, although accounts are kept decimally, there is in reality no decimal coinage. Drachmas, half and quarter drachmas, are supposed to exist. Here we see as usual binary division for practical purposes.

46. Such are the examples of actually existing decimal systems both in accounts and coinages, and we shall find that they will throw much light upon the important question whether it is expedient to decimalize the coinage of this country. We observe then, that the highest unit in a decimal system of coinage is the American dollar, which is divided nominally into dimes, cents, and mills. But practically, the only moneys of account are dollars and cents. The next highest is the Neapolitan ducat, 41½ pence, divided nominally into 10ths, 100ths, and 1,000ths. But in practice the accounts are kept in ducats and grains only. The coinage is entirely duodecimal. The next highest unit is the Russian ruble, about 38d., both nominally and in practice, divided into 100 copecks, but the copeck is divided into halves and quarters. Then comes the Netherlands, with its unit of 20d., divided into cents, and these into half-cents. Then the French, Swiss, Belgian, and Sardinian unit of 10d. nearly, divided nominally into decimes, centimes, and milliemes, but practically only into francs and cents. Here the centime is a coin so much below all ordinary use that there is no occasion for its division, and whether in commercial transactions it is so or not, we have no information. Then comes the Greek unit, also divided into 100ths; and lastly, the Portuguese unit, which is below the purposes of common life, and, therefore, does not require division. In all of these we observe that practically people refuse to go below cents in their accounts; so that we may fairly consider them as the pivots of the coinage, and whenever they go below cents in business, they invariably reject the decimal division, and adopt a binary one. And this becomes clearer as the nominal unit becomes larger.

47. The question of decimalizing the coinage and accounts of this country has been mooted at various times. In 1816, a royal commission was appointed to consider the possibility of establishing a more uniform system of weights and measures. They reported that the existing subdivision of weights and measures was far more convenient for practical purposes than the decimal scale. In 1824, Sir John (afterwards Lord) Wrottesley brought forward a motion in the House of Commons for inquiring into the applicability of the decimal system to coins. He proposed pounds, double shillings, and farthings, reduced four per cent. in value; in fact, what is now known by the name of the pound and mil scheme. The motion was, however, withdrawn, and the currencies of England and Ireland were soon afterwards assimilated. The standards of weight and measure were lost when the Houses of Parliament were burnt, in 1834, and in 1838 a Commission was appointed, consisting of the Astronomer-Royal (Mr. Airy), the President of the Royal Society (Mr. Francis Baily), Mr. J. E.

Drinkwater Bethune, Sir J. W. F. Herschel, Bart., Sir J. G. Shaw Lefevre, Sir J. W. Lubbock, Bart., the Very Rev. George Peacock, Dean of Ely, Lowndean Professor of Astronomy, and the Rev. R. Sheepshanks, all men distinguished in science, but not one having any practical knowledge of commerce. The Commissioners reported in 1841, strongly recommending the decimalization of the coinage, on the same system as already proposed by Sir John Wrottesley. In 1843, a second Commission was appointed, containing the names of the Astronomer-Royal, Sir John Herschel, Sir J. G. S. Lefevre, Sir J. W. Lubbock, the Dean of Ely, and Mr. Sheepshanks, members of the former Commission, to whom were added, the Marquis of Northampton, President of the Royal Society; the Earl of Rosse; Lord Wrottesley; and Professor Miller. The Report of this Commission, composed exclusively like the former of men of science, agreed with the former, and proposed to carry out its recommendations.

48. In 1847, a motion was made in the House of Commons, by Sir John Bowring, on the 24th April, for an Address to the Crown in favor of the coinage and issue of silver pieces of the value of 1-10th and 1-100th, of the pound sterling, in order to introduce the decimal subdivisions of the coinage. The motion was withdrawn, on the engagement of the Chancellor of the Exchequer that pieces of the value of the tenth of the pound should be coined. This was done, and these pieces called florins, are now in general circulation.

49. On the 26th of March, 1853, the Commissioners of 1843, hearing that a coinage of copper was in contemplation, addressed a letter to Mr. Gladstone, then Chancellor of the Exchequer, strongly urging upon him that this copper coinage should be in pieces of the value of 1-1000th, 2-1000ths, and 4-1000ths of a pound, being 4 per cent. below the present farthing, half-penny and penny, with the view to the introduction of the decimal system. On the 5th of April, Mr. Gladstone was asked in the House of Commons whether it was the intention of Government to carry out the decimal system, by coining the new copper money on that scale. The Chancellor replied that there was no intention on the part of the Government to make any change in the copper coinage. Nevertheless, considering the great importance of the subject, they would support the motion for a Committee by one of the members. Accordingly on the 12th of April, on the motion of Mr. W. Brown, member for South Lancashire, a Committee was appointed to consider and report upon the expediency or otherwise of adopting a decimal system of coinage.

50. This Committee examined twenty-five witnesses, all of whom were in favor of a decimal system of coinage, and all recommended the pound and mil scheme, as the plan of the former Commissioners was called, with the exception of Mr. Headlam, member for Newcastle, who strongly urged the expediency of making the $\frac{1}{4}$ d. the basis of the coinage, and multiplying from that unit. This would make the pound sterling equal to £1 0s. 10d. The Committee made their report on the 1st of August, strongly recommending the adoption of the pound and mil scheme. They recommended the withdrawal of the half-crown, the 3d. and 4d. pieces, and the introduction of

copper coins of 1, 2 and 5 mils, and silver coins of 10 and 20 mils.

51. The Report of the Committee excited much discussion in the newspapers and among the public, and was followed as usual by a great eruption of pamphlets. But a most extraordinary difference of opinion soon manifested itself among the zealous advocates for a decimal system. No less than eleven different schemes were brought forward, and urgently pressed, all based on some particular coin of the existing money. Most of them, too, were hostile to the adoption of any rival scheme, and preferred to maintain the existing coinage rather than have any plan but their own adopted. These rival schemes introduced greater complexity into the question. In 1855, the House of Commons passed a resolution, by 135 to 56, in favour of the further extension of the decimal system. But, before finally deciding, the Government referred the whole matter to a Commission, composed of Lord Monteagle, Lord Overstone, and Mr. J. G. Hubbard. This Commission made a preliminary report in April, 1857, signed by all its members. They examined a number of witnesses, who were adverse to the pound and mil scheme, and they prepared a series of questions to be addressed to eminent persons who lived in foreign countries, where the decimal system was already in use. Moreover, Lord Overstone prepared a series of questions, framed with the view of bringing into distinct notice and examination some of the advantages of the present system of coinage, and some of the principal difficulties and objections which have been suggested as attending the introduction of a system of decimal coinage.

52. The evidence given before this Commission, together with the experience gathered from foreign countries, and the answers to Lord Overstone's questions, may be said to have completely changed the aspect of the question, and to have conclusively settled it against the decimalization of the English coinage. Lord Monteagle retired from the Commission, and the final report was delivered on the 5th April, 1859, signed only by Lord Overstone and Mr. Hubbard. The conclusions which they jointly arrived at were, that the experience of foreign countries, where the decimal coinage had been introduced, was full of instruction and warning to us; but the circumstances of this country were so different, that no safe conclusion could be drawn from them. That commercial men as well as others were greatly divided on the subject. That it was difficult to come to any useful conclusion as to the merits of the decimal system in the abstract, and distinct and peculiar difficulties attended each separate form proposed for adoption. That the penny scheme had many advantages over the pound and mil scheme; nevertheless that the state of public feeling would not allow the pound to be disturbed. That as regarded the pound and mil scheme, there appeared to be an advantage in calculations, though the extent of the advantage was much disputed. That with regard to the reckonings of the shop and the market, and for mental calculations generally, the present system was unquestionably the best, as well as regarded the coins, provided by the rival schemes. That the pound and mil scheme could not be looked upon as a demonstrative improve-

ment, but rather as a doubtful experiment, attended with many transitional difficulties, partly of a moral character, arising from the difficulty of changing established usages and habits, and partly mechanical, arising from the non-interchangeability of the old and new coins. The advantages of decimal accounts might be attained without disturbing the coinage, by a more extensive use of the practice now adopted at the National Debt Office, and the principal Assurance Offices. That under existing circumstances, it was not desirable to disturb established habits by an attempt to introduce any new principle into the coinage alone.

53. These were the joint resolutions adopted by the two Commissioners. But Lord Overstone prepared a draft report, most ably and fully discussing the evidence obtained by the Commissioners, and weighing the alleged advantages and disadvantages of each scheme with perfect impartiality. The clear and convincing way in which the question is argued in all its different bearings, may be considered to have finally disposed of the subject. (DECIMALIZATION.)

COLBERT, Junior. Pseudonym.

The Age of Paper; or an Essay on Banks and Banking; containing the history of the most remarkable Paper Bubbles. London, 1793.

COLBERT, JEAN BAPTISTE, the greatest minister, probably, that ever ruled France, and by many erroneously supposed to be the author of the Protectionist system, was born at Reims, the 29th August, 1619, the son of Nicholas Colbert, a small landowner of Champagne, and Marie Pussort. His father was styled Lord of Vandières, and was of Scotch descent, and after his son rose to greatness, many curious inquiries were started whether he had ever been in trade, or was entitled to be called noble, without any very satisfactory answer.

Jean Baptiste was placed very young in a mercantile house in Lyons, but his ambition pointed to Paris, and by means of his uncle, Colbert of St. Poulange, Intendant of Lorraine, and brother-in-law of the Secretary Le Tellier, he was placed in his office.

Being sent to Sedan, where Mazarin was in exile, by the Secretary, with a letter of the Queen, with orders to bring it back with him, the Cardinal wished to keep it. But Colbert insisted on having it back, notwithstanding the anger of the Cardinal. Some time afterwards, when he returned to Paris, being in want of a Secretary, he applied to Le Tellier, who gave him Colbert. The Cardinal was in reality pleased at the firmness of the young man in obeying his orders, and desired him to serve him as faithfully as he had done his former master.

Colbert soon rose high in the Cardinal's esteem, who appointed him his intendant, or steward. In 1649, he was appointed one of the Council of

State, and, during the Fronde, he was the minister's right-hand man. When the minister was banished, Colbert remained in Paris, and was his agent for communicating with the Court.

In 1650, he married Mary Charon, whose father had made a large fortune in trade. Being threatened with a heavy tax, Colbert got him exempted, and in return the merchant gave him his daughter, with a handsome dowry. Colbert's family soon shared the bounty of the minister, and by 1655, they were all placed in good posts.

Louis XIV. was kept, during his minority, in a state of shameful penury. But while the king was in want of the commonest necessities, the profligate ministers batted on corruption. Mazarin, with boundless rapacity, and by gaming, accumulated a fortune, which, under the skillful management of Colbert, grew to colossal dimensions. The financiers and farmers of the revenue lived in the most profuse splendour, while the king and the people were starving. The chief minister of finance was Fouquet, who emulated Mazarin in his rapacity. It has been urged as a charge against Colbert, that he laboured systematically to overthrow him, to step into his place. The evidence in favour of the charge is not very clear, and even if it were, Fouquet would not be entitled to much sympathy. Mazarin thought more than once of displacing Fouquet, but in 1657, Colbert dissuaded him from it, alleging the merit of the superintendent. In 1659, however, he drew up an elaborate memoir on the finances, showing all the mischief of Fouquet's system, for the private information of the Cardinal. Fouquet obtained a copy of it by bribing the post-master.

In the same year, Mazarin sent Colbert to Pope Alexander VII., to persuade him to restore the Duchy of Castro to the Duke of Parma, and to assist the Venetians, who were besieged by the Turks in Candia. But the Pope hated Mazarin, and so the mission failed. After remaining in Italy four months, and vainly urging some other states to assist the Venetians, he returned to Paris, and found Mazarin struck with the malady of which he died in the following year.

As death drew near, Mazarin became alarmed lest the king might strip his family of his ill-gotten wealth. Colbert advised him to present it all to the king, being well assured that he would give it all back again. The king accordingly gave him permission to dispose of it as he pleased.

Mazarin left him his executor, and in his will recommended him to the king, as an adequate return for all the benefits he had received from him.

The finances had long been in terrible disorder. The farmers were all occupied in wringing as much as they could from the people, and giving as little as they could to the treasury. The king, by an unexpected force of will, determined never again to submit to such a thralldom as that of Mazarin, and to be his own minister. He used to preside regularly at the Council. Fouquet's accounts were purposely mystified, but at the next meeting of the council the king used to astonish every one by unravelling all their mystification, and exposing their errors. The fact was, that Colbert used to be closeted with him for several hours every evening, initiating him into the mysteries of finance.

The kingdom was overwhelmed with debts. The interest paid was 50 per cent. Sully had tried to reduce the *Rentes* on the Hotel de Ville, but this produced an insurrection, and he was forced to abandon it. In 1648, Mazarin was unable to pay the interest, and this was one of the ostensible pretexts of the Fronde.

The fate of the financiers was soon settled. There were abundance of precedents for such cases. France, to her misfortune, had been many times in a similar predicament. Eight times before, Chambers of Justice had been appointed, to make the financiers disgorge their plunder. Fouquet was struck down in the very height of his greatness. The king, intent on his destruction, treated him with extraordinary graciousness. When all was ready, the execution was left to Colbert, and he was arrested on leaving the council. In November, 1661, an edict was issued, denouncing in vehement language, the malpractices of the financiers. On the 11th December, all the clergy were ordered to invite their congregations to come forward publicly, and give information of any financial crimes committed since 1635.

The rapacious crew were struck with terror. Many fled the country, many were imprisoned, some were tortured, and some were hung. Five hundred were condemned to make restitution to the amount of 110 millions.

Louis determined that Fouquet should have no successor, any more than Mazarin. A few days after his arrest, a royal council of finance was formed, with the Maréchal de Villeroi nominally at its head, but with Colbert as the real man of business. Its meetings were held every week, and the king regularly attended, and signed every order for money. Hereditary rights to offices in the finances were abolished, and it was enacted that the State should have the first lien on all the property of the financiers, and their profits were reduced from 5 sous to 9 deniers the livre. The sums disgorged by these, in the hands of the Chamber of Justice, supplied some ready money, and Colbert made the financiers accept bills at 15 months for the taxes, which supplied him with more.

The restoration of the credit of the country was marvellous. Previously to this time, the government officials of all sorts were obliged to pay court to the financiers to get paid, and they thought themselves lucky if they could get bills at 18 months or two years. In 1662, the king not only paid off all the arrears of 1660 and 1661, but made them an advance. He not only refused 1,600,000 livres to give up his purchase of Dunkirk, but he borrowed 5,000,000 at 5½ per cent. to pay for it. In September, 1661, France and Europe saw the king in constant difficulties, living on the credit of his friends, and unable to undertake any extraordinary expense: in September, 1662, Colbert uttered the proud boast, that all Europe was afraid that the king would buy up any town or country he had a fancy to. He said that his master had only to stamp his foot on any part of France, and money would spring up.

In 1674, during the height of the war with Holland, the king not only paid back 50,000 livres which the merchants had presented him with, but added a gift of 6,000 more, to requite them for their zeal.

The best eulogy on Colbert's management of the finances is a simple statement of the receipts and expenditure during the first eleven years of his administration, till the war with Holland. They were as follows:—

	Receipts.	Expenditure.
1662 ...	75,568,750 liv.	74,826,456 liv.
1663 ...	48,053,826	46,826,576
1664 ...	68,602,796	68,071,008
1665 ...	90,888,978	90,871,856
1666 ...	67,459,001	66,611,895
1667 ...	72,520,925	72,090,744
1668 ...	70,875,374	70,875,381
1669 ...	76,468,967	76,283,749
1670 ...	78,900,755	77,209,879
1671 ...	87,501,077	83,875,723
1672 ...	87,067,787	87,928,561
	<u>813,903,231</u>	<u>810,471,228</u>

But, says M. Joublean, from whom these figures are taken, there is to be deducted from the receipts the sum of 4,292,773 livres on account of money carried from one year to another, leaving a total actual receipt of 809,610,458 livres, leaving on the whole period of 11 years an excess of 860,770 livres of expenditure over receipts. Such were the halcyon days of French finance! Gone, we fear, never to return.

There was one evil, however, which Colbert tried in vain to grapple with, though as long as he lived it was kept in somewhat moderate bounds, but after his death was one of the principal causes of the ruin of the finances and the monarchy.

Since the times of the last Valois of the first branch, certain sums had been paid to bribe foreign princes. These were called *ordonnances du comptant*, because they were general orders on the treasury payable on demand, without specifying the particulars. This plan was used afterwards to cover the greatest abuses. The princes of the blood had no civil list, and all their expenses ought to have been checked by vouchers by the proper officers. This was, however, naturally felt to be very degrading, and consequently they adopted the cover of an *ordonnance du comptant*. This had grown to an enormous abuse. From 1630 to 1656, the average yearly amount of the *ordonnances du comptant* had been 10 million livres. From 1656 to 1659, they suddenly rose to upwards of 320 millions. Such extravagance alarmed Colbert, and he tried in vain to abolish it. What could he do against the extravagance of the king, and the rapacity of his mistresses, and the crowds of greedy courtiers, and all the herd of kings, foreign ministers, and patriots, who were all clamouring for French gold? All he could do was to endeavour to regulate them a little, and thrust them on the king's notice as often as possible.

In 1674, the king's credit was so good that Colbert advised him to open a bank to receive public deposits to the amount of 12 millions. Everyone might place what sum he pleased, and received an order signed by the farmer-general, payable one year after date, with five per cent. interest. This bank was found of the greatest service during the war, and was retained for some time after the peace, and enlarged to 20 millions.

On the 31st December, 1681, the fund-holders who held stock created in 1674, 1676, and 1679, received notice that their principal would be paid

off, and those who had taken loans at the 14th, 16th, and 18th denier (or at 7 1-7th, 6 2-3rds, and 5 5-9ths per cent.) were allowed to convert them into new stock at the 20th denier, or five per cent.

Lastly, to shew the difference between the state in which he found France, and the state he left it in at his death, we may give these figures :

	Taxes.	Interest on Debts.	Net sum received by the Treasury.
1661 ...	84,222,196	61,877,184	22,8,97281
1688 ...	116,053,374	23,365,274	22,6404,00

These are sufficient, as financial details. We shall turn to some other parts of his administration.

No sooner was Colbert firmly seated in power, than he began to develop his gigantic schemes of organization.

The first thing to reform was the tariffs of the custom-houses, foreign and domestic. Nothing could be more complicated and bizarre than they were; and they were made an instrument of enormous oppression in the hands of the farmers, who could alter the duties as they pleased, and were always sure of being able to bribe the judges to decide in their favour. Each province had its own custom-houses. Sully had tried to do away with these barriers, and failed. The States General, in 1614, remonstrated against them in vain. Private interests were too strong, and instead of being diminished, the burdens were increased. In 1621, Louis XIII. even erected new ones where none had ever been before, and new imposts were levied in spite of the complaints of the merchants, many of whom abandoned commerce from these vexations. Agriculture itself was weighed down, large districts were left fallow, and the country was filled with beggars and vagabonds. In 1654, the six corps of merchants in Paris presented a remonstrance to the king, saying that excessive taxes destroyed industry.

Colbert wished to sweep away all these barriers; but he could do nothing. Stolid resistance was too powerful for him. Most of the provinces were systematically hostile to anything which could assimilate them to each other. They were incorporated with the monarchy on condition of retaining certain privileges, and they were pertinaciously attached to their individuality, and valued these barriers and custom-houses for that very purpose. Colbert had triumphed over large masses of individuals, but he could not overcome the Estates of each province. All he could persuade them to do was to modify and simplify their tariffs. There were five great farms in force through a considerable number of the provinces, called, from that, "The Provinces of the Five Great Farms." Others were called "The Provinces foreign to them;" and the two bordering on Germany, Alsace and Lorraine, as well as several seaports, were called "provinces treated like foreign countries," because they were allowed complete free-trade with foreign countries, and goods coming from them were treated exactly as if they came from foreign countries. These great farms being held by different leases, gave rise to an immense amount of trouble and tyranny, and a great multiplication of offices. Colbert reduced them all into one, and immediately doubled the produce.

Louis XI. founded a postal service in 1464, for

the use of Government, but private persons were not allowed to send their despatches by it. The universities had established private posts of their own, to enable their students to maintain a correspondence with their families, and many towns had also established them for the sake of commerce. But, of course, their charges were matters of private arrangement. In 1597, Henry IV. first established post houses at regular intervals on the great roads to Spain and Calais, and an officer, called the comptroller-general of the posts, was appointed, who was bound to keep them up at his own expense, upon receiving all the profits. M. d'Almeras, the comptroller-general under Louis XIII., first allowed the government coaches to carry private letters, and mails were regularly established between different towns. This device was found very profitable, and in 1627 a regular tariff was made to fix the price for carrying letters and parcels. The government posts, however, found powerful competitors in the private ones. In 1672, Colbert bought all these up, and the revenue of the post office soon rose from 100,000 to 3,700,000 livres.

Colbert having instituted a chamber of justice to call the financiers to account, proceeded to a verification of the titles of nobility, which was done much more easily than might have been expected from the numbers of those touched. The kings of France when in need, had often created and sold titles of nobility, and nevertheless had no compunction in taking them away again. Even Henry IV. after having sold several titles in 1593, annulled in 1598, all those created within 20 years, on the pretence of an inadequate payment, and the injustice done to others by exempting them from their share of taxes. Yet in 1606, he sold many new ones. In 1638, Louis XIII. sold several titles in each province, to celebrate the birth of his eldest son, and in 1640, all the ennoblements for the previous 30 years were annulled. On the accession of Louis XIV. two persons in each *généralité*, or province, were allowed to purchase nobility for 4,000 livres. Two years afterwards 50 titles were sold in the free towns of Normandy, and in 1661, all the titles created in 1606, and revoked in 1640, were reconfirmed for a payment of 1,500 livres.

In 1664, Colbert retracted all these titles. The pretext was that the king during his minority had improvidently sold them for inadequate sums, to the damage of many parishes, which were thus unable to pay their *tailles*. All titles granted since 1634 were revoked, and their possessors exempted from the *taille* of 1665. The estates of the different provinces were ordered to institute a rigorous investigation into the rights of innumerable persons who usurped titles without any claim at all. This investigation was strictly executed during many years, and the usurpers fined 50 livres each. In Brittany these fines produced 8,000 ecus up to 1670; in Provence 1,257 families were stripped of their borrowed plumes, and had to pay 63,000 livres. The fines levied throughout the whole kingdom amounted to 2 millions, and the other taxpayers were greatly relieved. According to this there were 40,000 sham nobles reduced to the ranks.

Colbert's next care was to reform the coinage. The astonishing frauds perpetrated on the French coinage during several centuries, are fully detailed

in the article **COINAGE OF FRANCE**. It may be mentioned as one redeeming point in Mazarin, that during his greatest financial embarrassments he did not tamper with the coinage, as even Sully and Richelieu had done. Colbert, as might be expected, followed Mazarin's example, which he probably advised. Like everything else the mints had been farmed out to the masters, who paid a fixed price, and were allowed to coin what they pleased. In 1662, Denis Genisseme obtained a lease of the mints for the sum of 102 thousand livres, on which there were charges to the amount of 58,646 livres, leaving 43,354 of net profit for the treasury. An edict in January 1666, revoked this lease, and the king took the management of the mint into his own hands, and henceforth the mint masters bought, manufactured, and sold bullion and coin on account of the State, receiving a fixed price per marc for their labor. France was at this time full of Spanish pistoles and light ecus, which were all much below their legal weight. They were all called in, but Colbert enacted that the holders of them should receive good coin, weight for weight for what they brought in. In 1679, the seigniorage on the coinage was abolished by law, which had been such a sore temptation to preceding kings, and had been the chief cause of their so frequently decrying and recoining the money. On the 21st August, 1671, an ordinance was published to render uniform the weights and measures in all the ports and arsenals of France. Colbert wished to extend this measure to the whole kingdom, but found it impossible, from the tenacity with which people cling to their old habits.

Mazarin had conferred state pensions on literary men, among whom the historian Mézerai figured for 4000 livres. Fouquet, who had liberal and generous tastes, pensioned many out of his own purse, among whom were Corneille, La Fontaine, and Scudery. Colbert, who was not devoid of similar tastes himself, and to encourage the king in what would contribute so much to his grandeur and magnificence, presented him a list of thirty-three of the most eminent literary and scientific men, who all received pensions of various amounts. Not content with that, he sent various sums to distinguished men in foreign countries. The totals were about 100,000 livres a year. He also founded the *Académie des Inscriptions et Belles Lettres* in 1663; the *Académie des Sciences* in 1666, to advance geometry, astronomy, physics, mechanics, anatomy, and chemistry. He also founded the Academies of painting and sculpture.

In 1664, he was appointed superintendent of public buildings, and the restoration of the finances soon displayed itself in their progress. The splendour of these gave rise to the most extravagant reports of their cost. Voltaire stated this at 500 millions, Mirabeau carried it up to 1,200 millions, and Volney surpassed every one by raising it to 4,600 millions. It was currently said that Louis had burnt the accounts to hide the proofs of his extravagance. But they have all since been found, and the sum total spent by Louis XIV. on his public buildings is proved by documents, verified by unimpeachable witnesses, to have not exceeded the sum of 166 millions from 1661 to 1710, including several sums for other things. It may be interesting to give the figures, shewing the expense of these famous places.

The total expense of Versailles, including churches, Trianon, Clugny, St. Cyr, the works of Marly, &c. &c., pictures, marbles, furniture, &c., was 116,796,229.	
Saint Germain.....	6,455,561
Marly, except the Waterworks	4,501,279
Fontainebleau	2,773,746
Chambord	1,225,701
Louvre and Tuilleries	10,608,969
Arc de Triomphe de St. Antoine	513,755
Observatory of Paris	725,174
The Invalides	1,710,332
Place Vendôme	2,062,699
Val-de-Grace, about	3,000,000
Meulan	88,412
Canal of Languedoc	7,736,555
Manufactures at Gobelins and Savonnerie	3,645,943
Manufactures in other towns.....	1,707,990
Literary Pensions	1,979,970

165,534,315

The immense advantages which would result from effecting a junction between the Atlantic and the Mediterranean, were so obvious, that the subject had long occupied the attention of the kings of France. It is even said that Charlemagne had some thoughts of executing the work. His sagacious project of uniting the Rhine and the Danube has only been executed in our own day. Only 14 leagues separated the Aube from the Garonne, and projects for uniting them had been discussed by the councils of Francis I., Charles IX., Henry IV., and Louis XIII. The real difficulty in the project was to insure a sufficiency of water at the summit level, 600 feet above the sea, to which the canal would be obliged to rise.

Pierre Paul de Riquet, Lord of Bonrepos, of a noble Provençal family, holding an office in the *gabelle*, owned an estate at the foot of the mountain which was the chief obstacle to the success of the work. The execution of this grand project had been his day-dream for years. After numerous experiments in his own grounds, he thought that he had at last succeeded, and communicated his ideas to the Archbishop of Toulouse, the Bishop of Saint Papoul, and other distinguished persons. They went over the ground with him, and were satisfied of the soundness of his plans. The Archbishop desired him to write to Colbert about it. The project was, moreover, laid before the Estates of Languedoc, who appointed a commission to examine it. It was decided that Riquet should make an experimental trench at his own expense. This would cost 200,000 livres, but Riquet was so confident of success that he undertook it. In May 1665, Riquet came to Paris, and obtained letters patent, authorising him to dig trenches to ascertain the fall of the water. In two months afterwards the work had succeeded beyond all expectation, and success was certain.

It was now proved beyond a doubt that the Canal could be made. But where was the money to come from? It was calculated to cost about 6 million livres, and the king, who spent more than that a year on his palaces, was unwilling to advance the money. The Prince of Conti, Governor of Languedoc, tried to induce the Estates to assist in it, but they refused to have anything to do with it. Riquet, not disheartened, proposed that the king should convey in fee simple to the man who would undertake it, the whole canal, and its necessary works. The question was long debated at the council, and Riquet's proposal was finally accepted, by the influence of Colbert.

The work then went on, and in six years was opened for a considerable distance by the Archbishop of Toulouse, who traversed it from Naurouse to Toulouse. Riquet died in October 1680, six months before his grand work was finished, in 1681. The total length from Cette to the Garonne was 54 leagues, which required 75 locks. Louis XIV. contributed 7,736,555 livres, the Estates of Languedoc 5,807,831 livres, and Riquet himself, 1,957,517 livres. Besides these, were extra works, warehouses, buildings, &c., which brought up the total expense to about 17 millions. In 1684, Louis sent Vauban, after the death of Colbert, to see if the works wanted repairs. The great engineer stood long, absolutely amazed at the magnificence of the works, the difficulties that had been surmounted, and especially at the grand reservoir, 7,200 feet long, 3,000 feet wide, and 120 feet deep.

Colbert then undertook the grand work of codifying the laws of France, which were in a state of the greatest confusion, being nothing but a medley of conflicting ordonnances and local customs. In spite of the warmest opposition from interested parties, the work was done, and the ordinance of Civil Justice was published in 1667, and was further amended in 1669. A medal was struck in honor of its publication, and it remained the civil code of France for 130 years, and was, in fact, the basis of the *Code Napoléon*. In 1670, a criminal code, and in 1673, a commercial code, completed the organization of public law. In 1669, a code regulating the "woods and forests," which occupied the labors of 21 commissioners for 8 years, was published, and remains, after some modifications in 1827, which have been much censured, the law in force at the present day.

Richelieu had created the navy of France. Before him, Holland, England, Spain, Turkey, Genoa, and Venice, had all powerful fleets, but France had only a few ill equipped vessels. In 1600, France was not strong enough to chastise the pirates and corsairs who ravaged her coasts. The town of Rochelle had seventy vessels, while Louis XIII. was obliged to borrow some from England, and their crews refused to fight against their co-religionists.

In 1626, Richelieu was appointed Grand Admiral of France, and by 1639, he had created a powerful navy of 92 ships and vessels. But after his death the fleet went to ruin. In 1661, the merchant navy of France did not exceed 200 vessels. It was said that there were 6,000 French sailors serving in foreign vessels. The fleet did not nominally exceed 20 or 22 vessels, most of which were rotting in harbour, and not more than two or three French ships of war had been seen at sea since 1650. Colbert, in 1669, was appointed Minister of Marine, and immediately determined to create a navy. All the dockyards and arsenals were set in motion, and in two years, in June 1671, France had 12 ships of the first rate, from 70 to 120 guns on three decks, amounting to 20,800 tons; 24 second rates from 56 to 70 guns, of 27,800 tons; 32 third rates of from 40 to 50 guns, of 28,950 tons; 24 fourth rates from 30 to 40 guns, of 17,250 tons; 28 fifth rates from 18 to 28 guns, of 13,150 tons; being 120 ships of war of 107,950 tons, besides 21 fire ships, and 55 frigates and smaller vessels, making a total of

196 ships and vessels. Before this time France was in the habit of buying her ships of war from other nations. Colbert founded a Board of Construction, and hired Dutch shipwrights, who were then considered the most skillful in the world, to teach the French their art.

It was found that vessels were the better the quicker they were built. The Venetians built a war galley in 24 hours before Henry III. The Dutch had offered, on three months' notice, to furnish a ship a day, ready for sea. Colbert ordered that no French vessel should be longer than three months building. The crews were generally got together chiefly by impressment. Colbert organized a general register of seamen, who were placed under commissioners. The first enrolment in 1670, numbered 36,000 sailors; in 1683, it was 77,582. In 1671, the French navy compelled England to abandon her pretensions to the sovereignty of the seas, by making all foreign vessels strike their topsails. In 1676, the French Admiral Duquesne gained a great victory over the Dutch commanded by De Ruyter with a much superior force.

Such were the parts of Colbert's administration which were indubitably glorious, we must now unfortunately turn to those which were not equally successful, and where his genius for organization and regulation did an immensity of mischief to his country.

The legislation of Sully with regard to agriculture was distinguished by the most enlightened sagacity. Firmly convinced that agriculture was the true source of the wealth of a country, he did everything to encourage it, while unfortunately he was adverse to manufactures, as he conceived they carried money out of the country. He saw that the true interests of agriculture demanded a perfectly free trade in exporting and importing, and this he maintained. He caused Henry IV. to repeal the prohibition of the grain trade with Spain, and to reprimand severely the Parliament of Toulouse for forbidding the export of corn from Languedoc. A magistrate of Saumur was threatened with severe punishment for a similar proceeding. On this occasion Sully wrote to the king that if every officer did the same, the people, and consequently the king, would soon be without money at all. In consequence of this wise legislation, a general abundance soon pervaded the kingdom.

Colbert unfortunately pursued the opposite course, with the most disastrous consequences. Not that he was hostile to agriculture, as has sometimes been said, but he carried his mania for regulation into a subject in which all regulation was mischievous, and the only thing wanted was absolute freedom. In 1662, and 1663, there was a dreadful famine, which added to the misery caused by the exactions of Fouquet, reduced the people to the greatest distress. These calamities unfortunately impressed the idea on Colbert, that the traffic in grain should be forbidden, a fatal doctrine, which it was one of the great glories of the Physiocrats to overthrow. In February 1662, the Government made immense purchases of grain in Poland, Holland, Sicily, and Africa, with which it supplied the province of Normandy, Rouen, Paris, and all the provinces bordering on the Loire. It also distributed from 30 to 40,000 loaves of bread every day, by this means the price

of corn was kept at 846 livres the muid, in these provinces, while it was at 650 livres in the other provinces. Multitudes of persons poured into Paris, while in the provinces great numbers died of starvation.

Thanks to the efforts of the Physiocrates, the boundless mischief of interfering in the commerce of grain are so well understood now, that it would only be waste of time to reiterate their arguments, which are now undisputed points of economic science. Colbert, however, was bitten with the mania of regulation, and accordingly, during the whole of his administration, the trade in corn was afflicted with regulations, which varied according to the supposed necessities of the State. The decrees from 1661 to 1669 are wanting, but from the latter period to Colbert's death in 1683, there were 29 edicts published, regulating the trade. During this period of 14 years, exportation was forbidden during 56 months. Eight edicts allowed grain to be exported on paying a duty of 22 livres the muid; five on paying the half or quarter of this duty; and eight without any duty at all; eight were absolutely prohibitive. The permissions to export were only for three or six months, and very rarely for a year. Boisguillebert, Forbonnais, and the Economists of the eighteenth century, have so completely pointed out the mischief of this system, that they have left nothing to be added. By these mischievous interferences agriculture was ruined during Colbert's administration, the farmers were reduced to the lowest state of misery. Numerous reports were addressed to Colbert by the intendants of the provinces, detailing the misery of the cultivators of the soil. In 1675, the Duc de Lesdiguières, governor of Dauphiné, wrote to Colbert, that he could no longer delay informing him of the misery to which the province was reduced. The greater part of the inhabitants had lived, during the winter, on bread made from acorns, and nuts, and that they were then eating grass and the sprouts of trees. In 1681, Colbert made a report to the king, saying that all the letters from the provinces, from the intendants, the receivers-general, the bishops and others, all spoke of the intense misery of the people. Vanban's celebrated description of the misery of France cannot be quoted here, because it refers to a later period, but there can be little doubt but that it was the result of Colbert's system.

In 1604, a Fleming, named Girard Leroi, who had served in the Dutch navy, formed the project of a Company, which was favourably received by Henry IV., and received letters patent from Louis XIII. in 1611, under the title of the Company of the Indies. In 1626, a new Company called that of St. Christopher was formed, in 1628, that of Canada, or New France, in 1637, Girard's Company changed its name to that of Madagascar, and in 1642, to that of the East. In 1660, the China Company was founded, but all these enterprises were uniformly unsuccessful. Colbert, not disheartened with these failures, tried to organise them on a better footing. The tonnage duty on foreign vessels had imparted activity to the French dockyards. The prodigious success of the Dutch companies inspired Colbert with the hopes of rivalling them, if only the causes of the former failures were removed. On the 21st of May,

1664, an edict was issued, constituting a new West India Company, detailing the faults that had ruined the previous ones. An existing company, called that *De la terre ferme d'Amérique*, was reorganized, and endowed with the exclusive privilege of trading to the West Indies, Cayenne, the Continent between the Amazon and the Orinoco, Canada, Arcadia, Newfoundland, the islands and other lands down to Florida, and all Africa between Cape de Verd to the Cape of Good Hope. The company was endowed with the most ample privileges and exemptions. In the same year an East India Company was formed to rival the Dutch. A member of the Académie, Charpentier, was ordered to explain to the public the causes of the failure of the preceding ones, and to shew that foreign nations had failed at first. The Dutch Company then realized from 40 to 60 per cent. per annum. Charpentier said that six millions would be enough to equip 14 vessels of 800 to 1400 tons, of which the king would subscribe for a tenth, and many great landowners were ready to take three millions of stock.

Royal letters to the syndics, mayors, and aldermen of the great towns, accompanied this appeal to the public. To take shares was the best way to win favour at court. Some of the financiers, fined by the Chamber of Justice, were allowed to commute their fines into shares. It was soon seen that the proposed capital was insufficient, and that fifteen millions were required to establish the Company on a durable basis. The efforts to procure subscriptions were redoubled. The Chancellor Seguier, by order of the king, ordered the whole Chamber of Justice to take shares. Those who were slow were frowned upon.

By dint of these exertions the company was at length formed, with a capital of fifteen millions, of which the king subscribed for three, without interest. It was endowed with a monopoly of all the trade to the Indies, the Eastern and the Southern Seas, for fifty years. It was allowed to hold in full sovereignty for ever, all the lands, towns, and islands conquered from the enemy and the natives. All salt was to be furnished to the State at cost price, and it was to receive a bounty of 50 sous a ton on all merchandize exported from France, and half that on imports, besides many other privileges.

All these magnificent powers were frustrated by the misconduct of the Company's servants. Colonists did not come forward. The king paid four millions; but private persons failed in their engagements. Colbert exerted himself to support his favourite scheme; but public bodies were greatly in arrear. In 1670, the Dutch Ambassador told Colbert that the Dutch Company paid 40 per cent. This was a cruel mortification to Colbert, for his own was in *extremis*.

The West Indian Company was no better off. Colbert was obliged to advise them to moderate the activity of the Jesuits. But all his efforts failed. In 1671, he made an effort to pay the shareholders 5 per cent. But it was soon clear that failure was inevitable. In ten years it lost 3,523,000 livres. On its liquidation the king bought up all its establishments for 1,300,000 livres.

All the Companies established by Colbert came

to a similar disastrous end. There were besides those mentioned, the Companies of Senegal, the North, the Levant, and the Pyrenees.

Colbert, without actually intending to discourage agriculture, as has sometimes been erroneously said, regarded manufactures and commerce as the true sources of wealth to a country, because they were supposed to bring in gold and silver, which were the only wealth according to the mercantile system.

We have now come to that part of Colbert's system which is more especially distinguished by the name *il Colbertismo*, and which is more familiarly called by the name of Protection to Native Industry. The fundamental principles of this system are to stimulate national industry, by forbidding the import from foreign countries of all manufactures which can be produced at home, and next, to secure the monopoly of the home market to the native growers. The great engine by which these results were to be produced, was a proper regulation of tariffs.

In 1655, notwithstanding Anne of Austria's aversion for the Protector, she had been advised by Mazarin to conclude a treaty of Commerce with England, providing for entire freedom of trade between the two countries. But this state of matters did not last very long. France wanted to create a commercial navy, and in 1659, she imposed a duty of fifty sous a ton on all foreign vessels. England also wanted to strike a blow at the Dutch, and she enacted her famous Navigation Act, which still further embittered the relations between the two countries. The great blow, however, was struck by the tariffs of 1664 and 1667, which formally inaugurated the disastrous era of the war of tariffs, which soon degenerated into a war of blood.

The effect of these two tariffs, by which the duties on foreign manufactures were in many cases quintupled, was to prohibit the great majority of English and Dutch goods from entering France. The consequences were very simple. It was a game that two could play at; and though the result of modern investigation has shown that it would be much wiser for the second party *not* to play at it, yet in that age, when passion was supreme, retaliation was, of course, swift and sure. The outcry in England and Holland was immense, and all representations being in vain, England greatly raised her duties on French produce, and Holland excluded it altogether. But a very extraordinary result ensued. The duties laid on French wines and brandy for the purpose of destroying their use, had only the effect of stimulating it in England. During twelve months preceding the tariff of 1664, the entry of French wines into the port of London had been 6,828 tuns, and so little brandy, that it was not counted. After the duty was laid on, the entry in two years was 17,000 tuns of wine and 3,000 of brandy. Between 1672 and 1674, the quantity of wine rose to 22,500 tuns; and in a short time the export of brandy rose to 5,000 tuns. These results, so contrary to what were intended and expected, only confirmed Colbert in his policy. Holland was greatly more dependent on the commerce with France than England was. The commotion excited in that country was therefore proportionably more severe; but Colbert only adhered the more firmly to his tariff, because the

express intention of it was to ruin the commerce of the Dutch; and the louder they cried, the more surely it proved that it had that effect. We need not pursue the subject further. The war of 1672 was the direct consequence of these hostile tariffs, and at the peace of Nimeguen, in 1678, Louis XIV. consented to abrogate the tariff of 1667, and return to that of 1664, to the profound chagrin of Colbert.

He then applied himself to develop the internal commerce of the country. As it could not flourish while the great towns and the communes were overwhelmed with debts contracted during the preceding wars, commissioners were appointed to investigate the communal debts, which had been chiefly formed since 1647, in consequence of the poverty of the king's exchequer, by Mazarin, who seized all the octroi duties, and allowed the magistrates to levy fresh ones. The communes preferred to raise the sum by loan, and pay it over at once, and raise the interest by taxes, which were in many cases illegal. In 1663, the king remitted half the octroi duties, and annulled the leases by which they were held at a low rate, to the great relief of the communes. Richelieu had endeavoured to encourage maritime commerce by declaring that engaging in it should not derogate from nobility. Colbert, still further to promote it, ennobled several merchants, and enacted that the nobles might engage in any species of commerce without losing their rank.

Colbert's system of meddling in commerce was carried to a length which seems absolutely ludicrous. The length, breadth, and quality of each article was rigorously prescribed by law. These interferences with industry excited the warmest opposition, and manufacturers and workmen refused to work under such conditions. The more they cried out the firmer Colbert was in ordering the laws to be rigorously executed. The intendant of Tours, in order to curry favor with Colbert, ordered that all the pieces of stuff which did not comply with the regulations, should be exposed on a post with the names of the culprits. Colbert was delighted at the idea, and immediately issued an edict, that for the first offence all such stuffs should be exposed on a post nine feet high, with the names of the merchant and workman, for 48 hours, and then cut up and burnt. For the second offence, the merchant and workman should be publicly reprimanded by the guild to which they belonged, and for the third offence be put in the stocks, with a sample of the confiscated stuff, for two hours.

Forbonnais says that the people thought that this strange edict was translated from the Japanese, though such an idea was probably a libel upon that people. The opposition and hatred to these absurd follies lasted all his life, and had a great effect in rendering his efforts for the encouragement of manufactures null, by frightening people from working. Another specimen of this extraordinary legislation may be given. The bye-laws of Amiens ordered that if any thread should be found to be damped for the purpose of fraudulently increasing its weight, it should be burnt! It would have been more sensible to have it dried!

Such folly as this naturally excited the indignation of men of business. One day Colbert summoned the principal merchants of Paris to

confer about commerce. No one dared to speak. "Gentlemen, are you dumb?" said he. "No, my Lord," said Hazar of Orleans; "but we are all equally afraid of offending your greatness, if we say a word to displease you." "Speak freely," said the Minister; "he who speaks most freely is the best servant to the king, and the best friend to me." Hazar replied, "My Lord, since you desire it, and you promise to take in good part what we have the honour to say to you, I will tell you frankly, that when you became minister, you found the coach upset on one side, and since you have been so, you have raised it up, only to upset it on the other." Colbert, in a rage, asked if any one else had anything to say, but no one dared say a word.

Colbert shared the error of his times, and indeed which prevailed to a very much later time, and it appears in Adam Smith, that it was of very great importance to stimulate the population of the country. Premiums were given for numerous families. Commoners were exempted from tailles and public taxes, by edicts in 1666 and 1667: and noblemen who had ten children, received pensions of 1,000 livres, and those who had twelve, received 2,000 livres. Those who married under twenty were exempted from taxes for five years; those who married under twenty-one were exempted for four years. These injudicious measures were, however, repealed in 1683. He tried sumptuary laws too, but was obliged to abandon them.

The venality of public offices had been allowed from a very early period, and an immense number of families were interested in the abuse. St. Louis forbade the office of judge to be sold, and Louis le Hutin and Philip le Long farmed them out. Charles V., Charles VII., Louis XI., and Charles VIII., ordered that, on a vacancy, the other officers of the tribunal should designate two or three of the most able, among whom the king should choose the most worthy. Louis XII. was obliged to sell them, to pay the debts contracted by his predecessors in the Italian wars, intending to refund the money when possible.

There have not been wanting writers of great eminence to defend the venality of offices on principle. But Colbert was very much opposed to it, and tried to abolish it. In 1664, he paid off the holders of a great number of useless offices, and suppressed 215 secretariats to the king. He ascertained that the number of Officers of Justice and Finance in the kingdom was 45,780.

In 1664, with great sagacity, he organized a warehouse system, which was not done in England till 1803. The provinces which accepted his tariff, were separated by a double line of custom-houses from those which did not. In them eleven great warehouses were erected, in which merchants might store their goods. In 1670, all the seaports were allowed to have the benefit of similar buildings, where merchants might keep their goods till they sold them in France, or exported them. To encourage transport, all duties were taken off goods passing from Flanders to Spain.

In 1671, England opened negotiations for a treaty of commerce, and asked, among other things, to stipulate that the tariff should be restored to its state in 1664; but Colbert replied that such a stipulation was inadmissible, and that the king

would never give up his right to regulate the duties in his own country as he pleased.

We have seen the happy state into which the financial genius of Colbert had brought the country during the eleven years from 1661 to 1672. The war unfortunately ruined all. Fresh taxes had to be laid on, and Colbert was obliged to resort to the abominable practice of raising the prices of all the public offices, and to create *rentes* to the amount of 900,000 livres. To pay the interest on these, taxes were levied on all the houses built in Paris beyond the limits of 1638, and on stalls in the public markets, as well as other necessities of the poor. This created a great fury against Colbert. Multitudes of offices were created, interfering with trade in every way. But these means were all insufficient. Louvois was strongly in favour of loans, and against taxes, because they made the war unpopular. For that very reason Colbert was in favour of taxes. In the end, recourse was obliged to be had to both, and the effect was, that the whole weight of the odium fell on Colbert. Stamp duties were imposed on paper, which gave rise to many alarming tumults and insurrections in different provinces.

Up till 1671, Colbert's relations with the king seem to have been friendly, but at that time the influence of Louvois, who was anxious to engage Louis in war, seems to have predominated; and in April, 1671, some great rupture took place between the king and Colbert, the details of which we are not exactly informed, but it appears that Colbert contradicted the king somewhat brusquely. In 1672, the king said one day to him that he must have sixty millions more to carry on the war. Colbert, in alarm, hastily replied that he could not furnish such a sum. The king told him to look to it, for if he would not, there were others who would. From this time his manner visibly changed to an air of settled melancholy, and he was continually persecuted with false charges and insults by the war party, who wished to drive him to resign.

In 1680, he accompanied the king on a journey to the Low Countries, and was seized with a malignant fever, of which an English physician cured him by quinine, which brought that medicine into fashion.

Louvois paid great attention to the expenses of his department, examining the smallest accounts. Thinking that he had discovered that Colbert had improperly passed some accounts, he reported it to the king. When Colbert gave in his accounts, the king was extremely rude to him, saying at last that there was roguery in his accounts. Colbert replied that he hoped that was not intended to refer to him. The king said, no; but that he must pay more attention, and that if he wanted to know what economy was, he should go to Flanders, and see how little the fortifications of the captured towns had cost. Colbert was thunderstruck at this insult, and immediately fell ill. The king sent a gentleman to see him, and wrote him a letter. Colbert pretended to be asleep, and refused to see the messenger or read the letter, saying that he wished to hear no more of the king. His last words were, speaking of the king, "If I had done for God what I have done for that man, I should have been saved twice over, and now I don't know what will become of me."

Colbert died on the 6th September, 1683, and

such was the hatred of the people towards him, that his body was obliged to be carried under a strong escort, by night, to be buried in the Church of St. Eustache. Torrents of libels, satires, and epigrams upon his harshness and avarice, were circulated everywhere. Such was the gratitude of the people to the man who had raised France to be the first power in Europe.

Notice sur la vie et l'administration de Colbert. By P. Clement. Paris, 1853.

Etudes sur Colbert. By J. P. Joublean. Paris, 1857.

Both these works were crowned by the Academy of Moral and Political Sciences.

COLEBROOKE, HENRY THOMAS, one of the most distinguished Oriental scholars that England has produced, was born in 1765, the third son of Sir George Colebrooke, Bart., an East India Director. In 1782, he obtained a writership in India, and was placed in the Financial Department at Calcutta. He was afterwards transferred to various country departments, and was appointed, along with Mr. Lambert, a merchant, to draw up a report on the resources of Bengal. Mr. Colebrooke then began to study Sanskrit, and translated several legal treatises from that language for Sir William Jones. On the foundation of the College of Fort William, he was appointed Professor of Sanskrit. He was afterwards promoted to the Chief Judgeship of some of the Indian Courts, was President of the Board of Revenue, and a member of the Supreme Council of Bengal. Mr. Colebrooke's publications regarding the Sanskrit literature, which made him so famous, are of course beyond the scope of our present notice. He held, along with his two brothers, the patent place of Chirographer to the Court of Common Pleas. He died on the 10th of March, 1837, in London.

Remarks on the Agriculture and Commerce of Bengal. 1794.

Remarks on the Husbandry and Internal Commerce of Bengal. 1806.

On the Import of Colonial Corn. London, 1818.

COLLECTION des PRINCIPAUX ECONOMISTES. This is an excellent collection of the works of the principal Economists from Vauban to Ricardo, published by Messrs. Guillaumin & Co., of Paris. The works of each author are preceded by a biographical notice, and accompanied with notes and commentaries. The collection comprises 15 volumes, published from 1846 to 1848.

Vol. I. *Economistes Financiers du XVIII^e siècle.*

Vauban; *Projet d'une dîme Royale.*

Boisguillebert; *Détail de la France—Factum de France, &c.*

Jean Law; *Œuvres complètes.*

Mélon; *Essai sur le Commerce.*

Dutot; *Réflexions Politiques sur les Finances et le Commerce.* Edited by M. Eugène Daire.

Vol. II. *Physiocrates.*

This volume, also edited by M. Eugène Daire, contains the works of the principal of those writers who were called the *Economistes*, or *Physiocrates*. The works included in it are those of Quesnay, Dupont de Nemours, Mercier de la Rivière, l'Abbé Baudeau, and Le Trosne. In an introduction, M. Daire explains the nature of the Physiocrate doctrine.

Vol. III. and IV. *Œuvres de Turgot.*

This volume is edited by MM. Eugène Daire and H. Dussard.

Vol. V. and VI. *Recherches sur la nature et les causes de la Richesse des Nations, par Adam Smith.*

This translation of Adam Smith is by Garnier, and includes the notes of the translator, McCulloch, Malthus, James Mill, Ricardo, Sismondi, Storch, and J. B. Say. It is edited by M. Blanqui, who has revised it, written a biographical notice, and added notes of his own.

Vol. VII. *Essai sur le principe de Population, par Malthus.*

Translated by MM. P. and G. Prevost, of Geneva, with an Introduction by Rossi, and a biographical notice by Ch. Comte, edited with additional notes by M. Joseph Garnier.

Vol. VIII. *Principes d'économie politique, considérés sous le rapport de leur application pratique.* Containing also a translation of Malthus's definitions in Political Economy, with some hitherto unpublished remarks of J. B. Say.

Vol. IX. *Traité d'économie politique : ou simple exposition de la manière dont se forment, se distribuent, et se consomment les richesses.* By J. B. Say.

Vol. X. and XI. *Cours complet d'économie politique pratique; ouvrage destiné à mettre sous les yeux des hommes d'état, des propriétaires, fondateurs et des capitalistes, des savants, des agriculteurs, des manufacturiers, des négociants, et en général de tous les citoyens, l'économie des sociétés.* By J. B. Say.

Vol. XII. *Œuvres diverses de J. B. Say.*

Vol. XIII. *Œuvres complètes de Ricardo.*

Vol. XIV. *Mélanges; DAVID HUME; Essais sur le commerce, le luxe, l'argent, les impôts, le crédit public, sur la balance du commerce, la jalousie commerciale, la population des nations anciennes—V. DE FORBONNAIS; Principes économiques—CONDILLAC; le commerce et le gouvernement—CONDORCET; lettre d'un laboureur de Picardie à M. N(echer).—Réflexions sur l'esclavage des nègres—Réflexions sur la justice criminelle—De l'influence de la révolution d'Amérique sur l'Europe—De l'impôt progressif.—LAVOISIER; De la richesse territoriale du royaume de France.—FRANKLIN; La science de bonhomme Richard.*

Vol. XV. *Mélanges; Necker, sur la législation et le commerce des grains.—L'Abbé Galiani; Dialogues sur le commerce des blés, avec la réfutation de l'Abbé Morellet.—MONTYON; Quelle influence ont des diverses espèces d'impôt sur la moralité, l'activité, et l'industrie des peuples?—BENTHAM; Défense de l'usure.*

COLLIER, W. R.

Remarks on the Protective System. Andwer, U. S., 1832.

COLLIGNON, CHARLES.—A French Engineer, Chief of the Office of Roads and Bridges.

Des concours des canaux et des chemins de fer. Paris, 1845.

COLLIN, JONAS.

COMBE, GEORGE, born October 21, 1788, at Edinburgh, where he became a Writer to the Signet in 1812. He early became a disciple of the doctrines of phrenology propounded by Gall and Spurzheim, and devoted much labour and time in propagating their views, which led him into several controversies. During 1838, 1839, and 1840, he resided in the United States, where he was led to pay much attention to the pheno-

mena of the monetary convulsions which agitated the Union in these years. Mr. Combe published several works which have become very popular, but which we cannot notice here. In 1833, he married a daughter of Mrs Siddons. In 1836, he was a candidate for the Chair of Logic and Metaphysics in the University of Edinburgh, which, however, Sir William Hamilton obtained. The title of Mr. Combe to be reckoned among Economical writers, is founded upon some articles he wrote in the *Scotsman* newspaper, during the Currency crisis of 1855, which were reprinted in the *Times*, and attracted great attention, and were republished in a pamphlet, which in a very short space of time had the extraordinary fortune to get through about eleven editions. Mr. Combe died in 1859.

The Currency Question; considered in relation to the Act of the 7th and 8th Vict., c 32, commonly called The Bank Restriction Act. London, 1856.

Refutation Refuted; a reply in answer to pamphlets put forth in answer to the Currency Question considered. London, 1856.

COMSTOCK, JOHN L.

A History of the Precious Metals from the earliest periods to the present time, with directions for testing their purity. Hartford, U. S., 1849.

COMTE, AUGUSTE, who has published a system which he calls the "Positive Philosophy," was born at Montpellier, the 12th January, 1795. His family, he tells us, were extremely catholic

and royalist, and placed him at one of Napoleon's Lyceums, where great efforts were made to restore the ancient theologico-metaphysical system. He was scarcely fourteen when he revolted against the system, and resolved to commence a universal regeneration, both political and philosophical. He entered the *Ecole Polytechnique* in 1814, and the mathematical studies of the place strongly confirmed this tendency; and he made up his mind that the same spirit of philosophizing must be applied to vital and social questions as was already applied to inorganic substances, and that the education which stopped at the latter was imperfect. The whole system of this philosophy he called the Encyclopædic Hierarchy.

At this period St. Simon was in the height of his fame, and attracted most of the ardent young speculators of France. Comte was the youngest, and not the least distinguished of the number. In 1820, he published his views in the *Organisateur*. He afterwards separated from St. Simon, and in the preface to the 6th volume of his *Cours de Philosophie Positive*, speaks of him in very disparaging terms, saying that he was very ingenious, but very superficial—more active than speculative—not philosophical by nature, and only actuated by an immense personal ambition. Comte speaks of him as having exercised a very deleterious influence over him and his philosophical studies.

In 1826, he was seized with an attack of mental aberration, brought on by overwork and anxiety. He was sent for cure to the private asylum of Esquirol, who was a famous mad-doctor, and through his treatment, Comte's insanity had nearly proved permanent. After the doctor had pronounced it incurable, the strength of his constitution, soothed by domestic affection, threw it off, and in the following year he was quite recovered. He then worked at his philosophical speculations, and, in 1830, the first volume of his *Cours de Philosophie Positive* was published.

Comte not having any private fortune, was obliged to do something for his living, and in 1816 began to give lessons in mathematics, and this was his sole means of subsistence during his life. In 1832, he was appointed, in the lowest position, to a professorship at the *Ecole Polytechnique*, where, according to his own account, the success of his teaching and his reputation as a philosopher, excited the jealousy of his colleagues. In 1836, he was appointed to occupy, *ad interim*, the principal mathematical chair. In 1840, this chair was vacant, and Comte naturally expected to be appointed to it, but owing to the influence of Arago, Sturm, the inventor of the famous theorem, got it. This excited Comte's enmity against Arago, and he seems to have got on badly with his colleagues; and in 1852, his refusal to take the oaths to Napoleon III., deprived him of his place, and at 57 he was turned adrift on the world, and lived in great penury, supported by the contributions of his admirers and friends in England and France. He died in Paris in September, 1857.

Comte denominates his Philosophy "Positive," because he says that every science has passed through three stages of opinion; 1st, the theological; 2ndly, the metaphysical; 3rdly, the positive. The first, when men in their ignorance and incapacity to account for phenomena, referred

them on all occasions to the direct interposition of the Deity. The next stage was, when having abandoned this, they tried to speculate on the *causes* of phenomena, and attributed them to certain mysterious agencies. Comte maintains that this is beyond the reach of human faculties, and that all they can do is to discover the *laws* of the phenomena. As an example of the metaphysical state of a science, he instances the two prevalent theories of light—the emission and the wave theory. Both of these he condemns as unphilosophical, and considers the researches into the laws of heat as the true model of scientific investigation. This system of inquiring only into the *laws* of phenomena, he denominates the Positive System, to which all philosophy will, as he asserts, finally confine itself.

Now, with respect to what he says about the theological phase of opinion, there is much truth. But Bacon said the same very long before. He tells us that Providence acts through secondary laws, and these are the only ones which the philosopher has to investigate. So Pope said long ago, that

"The Universal Cause

Acts not by partial, but by general laws."

So that this part of Comte's doctrine was not very novel. In the next place, men of science, long before Comte's day, were perfectly agreed that the true method of procedure in every science is to begin by ascertaining the *laws of the phenomena*. Newton laid this down in his *Optics*, and the rule was perfectly well understood and acted on by all physicists long before Comte. But with respect to Comte's next doctrine, that philosophers must stop there, and never seek to investigate the *causes* of these laws, that is a limitation of the powers of the human mind that no physicist will ever submit to. In fact, as soon as *laws* are ascertained, they become *phenomena*, and by collecting a vast body of these laws together, the human mind naturally and irresistibly endeavours to discover, by the same method of philosophy, if these phenomena are not subject to the same general laws, as well as the first order of phenomena. They will certainly try to discover if there are not certain laws of laws. When we once seek for laws at all, it is not more metaphysical to seek for the law of a law, than for the law of a phenomenon. In fact, Comte's system would go to forbid us to inquire into the *reason* of anything at all—a restraint to which the human mind will never submit.

Comte's great doctrine is, that there is a certain progressive order in science, and that the social science must be investigated by methods strictly analogous to those pursued in physical science, and that the study of the latter must precede the former.

Some of his admirers seem to think that this is a totally novel idea on the part of Comte. Thus, Mr. G. H. Lewes, in his work on Comte's Philosophy, published in Bohn's series, p. 10, says:—"Let me now call attention to Comte's initial conceptions; and first, to the luminous conception of all the sciences—physical and social—as branches of one science, to be investigated on one and the same method.

"To say that science is one, and that the method should be one, may, to the hasty reader, seem more like a truism than a discovery, but on inquiry he will find that before Comte—although

a general idea of the connection of the physical sciences was prevalent—yet, to judge from Mrs. Somerville's work, or Herschell's *Discourse*, it was neither very precise or very profound. *No one had thought of a social science, issuing from the physical sciences, and investigated on the same method.* In fact, to talk of moral questions being reduced to a positive science, would even now be generally regarded as absurd!!"

After reading this astounding statement, we can only ask, Did Mr. Lewes ever read Bacon? Why, the very purpose of the *Novum Organum* is, to inculcate that physical science is the basis of moral science; and throughout all Bacon's other works, his constant assertion is, that there is a *Continuity* of the sciences; and his complaint is, that they are all barren and useless, because they are torn away from Natural Philosophy, their nursing mother. For proof of this, we have only to refer to the articles *AXIOMS AND DEFINITIONS*, and *CONTINUITY*, *LAW* or, in this Dictionary, when it will at once be seen how preposterous a notion it is that Comte was the originator of this idea, and many illustrious men had preached the same doctrine since Bacon's day, but, unfortunately, they did little more than preach it.

Dismissing then this untenable claim set up for Comte, we now come to his own work, in which there is much to be approved of.

Comte's fundamental doctrine as expressed above, which is in entire accordance with Bacon's great doctrine of the Continuity of the Sciences, is that there is a certain due and proper order in which only the sciences can be properly understood. First of all, as the basis of all human knowledge, Mathematics. Then the Inorganic sciences, Astronomy, Physics, and Chemistry. And next the organic sciences, Physiology, the study of the individual, and last of all Social Science, or the individuals in Society, which he calls also Social Physics. Comte strongly urges the necessity of studying the Anterior sciences in due and proper order, and that each one should be understood before proceeding to the next; and especially, those who study Social Physics should be well acquainted with Astronomy, Physics, Chemistry, and Physiology, before they attempt it.

To this doctrine we give our entire assent, so far as regards the Science with which this work is concerned—Political Economy. Comte says that the errors of many Chemists are owing to their want of acquaintance with Mathematics. We say that most of the fundamental defects of our Economists are owing to their palpable want of acquaintance with Physical Science.

Among several excellent parts of his introductory chapter, we may observe that he properly calls attention to the difference between *precision* and *certainty* in science; whence he says a dangerous prejudice has sprung up, that because the *precision* of different sciences is very unequal, that therefore their *certainty* is so too. This tends much to discourage the study of the most difficult. Precision and certainty are perfectly distinct. An absurd proposition may be very precise, as for instance, that the angles of a triangle are equal to three right angles. On the other hand a certain proposition may not be precise, as that a man will die. Hence, although

the different sciences may vary in precision, that does not affect their certainty.

This observation applies very forcibly to Political Economy. Many persons are apt to despise it, and think that there is nothing in it, because it does not bring out its results with the same numerical precision as those of Mathematics. That, however, is a very grievous mistake. The laws of Political Economy are quite as *certain* as those of Physical Science, though it may not be possible to reduce them into formulæ of the same numerical *precision*.

Comte says that there is no hope of a really rational education until the plan laid out by him is pursued systematically in instructing youth. To this we to a great extent agree.

It is somewhat surprising, however, that when Comte comes to Political Economy, which one would think is specially adapted to shew the truth of his method, he speaks of it with the greatest contempt, and does not admit it to be a science at all. Except Adam Smith, whom he lauds for not making it a science, he treats the Economists with unbounded disdain.

Now, we adopt Bacon and Comte's doctrine to the full. Physical science is the true basis of moral science. Political Economy is, to all intents and purposes, a physical science. We have endeavoured to show that mathematical ideas are capable of being applied to it, to an extent that has never yet been thought of.

Thus, we have shewn that the theory of Credit can only be explained by the great modern algebraical doctrine of the separation of the signs of position and operation.—(CREDIT.)

It is this great principle of the continuity of science that can alone raise Political Economy to rank with the physical sciences.

Comte's works relating to our subject, are—*Cours de Philosophie Positive*. Paris, 1830-42.

This work has been admirably condensed by Miss Harriet Martineau, in two volumes.

Discours sur l'esprit positif. Paris, 1844.

Discours sur l'ensemble de positivisme. Paris, 1846.

Système de politique positive, ou traité de sociologie, instituant la religion de l'humanité. Paris, 1851-3.

COMTE, FRANÇOIS CHARLES LOUIS, a very eminent French publicist, was born on the 25th August, 1782, at St. Eminie, a village in the department of Lezère. He became a member of the Paris bar. He had voted against the Empire being conferred on Napoleon. In 1814, he published *Le Censeur*, to resist the reactionary designs of the Bourbons. He was shortly afterwards joined by M. Charles Dunoyer, and these two writers maintained constitutional doctrines against absolutism for six years. When Napoleon landed at Cannes, M. Comte published a pamphlet shewing that constitutional government was impossible under a military chief, and especially under Napoleon. The editors of the *Censeur* were, nevertheless, accused by a royalist paper, of being in a conspiracy to bring back the Emperor. They brought an action for libel against the paper. The case was set down for the 19th of March, when Napoleon was already at Fontainebleau. The judges were placed in rather a delicate position, between the existing and the *pau*

post futurum governments. The defendant wished the case postponed; but to this the plaintiffs demurred, and when the case came on, the Emperor was actually on the throne. They insisted on the case going on, notwithstanding its now being without an object. We are not told how judgment went. The *Censeur* was seized by the Imperial Government, and fared no better under the second restoration, so that its publication was suspended during two years. In the mean time the editors applied themselves to Political Economy. M. Comte took lessons from J. B. Say, and married his daughter.

This study had much influence on the future views of the *Censeur*, which, on its reappearance, took the name of the *Censeur Européen*. It became an ardent advocate of economical reform and free trade. But they had the misfortune to come into collision with the Censorship, and were sentenced to a fine of 2,000 francs, and two months imprisonment. M. Comte considering the sentence illegal, took refuge in Switzerland, and, in 1820, a Chair of Jurisprudence was offered him at Lausanne, which he filled with great success till 1823. The French Government then demanded his expulsion, but the Canton de Vaud stoutly resisted such an order. M. Comte, however, not to be a cause of embarrassment to the hospitable government, retired of his own accord to England, where he became an intimate friend of Bentham.

When the term which satisfied the sentence had expired, he returned to France, and published his *Traité de Législation*, to which the Academy awarded the great Montyon prize in 1828.

This work became a very favourite one with Frederick Bastiat.

After the Revolution of July, M. Comte was elected to the Chamber of Deputies by the department of the Sarthe, and was appointed King's Advocate in the Court of the Seine. When the Academy of Moral and Political Sciences was restored, he was appointed a member, and shortly after, Perpetual Secretary. In 1834, he published his *Treatise on Property*, which obtained a very high reputation. In his capacity of Perpetual Secretary, he pronounced the *Éloges* of Garat and Malthus. He died 13th April, 1837.

Le Censeur, ou examen des actes et des ouvrages qui tendent à détruire ou à consolider la constitution de l'Etat. Paris, 1814-15.

Le Censeur Européen, ou examen de diverses questions de droit public et de divers ouvrages littéraires et scientifiques, considérés spécialement avec les progrès de la civilisation. Par MM. Comte et Dunoyer. Paris, 1817-1819.

CONDILLAC, ETIENNE BONNOT DE,

Abbé de Muraux, who, La Harpe says, was the founder of sound Metaphysics in France, was born at Genoa, the 13th September, 1714. He was the younger brother of the Abbé de Mably. There are few persons who attained such eminence, whose lives were so utterly devoid of events. His biographers tell us nothing deserving the name of an incident about him, except that having won a great reputation by his first publications, he was appointed preceptor to the Prince of Parma, Louis XV.'s grandson, for whom he wrote most of his subsequent works. In 1768, he was appointed a member of the French Academy in the room of the Abbé l'Olivet, and after having delivered the usual preliminary discourse, he never entered it again. In 1777, he was requested to write an elementary work on Logic, for the schools in Poland, and he died 3rd August, 1780, at his place of Flux, near Bangenci, where he lived in retirement all his life. It would be obviously out of place here to give any account of Condillac's metaphysical system, which attained great popularity in his day. He professed to be a follower chiefly of Locke, though he carried Locke's views to an extreme; so that his school is called by the name of the *Ultra-sensational*, because he refers the acquisition of all knowledge exclusively to the senses. There is one part, however, of Locke's and Condillac's philosophy which we must mention, as it is very pertinent to our present subject.

Bacon dwelt with great earnestness, in his *Novum Organum*, and elsewhere, on the extreme importance of forming true conceptions—*notiones*. Locke devotes a whole Book, the III., to the discussion of words, or language, its use and abuse. He speaks with great severity of the confusion of language so prevalent in controversies. He says, (B. III, c. x, § 5),—"It is hard to find a discourse written upon any subject, especially of controversy, wherein one shall not observe, if he read with attention, the same words (and those commonly the most material in the discourse, and upon which the arguments turn), used sometimes for one collection of simple ideas, and sometimes for another, which is a perfect abuse of language. Words being intended for signs of my ideas, to make them known to others, not by any natural signification, but by a voluntary imposition, it is plain cheat and abuse when I make them stand, sometimes for one thing, and sometimes for another, the wilful doing whereof can be imputed to nothing but great folly, or greater dishonesty." In § 22, he says,—“Know-

HH

ledge and reasoning require precise and determinate ideas. * This abuse of taking words upon trust, has nowhere spread so far, nor with so ill effects, as amongst men of letters. The multiplication and obstinacy of disputes which have so laid waste the intellectual world, are owing to nothing more than this ill use of words. For though it be generally believed that there is great diversity of opinions in the volumes, and varieties of controversies, the world is distracted with, yet the most I can find that the contending learned men of different parties do, in their arguments one with another, is that they speak different languages."

In chapter II. of the same book, Locke says that morality, or the moral sciences, are as capable of exact demonstration as mathematics, if the language were reduced to the same degree of exactness, which is perfectly capable of being done—"And it must be great want of ingenuity (to say no worse of it) to refuse to do it, since a definition is the only way whereby the precise meaning of moral words can be known; and yet a way whereby their meaning may be known certainly, and without leaving any room for any contest about it. And, therefore, the negligence or perverseness of mankind cannot be excused if their discourses in morality be not much more clear than those in natural philosophy." § 26. "If men will not be at the pains to declare the meaning of their words, and definitions of their terms are not to be had, yet this is the least that can be expected, that in all discourses wherein one man pretends to instruct or convince another, he should use the same word constantly in the same sense; if this were done (which nobody can refuse without great dissimulation) many of the books extant might be spared, many of the controversies in dispute would be at an end, several of those great volumes swollen with ambiguous words, now used in one sense, and by-and-bye in another, would shrink into a very narrow compass."

This part of Locke's philosophy, Condillac has adopted to the full, and Dr. Whewell says, (*Phil. of Disc.* ch. XIX. § 6.) that the doctrine of the importance of terms is the most considerable addition to the Philosophy of Science, which has been made since the time of Bacon. Condillac maintains throughout his system that every science attains perfection just in proportion as its language is exact. Algebra is the great model of all science, and it was so, only because its language is the most perfect. And every science is capable of being brought to the same degree of exactness as Algebra, by bringing its language to the same degree of perfection.

Condillac is charged by later writers with having pushed this doctrine somewhat too far, which is probably true. But there is no doubt whatever but the censures of Locke, and the doctrine of Condillac are strikingly applicable to Political Economy. Nineteen twentieths of the controversies in this science are due to the contempt and neglect of accurate language by Economists. And the only way to raise Political Economy to the rank of an exact science, is to bestow as much care in refining and polishing its language as is done with physical science.

Condillac published a work in 1776, the same year as the *Wealth of Nations*, which gives him a position among Economists. In fact, he may

probably be considered as the founder of the Third School of Economists, for he expressly treats Economic Science as the science of Commerce, or Exchanges, which is the conception to which the general opinion of Economists is now gravitating. Although Condillac has by no means exhausted the subject, and may have expressed some inaccurate views, we have no hesitation in placing it as the foundation of true Political Economy; and nothing can be more striking than the lucid clearness and consistency of his views, contrasted with the astounding self-contradictions and obscurities of later writers. His work, of which we shall give an analysis, is called—

Le Commerce et le Gouvernement, considérés relativement l'un à l'autre. Paris, 1776.

We have shewn (PRELIMINARY DISCOURSE) that there are three schools of Economists, the third of which has for its fundamental doctrines, that the true conception of Economic Science is, that it is the Science of Exchanges, or the Philosophy of Commerce, and that value is not any quality, or anything inherent in an object, but is the exchangeable relation existing between any two quantities; and that it takes its rise exclusively in the human mind, or, as it may otherwise be expressed, in DEMAND, as Aristotle said two thousand years ago.

The general opinion of European Economists is now gravitating to this view of the science, and as far as we are at present aware, Condillac is entitled to be considered as the founder of this school of Political Economy in the above work, which was published in the same year as the *Wealth of Nations*. In consideration, therefore, of its great importance, we shall give an analysis of it.

Condillac intended to have published three divisions of his work, the first, in which the phenomena of commerce, or exchanges, which is Economic Science, are explained; the second, in which the relations of commerce, or Economic Science, to the government, and their reciprocal influence over each other, are investigated; and the third, containing a collection of practical examples, shewing the application of the principles developed in the two preceding parts. Unfortunately the third part never was published.

Condillac begins (ch. i.) by investigating the foundation of the value of things, and shews that it originates entirely from the wants and desires of men. Those things which satisfy some want, have utility; and this *want*, or estimation, is called value. To say that a thing has value, means that we think it useful for some purpose.

As people feel new wants, they learn to make use of things which they did not before. They give, therefore, value at one time to things to which at another time they did not.

Now, when things are very abundant, they feel the want of any particular portion less, because they are not afraid of being without it. On the contrary, when things grow scarce they feel the want more, because they may be without them altogether.

Hence the want, or value of a thing, naturally increases during scarcity, and diminishes during plenty. During a very great plenty, this may diminish to any degree; on the contrary, during a very great scarcity it may increase to any degree. Hence it is these variations in wants that give rise to all variations in value.

However abundant a thing may be, it has some value, however infinitesimally small, as long as we want it. On the banks of a river the water has some value, however small, because the labor of stooping to raise it up is something given for it. But in some cases a traveller would give 100 louis for a glass of water, and then it is worth 100 louis, simply because he wants it so much that he will give that for it.

Hence all value resides in the mind. But people have come to regard value as an absolute quality which is inherent in things, independently of the opinion we have of them, and this confusion of ideas is the source of bad reasoning. Value is founded on estimation.

Value, therefore, exists before an exchange. Condillac blames the Economists for saying that it consists in the relation of one thing exchanged for another. This criticism of Condillac, will we think be found somewhat overstrained, because, unless there be an exchange, there is no manifestation of value, which can be the subject of Economic Science. That science has nothing to do with an impotent desire of the mind, which has no external manifestation, but only with an effective desire which produces a phenomenon, or an effect. So mechanics has nothing to do with latent forces which give no outward sign of their existence, but only with the phenomena produced by forces.

Condillac lays down, as his fundamental doctrine,—“Une chose n’a pas une valeur, parce qu’elle coûte, comme on le suppose; mais elle coûte, parce qu’elle a une valeur.” And to this doctrine every one of common sense will give his assent.

Value, then, being the desire we have to obtain something, Condillac shews, in chap. ii., that what we give to obtain what we want, is called its *price*.

One man has more corn than he wants, another has more wine than he wants. The first wants wine, and the second corn. They must therefore make an exchange. In such an exchange, both parties will give what he wants less, to obtain what he wants more; therefore each will gain. Nevertheless, as each will wish to gain as much as he can, he will naturally try to give as little as he can of his own, and get as much as he can from the other. This contention, however, must be brought to an end. An exchange takes place, and each thing exchanged is the price of the other.

Hence we see that value and price are not absolutely identical, so as to be used always convertibly with one another.

To this we may say, that Condillac is right to a certain extent; but since, as we have said above, value is not the subject of Economic Science until it is manifested visibly by price, it can never lead to error to use price and value as convertible terms. No doubt value resides in the mind, but what we give for a thing is the measure of our value of it, and is the only thing we are concerned with. What we give for it, may therefore be correctly called ~~the~~ value of it, or its price.

Condillac then shews (chap. iii.), that all variations in price are caused by variations in what is called the law of supply and demand, and therefore that there is no such thing as absolute price.

The price varies from market to market, and is always settled by competition. That it is useless and dangerous to try to prevent these variations.

Commerce (chap. v.) is an exchange of two things, and everything which is exchanged is merchandize. Each article of merchandise is the price of the other. It supposes two things, first a superfluity of possessions on one part, and secondly a want on the other. Agriculturists and other producers, however, cannot always dispose of their surplus produce on the spot, there is, therefore, need of another class of persons to carry it to where it may be more profitably disposed of, and these persons are called merchants. This gives rise to a greater number of exchanges. Moreover they give rise to value, because, if there were no demand for the surplus on the spot where it is grown, it would have no value, but when they transport it to a place where it is wanted, it acquires a value.

In this manner, therefore, commerce augments the mass of riches (chap. vi.) It is true that it is the earth alone which produces all things, therefore it is the only source of riches. The agriculturist multiplies things of use by working the fields.

What then do merchants, if as is commonly said, an exchange is an equal value given for an equal value? If that were true it would be useless to multiply exchanges, and there would always be the same mass of riches.

It is, however, false that in an exchange the values are equal. On the contrary, each party gives less and receives more. If they did not, there could be no gain on either side. But both sides gain, or ought to do so. For this reason that value has no reference except to our wants, and that which is more to one is less to the other, and reciprocally.

The source of the error is in supposing that things have an absolute value, and therefore people think that in an exchange they give and receive an equal value. Each, however, gives less and receives more, because he gives what he wants less, and receives what he wants more. It is the surplus which furnishes the funds for commerce, and this surplus becomes wealth when it can be exchanged for something that has value for the owner, and it has value for the purchaser.

If the surplus could not be exchanged it would not be wealth. Merchants are the canals by which this surplus is carried off, and thus they encourage husbandmen to grow more. A spring which loses itself in the rocks and the sands, is not wealth for me, but it becomes so if I make trenches to carry it to my meadows. The spring is the surplus produce of the farmer, the trench is the merchant.

The wants of men (chap. vii.), as they multiply, give rise to the arts, and these increase the mass of wealth. Each artisan increases the mass of wealth, or the abundance of things which have value. The husbandman supplies the raw material, but it is the artisan who puts it into a form to be useful to society, and therefore gives it value. Every new art, therefore, gives rise to new wealth, and gives a new stimulus to commerce, for which it supplies a new fund. Thus all husbandmen, merchants, and artisans, combine to augment the mass of wealth.

If, therefore, the earth is the only source of

productions, and therefore of wealth, we see, on the other hand, that labour gives a value to a number of productions, which without it would have none. It is therefore shewn that labor is also a source of wealth.

In chap. viii., Condillac discusses wages, and shews why wages differ in different employments. Each man's wages regulate his consumption.

In chap. xii., Condillac defends the right of property and bequest.

Commerce gives rise to the necessity of a precise method of estimating the value of things, hence arose the use of money. Gold, silver, and copper were the metals first discovered, because they lie more generally on the surface, and are more easily worked than iron. They were found to be useful for many purposes, and therefore they acquired a value. This value was settled exactly in the same way that the value of everything else was settled. The metals having thus become merchandize, it was found necessary to have something in commerce to perform the functions of money, and they were then appropriated to this purpose, as being found to be most suitable for it.

In the beginning of society there was no need for a measure of value. But when commerce began, the want of one was felt. And it was from the use of this measure, that the misconception gradually arose of things having an absolute value. Gold and silver are the best suited by nature to serve as this measure of value. Commerce, as said above, augments the mass of riches by facilitating and multiplying exchanges, and thus gives value to things which had none before. Gold and silver money tend powerfully to the same end by facilitating and multiplying exchanges.

And we may add, Credit does more so still, as it increases the number of exchanges just as money does. (CREDIT).

Gold and silver thus becoming money, it was next found convenient to have them divided into pieces of fixed weight and fineness, by public authority, stamped with a sign to denote this, and these pieces were called *coins*.

The metals, however, so divided and stamped, were nothing but merchandize. They had merely a stamp and a new name. They had no value except what they had as merchandize. They are, therefore, valuable things like everything else. Because it is with gold and silver that we purchase things, men got the notion that they were the only species of wealth, or at least the principal. This is an error; but it is also an error to say that they are nothing.

The use of money (chap. xv.) as a measure of value has given rise to the confusion about value. If men had continued to traffic by way of barter, they would have seen clearly that they always gave less and received more.

But as soon as money was introduced, they naturally thought that it was an exchange of equal values, because each thing was valued at the same quantity of money. By means of money the respective values of quantities of corn and wine may be measured, and then men see nothing in their values except the money, which is their measure. All other considerations are lost sight of, and because this quantity is the same, they think that each of the quantities is equal in value.

Nevertheless, although a man gives a quantity of corn, valued at 10 ounces of silver, and receives a quantity of wine valued at the same, it by no means follows that the advantage of both parties is equal. Because, if the corn is absolutely necessary to one, and the wine is not necessary to the other, one has the advantage and the other not. The comparative gains of the parties are, therefore, to be estimated by the intensity of their relative wants, and not by the absolute amount of money.

It is the inequality of values, according to the wants and opinions of people, that gives rise to and supports all commerce. Because, by it, each one gives less and receives more.

Every year (chap. xvi.), at a fixed time, the farmers carry their rents in a lump to the towns; every market day they sell some produce, and thus bring back to their village, in detail, the sums they sent away in gross.

The merchant buys things wholesale, and sells in detail, and receives back the price. Thus, continual small sales replace the sums spent in purchasing in gross; and when this replacement is made, purchases are again made in gross, to be replaced in detail. Money is, therefore, always being scattered, to be again collected into reservoirs, as it were, from which it is again spread by a multitude of small canals, which bring it back to its first reservoirs, whence it is again scattered, and to where it again returns. This continual movement, which collects it to scatter it, and scatters it to collect it, is called *CIRCULATION*.

This circulation manifestly means an exchange at each movement. If there is no exchange, it is not *circulation*. Mere transport of money is not circulation. In circulation, the money must, as it were, transform itself into something else.

Credit, however, is used to a great extent instead of money, and performs the same functions.

The mention of Credit then leads Condillac to explain the nature of the exchanges (chap. xvii.). This is very clearly done, but as there is nothing novel in it we may pass it over. In chap. xviii. he explains the nature of interest, and shows that money naturally produces interest, which was the stumbling-block of Aristotle, and the Church in the middle ages, and was first dispelled by Calvin. (CALVIN.) In chap. xix. he examines the causes of the different values of the precious metals. In chap. xx. he investigates what he calls the true price of things, and shews that it depends on the general competition in all the different markets. In the two next chapters he treats of monopolies and the circulation of corn.

In chap. xxiii., Condillac says that the precious metals are the best fitted of any merchandize to be a common measure. But from age to age they vary very greatly in their quantity, and therefore they are unfit to be a permanent measure. Nor are they fit measures in different places for the same reason.

To judge of one's income simply by the quantity of money received, is erroneous. One appears richer in a town, and less rich in the country than the reality. An article is always of the same value if the proportion of supply and demand is always the same. No other commodity preserves this relation so uniformly as corn. Corn, therefore, has always the same value, a value fixed and permanent. Here is a slip of Condillac's,

for this is making value absolute, which he has himself so strongly contended against.

This fixed and permanent value can, however, only attach to corn, when the trade in it is absolutely free. If it is oppressed by duties, monopoly, and prohibitions, it can never be at its true value, and if not, it will perpetually vary in value.

Farmers who pay fixed rents in money, lose when corn is very low, landlords lose when it is very high. It is better for all parties, therefore, that rent should be paid in kind. This opinion of Condillac's which is very commonly held, is not, we think, well founded. (RENT.)

Condillac then (chap. xxiv.) traces excellently, the inter-dependence of all classes upon each other, and how order arises from this mutual dependence. If all men had the same wants and tastes, the same arts and products would be everywhere cultivated. But when new tastes and wants are called forth, these new demands give rise to new productions, and to new arts. Thus arises a great commerce which enriches the State.

Condillac then considers many questions relative to cultivation, and population, and shews the erroneousness of making the numbers of the population, a certain test of the prosperity of the nation, as was commonly done, and as Adam Smith does. In the two next chapters, he enters into considerations about the habits and manners of the people, which are, in our opinion, somewhat beyond the strict limits of Political Economy, and therefore we shall omit them.

In chap. xxviii, he discusses Taxation, and in this he shares the views of the Physiocrats more nearly than in any other part of his doctrines. He says that there are only two classes of citizens, proprietors, to whom all the lands and productions belong, and those who having neither lands or productions of their own, live on the rewards of their labor, or as we may borrow the French expression, the *salaried* classes.

The first class can easily pay, because owning all the productions, if it has not all the money, it has more than its equivalent, and besides it all passes through their hands.

The second class of persons cannot. It cannot furnish subsistence to those who work, since it has no productions of its own. It cannot give them money to buy this subsistence, because it has no money but what it earns. And these wages reduced to the lowest point by competition, are only enough to enable it to subsist itself.

The first idea that would strike unprejudiced persons would be this,—Are those who have nothing to contribute to the expenses of the State in the same way as those who have something? Or in this way,—Are those who have nothing but their brains and arms, to pay to the State money that they have not got? To tax the *salaried* classes, who only earn just enough for their own living, is to ask them to pay money that they have not got.

Taxes upon industry seem to us to be reasonable and just, because without ever really investigating the matter, we judge them to be so, from finding them established. Nevertheless, this established order is very frequently nothing but an abuse.

If we go to the merchants, when they have just had a new tax laid on them, we are not the least astonished that they wish to raise their prices.

We see that they are right, and we pay the price they demand. We are, therefore, manifestly self-contradictory. We wish to make the merchants pay taxes, and then immediately to recoup them. Surely it is much simpler to tax ourselves at first!

But the merchants and artisans grow rich! There is the source of our prejudices. Tax them then! They will repay themselves. It is, therefore, impossible to tax them.

It may be said that owing to their necessity to sell, they cannot always recoup themselves the whole of the tax, and, therefore, they must pay part. That is partly true. But it is to be observed that that part comes out of their wages, and that diminishes their consumption. In France, there are by this means, several millions of citizens who are obliged to retrench their consumption. Can the land, therefore, produce the same income when it sells fewer products to many millions of citizens? No matter whether the *salaried* classes recoup themselves the whole, or only a part of the taxes levied on them, it is proved that these taxes must equally fall back on the proprietors. The proprietors must pay for the *salaried* classes, because they pay them. It short, whichever way we look at it, they must pay all.

Either the country produces enough for all its citizens, or only a part of it. In the first case, its productions which form all its wealth, belong entirely and exclusively to the proprietors. This class, alone, therefore, can sustain all the public expenses.

In the second case, the soil does not produce enough to support its inhabitants. They must therefore obtain what is wanted elsewhere, which can only be done by their industry. By the products of this they purchase what they require.

This riches, however, is precarious, and may be lost; and when it is so, the population will diminish proportionably, until it is no greater than its soil can support. While it continues, however, a great part of its wealth will belong to the merchants, who have acquired it by their industry from foreign nations. Condillac then enters into an argument, to prove that by laying a tax on merchants, the proprietors in foreign countries are made to contribute to the national burdens—a doctrine that is clearly untenable—though it was for long the Protectionist creed in this country, when it was asserted that by laying on an import duty, we were taxing the foreigner, whereas it was quite clear that it was just the reverse. The way to tax the foreigner is to put on an *export* duty.

Condillac then comes back to his previous doctrine, and ends by saying, that all taxes on industry are illusory, because, turn it how we may, they always fall back on the proprietors. They necessarily diminish consumption, and in diminishing consumption, they hinder reproduction. They tend, therefore, to deteriorate agriculture.

Such is Condillac's doctrine. The considerations opened up by it are much too vast and important to be despatched in a few sentences; we, therefore, say nothing about it here.—(TAXATION.)

Condillac then says (chap. xxix.) that riches are only multiplied by labour. All productions are owing to the labour of the husbandman, and

all the forms given to raw produce are owing to the artisan and the artist. Moreover, these riches only acquire a value by the labour of the merchant, who transports them from where they are superabundant to where they are wanted. The value of things is, therefore, partly due to the labour of merchants. Moreover, all these classes want a protector to preserve order. The government, therefore, combines with the others to increase, as well as to preserve wealth. The nation is most rich which gives occasion to the greatest variety of labor. Let us suppose for a moment, that all the nations of Europe guided themselves by these principles, which perhaps they will never understand. There would then be entire free trade, in which they would all find their advantage. All equally busy, they would feel their mutual want. They would no longer think of depriving each other of their manufactures and commerce. They would be satisfied each to work and to have something to exchange. What does it matter whether a certain species of cloth is made in England or in France, if the English are obliged to exchange their cloth for other manufactures of France. Only let us work, and we shall have nothing to envy other nations. As much as we want to work for them, just so much do they want to work for us. If we want to take their works, they want to take ours. We injure them, they injure us. Absolute freedom of employment, then is the true source of wealth.

Occupied in doing each other as much injury as possible, each nation wishes to enjoy exclusively the advantages of commerce, each in the exchanges made, wishes to keep all the profit. They do not see that by the very nature of an exchange, *there is necessarily a profit on both sides, because each side gives less and receives more.*

A single person who does not know the true market price, may be cheated in his purchases. Nations are merchants; it is at home that the markets are held; the price of things is known to them. By what art then can we force them to give us always more for less, in respect to them, when we always give them less to receive more in respect to us? This art is nevertheless the grand object of government. It is the philosopher's stone which they are searching for, and which they will assuredly never find.

But say you, it is of the greatest consequence to draw to ourselves as much gold and silver as possible from foreign nations. We must, therefore, prevent them from selling us what they produce or manufacture, and force them to buy what we produce or manufacture.

You really believe then, that a million of gold and silver is greater wealth than a million of other productions! Are you really ignorant that productions are the first wealth? What will you do if other nations, who reason as ill as you do, wish also to draw your gold and silver to themselves? That is what they will try. Every nation will, therefore, try to prevent foreign merchandise from coming to them. And if they succeed, it is a necessary consequence that their own merchandise will not go anywhere else. For wishing to keep each to itself, all the profits of trading, they will cease to trade with one another, and thus they will lose all profits.

Such is the effect of prohibitions. Who yet

dares to be sure that Europe will open its eyes? I wish it would; but I know the force of prejudice, and I don't expect it.

In short, commerce is not for Europe an exchange of works in which each nation finds a profit, it is a state of war in which each tries to rob the other. They think, as they did in times of barbarism, that nations can only grow rich by robbing their neighbours.

Condillac then concludes the chapter by earnestly advocating unbounded freedom of trade.

The first part of the work concludes with a chapter giving a *résumé* of the doctrine of the whole part.

Condillac having thus, in the first part, traced the grand outlines of Economic Science, and shewn that universal free trade is the proper order of things, in the second part takes general free trade as the basis of his argument, and examines in succession the mischievous consequences produced by all violations of, and attacks on, the principle. These are wars, custom-houses, taxes on industry, privileged and exclusive companies, taxes on consumption, tamperings with the currency, government loans, paper money, laws about the export and import of corn, laws about the internal circulation of grain, tricks of monopolists the commercial jealousy of nations, commercial gambling, &c. The effects of each of these are examined with admirable skill.

Such are the first two parts of this work. The third, unfortunately, was never written.

The analysis given above, will give the reader a notion of the scope of this admirable work, and its immense importance is manifest: for it is the true foundation of modern Political Economy.

Condillac expressly declares the true function of Economic Science to be the Science of Commerce. And in dealing with the subject, we see the immense superiority of a mathematical and metaphysical mind. For he places the source of value in the human mind, in wants and desires, or in demand. And having done so, he naturally shews that all variations in value depend on variations in demand and supply. That is, he instinctively, as a physical philosopher, never dreams that there can be more than one general fundamental theory of value. He, as every physicist would do, who really paid attention to the subject, would have been utterly aghast at the notion that the science could be based on six or seven fundamentally conflicting theories of value, as is the fashion at the present day.

Thus, too, he strikes at the root of many of the prevailing theories of value, which are based upon labour; for he says that people pay for things because they value them, and they do not value them because they pay for them, as is commonly supposed. This is exactly the doctrine of Dr. Whately, when he says that people dive for pearls because they fetch a high price, and they do not fetch a high price because people dive for them. It is the identical doctrine that we have so often maintained, that it is not labour that is the cause of value, but value that attracts labour.

This is a complete revolution in Political Economy—as great as has occurred in any of the physical sciences.

Condillac having thus laid down the true basis of the science, first proclaimed, as far as we are

aware, the doctrine that in commerce *both* sides gain. The old doctrine sanctioned by Montaigne, Bacon, and many others, was that what one side gains, the other loses. This pernicious folly was the cause of many bloody wars. The Physiocrats then maintained that in exchanges the values are equal. But Condillac laid down the true doctrine, that in commerce *both* sides gain. And he shews truly that the whole of commercial dynamics arise from these inequalities of value.

Condillac has been classed as a Physiocrate, because he says in one place that the earth is the source of all wealth. His doctrines also of taxation agree with theirs. But with respect to the first he is not consistent, because he shews unanswerably that labor is productive, as well as the earth. This was the same doctrine as Smith maintained in the *Wealth of Nations*, published in the same year. He has also well stated the true doctrine of CIRCULATION. He has treated the subject in the true scientific manner, as he begins by assuming a state of perfectly free exchanges, and considering the evil effects produced by various perturbations.

It is true that Condillac's work can by no means be considered as a complete treatise, because it requires immense development. Nevertheless it lays down the broad outlines of true Economics. Smith's work and Condillac's were published in the same year. Smith's attained universal celebrity in a very short time. Condillac's was, as far as we can find out, quite neglected. Nevertheless the whirligig of time is now bringing about its revenges; for all the best European Economists are now gravitating to the opinion that Condillac's is the true conception of Economic Science. (ECONOMY, POLITICAL). The beautiful clearness, and simplicity, the instinct of the true Physicist are visible throughout, and shine in painful contrast to the incredible confusion and self-contradictions of Adam Smith. At length he will receive justice, and after the neglect of 85 years, he will emerge as the true founder of modern Economic Science.

CONDI-RAGUET, of Philadelphia, United States, *Chargé d'Affaires* at the Court of Brazil. *A Treatise on Banks and Circulation.*

CONDORCET, MARIE JEAN ANTOINE NICOLAS, MARQUIS DE, a distinguished mathematician, philosopher, and Economist, was born at Ribemont, near St. Quentin, in Picardy, the 17th September 1743. His father, the younger brother of Caritat, successively from 1741, Bishop of Gap, Auxerre, and Lisieux, was a captain of cavalry, and belonged to a family of a high rank in the principality of Orange. The captain died when his son was four years old, and he was then entirely under the care of his mother, a superstitious devotee, who thought that the only way to preserve him from the dangers of childhood was to dedicate him to the Virgin, and clothe him in white. For the next eight years he was therefore dressed as a girl! This of course prevented him going to school and mingling with other boys, and enjoying the education and sports of a boy. He saw nobody at home but Jesuits and persons imbued with the highest notions of aristocracy. The natural reaction followed, and Condorcet afterwards became the warmest opponent of priests and aristocracies.

In 1756, at the age of 13, he carried off the second prize at the Jesuits' school at Reims, and in 1758, he was transferred to the Collège de Navarre at Paris, where he began his mathematical studies, and in ten months his progress was so rapid, that three of the most eminent mathematicians of the day, Clairant, d'Alembert, and Fontaine, who examined him, hailed him as a future member of the Academy. This decided him to follow up his scientific bent.

In 1762, we find that he was under the guardianship of the Duc de la Rochefoucauld, who introduced him to the most distinguished society of Paris.

The new analysis founded by Leibnitz, was now cultivated with the greatest ardour by a brilliant band of continental mathematicians, and Condorcet flung himself into it with zeal.

In 1764, he presented an essay on the Integral Calculus to the Academy of Sciences, which was received with great favour and printed in its transactions.

In 1768, the Academy was willing to elect him a member, but his relations were horrified at the idea that one of their family should so far forget what was due to their rank, as to devote himself to science. But in 1769, his love for science was so strong, that they were obliged to resign themselves to their fate that he should become a philosopher instead of a captain of cavalry, and he was elected a member, notwithstanding his youth.

The doctrines of the Economists were then making a sensation in the philosophical world. Condorcet soon became the fast friend of Turgot, and resolved henceforth to confine himself to mathematics and Economics. He became an ardent Free Trader, and proclaimed it as one of the fundamental rights of men of which no law could justly deprive them. He wrote strongly against Necker, who was a Protectionist.

On the death of Louis XV., Turgot was called to the ministry in accordance with the general demand of the public, and he rewarded Condorcet by appointing him inspector of the Mint. After the fall of Turgot, of whom the public was not worthy, Condorcet did not choose to hold office under Necker, who was his personal enemy in consequence of his attacks on his doctrine, and he resigned: Condorcet testified his friendship for Turgot by writing his life in 1786.

In 1773, he was elected perpetual secretary of the Academy, in consequence of having written the *éloges* of the members who had died between 1666 and 1699, when Fontenelle's celebrated series begins. Condorcet's *éloges* were much admired, and he was told that the public would wish an Academician to die every week, in order to have an *éloge* from him.

The Academy was divided into two parties, headed by Buffon and d'Alembert. In 1782, there was a vacancy, and the election of a member was one of the great pitched battles between these great rivals. D'Alembert started Condorcet, and Buffon backed Bailly. After a keen conflict Condorcet carried the election by one vote. D'Alembert rushed about with the greatest glee, saying that he would sooner have beaten Buffon than squared the circle.

Condorcet was elected to the Legislative Assembly and appointed its secretary, on the 3rd of October, 1791. In February, 1792, he was made

President. In April he brought forward an important scheme for the organisation of public education. He was one of the Commissioners appointed to take into consideration the weights, measures, and coinage; and on whose report the decimal system was introduced into France.

Condorcet was one of the Girondins. He voted for the severest punishment on Louis XVI., short of death. Although a Girondin, he respected the integrity and public spirit of Robespierre's party, and did all he could to reconcile them, though unfortunately, without effect. On the 31st of May, the blow was struck at the party by a decree ordering the arrest of 29 of their numbers. Condorcet issued an appeal to France, and his constituents, against the act. But seeing that his friends were overpowered, he retired, and concealed himself under the care of a lady. During this period of seclusion, he occupied himself in tracing the progress of the human race to perfectibility. At length the danger increasing, and the pursuit becoming hotter every day, he did not choose any longer to expose his generous hostess to the danger of being discovered and executed. He accordingly, in defiance of all remonstrances, escaped from Paris, hoping to take refuge with a friend in the country. This friend however was, unhappily, not at home, and Condorcet wandered about for two days and nights in the extremest distress. At length hunger drove him to a small inn at Clamart, where he ordered an omelette. Being asked of how many eggs he wanted it, he replied a dozen. Such an order as this proceeding from an apparent working man, immediately excited suspicion, and a municipal officer who was present, demanded his papers and his trade. Condorcet said he was a carpenter. But he had no papers, and his hands belied his asserted trade. He was arrested on suspicion, and taken to a prison at Bourg-la-Reine, where he was confined for the night. The next morning, the 28th of March, 1794, when the Commissioners came to interrogate him, he was found dead, having taken poison, which he always carried about him in contemplation of such an emergency.

CONSILIENCE OF INDUCTIONS. It has been universally observed in the history of every great Inductive Science, that as soon as true general conceptions are obtained, groups of phenomena, which have no apparent connection with one another, are suddenly discovered to depend on the same law. Thus, every great science tends towards uniformity and simplicity. This is called by Dr. Whewell by the expressive name of the *Consilience of Inductions*. (*Nov. Org. Renov.* p. 88.)

He says that he is not aware of any example in the whole history of science, in which this Consilience of Inductions has given testimony in favour of an hypothesis afterwards discovered to be false. That the theory of universal gravitation, and of the undulatory theory of light, are full of examples of this Consilience of Inductions.

Now this is so sure a mark of the certain progress of science, that if it be wanting, we may certainly conclude that it is not in a sound and progressive state.

According to the systems of Political Economy hitherto prevalent, there never has been the faintest trace of such a Consilience of Inductions. Nay, it never seems to have occurred to any one that it was either necessary or possible to arrive at any single general theory in Political Economy. On the contrary, so utterly wanting has anything like an inductive spirit been among Economists, that it is the usual practice to devise a distinct theory for each separate class of cases.

It will nevertheless be found that as soon as the true conception of Political Economy is grasped, and true general laws are discovered by genuine induction, that the very same results will be observed as have occurred in every other Inductive Science. Phenomena which were apparently unconnected, will at once be seen to be merely exemplifications of one general law.

Many examples might be cited; we will, however, only give one. Thus, it is universally observed, that small farms let at a higher comparative rate than large ones; small houses let for a comparatively higher rent than large ones; if the shares of a public company be divided into small amounts, they will bear a higher price than if they be large. Now, all these results which

are known by experience to be true, arise from the general law of supply and demand; because there are many more persons, comparatively speaking, who can afford to buy small parcels than large ones; and therefore there is, comparatively speaking, a greater competition for small than large ones.

The same rule holds good with diamonds. There is a rule regarding the value of diamonds, that they increase in price in a rapid ratio compared with the weight. This rule is found to hold good for moderate sizes, but as soon as diamonds become very large, this rule fails. Very large diamonds have not nearly the value they ought to have according to the theoretic rule. And the reason is, simply, that when they become extraordinarily large, the competitors to buy them dwindle away to such a small number, that there is comparatively less demand for them.

The very same rule holds good with the relative values of gold and silver. Ricardo has brought forward as an example of his doctrine, that cost of production regulates value, the relative value of gold and silver. "Gold and silver," he says, (p. 421, 3rd. edit.) "like all other commodities, are valuable only in proportion to the quantity of labor necessary to produce them, and bring them to market. Gold is about 15 times dearer than silver, not because there is a greater demand for it, nor because the supply of silver is 15 times greater than that of gold, but solely because 15 times the quantity of labor is necessary to produce a given quantity of it." Such an assertion, that it takes 15 times the quantity of labor to produce a certain quantity of gold, that it does to produce an equal quantity of silver, is one of those assertions, which, being contrary to a known truth, is one of those tests which proves the fallacy of the whole of Ricardo's argument. Adam Smith says very justly, (Book I. chap. xi.)—"Silver is very seldom found virgin, but like most other metals, is generally mineralized with some other body, from which it is impossible to separate it in such quantities as will pay for the expense, but by a very laborious and tedious operation, which cannot well be carried on but in workhouses erected for the purpose. Gold, on the contrary, is almost always found virgin. It is sometimes found in pieces of some bulk, and even when mixed in small and almost insensible particles with sand, earth, and other extraneous bodies, it can be separated from them by a very short and simple operation, which can be carried on in any private house by any body who is possessed of a small quantity of mercury." Smith has omitted here to mention the gold found in rocks, which requires more expensive and troublesome processes to extract, than he contemplates. But it is quite certain that even then, the process is the simplest that is required in the working of any metal. It would be far more expensive to produce an equal quantity of iron than gold. Moreover, Ricardo is in error in saying that the supply of silver is not 15 times as large as that of gold. The best authorities declare that the supply of silver is from 40 to 45 times as large as that of gold. But while its quantity is not less than 40 to 1, its value is about 1 to 15 to that of gold. How is this difference to be accounted for? The least reflection will shew that it is simply an example of the law of supply and demand, where the value of small

parcels is comparatively greater than that of large ones. Silver is, comparatively speaking, in much greater demand than gold. There are few persons in easy circumstances who do not possess more or less of solid silver plate. But such a thing as gold plate scarcely exists. What is called gold plate is only silver gilt. Solid gold is only used for such purposes as watch cases, or trinkets, such as chains, pencil cases, brooches, &c. Silver, therefore, is in far greater demand for commercial purposes than gold is, and it is this which raises its value to a higher proportion in comparison to gold, than might be expected from their comparative quantities. It might no doubt be said, that it is its very cheapness in comparison to gold that makes it more sought after, and the excessive dearness of gold that prevents it being used as extensively as silver, which is to a certain extent true. But the very cheapness of silver causes a much greater number of persons to be able to afford to have it than gold, and consequently the intensity of the demand for silver compared to the supply, is much greater than the intensity of the demand for gold compared to the supply, and this has a similar effect, as in the other cases, of raising the value of the smaller article to a much greater comparative rate than that of the larger one.

This example, too, has the further advantage of breaking down the false distinction erected by Ricardo in treating different cases of values, which is utterly subversive of the fundamental principles of Inductive Philosophy, (CONTINUITY, LAW OF,) and bringing all cases of value under one general theory.

The process of creating the science of Political Economy on the true principles of Inductive Science, furnishes many other examples of a similar nature, but this will suffice for the present, the fact is, that like the law of gravitation in astronomy, the undulatory theory in optics, the application of the law of supply and demand to Political Economy is a succession of felicities.

CONSILIENCE OF REFUTATIONS. In the preceding article we have stated that Dr. Whewell has given the apt name of *Consilience of Inductions* to the well-ascertained fact in the progress of all true Inductive Sciences, that different classes of phenomena are reduced to the same general principle, thereby affording never-failing evidence of its truth. Now, correlative to this, we may have what we may call, in imitation of Dr. Whewell, a *Consilience of Refutations*; that is, where different classes of fallacies, apparently remote and unconnected with each other, spring from the same false principle. If the eminent historian of the Inductive Sciences would think it worth his trouble, we doubt not that he might furnish examples of this second principle, as instructive and conclusive as of the first. At any rate, as Political Economy abounds with examples of the *Consilience of Inductions*, it also presents abundant examples of the *Consilience of Refutations*. We will only give one here. There are two erroneous currency doctrines, apparently of the most opposite description, yet they both proceed from the same fundamental error. The one is what is called the currency principle, which is so strongly supported by Lord Overstone and his sect. It is this, that when a paper currency be

permitted to be issued, it should only be exactly equal to the coin it displaces. The other is Law's Theory of Paper Currency, which maintains that as gold is made the basis of paper currency, so also any other article of value, such as land, &c., may be turned into money to the amount of its value, in a similar way. Now, both these errors, which are manifestly exactly opposite to each other, spring from the same fundamental error respecting the *nature* of credit. They both suppose that paper credit *represents* money. The one party says that it ought strictly to be confined to the money it displaces; the other says, apply the same principle, and turn all the valuable property in the kingdom into paper currency.

Now these spring from a fundamental misconception of the nature of credit. Credit, as we have fully explained under CREDIT and CURRENCY, does not *represent* money, but is a *substitute* for money, and is independent exchangeable property itself; and it is not founded on the quantity of money, but on the number of *transfers* of money. Now, these opposite doctrines being both founded on complete ignorance of the nature of the subject, have produced great mischief in practice. Law's Theory of Money having been repeatedly tried, has produced great financial catastrophes, which are fully detailed in this work. The attempt to enforce the other doctrine of the currency principle, would also have produced wide-spread disaster and ruin if it had been persevered in; but in the two crises of 1847 and 1857, the ministry did not dare to maintain the Bank Act, and resorted to the dangerous precedent of authorizing the Bank of England to violate the law, rather than bring down the tremendous ruin that would have ensued if it had not been relaxed. CONSUMPTION. All Economists use the word Consumption as the correlative of Production, whatever that may mean. Unfortunately, however, no Economist has scientifically investigated the meaning of the word Production, and consequently the economic meaning of Consumption is still in an equally unsettled state.

The words Production and Consumption are two of the leading fundamental terms in Economic Science, and they are so intimately related to one another, that it would have been very convenient to have considered them together. As the arrangement of this work, however, does not permit that, we must simply refer to the article PRODUCTION, in which the Economic meaning of that term is fully investigated.

We shall, in the following remarks, lay before our readers what some of the principal writers on the subject have said about Consumption, and the different meanings that have been attributed to it,

and we shall then endeavour to eliminate all accidental ideas from the term, by the usual methods of Inductive Logic, and reduce it to that extreme degree of generality to which we have said that all the fundamental conceptions of every science must be brought, before they can be accepted as fitted to form the basis of a science—namely, that in which they shall contain but one fundamental idea. And what this single fundamental idea is, can only be determined by keeping steadily in view the nature and the limits of the science.

It will not be necessary to go to any author before Adam Smith; we shall therefore lay before our readers a few passages from the *Wealth of Nations*, and endeavour, if possible, to discover what Smith meant by *Consumer* and *Consumption*. The first sentences of the Introduction to the work are as follows:—

“The annual labour of every nation is the fund which originally supplies it with all the necessities and conveniences of life which it annually consumes, and which consist always either in the immediate produce of that labour, or in what is purchased with that produce from other nations.”

“According, therefore, as this produce, or what is purchased with it, bears a greater or smaller proportion to the number of those who are to consume it, the nation will be better or worse supplied with all the necessities and conveniences for which it has occasion.”

In Book II., chap. i., he says, that when a man possesses sufficient stock to maintain him for months, or years, he “naturally endeavours to derive a revenue from the greater part of it, reserving only so much for his immediate consumption as may maintain him till this revenue begins to come in.”

He also says, in the same chapter, that in floating capital is to be classed “money by means of which all the other three are circulated and distributed to their proper consumers.”

In chap. ii. of the same Book, he says:—

“Though the weekly or yearly revenue of all the different inhabitants of any country in the same manner may be, and in reality frequently is, paid to them in money, their real riches, however, the real weekly or yearly revenue of all of them taken together, must always be great or small in proportion to the quantity of consumable goods which they can all of them purchase with this money. The whole revenue of all of them taken together is evidently not equal to both the money and the consumable goods; but only to one or other of those two values, and to the latter more properly than to the former.”

“Though we frequently, therefore, express a person's revenue by the metal pieces which are annually paid to him, it is because the amount of those pieces regulates the extent of his power of purchasing, or the value of the goods which he can annually afford to consume. We still consider his revenue as consisting in this power of purchasing or consuming, and not in the pieces which convey it.”

And further on in the same chapter, after shewing that the use of money is to circulate and distribute these consumable goods to their proper owners, speaking of a banker's notes, he says that—“The same exchanges may be made, the same

quantity of consumable goods may be circulated and distributed to their proper consumers, by means of his promissory notes to the value of £100,000, as by an equal value of gold and silver.” here evidently shewing that credit performs exactly the same functions as money in circulating goods. And there are abundance of passages which may be quoted from Smith, to shew that he always considers instruments of credit of all sorts as performing the very same functions that money does. (CREDIT.)

Again he says, in the same chapter—

“The circulation of every country may be considered as divided into two different branches: the circulation of the dealers with one another, and the circulation between the dealers and the consumers. Though the same pieces of money, whether paper or metal, may be employed, sometimes in the one circulation, and sometimes in the other, yet as both are constantly going on at the same time, each requires a certain stock of money of one kind or another, to carry it on. The value of the goods circulated between the different dealers, never can exceed the value of those circulated between the dealers and the consumers; whatever is bought by the dealers, being ultimately destined to be sold to the consumers. The circulation between the dealers as it is carried on by wholesale, requires generally a pretty large sum for every particular transaction. That between the dealers and the consumers, on the contrary, as it is generally carried on by retail, frequently requires but very small ones, a shilling or even a halfpenny being often sufficient. But small sums circulate much faster than large ones. A shilling changes masters more frequently than a guinea, and a halfpenny more frequently than a shilling. Though the annual purchases of all the consumers, therefore, are at least equal in value to those of all the dealers, they can generally be transacted with a much smaller quantity of money, the same pieces, by a more rapid circulation, serving as the instrument of many more purchases of the one kind than of the other.

“Paper-money may be so regulated as either to confine itself very much to the circulation between the different dealers, or to extend itself likewise to a great part of that between the dealers and the consumers. Where no bank notes are circulated under ten pounds in value, as in London, paper-money confines itself very much to the circulation between the dealers. When a ten pound bank note comes into the hands of a consumer, he is generally obliged to change it at the first shop where he has occasion to purchase five shillings' worth of goods, so that it often returns into the hands of a dealer before the consumer has spent the fortieth part of the money. When bank notes are issued for so small sums as twenty shillings, as in Scotland, paper-money extends itself to a considerable part of the circulation between dealers and consumers.”

Again, in Book V., c. ii., in speaking of taxes on commodities, he says,—“Consumable commodities, whether necessities or luxuries, may be taxed in two different ways: the consumer may either pay an annual sum as on account of his using, or consuming, goods of a certain kind: or the goods may be taxed while they remain in the hands of the dealer, and before they are delivered to the consumer. The consumable goods which

last a considerable time before they are *consumed* altogether, are most properly taxed in one way: these of which the *consumption* is either immediate or more speedy in the other."

So again, in the same chapter, he says,—"The duties upon foreign luxuries imported for home *consumption*, though they sometimes fall upon the poor, fall principally upon people of middling, or more than middling, fortune."

Now the question is this—In these passages just cited, what is the meaning of these mysterious words *Consumer* and *Consumption*? Can any human being divine what Smith means by *consumable goods*? From many of the passages cited he evidently means destructible goods. Is that his meaning? Most goods, we imagine, are capable of being destroyed. But do persons always buy goods to *destroy* them? Is the consumer of goods the destroyer of them? It is true that some goods are bought for the purpose of being destroyed, such as food of all sorts, candles, oil, fireworks, and many other things, in which destruction is necessary to their use, and they are only useful by being destroyed. In other goods, again, destruction is incidental to their use—such as clothes, houses, some species of furniture, utensils, carriages, watches, &c. Now these are not bought for the purpose of being destroyed, though that invariably accompanies their use. But there are many things which are not bought for the purpose of being destroyed, nor is destruction incidental to their use. Thus, for instance, if a man buys statues with his income to gratify his tastes, does he mean to *destroy* them? or is destruction incidental to their use? Certainly not. If a statue be preserved from the weather, there is no limit to its duration. It will last as long as the world. The same may be said of many other things, such as porcelain, trinkets, precious stones, and many articles of furniture.

Now the sculptors, goldsmiths, &c., who make and sell these statues, trinkets, &c., are certainly their *producers*, and therefore we should naturally call the purchasers the consumers, and, in fact, Smith, in some of the above passages, evidently uses the word *consumers* as synonymous with purchasers. Is then the purchaser of an article to be considered as the *consumer*, if he does not destroy it? We do not think that Smith's work furnishes any answer to this question; or is the word consumers to be confined to the purchasers of destructible articles? Are then the purchasers of indestructible articles not consumers? If the makers and sellers of all articles, destructible and indestructible are *producers*, surely the purchasers of these same articles must be all *consumers*, since it is agreed that consumption is the end of all production.

Smith's work, according to the introduction, only treats of Production and Distribution, whatever they may mean, and there is no part of it which expressly treats of consumption. But J. B. Say defines Political Economy to be the Science which treats of the *Production, Distribution, and Consumption of Wealth*, and it is divided into books treating of these respective subjects. Now by production he means the creation of Value (*Production*), and by Consumption he means the destruction of value. Thus, in the *Epitome* at the end of his *Traité d'Economie*

Politique, p. 572, he gives these definitions:—

"*CONSOmmATEUR*. C'est celui qui détruit la valeur d'un *produit*, soit pour en produire un autre, soit pour satisfaire ses goûts ou ses besoins.

"*CONSOmmATION*; *CONSOmmER*. Consommer, c'est détruire la *valeur* d'une chose, ou une portion de cette valeur, en détruisant l'*utilité* qu'elle avait, ou seulement une portion de cette utilité.

"On ne saurait consommer une valeur qui ne saurait être détruite. Ainsi, l'on peut consommer le *service* d'une *industrie*, et non pas la *faculté industrielle* qui a rendu ce service; le service d'un terrain, mais non le terrain lui-même.

"Une valeur ne peut être consommée deux fois; car dire qu'elle est consommée, c'est dire qu'elle n'existe plus.

"Tout ce qui se produit se consomme; par conséquent toute valeur créée est détruite, et n'a été créée que pour être détruite. Comment dès lors se font les accumulations de valeurs dont se composent les *capitaux*? Elles se font, par la *reproduction* sous une autre forme, de la valeur consommée; tellement que la valeur capitale se perpétue en changeant de forme."

This doctrine of consumption, meaning destruction, has been so widely received among Economists, that we must give some further extracts from Say to make our readers fully acquainted with his doctrine. The third book of his *Traité* treats of the *Consumption of Wealth*, and he says:—

"La production ne pouvait s'opérer sans consommation, j'ai dû, dès le premier Livre, dire le sens qu'il fallait attacher au mot *consommer*.

"Le lecteur a dû comprendre, dès-lors, que, de même que la production n'est pas une création de matière, mais une création d'utilité, la consommation n'est pas une destruction de matière, mais une *destruction d'utilité*. L'utilité d'une chose une fois détruite, le premier fondement de sa valeur ce qui la fait rechercher, ce qui en établit la *demande*, est détruit. Dès-lors elle ne renferme plus de valeur; ce n'est plus une portion de richesse.

"Ainsi, *consommer, détruire l'utilité des choses* *anéantir leur valeur*, sont des expressions dont le sens est absolument le même, et correspond à celui des mots, *produire, donner de l'utilité, créer de la valeur*, dont la signification est également pareille.

"Toute consommation, étant une destruction de valeur, ne se mesure pas selon le volume, le nombre ou le poids des produits consommés mais selon leur valeur. Une grande consommation est celle qui détruit un grand valeur, sous quelque forme que cette valeur se manifeste.

"Tout produit est susceptible d'être consommé; car si une valeur a pu être ajoutée à une chose, elle peut en être retranchée par l'usage qu'on en fait, ou par tout autre accident. * * *

"Tout ce qui est produit est tôt ou tard consommé. Les produits n'ont même été produits que pour être consommés."

Now, with respect to this doctrine, we ask—Are statues and other gold ornaments produced for the purpose of being destroyed? And the work of the sculptor produces a value, according to Say. This case, as well as numerous others that might be cited, at once proves the fallacy of Say's doctrine. There are many works of value produced without the smallest intention of their being destroyed, and which have no principle of decay in them whatever. Was the Britannia

Bridge produced for the purpose of being destroyed?

It is quite clear from these examples that we must search for some idea of consumption far more general than that of destruction.

Say having, then, defined consumption to mean destruction, says that there are two kinds of consumption, Productive Consumption and Unproductive Consumption.

Productive Consumption is where an article is destroyed with the intention of being reproduced, or at least in its value.

Unproductive Consumption is where an article is destroyed without replacing its value.

The former of these corresponds with what Smith denominates Capital, and the latter with Revenue.

Say was determined to make the term *productive consumption* co-extensive with Capital; and in order to do this, he is led into a very remarkable confusion of ideas. For he is led not only to apply it to a destruction of materials, but also to their exchange.

Thus he says, *Traité*, p. 438,—"Dans sa consommation annuelle d'un particulier ou d'une nation, doivent être comprises les consommations de tout genre, quels qu'en soient le but et le résultat, celles d'où il doit sortir une nouvelle valeur, et celles d'où il n'en doit point sortir; de même qu'on comprend dans la production annuelle d'une nation la valeur totale de ses produits créés dans l'année. Ainsi l'on dit d'une manufacture de savon qu'elle consomme en soude une valeur de vingt mille francs par an, quoique la valeur de cette soude doive reparaître dans le savon que la manufacture aura produit; et l'on dit qu'elle produit annuellement pour cent mille francs de savon, quoique cette valeur n'ait eu lieu que par la destruction de beaucoup de valeur qui en réduiraient bien le produit, si l'on voulait les déduire. La consommation et la production annuelles d'une nation ou d'un particulier sont donc leur consommation et leur production brutes.

"Par une conséquence naturelle, il faut comprendre dans les productions annuelles d'une nation, toutes les marchandises qu'elle importe, et dans sa consommation annuelle toutes celles qu'elle exporte. Le commerce de la France consomme toute la valeur des soieries qu'il envoie aux Etats Unis; il produit tout la valeur des cotons qu'il en reçoit en retour."

Say's idea is that the nation loses the value of what it exports, and gains the value of what it imports,—it may therefore be said to consume the one and produce the other.

But surely this is inconsistent with accepted language. A nation surely *produces* what it exports and consumes what it imports.

If this doctrine be true, the seller and the buyer of goods must both *consume* them. Because the seller loses their value, gaining their price in exchange, and the buyer, in most cases, destroys them.

If this be true every shopkeeper consumes his goods by selling them.

We shall now see the consequences of this contortion of language. Say says a little further after the last extract, at p. 440:—"L'effet le plus immédiat de toute espèce de consommation est la perte de valeur et par conséquent de richesse, qui en résulte pour le possesseur du produit consommé. Cet effet est constant, inévitable, et jamais on ne

doit le perdre de vue toutes les fois qu'on raisonne sur cette matière. Un produit consommé est une valeur perdue pour tout le monde, et pour tous-jours."

Now let us apply this last doctrine to Say's previous one, that a nation consumes what it exports. Two nations export their produce one against the other. Each, therefore, according to Say, consumes its exports. But every consumption is destruction. Therefore, each nation destroys its exports for all the world and for ever! Therefore, nations by trading with each other destroy their wealth! A watchmaker sells a gold watch to a customer for money. According to Say he consumes the watch, and the buyer, by the same doctrine, consumes the money. But every consumption is a destruction of wealth for all the world and for ever. Therefore, the buying a gold watch for money, is a destruction of the money and the watch!! Therefore, by exchanging things, we destroy them!!

But, as according to the same passage, each produces what he purchases, that is the creation of two new values, it follows that the same act of exchange is at the same time a total annihilation of the things exchanged, and a creation of two new values!!

Such are the astonishing absurdities into which able men are led by a premature grasping at the meaning of a scientific term. The settlement of the meaning of a term requires as genuine an act of induction as the settlement of a principle.

Say, then, considers the different kinds of Consumption, which he considers the same as expenditure, and under this head places taxation and the public expenditure of all sorts, public debts, &c.

Now, it is manifest that these are all exchanges as truly as exchanges of merchandise. The army, the administration of all descriptions, public instructors, receive their pay in exchange for a service rendered.

Ricardo says nothing about Consumption. Malthus (*Definitions in Political Economy*, p. 247), says:—"Consumption. The destruction, wholly or in part, of any portions of wealth." And at p. 259—"Consumption is the great purpose and end of all production." So Mr. McCulloch says—"By Consumption is meant the annihilation of those qualities which render commodities useful or desirable. To consume the products of art and industry, is to deprive the matter of which they consist of utility, and consequently of the exchangeable value communicated to it by labour. Consumption is, in fact, the end and object of human exertion; and when a commodity is in a fit state to be used, if its consumption be deferred, a loss is incurred."

On this Mr. Senior has justly remarked (*Political Economy*, p. 54), "That almost all that is produced is destroyed, is true; but we cannot admit that it is produced for the purpose of being destroyed. It is produced for the purpose of being made use of. Its destruction is an incident to its use, not only not intended, but as far as possible avoided. In fact, there are some things which seem unsuceptible of destruction, except by accidental injury. A statue in a gallery, or a medal, or a gem in a cabinet, may be preserved for centuries without apparent deterioration. There are others, such as food and fuel, which

perish in the very act of using them; and hence, as these are the most essential commodities, the word Consumption has been applied universally, as expressing the making use of anything. But the bulk of commodities are destroyed by those numerous gradual agents which we call collectively *time*, and the action of which we strive to retard. If it be true that Consumption is the object of all production, the inhabitant of a house must be termed its consumer, but it would be strange to call him its destroyer, since it would unquestionably be destroyed much sooner if uninhabited. It would be an improvement in the language of Political Economy if the expression, "to use," could be substituted for that of "to consume."

Mr. Senior's remarks, that consumption cannot mean destruction, are perfectly just, partly because it is wholly false that all articles are produced for the purpose of being destroyed; and partly because Political Economy has nothing whatever to do with the destruction of things. Mr. Senior's proposal to substitute the word *use* for *destruction* is open to the same objection, on the latter ground. On the former ground it is quite correct. Things are produced for the purpose of being *used*,—but then Political Economy has nothing whatever to do with their use. At page 14, Mr. Senior says that Consumption is sometimes used as synonymous with Demand.

Mr. J. S. Mill has truly seen that the destruction of things is no part of Economic Science, and has therefore not given any part of his work to consumption, which he uses in the sense of destruction.

What then is the meaning of this word *Consumption*? It is agreed that it is the correlative of Production, and that the end of Production is Consumption. Now, it has been manifestly shewn, that if Production be held to mean to creation of a Value, and Consumption the destruction of a Value, the proposition cannot be maintained. It is wholly untrue that all values are produced or created for the express purpose of being destroyed; it is therefore not true that Consumption is the end of all Production.

The fact is, all the confusion arises from Economists never having formed a clear and distinct conception of the nature and limits of the science, and selecting that idea alone among those conveyed by the leading terms which are in harmony with the fundamental conception of the science. We have shewn under PRODUCTION that Political Economy has nothing whatever to do with the art and process by which things are manufactured, or formed, but only with their price when produced, or the things for which they will exchange. We have shewn there, that strictly following the true etymology of the word, and interpreting it in strict harmony with the fundamental conception of the science, the only true economic meaning of to *produce*, is to place a thing on a given spot for the purpose of exchanging it for something else. It makes no difference in what way the article was formed or procured, whether by growth as corn, by manufacture, or by commerce, the PRODUCER, in an economic sense, is the person who offers it for sale. And here at once we see how CONSUMPTION is the correlative of PRODUCTION. For if the Producer is the one who offers something for sale, the Con-

sumer is the purchaser of it with something else, and the CONSUMPTION means the quantity purchased.

As soon as we grasp the distinct conception that Economic Science is the Science of Commerce, or of Exchange, or of Value, it is clear that we must admit no considerations exceeding these limits. An Economist has no business to examine how, or by what process, or art, things were produced; nor has he any business to inquire for, or follow after, them when once they have been exchanged, to see what becomes of them. The domain of his science is expressly limited to the phenomenon of the exchange.

If we were to examine how things are produced, that would at once let in all the arts and manufactures of every description into Political Economy, which no Economist would dream of doing. His only office is to ascertain the laws of the changes of value of the thing when produced.

So also, as far as regards the purchaser, the Economist has nothing to do with the use he puts the thing to, but only with the price he pays for it.

Now things which a man makes and uses himself do not enter into the domain of Economics at all, only those which he acquires by purchase. If a person uses his accomplishments for the delectation of himself and his friends, the Economist has no business with him. It is only when he endeavours to exchange or turn them to profit, that they become the subject of value, and an economical phenomenon.

And this is the true commercial sense of the word, and Economics being the science of Commerce, it is proper, as far as possible, to adopt the language of Commerce. Now in the language of commerce, producers and consumers are simply sellers and buyers. Production and consumption are simply supply and demand. It is by Economists divagating from the true limits of the Science that all the confusion has arisen. Bastiat has expressed it truly (*Harmonies Economiques*, p. 360. *Art. Producteur-Consommateur*)—"En général nous nous adonnons à un métier, à une profession, à une carrière; et ce n'est pas à elle que nous demandons directement les objets de nos satisfactions. Nous rendons et nous recevons des services; nous offrons et demandons des valeurs; nous faisons des achats et des ventes; nous travaillons pour les autres, et les autres travaillent pour nous: en un mot nous sommes *Producteurs* et *Consommateurs*."

Now we see that this is the only sense in which the doctrine that Consumption is the end of Production is true, and in fact it becomes tautology, for it is reduced to this, that people offer things for sale for the purpose of being sold.

It is the only sense, too, in which consumption is the correlative of production. It is, as we have seen, wholly false to assert that all things are produced for the purpose of being destroyed.

Hence we see that Production and Consumption together constitute Exchange—the domain of Economic Science. And it is quite easy to show that the conception of the science as that of Exchanges, is fundamentally the same as that of those writers who consider it to be that of the Production and Distribution of Wealth. Because by distribution these writers mean the quantity of things acquired by persons in ex-

change for their services, &c., that is, what they have the right to consume, or purchase. And we have seen in the extracts given from Adam Smith above, that he several times uses consumers as synonymous with purchasers, which is its true commercial sense. Consumption, therefore, is equivalent to Distribution, and thus the science comes to be that of Production and Consumption, or of Exchange.

And here, too, we see the truth of what is said under CAPITAL, § 94, that it is consumption, or demand, that gives value to production, and not labour. Smith himself, after saying that the real wealth of a country consists of the annual produce of its land and labour, says that if an article will exchange for nothing, it has no value, and therefore is not wealth.

The value of a thing being the thing it will exchange for, it is quite clear that if there be no demand for it—that is, if no person will give anything for it—it has no value, whatever quantity of labour may have been bestowed in producing it. Again, if people will give a great deal to possess a thing, it has great value, no matter what labour has been bestowed in producing it. There are immense species of property which never had, nor by any possibility could have, any labour bestowed on them at all. What is it that gives value to the copyright of a work, and in fact creates a valuable property at all, but the demand for the work? What gives value to Government Stock, but the willingness of the public to purchase it? And so on of everything else whatever. By the very terms of the expression, it can be only the consumer, or purchaser, who confers value on anything whatever. When demand springs up for a thing, it has value; when the demand ceases, it loses its value, and is not wealth. Hence we see that—

CONSUMPTION or DEMAND, and not LABOUR, is the ONLY SOURCE of VALUE.

CONTARENUS, VINCENTIUS.

De frumentariâ Romanorum largitione liber.
Venetiis, 1609.

CONTINUITY, LAW OF. The great fundamental doctrine of the Continuity of the Sciences, and what is more particularly called the *Law of Continuity*, are so intimately blended together in spirit, that it is impossible to separate them. In fact, we may extend the term of the *Law of Continuity*, which is generally applied to certain doctrines in each particular science, to include the method of arguing by analogy from Science to Science.

The *Law of Continuity* is one of the most powerful weapons of Inductive Logic, and is of very wide application in Physical research. It has been applied with immense effect in settling the fundamental conceptions of Mechanics, Electricity, Geology, and, indeed, of every other science. Its capability of being applied to settle the fundamental conceptions of Political Economy has never yet, that we are aware of, even been suspected!

The grand function of the *Law of Continuity* in its application to each particular Science is to abolish false distinctions. The province of Logic being, as we have shewn (Logic), not to lead persons to argue correctly, as is very commonly

supposed, but to teach them how to JUDGE of the truth of arguments proposed. The function of the Law of Continuity may, in a general way, be said to be to abolish false distinctions. In the wider sense, which we wish to give it, as applied to the connection of the various sciences, its function is to judge by the analogy of the acknowledged standards of reasoning in one science, whether certain modes of reasoning in another are correct or not.

We shall endeavour to shew that a due application of the *Law of Continuity* in its wider sense of arguing by analogy from science to science, as well as by its particular application within the science itself, will be sufficient to close for ever a very large portion of the controversies in Political Economy.

It was a very favorite opinion of the ancient philosophers that there was a great chain of continuity throughout all nature. But it was impossible for them to perceive the full extent of this principle, and that the general principles of the reasoning in Physical Science were applicable to Moral Science. We have seen (AXIOMS AND DEFINITIONS) that Socrates was so far from perceiving any connection between the two, that he expressly discountenanced the study of physical science, and enjoined his disciples to confine themselves to the study of moral Science.

It is one of the transcendent merits of our immortal Bacon to have perceived, and proclaimed with the voice of a trumpet, this grand doctrine of the Continuity of the Sciences. And we must be the more earnest in defending the just title of Bacon to this glorious discovery, because the admirers of another writer, recently deceased, have had the preposterous absurdity to claim for him the originality of this idea, (COMTE.) But we have shown abundantly that Bacon was the true discoverer of the doctrine. With physical science not in a very much better state than it was in the days of Socrates, Bacon not only did not discountenance it, but he had the miraculous sagacity to perceive that the way to true and certain reasoning in Moral Science lay through Physical Science. And he complains bitterly of the mutual damage to the sciences by their separation, and neglect of Natural Philosophy, which ought to be held as the great nursing mother of them all. We have shewn (AXIOMS AND DEFINITIONS) that it is the whole scope and purpose of the *Novum Organum* to lay down fundamental principles for the formation of Conceptions and Axioms in Natural Philosophy, and to enforce the doctrine that the Conceptions and Axioms of the Moral Sciences must be framed by analogous methods. So also in *Valerius Terminus*, he says,—"And it is a matter of common discourse, of the chain of sciences, how they are linked together, insomuch as the Greeks, who had terms at will, have fitted it of a name of circle-learning. Nevertheless, I that hold it for a great impediment towards the advancement and further invention of knowledge, that particular arts and sciences have been disincorporated from general knowledge, do not understand one and the same thing which Cicero's discourse and the note and conceit of the Grecians in their word Circle Learning do intend. For I mean not that use which one science hath of another for ornament, or help in practice, as the orator hath of

knowledge of affections for moving, or as military science may have use of geometry for fortifications; but I mean it directly of that use by way of supply of light and information, which the particulars and instances of one science do yield and present for the framing or correcting of the axioms of another science, in their very truth and notions. And therefore that example of oculists and title lawyers doth come nearer my conceit than the other two; for sciences distinguished have a dependence upon universal knowledge, to be augmented and rectified by the superior light thereof; as well as the parts and members of a science have upon the maxims of the same science, and the mutual light and consent which one part receiveth from another.

* * * * *

"And these are no allusions, but direct communities, the same delights of the mind being to be found not only in music, rhetoric, but in moral philosophy, policy, and other knowledges, and that obscure in the one, which is more apparent in the other; yea, and that discovered in the one which is not found at all in the other; and so one science greatly aiding to the invention and augmentation of another. And therefore without this intercourse, the axioms of sciences will fall out to be neither full nor true."

And, since his day, hosts of eminent men have proclaimed the same doctrine; among others Locke and Condillac (CONDILLAC) have strongly enforced the necessity of precision and accuracy of language, and said that the moral sciences might be brought to a state of demonstration as well as mathematics, if their language were polished and refined, to the same degree of exactness as that of mathematics.

Nay, among others who have maintained this doctrine, is Mr. Mill, in the sixth book of his *Logic*; for he says, in the Table of Contents to that book, which is on the *Logic of the Moral Sciences*,—"The backward state of the moral sciences can only be remedied by applying to them the methods of physical science, duly extended and generalized." And at p. 405, 4th edit. of his *Logic*, he says,—"*In scientific investigation, as in all other works of human skill, the way of attaining the end is seen, as it were instinctively, by superior minds, in some comparatively simple case, and is then, by judicious generalization, adapted to the variety of complex cases. We learn to do a thing in difficult circumstances by attending to the manner in which we have spontaneously done the same thing in easy ones.*"

"This truth is exemplified by the history of the various branches of knowledge which have successively, in the ascending order of their complication, assumed the character of sciences, and will doubtless receive fresh confirmation from those, of which the scientific constitution is yet to come, and which are still abandoned to the uncertainties of vague and popular discussion. Although several other sciences have emerged from this state, at a comparatively recent date, none now remain in it, except those which relate to man himself, the most complex and most difficult subject of study on which the human mind can be engaged.

"Concerning the physical nature of man, as an organised being—though there is still much uncertainty and much controversy, which can only

be terminated by the general acknowledgment and employment of stricter rules of induction than are commonly recognised; there is, however, a considerable body of truths which all who have attended to the subject consider to be fully established; nor is there now any radical imperfection in the method observed in this department of science by its most distinguished modern teachers. But the laws of Mind, and even in a greater degree those of Society, are so far having attained a similar state of even partial recognition, that it is still a controversy whether they are capable of becoming subjects of science in the strict sense of the term; and among those who are agreed on this point, there reigns the most irreconcilable diversity on almost every other. Here, therefore, if anywhere, the principles laid down in the preceding Books may be expected to be useful.

"If on matters so much the most important with which the human intellect can occupy itself, a more general agreement is ever to exist among thinkers; if what has been pronounced 'the proper study of mankind' is not destined to remain the only subject which philosophy cannot succeed in rescuing from empiricism,—the same processes, through which the laws of many simple phenomena have by general acknowledgment been placed beyond dispute, must be consciously and deliberately applied to those more difficult inquiries. If there are some subjects on which the results obtained have finally received the unanimous assent of all who have attended to the proof, and others on which mankind have not yet been equally successful; on which the most sagacious minds have occupied themselves from the earliest date, and have never succeeded in establishing any considerable body of truths, so as to be beyond denial or doubt; it is by generalizing the methods successfully followed in the former inquiries, and adapting them to the latter, that we may hope to remove this blot on the face of science."

Will our readers believe that Mr. Mill, who has in the foregoing passage as clearly and distinctly affirmed as it is possible to do that the science of Society, and of course Political Economy as a part of it, is to be investigated on analogous methods to those pursued in Natural Philosophy, is the same writer, who as we have shewn under AXIOMS AND DEFINITIONS, § 19, has expressly asserted on the contrary, that Political Economy is essentially an abstract science, and its method the *a priori* one? That it must necessarily reason from assumptions and not from facts. That the *a priori* method is the only one by which truth can possibly be attained in any department of the Social Science! And he anathematizes every one else who thinks differently.

"Can such things be,
And overcome us like a summer's cloud,
Without our special wonder?"

If, then, Political Economy is to be raised to the rank of an exact science, we may say, arguing from the general analogy of science, that there must be some great body of phenomena connected together by some one principle, or idea; and if it is to be of the same wide and general nature as the other physical sciences, it must be based on Conceptions and Axioms of the same wide and general nature that they are, which must be

capable of explaining all the phenomena. Moreover, as the general conceptions and axioms in Mechanical Science not only enable us to attain desired results, but also explain the causes of Mechanical catastrophes, which can be shewn to be produced by violating the fundamental conceptions and laws of Mechanics, so it is a test of the truth of general Economical conceptions and axioms, that Economical catastrophes can be proved to be the inevitable consequence of violating these conceptions and laws.

Now, with respect to the general conception of the Science itself, we have fully explained under the article *ECONOMY, POLITICAL*, the phases of opinion with regard to the nature and extent of the Science, and the reasons which have made us adopt the conception to which the general opinion of European Economists is now gravitating, that it is the Science of Commerce, or of Wealth, and that its true function is to investigate the Laws which regulate the Exchangeable Relations of Quantities.

Although all Economists are now agreed, we believe, that Political Economy treats about Wealth, there are, unfortunately, the widest differences of opinion as to what Wealth is, and therefore as to what are the true limits of the Science. Moreover, there is scarcely a single term in the subject whose meaning is agreed upon by writers. We shall now endeavour, by the application of the Principle of the Continuity of Science, and the Law of Continuity, to shew that these differences of opinion may be settled by the analogy of other sciences.

Arguing, then, from the analogy of physical science, we may lay down these fundamental canons:—

I. *The Fundamental Conceptions and Axioms of every Science must be perfectly General.*

II. *No General Conception and no General Axiom must contain any term involving more than one Fundamental Idea.*

The truth of this is manifest, because if any term involve more than *one* fundamental idea, it limits the generality of the Conception, or the Axiom, which is contrary to the first Canon.

Consequently, if we wish to bring Political Economy to the state of an exact science, we must carefully examine all its fundamental Conceptions and Axioms, and reduce them to the state of simplicity and generality prescribed by the above Canons, and hence if we meet with Conceptions and Axioms which violate them, by containing several ideas, we must apply the general principles of Inductive Logic to discover which is the single true general idea, and eliminate all the other accidental, or particular ones.

On the application of the Law of Continuity to determine the nature of an Economic Element, or the Definition of Wealth.

Every great science is founded upon some single idea, or quality, which must be of the most general nature; and every quantity that possesses that quality, is an Element in that science, no matter what its nature be, or what other qualities it may possess.

Thus every substance which possesses divers qualities will be an element in as many sciences as it has qualities. And single qualities may exist in quantities of the most divers natures.

PART VI. VOL. I.

It thus happens that in every science there are elements of the greatest possible diversity of form and nature.

Thus, the science of Arithmetic, or Algebra, is the science of number or measure; and consequently whatever may be numbered or measured, is an arithmetical or algebraical element. Thus, quantities of the most divers natures are brought under the dominion of Algebra, or Arithmetic, simply from their capability of being measured.

Thus time, space, velocity, material substances of all sorts, which have no other property in common but the capability of being measured, are all algebraical elements.

So the science of Mechanics, in its most general form, treats of forces. And these forces are of the most divers natures and forms, and agree in nothing except that their effects may be measured.

The general definition of force in Mechanics is, *Anything that causes, or tends to cause, motion.*

Thus, some forces are incorporeal, invisible, and intangible, like gravity.

Others may be material and corporeal, like the human arm, or animals, or a stream of water.

So there is the force of the wind, and of steam.

Others are explosive, like gunpowder.

Now, all these forces of the most diverse natures, are all mechanical elements, because they all satisfy the general mechanical definition of force.

So also in Chemistry, which is the science of the combination of bodies, there are elements of the most diverse natures, solid, liquid, and aeriform.

Now, Political Economy is the science of Values, or Exchanges; and Economists are agreed that the test of wealth is its capability of being exchanged. It is exclusively founded on the idea or conception of *exchangeability*, and consequently, following the analogy of every other physical science, *WHATEVER* can be exchanged is an economical element, whatever its nature be, material or immaterial, enduring or evanescent.

We have, then, this fundamental conception in Political Economy, that whatever can be exchanged separately, is an economic element, or an article of wealth; and the totality of economic elements is the wealth of a country, or the domain of Political Economy.

The criterion, then, of an economic element is this:—Can it be valued? Can it be exchanged for anything separately, and independently of anything else?

This criterion may seem a very simple one, and we think would meet with general assent; and yet its application requires, in many cases, a knowledge of Law and Equity, and is the test which explains the fallacy of some of the most plausible but fatal currency schemes, which have produced the most terrible catastrophes in the world.

Arguing, then, from the general analogy of the other physical sciences, we should naturally expect to find economic elements of a great variety of different forms and natures, which shall possess no quality in common, but that of being measured in value.

Thus we have, as elements containing the principle of exchangeability, some that are material and enduring, some that are material but perishable, and some that are material, and whose very use implies destruction.

So there are incorporeal elements, which perish in the using, like music, instruction of all sorts, &c.

There are incorporeal elements, which last only a limited time, like instruments of credit of all sorts, copyrights, patents, &c.

There are incorporeal elements, which contain no principle of decay in them at all, as the Funds, shares in commercial companies of all sorts, ground-rents, the goodwill of a business, &c.

Now each of these is an economical element, or an article of wealth, as long as it exists, and can be exchanged; when it ceases to exist, of course it is no longer an economic element, or wealth.

The same physical substance is an element in as many sciences as it has qualities. Thus, man is an arithmetical element, because he can be numbered.

He is a mechanical element, because he is capable of exerting mechanical force.

He is a chemical element, because his body consists of elements in combination.

He is an economical element, because he is capable of being valued, either in slave countries, where he can be corporeally sold, like cattle; or in free countries, where his services of all sorts can be measured in money. The inhabitants of a country are, therefore, parts of its wealth, or, as Adam Smith said, part of its fixed capital.

On the other hand, whatever cannot be measured in value, is not an economic element. Thus, time is not an economic element, because it cannot be valued, it cannot be bought and sold. Nor is velocity an economic element; but space may be, because space may be bought and sold.

The *Law of Continuity* will enable us to eliminate the intrusive elements, which have sometimes been held to be necessary to the definition of wealth. Thus, various writers, all admitting that exchangeability is a necessary quality of wealth, have clogged it with other ideas as requisite to it, such as labour, materiality, durability, and utility.

Now, with respect to labour, it is perfectly undoubted, that differing quantities of labour in no way whatever affect the values of the same qualities of articles.

If a man finds a nugget of gold in ten minutes, and another man takes twelve months to find a precisely similar one, that causes no difference whatever in their value.

If a man finds a diamond, it makes no difference whatever in its value whether it be found after the labour of an hour, or a day, or a week, or a month, or a year, or any number of years. Hence we see that varying degrees of labour have no influence on value. Now the *Law of Continuity* says, that *that which is true up to the limit, is true at the limit*; and as we find that varying degrees of labour do not affect value, if we diminish the labour to 0, the same doctrine must be true, and hence we eliminate *labour* from the definition of wealth.

Moreover, we observe that there are many things which may have any quantity of labour bestowed on obtaining them, and yet have no value; as, for instance, the oyster-shell, in which the pearl is found, or the rubbish in which the diamond is found, which have no value, although obtained with exactly the same labour as the pearl and the diamond.

There are also many things which have value, upon which no labour at all has ever been bestowed, such as instruments of credit, space in towns, &c.

Hence we see that LABOUR is not the ESSENCE, but the ACCIDENT of WEALTH.

We therefore eliminate LABOUR from the definition of Wealth.

We next observe that there are things of all sorts which have value, which have various degrees of durability; thus, a watch lasts very long; clothes last a shorter time; food a still shorter time; and hence, as that which is true up to the limit, is true at the limit, it follows that the durability of wealth may be reduced to the least possible time, and yet it is wealth.

Hence, we see that DURABILITY is not the ESSENCE, but the ACCIDENT of WEALTH.

We therefore eliminate *Durability* from the definition of Wealth.

This at once furnishes an answer to Adam Smith and Mr. Mill.

Smith says (Book II, c. iii.), that "The labour of a servant is unproductive, and adds to the value of nothing; but the labour of the manufacturer fixes and realises itself in some particular subject, or vendible commodity, which lasts for some time at least, after that labour is past. It is, as it were, a certain quantity of labour, stocked and stored up, to be employed, if necessary, on some other occasion. * * *

"The labour of some of the most respectable orders in the society is like that of menial servants, unproductive of any value, and does not fix or realise itself in any permanent subject, or vendible commodity, which endures after that labour is past, and for which an equal quantity of labour could afterwards be procured. The sovereign, for example, with all the officers both of justice and war who serve under him, the whole army and navy, are unproductive labourers. They are the servants of the public, and are maintained by a part of the annual produce of the industry of other people. Their service, however honourable, how useful, or how necessary soever, produces nothing for which an equal quantity of service can afterwards be procured. The protection, security, and defence of the commonwealth, the effect of their labour this year, will not purchase its protection, security, and defence for the year to come. In the same class must be ranked some both of the gravest and most important, and some of the most frivolous professions; churchmen, lawyers, physicians, men of letters of all kinds; players, buffoons, musicians, opera singers, opera dancers, &c. The labour of the meanest of these has a certain value, regulated by the very same principles which regulate that of every other sort of labour; and that of the noblest and most useful produces nothing which could afterwards purchase, or procure an equal quantity of labour. Like the declamation of the actor, the harangue of the orator, or the tune of the musician, the work of all of them perishes in the very instant of its production."

Smith says that the labour of soldiers and judges is unproductive, because the protection and security purchased by it this year, will not purchase it for the next year. He might just as well have said that those who sell food of all sorts are unproductive labourers, because the dinner which we eat, and which supports us to-day, will not support us to-morrow; or that a tailor is an unproductive labourer, because the clothes we wear out this year will not protect us

next year. He has not given us the least notion of how long things must last after they are produced, before they are destroyed, to entitle their producer to be called a productive labourer. Hence the degree of durability is immaterial, hence by the *Law of Continuity* we may eliminate it altogether.

The same observations apply to Mr. Mill. He tells us at page 8; vol. i., that "*Everything forms therefore a part of wealth, which has a power of purchasing*,"—a definition which is perfectly unexceptionable, and is, in fact, the true one. Now this definition is manifestly perfectly general, and therefore, according to it, everything, no matter what its nature be, for which anything can be had in exchange, is Wealth. This, manifestly, is contrary to Smith's notion in the last extract, for as the labour of the soldiers, judges, musicians, &c., is paid for, and therefore has power of purchasing, it must be wealth. But at page 59 of the same volume, when he comes to enumerate what he considers to be Wealth, he says that utilities produced by labour are of three sorts; utilities fixed and embodied in outward objects; utilities fixed and embodied in human beings; and lastly, utilities not fixed or embodied in any object, but consisting in a mere service rendered. He then says, "Utilities of the third class, consisting in pleasures which only exist while being enjoyed, and services which only exist while being performed, cannot be spoken of as wealth, except by an acknowledged metaphor. It is essential to the idea of wealth, to be susceptible of accumulation; things which cannot, after being produced, be kept for some time before being used, are never, I think, regarded as wealth, since however much of them may be produced and enjoyed, the person benefited by them is no richer, is nowise improved in circumstances. But there is not so distinct a violation of usage in considering as wealth any product which is both useful and susceptible of accumulation. The skill, and the energy, and perseverance of the artisans of a country, are reckoned part of its wealth, no less than their tools and machinery. According to this definition we should regard all labour as productive, which is employed in creating *permanent* utilities, whether embodied in human beings, or in any other animate or inanimate objects."

It is quite clear that this last extract is inconsistent with Mr. Mill's own definition of wealth, which was perfectly general. For here he has introduced the limitation that wealth must be susceptible of accumulation. But here he does not say what is the *degree of permanence* which objects must possess to be called wealth. Is it to be a minute, or an hour, or a day, or a month, or a year? The durability of a minute will satisfy Mr. Mill's requirement of "some time," as well as a year. And therefore, by the *Law of Continuity*, we eliminate durability altogether.

But the fact is, that Socrates, with his strong common sense, settled the matter 22 centuries ago. In the Dialogue of *ÆSCHINES SOCRATICUS*, which we have given, the question discussed was, What was wealth? And Socrates rightly decides, that whatever will purchase anything else is wealth. He says that if a man gains his living by giving instruction, that instruction is as much wealth as gold or silver. Thus we see that the principles of Inductive Logic and Socrates are in

complete harmony with each other. We, therefore, altogether reject the notion that any degree of permanence is necessary to wealth.

With respect to materiality, we cannot apply the *Law of Continuity* to that, because there are not various degrees of materiality. A quantity is either wholly material or wholly immaterial, and cannot pass from one state into the other. But as there are enormous masses of incorporeal property, which are bought and sold every day, just the same as corporeal property, that is quite sufficient to eliminate materiality from the conception of wealth.

With respect to utility, that is so vague and uncertain, that it is impossible to say what it is. There is no such thing as absolute utility. It entirely depends upon the individual. It is simpler to say that what people want and will pay for, is useful, or wealth.

We therefore eliminate all intrusive elements, and finally have exchangeability, as the sole idea of wealth. Moreover, all *degrees* of exchangeability are excluded by the same *Law of Continuity*. If a thing is exchangeable at all, it is wealth, quite independently of the area of its exchangeability. There is probably nothing which has universal exchangeability. Place gold money in a position where it ceases to be exchangeable, and it is not wealth. What use would a bag full of sovereigns be among the Red Indians, or in the centre of Africa? Hence, if a thing possesses the lowest degree of exchangeability, it is wealth. This doctrine is of great importance in the subject of Credit; because there are enormous masses of credit which never perform more than a single exchange, and yet they are to be accounted as wealth, as much as more general forms of credit. In fact, probably the largest portion of the circulating, or purchasing, power of this country consists of credit, which never moves but once.

These considerations shew that vast quantities of property must be brought into Political Economy, which have never been alluded to in any English work on the subject, such as Copyright, Patents, Annuities of all sorts, which quite overthrow many doctrines which are considered as fundamental.

Application of the Law of Continuity to settle the Definition of Consumption.

The *Law of Continuity* may be very extensively used to settle most of the other fundamental conceptions of Political Economy. Thus, we may use it to eliminate the intrusive element from the Definition of Consumption. That word is used frequently to mean destruction. But things which are purchased, are of all degrees of destructibility, from infinity downwards. Hence, as the word "consumers" is taken to mean purchasers, whether the thing purchased be destructible or not, it is quite clear that destructibility is the intrusive element, and that the true economic meaning of consumption is simply purchase.

Application of the Law of Continuity to determine the Definition and Limits of the Currency.

We shall now treat of a very important application of the *Law of Continuity*—namely, to

examine the controversies regarding the definition of currency.

The controversies as to what should be included under the term "currency," had not begun in Adam Smith's day, and consequently he does not discuss the point. But it is quite clear from his work, that he included all forms of paper credit under the term money, or currency.

In Book II., c. i., he classes as floating capital, the MONEY by means of which things are distributed to their proper consumers. He then treats paper money as in all respects the same as gold and silver for economical purposes. He says—(Book II., c. ii.)—"There are several different sorts of paper money; but the circulating notes of banks and bankers are the species which is best known, and which seems best adapted for this purpose." Here he expressly says, there are other sorts of paper money, which perform the function of circulation, besides bank notes. Now, what are these other sorts but bills of exchange and other forms of credit? He then shews that bank notes serve all the purposes of money. And how can one species of debts be currency and others not? In Book III., c. i., he speaks of the commerce which is carried on by every civilized society, between the inhabitants of the town and the country. "It consists of the exchange of rude for manufactured produce, either immediately or by the intervention of money, or of some sort of paper which represents money." Now, as bills of exchange perform the greatest part of these exchanges, it is perfectly clear that Smith considered them as part of the money or currency of the country.

We think, therefore, that it is perfectly certain from these, as well as many other passages that might be cited, that Smith clearly meant that all forms of credit were part of the currency. And this continued to be the opinion of the great majority of writers and speakers, as is fully shewn under the word CURRENCY, till a comparatively recent period.

In recent times, however, a different opinion has been adopted by an influential sect in this country. This doctrine began to appear before the Committee on the Bank Charter Act in 1832, and still more strongly before that of 1840. They exclusively limit the term currency to Bank Notes payable on demand only, and rigorously exclude all other forms of paper credit from that term; and they maintain that there are certain laws which apply to Bank Notes, payable on demand, and not to other forms of credit.

This opinion they support by certain legal reasons, which we shall not investigate here, as that is fully done under CURRENCY. We shall merely apply the *Law of Continuity* to ascertain whether this distinction is tenable or not.

The fundamental conception of a Currency which we have obtained (CURRENCY), at once shews the untenable nature of this distinction. We have shewn that Aristotle gave the true conception of a currency, that it is a pledge that we may effect a future exchange. It is, in fact, the representative of debt, or of services due, and for which no equivalent has been received. And this pledge may either be in the material and general form of money, which is only the highest and most general form of Credit, or it may be in the incorporeal and particular form of Credit,

whether expressed on paper or not. Now it is perfectly clear that there can be no distinction in principle between a debt promised to be paid one year hence, or eleven months hence, or ten months hence, or one month hence, or a week hence, or a day hence.

Hence it is clear that the different degrees of the distance of payment do not affect the nature of the thing. Therefore, by the *Law of Continuity*, that which is true up to the limit is true at the limit; if we diminish the postponement of the payment to 0, it is quite clear that it cannot affect the nature of the instrument. Hence there can be no possible distinction in principle between notes payable at any date after demand, and those payable on demand.

Nor can a debt in one form be different in its nature from a debt in another form, hence a promise to pay cannot be different in kind from an acceptance, because they are both, in fact, engagements to pay.

Hence there is no distinction in kind between Bills, or Notes, payable after date, or on demand.

The palpable absurdity of supposing that there is any distinction in principle between notes payable on demand, and after a certain date, will appear still more strongly if we take a particular case. It used to be the custom of country banks in this country to issue notes payable at certain dates after demand, for the sake of protecting themselves from a sudden demand for gold, when communication with the metropolis was slow. In some districts these notes were payable 20 days after demand. Now, the express doctrine of the sect above alluded to, excludes these notes from the term currency. Now these notes passed from hand to hand, and circulated goods just in the same way as if they were payable on demand. And we may ask,—If they were not currency, what were they? Moreover, they became currency on the day they became payable. Now, of course they were only payable during business hours. So we have this consequence:—During the 19 days they were circulating, they were not currency. They were not currency until the first stroke of the clock at which the bank doors were opened. At the last stroke, when the bank doors were opened, they were payable on demand; and then, at one stroke of the clock, in the twinkling of an eye, they were suddenly transmuted into currency! Being something before, of which we have no knowledge, in a single instant they changed their nature, and became currency! Can the force of absurdity go further? Hence we see that the *Law of Continuity* entirely annihilates the false distinction which has been erected between different forms of paper credit.

Application of the Law of Continuity to Ricardo's Distinction between Fixed and Floating Capital.

Adam Smith has divided Stock into two fundamentally distinct portions: one, which the owner uses directly for himself, which he calls revenue; the other which he employs for the purpose of profit or production, which he calls capital. And in this distinction he has been followed by nearly every other Economist. The distinction is manifestly a just one, and founded in nature; because the one is a stationary quantity, and the other is an increasing one. Mr. McCulloch, it is true, has objected to this, and

denominates capital the accumulation of existing products. (CAPITAL, § 31.) But he has evidently missed the true ground of the distinction which is founded in nature.

Now we see that Smith makes the distinction between Capital and Revenue to consist exclusively in the method of using the thing, or to reside in the mind of its owner, and not to be anything inherent in the thing itself.

But Smith has further subdivided Capital itself. And his distinction is an exact analogy with his distinction between Capital itself and Revenue, namely—it is according to the method of using the thing, and not according to the nature of the thing itself. He divides Capital into *Fixed* and *Floating*; the former being Capital which remains in possession of the Capitalist, and from which he only makes a profit by its use; the latter being that which passes, or floats away from him altogether, and whose value only is replaced to him by the purchaser. Now this distinction is by no means futile or unnecessary; it is attended by the very important consequences. As, for instance, the too rapid conversion of floating into fixed Capital may be productive of very serious inconvenience to a country.

Ricardo, however, has totally missed the true nature of Smith's distinction between fixed and floating capital, and has introduced what Mr. Senior has aptly termed a cross distinction. He says (*Principles of Political Economy and Taxation*, 3rd edit., p. 26,) "According as Capital is rapidly perishable, and requires to be frequently reproduced, or is of slow consumption, it is classed under the heads of circulating, or of fixed capital." Now this is a distinction of a totally different nature from that of Smith, because it makes the distinction reside in the nature of the thing itself. Moreover, as Ricardo says in a note to this very passage, "A division not essential, and in which the line of demarcation cannot be accurately drawn." This last expression is perfectly true. Capital is of all degrees of perishability, and where is the exact line to be drawn between fixed and floating capital? At what degree of perishability does one shade into the other? The *Law of Continuity* shews there can be no such point. The distinction is therefore a false one. The true distinction lies in the *method of use*, and not in the *degree of perishability*. It is quite clear, that if we take Ricardo's distinction, the expression of converting floating into fixed capital, becomes absolute nonsense; whereas, when it is referred to method of use, it is intelligible and of great importance.

Application of the Law of Continuity to the Ricardian System of Political Economy.

We have shewn that Condillac published a treatise in the same year as the *Wealth of Nations* appeared, in which he treated Economic Science as the Science of Commerce, or of Exchanges, and this is the conception of it, which is now becoming general among modern economists. Condillac having formed this conception of it, instinctively from the analogy of Physical Science, never supposed it possible that there could be more than one general Theory of Value. He shews that all variations of value are caused by variations in the intensity of the demand and the quantity of the supply. This treatise, how-

ever, was generally neglected, and Smith's, which was published the same year, shortly attained universal celebrity, and became the principal work on the subject.

Ricardo, the next most influential writer in this country, has nowhere expressly stated, what his conception of the Science was. But it is clear from his work, that the idea of it, which was floating in his mind, was the same as that of Condillac. And this view is now becoming general among economists, and in accordance with this conception, it may be defined to be the Science which treats of the *Laws which Regulate the Exchangeable Relations of Quantities*. The exchangeable relation of any two quantities whatever, being denominated their value with respect to each other.

The object, then, of Political Economy is to ascertain the Laws of Value.

Assuming this to be the case, let A and B be any two quantities whatever, supposed perfectly general, it is quite clear that their exchangeable relations are contained in the following limits:—

$$\begin{array}{rcl} \infty A & = & 0 B \\ \&c. & = & \&c. \\ 2 A & = & \frac{1}{2} B \\ A & = & B \\ \frac{1}{2} A & = & 2 B \\ \&c. & = & \&c. \\ 0 A & = & \infty B \end{array}$$

That is where the exchangeable relation between A and B gradually and continuously changes, from where the greatest possible quantity of A will exchange for the least possible quantity of B, to where the least possible quantity of A will exchange for the greatest possible quantity of B.

Now, the *Law of Continuity*, as stated by Dr. Whewell (*Nov. Org. Renov.*, p. 221), says:—"That a quantity cannot pass from one amount to another by any change of conditions, without passing through all intermediate degrees of magnitude, according to the intermediate conditions."

He also says, p. 223, "The evidence of the Law of Continuity resides in the universality of those ideas which enter into our apprehension of Laws of Nature. When, of two quantities, one depends upon the other, the Law of Continuity necessarily governs this dependence. Every philosopher has the power of applying this law, in proportion as he has the faculty of apprehending the ideas which he employs in his induction, with the same clearness and steadiness which belong to the fundamental ideas of quantity, space, and number. To those who possess this faculty, the law is a rule of very wide and decisive application. Its use is seen rather in the disproof of erroneous views, and in the correction of false propositions, than in the invention of new truths. It is a test of truth rather than an instrument of discovery," which is the true function of all logic.

Now, before we examine any particular laws which have been proposed as regulating particular cases of value, we may affirm, by virtue of the *Law of Continuity*:—

I. *That if it can be indubitably proved that ANY particular law holds good at ANY one point in the range of prices, that same law must necessarily hold good at ALL points throughout the whole range of prices.*

II. *That as the symbols A and B are perfectly*

general, if ANY law whatever can be proved to hold good in the variations of the exchangeable relations of ANY two quantities whatever, that same law must necessarily hold good in the exchangeable relations of ALL quantities whatever.

Thus, by the Law of Continuity we are enabled to affirm:—

That if ANY law whatever can be proved to be true at ANY one point in the range of prices, between ANY two quantities whatever, that same law must be necessarily true at ALL points in the range of prices, and between ALL quantities whatever.

Thus we affirm by virtue of the Principle of the Continuity of Science, and arguing from the analogy of every other physical science, that, however varied and complicated the different phenomena of value may appear to be, there can be no possibility be more than one grand general Theory of Value, whatever it may be.

Now in the progress of the different Physical Sciences, different opinions have been held as to which was the true general Theory of the Science. But no one ever dreamt of supposing that it could be built on more than one general theory, or believed in two fundamentally distinct theories at the same time. In Astronomy there have been the Theory of Ptolemy, and the Theory of Tycho Brahe, and the Theory of Copernicus, all of which may have had their admirers. But no one ever dreamt of believing, or being required to believe, in all these different theories at the same time. No one ever wrote a Treatise on Astronomy, in which one chapter, or class of phenomena, was explained by the Theory of Ptolemy, another class of phenomena by the Theory of Copernicus, and another class of phenomena by the Theory of Tycho Brahe, and three or four other classes of phenomena by as many different theories.

So in Optics, there have been the Emission Theory and the Wave Theory, both of which have had their supporters. But neither party ever thought it possible to believe in both theories at once, or ever dreamt of writing a Treatise on Optics, in which one class of phenomena was explained by one theory, and another class by the other theory.

So, throughout the range of Physical Science, every one knows that it is the very object of induction to obtain the ONE general theory which lies at the base of all the phenomena. To suppose that any Physical Science could be based on a multitude of conflicting theories, would be enough to make the hair of every Physicist stand on end.

And yet this is exactly what Ricardo does. His conception of the nature of the Science is perfectly just, and agrees with that of Condillac. But Condillac never supposed that there could be more than one general Theory of Value, and he shews that all variations of Value are reducible to this single general principle. But how does Ricardo proceed?

In the first place, there are gigantic masses of property which are not even mentioned in his work. But in the comparatively small portion of wealth he does treat of, he says that in one class of cases, the Value of things are governed by the Law of Supply and Demand; in another class of cases, by the Cost of Production of the things themselves; in a third class of cases, by

the Cost of Production of the last quantity raised; in a fourth class, Wages, by a different law altogether. Some of his followers have introduced another Law of Value for a class of cases not mentioned by him; and if we take into consideration that enormous mass of wealth of whose existence he does not appear to be aware, it is necessary to have at least six—probably many more—distinct and contradictory Theories of Value to construct the Science of Economics!

But, more than that, in chap. xxx., he admits that the law of *Supply and Demand* regulates the prices of all commodities for a limited period, and then, at some particular point, it suddenly changes into the law of *Cost of Production*; and then, as price continues to change, it then suddenly goes back again to the law of *Supply and Demand*.

That is to say, that while a quantity is undergoing a continuous change of magnitude, it is subject to a certain law up to one point, at which it is subject to a totally distinct law. As soon, then, as it has passed through this point, it suddenly becomes subject to the other law, and continues so during all the remainder of its changes of magnitude. At the very statement of such a doctrine, it would be instantly condemned by every Physicist.

But Ricardo had before him what every man of science will see to be the true law, and yet he failed to recognise its universality. He quotes from a work of Lord Lauderdale's, entitled *An Inquiry into the Nature and Origin of Public Wealth*, which contains little else of any worth, what is clearly the true general law of Political Economy.

Lord Lauderdale says, p. 12, that of two quantities which may each vary, if we suppose the variation to take place in one of them first, the other remaining the same, its value would be influenced by four causes:—

It would increase in value—

- (1.) *From a Diminution of Quantity.*
- (2.) *From an Increase of Demand.*

It would diminish in value—

- (1.) *From an Increase of Quantity.*
- (2.) *From a Diminution of Demand.*

Now, as the variations of the other quantity will be influenced by the same four causes, it is quite clear that the variations of both quantities will be influenced by eight independent causes, and if these be connected in the form of an algebraical equation, that will be manifestly the true general equation of Political Economy.

Such a general equation must manifestly comprehend the whole science; and as it contains no less than eight independent variables, it at once shews the extremely complicated nature of the science.

Now, Ricardo admits it to be true for all monopolized commodities, and for all others during a limited period. But his want of training in Inductive Science prevented him from seeing that if it be true in any one case, it must be true in all.

The fact is, that the Law of *Supply and Demand*, of which the above extract from Lord Lauderdale is the full expression, is admitted by all Economists to be true when the price of things is very low, and it is also admitted to be true when the price is very high. No other law

whatever but that of *Supply and Demand* operates at the extremes of price; and, therefore, it is manifest, by the *Law of Continuity*, that all intermediate prices must be governed solely by the same Law of *Supply and Demand*. The *Law of Continuity*, therefore, proves that all the proposed distinctions of different classes of cases are utterly false, and to be rejected from a true scientific treatment of the science.

It is quite manifest that the above is the true general equation of Political Economy, and the whole science must be constructed, taking that equation as the basis.

In obtaining this general expression, we have followed the method usual in all physical science. We have obtained the *Independent Variables*, and they are connected in a General Law, or *Formula*. This insures *certainty* in the Science. But it is in the last point that the real difficulty arises, namely, in giving *precision*, or numerical amounts, to the *Coefficients*. It is difficult, probably impossible to say, what numerical variations in supply and demand produce certain numerical variations in price. This has been attempted in some cases, as that of corn, but it is manifestly impossible to obtain exact numerical data.

It is this difficulty, or rather let us say the entire impossibility of giving exact numerical values to the coefficients, that makes many writers suppose it impossible to make Political Economy an exact Science. Thus Professor Cairnes, commenting upon a former statement of ours, shewing why Political Economy might be made an exact science, says that for a science to be an "exact" one, it is necessary that its laws be capable of precise quantitative statement. This, however, is an error which has been specially noticed by Comte (Comte), who well points out the difference between *certainty* and *precision* in science. To constitute an exact science, it is not necessary that the precise numerical laws can be ascertained, but only that the reasoning be exact or certain. In Political Economy the causes of phenomena can be ascertained with positive certainty, and if we want to produce any given effect, the proper method of producing it can be pointed out with absolute certainty. This is all that is necessary to constitute it an exact science, because the method of producing the result being pointed out with certainty, it may be followed until the required result is produced.

These examples, out of many which might be adduced, will serve to shew how the ordinary principles of Inductive Logic may be used to decide controversies, both as to the Conceptions and the Axioms of Political Economy.

COPYRIGHT is the name of a certain species of incorporeal property.

It is the exclusive right of receiving the profits from publishing and selling works of literature and art.

We have fully explained under **CREDIT** and **PROPERTY**, that property is a right residing in the person, and that there may be property in things which already exist, and also property in things which will only come into existence at a future period. The former is usually called corporeal property, and the latter incorporeal property.

Thus there may be property, or the exclusive right, to use a manuscript, or a printed book, and there may also be the property, or exclusive right, to multiply and sell copies of the manuscript, or book, and appropriate the profits. This latter property is called Copyright, and is manifestly a distinct property from the former.

We have also shewn that every future profit whatever has a present value, which may be bought and sold, like property in any material existing substance. This mass of property receives different names, according to the source of the profit, such as the *goodwill* of a business, the *practice* of a profession, the *patent* of an invention, the *shares* in a commercial company, the *funds*, and *annuities* of all sorts, *credit*, and **COPYRIGHT**.

Now, as economists are agreed that whatever is exchangeable is wealth, it follows that this enormous mass of property is wealth, nay, it is probable that 19-20ths of existing wealth is in this form, and yet there is scarcely one word about it in any English work on Political Economy!

The only English work on Political Economy that we are aware of at present, that even mentions copyright, is Dr. Whately's *Lectures on Political Economy*, p. 6, where he says, "In many cases where an exchange really takes place, the fact is liable (till the attention is called to it), to be overlooked, in consequence of our not seeing any actual transfer from hand to hand of a material object. For instance, when the Copyright of a book is sold to a bookseller, the article transferred is not the mere paper covered with writing, but the exclusive *privilege* of printing and publishing. It is plain, however, on a moment's thought, that the transaction is as real an exchange as that which takes place between the bookseller and his customers, who buy copies of the work."

It is quite clear that Copyright is a species of fixed capital. When a publisher buys the Copyright of a popular work, it is manifest that is part of his capital. When an author produces a work for which there is a popular demand, and whose Copyright is therefore valuable property, he is unquestionably producing wealth.

The introduction of this species of property into Political Economy, which can by no possibility be excluded from it, shews the inconsistency of the fundamental conceptions of many writers. Thus Mr. Mill, who says that everything forms a part of wealth which has a power of purchasing, and therefore admits, by implication, that a Copyright is wealth, speaks of the production of wealth as the extraction of the instruments of human subsistence and enjoyment from the materials of the globe, thereby very

nearly agreeing with Adam Smith's notion of wealth, as the produce of land and labour. But how is a Copyright extracted from the materials of the globe? How is it the produce of land and labour?

It also shows that some theorems which he lays down as fundamental, are not so. Thus he says that all capital is the result of saving. But how is a Copyright the result of saving? He also states as another fundamental theorem, that although saved, and the result of saving, all capital is nevertheless consumed. But how is a Copyright consumed? He says that "Capital is kept in existence from age to age, not by preservation, but by perpetual reproduction, every part of it is used and destroyed, generally very soon after it is produced, but those who consume it are employed meanwhile in producing more." Vol. i., p. 92. But how is Copyright kept in existence by perpetual reproduction? How does the owner of a valuable Copyright consume it, and how is he employed in producing more? These are examples of hasty generalization from too small an induction of facts.

Copyright, we thus see, is a species of valuable property, produced entirely by the demand of the public for works of literature and art. It is thus purely the creation of diffused civilization and education, and could not have any existence, except from the educated taste of the public, and unless there were the means of gratifying it at a moderate expense.

It has been discussed whether there was any Copyright among the ancients. Mr. McCulloch, quoting some well known passages, thinks there was. But we think the passages he alleges do not bear out any such doctrine. Thus he quotes from the prologue to the *Eunuchus* of Terence, who, we are told by Suetonius, received 8,000 sesterces, or £64 12s., for writing the play to be acted at the Megalensian games. This was the largest sum paid to any poet for such a work. This, however, proves nothing as to Copyright. It was a mere payment for writing a play for a particular occasion. Juvenal also speaks of selling a play to an actor (vii., 87). But this is manifestly merely payment for writing a play to be acted, as was usual. This did not refer to Copyright, for the very purpose of the satire is to lament the utter decay of all taste for literature among the Romans. Horace (*Ep.* i., 20, 2; *Art. Poet.* 345) speaks of the *Sosii*, who were his publishers, and Martial (i., 67; iv., 72; xiii., 3; xiv., 194) speaks of Tryphon, who had his works on sale. These cases point to Copyright much more than the others. But yet they are by no means conclusive. They by no means imply that the author received payment for the exclusive right to sell his works. We may well understand that there might be a certain comity of trade that one publisher should not sell another's works; but that does not prove the legal right to prevent him doing so. The real question is,—Could an author, or publisher, bring an action to prevent another from copying and selling his works? Now, if such a property had existed, it would certainly have been mentioned in the Pandects. But there is no mention in them of any such property. There is no name in Roman Law for Copyright. There is no case in Roman Law of any action having been brought to punish the

invasion of such property. Therefore we think the only conclusion is that it did not exist.

It is stated by Bishop Fell, that before the invention of printing, the University of Oxford claimed to have the exclusive right of transcribing and multiplying books by means of writing. This, however, by no means implies Copyright, because it does not imply that the works so copied were the property of the University, but only that they had the monopoly of writing them out.

Soon after the invention of printing, a printer, called the king's printer, was appointed to print papers of state, proclamations, &c. The earliest notice we have of such an appointment is in 1604, when William Faques styles himself "Regius Impressor," in a proclamation against clipped money. Richard Pynson succeeded Faques in this office, and, in 1518, we have the earliest instance in England of Copyright. A speech printed by him has the following colophon:—"Impressa Londini anno verbi incarnati m.d.xviii. idibus Novembria, per Richardum Pynson, regium impressorem, cum privilegio à rege indulto ne quis hanc orationem infra biennium in regno Angliæ imprimat, aut alibi impressam et importatam in eodem regno Angliæ vendat."

During the reign of Henry VIII., these privileges were frequently granted to printers, usually for seven years. Piracy was not long in showing itself. In 1523, Wynken de Worde printed a treatise on grammar by Robert Witinton. The author, in a new edition in 1533, complains that the work had been pirated by Peter Trevers. To prevent this being done to the second edition, he procured the king's privilege for it.

These cases seem to negative the idea that there was then believed to be any such thing as Copyright at Common Law.

All these privileges had been granted to printers, who may probably be supposed to have paid the authors something for their work. In 1630, we have the first instance of Copyright granted to an author. John Palsgrave had published a French Grammar at his own expense, and in consideration of this he received a privilege for seven years.

In 1556, the subject of Copyright was put on a new footing. Complaints were made that many false, seditious, and heretical books, ballads, and rhymes were published. To bring printers more under control, they were incorporated by the name of the Stationers' Company. They were allowed to make bye-laws, and no one but a member of their body was allowed to practise the business of printing in England. In 1558, they received a second charter, and a bye-law was made that every one who printed a work should enter it in their register, and pay a fee; and every one who omitted to do this, or printed a book belonging to another member, was fined. In this year, entries of copies for particular persons begin, and in 1559, there are persons fined for printing other men's copies. In 1573, there are entries of the sales of copy and their price.

Privileges for printing particular works were the legitimate protection of the labour and expense of publication. But with the general spirit

of monopoly which prevailed to such a pernicious extent, patents for the exclusive right to publish all works on particular subjects were granted to various persons. Thus one had the monopoly of printing all books on Common Law; another all catechisms and spelling books; another all music books; another all almanacks, &c. The printers were so injuriously affected by these monopolies, that they petitioned the Queen against them. But meeting with no redress, they disputed the Queen's right to grant these patents, and printed works in defiance of them, and the rules of their own company. Complaints were made to the Privy Council of these irregularities, but they were too much occupied with foreign and domestic troubles, to take any effectual steps to remedy them.

The Queen had, in 1559, issued a proclamation, strictly forbidding any one to publish anything without a licence. In 1566, this proclamation being little regarded, the Star Chamber issued a decree enforcing it, under the penalties of seizure of all books so printed, disability from exercising the trade of printing, and three months' imprisonment. The printers were ordered to give bonds to observe the decree. But they continued to disregard all decrees and penalties, and in 1586, another decree was issued, to restrict the number of printers, and to confine the trade to London, except one press at Oxford, and another at Cambridge. All printers were forbidden to print books contrary to the bye-laws of the company.

A proclamation of the 25th September, 1623, forbade any one to import from abroad any works which were copyright. Another proclamation to a similar effect was published in 1637.

In 1640 the Star Chamber was abolished. All regulations of the press by proclamation, decrees of the Star Chamber, and the powers of the Stationers' Company were declared illegal and void. But the abuses of unlicensed printing were so great, that in 1643, it was ordered that all books should be entered in the register of the Stationers' Company, according to ancient custom. Copyright was thus restored as it stood before. In 1644, Milton published his famous *Areopagitica*, against the licensing Act, but he particularly excepts that part relating to "the just retaining of each man his several copy, which God forbid should be gainsaid." In 1649, an Act of Parliament ordained that any one printing, or reprinting, or stitching, or binding, any books entered in the register of the Stationers' Company, without the consent of the owner, should forfeit all such books, and be fined 6s. 8d. for each. No presses were allowed, except in London, the Universities, York, and Finsbury.

The Statute 1662, cap. 33, re-enacted these provisions, and ordered that a copy of every work printed should be deposited in the King's Library, and each of the Universities. This Act, after several renewals, expired in 1679, and with it expired all legislative penalties for pirating copyright. Accordingly, piracy very soon began to be common, and in 1681, the Stationers' Company passed a bye-law to fine every one so offending in the sum of 12d. for every copy so printed, or imported. In 1684, Charles II. granted a new charter to the Sta-

tioners' Company, in which it was stated,—“That divers brethren and members of the Company have great part of their estates in books and copies, and that for upwards of a century before, they had a public register kept in their common hall, for the entry and description of books and copies.” It then said—“We, willing and desiring to confirm and establish every member in their just rights and properties, do well approve of the aforesaid register,” and—“that every member of the company who should be the proprietor of any book, should have and enjoy the sale, right, power, and privilege and authority of printing such book and copy, as in that case has been usual heretofore.”

The Act of 1662 was revived by the 1 Jac. II., c. 7, for the term of seven years, and renewed till the end of the session of Parliament next after the 13th February, 1692. The booksellers petitioned against it, and eleven peers entered a protest against it, as subjecting all learning and true information to the arbitrary will and pleasure of a mercenary and perhaps ignorant licenser, and destroying the property of authors in their copies.

It appears that at this time the Stationers' Company had been guilty of many malpractices. They sometimes extorted large sums for entering works; sometimes they refused, or neglected, to do so at all. Sometimes they made false entries, or fraudulent erasures, or cut out the leaves in which entries were made, to the confusion of all literary property, which was supposed to rest on the entry in the register.

Attempts were made to renew the Licensing Act, but the Commons resisted, and it finally expired on the 25th April, 1694. The circumstance which brought about the final emancipation of the English press are fully stated by Macaulay.

The opposition of the Commons was to the arbitrary power of the licenser. They clearly thought that the property in Copyright was inherent in the author and his assigns, and well secured by the Charters and Laws of the Stationers' Company. But unfortunately, in abolishing the Licensing Act, they had swept away all statutory penalties for pirating Copyright; and persons whose rights were invaded had no other remedy but for damages at Common Law. Several cases had been before the Courts relating to Copyright, but these all referred to disputed property, none ever questioned the right. In the case of *Roper v. Streater* (Skinner, 234), the Court of Common Pleas held that the plaintiff having purchased it from the executors of the author was owner of the copy at Common Law.

The removal of the statutory penalties for piracy opened the door to the same practices as had been committed before, and in 1694 the Stationers' Company renewed their bye-law of 1681, but with little effect. The recovery of damages at law was so hazardous and uncertain, as most of the pirates were men who had no property sufficient to pay damages, and as it required a separate action for each copy proved to be sold, that it was in practice illusory. In 1703, 1706, and 1709, the owners of copies petitioned Parliament for redress, and security to their properties. They had been so long secured by penalties that it had not occurred to them to proceed by a Bill in Equity, which had never hitherto been attempted

or thought of, except upon letters patent adjudged to be legal.

The petitioners declared that the property of English authors had always been owned as sacred among the traders, and generally forborne hitherto to be invaded. That when the author had conveyed over his copy to any one of them, they had a just and legal property thereunto. That they had given sums of money for copies, and had settled these copies on their wives at marriage, or on their children at their deaths. That many widows and orphans had none other subsistence. That their existing copies had cost them at least £50,000. That this property was the same with houses and other estates. In consequence of these petitions, an Act was passed in March, 1710, for the encouragement of learning, by vesting the copies of printed books in the authors, or purchasers of such copies, during the times therein mentioned. It gave authors of the works then existing, and their assigns, the sole right of printing the same for twenty-one years, from the 10th April, 1710, and no longer. Authors of works not printed, and their assigns, had the sole right of doing so for fourteen years, and no longer. The penalties in the Act were not to be exacted from any one unless the book should be entered in the usual way in the register of the Stationers' Company. If too high prices were put upon books, certain great officers of State might order them to be lowered. The number of copies to public libraries was increased to nine. The libraries of the four Universities of Scotland, Sion College, London, and the Advocates' Library in Edinburgh, were added to those entitled by the Statute of Charles II. If the authors were alive at the end of the first fourteen years, they received a prolongation of their privilege for another fourteen years. All penalties under the Act were to be sued for within three months after the offence was committed. Nothing in the Act was to prejudice or confirm any right that the Universities, or any person or persons, had, or claimed to have, in the printing or reprinting any book, or copy, already printed, or hereafter to be printed.

We thus see that, with that tender regard for the interests of the robe, which Parliament displays, they carefully avoided pronouncing any decision at all with regard to the right of copy at Common Law, but took care to leave the door open for a plentiful crop of litigation.

It is quite impossible to read this Act without seeing that it distinctly recognizes Copyright as existing already, and independently of the Act. All they did was to enact certain statutory penalties for its infringement. But that, by a well known rule of law, in no way affected proceedings at Common Law. We have seen that the courts of law never raised the slightest doubt as to the existence of Copyright at Common Law. We shall now see how the Court of Chancery regarded it.

As the Act gave twenty-one years for old copies from the 10th of April, 1710, no question on Copyright at Common Law could arise before 1731. In 1735, Sir Joseph Jekyll granted an injunction in the case of *Eyre v. Walker*, to restrain the defendant from printing the *Whole Duty of Man*, the first assignment of which had been made in December, 1657, being seventy-eight years before.

In the same year, Lord Talbot, in the case of *Matte v. Falkner*, granted an injunction restraining the defendant from printing *Nelson's Festivals and Fasts*, printed in 1703, during the life of the author, who died in 1714.

In 1739, Lord Hardwicke, in the case of *Tonson and Another v. Walker*, otherwise *Stanton*, granted an injunction restraining the defendant from printing *Milton's Paradise Lost*, the Copyright of which was assigned in 1667, or seventy-two years before. In 1752, Lord Hardwicke, in the case of *Tonson v. Walker and Merchant*, granted an injunction, restraining the defendants from printing *Milton's Paradise, or Life, or Notes*.

All this time there had never been any solemn decision by the King's Bench as to the existence of Copyright at Common Law, or as to how it was affected by the Statute of Anne. But the Court of Chancery never granted an injunction unless the legal right was clear and undisputed. If there had been any doubt about it, they would have sent it to be argued in a Court of Common Law.

At last the question was brought before the King's Bench, in the case of *Tonson v. Collins*, but after it had gone into the Exchequer Chamber, and the leaning of the Court was clearly in favour of the plaintiff, it was discovered that it was in fact a collusive action, got up merely to obtain the judgment of the court, and they thereupon refused to proceed with it. While this action was pending, applications to the Court of Chancery for an injunction were refused, until the result of the Common Law action was decided. Lord Mansfield said that he looked upon these injunctions as equal to any final decree, because they were never granted unless the legal property of the plaintiff was made out.

At length, in 1769, the question was solemnly argued before the King's Bench in the famous case of *Millar v. Taylor*. Millar had purchased from Thomson the copyright in the *Seasons*, which were published in 1728, and therefore if the right existed only by statute, it expired in 1756. Taylor published an edition in 1763, and Millar brought an action for damages against him in 1769. It, of course, cannot be expected that we should give an outline of the arguments in this celebrated case. It is sufficient to say that three of the judges, Lord Mansfield, and JJ. Aston and Willes, held that every author had by Common Law, a perpetual copyright in his own works, quite independent of the statute. Yates, J., held that there was no such property at Common Law. The plaintiff therefore got the judgment, and in Trinity Term, 1770, the Lords Commissioners granted an injunction.

In 1774, however, the question was again raised. In the case of *Beckett v. Donaldson*, the plaintiff had obtained an injunction founded on the decision in the case of *Millar v. Taylor*. The case was immediately carried by appeal to the House of Lords, when the House proposed the following questions to the judges :—

I. Whether at common law an author of any book, or literary composition, had the sole right of first printing and publishing the same for sale, and might bring an action against any person who printed, published, and sold the same without his consent ?

Upon this question, JJ. Nares, Ashurst, Blackstone, Willes, Aston, Perrot, and Adams ; Smythe, C.B., and De Grey, C.J. of the Common Pleas, held the affirmative ; Eyre, B., held the negative.

II. If the author had such right originally, did the law take it away upon his printing and publishing such book, or literary composition ? And might any person afterwards reprint and sell for his own benefit such book or literary composition, against the will of the author ?

Upon this question Judges Nares, Ashurst, Blackstone, Willes, and Aston, and Smythe, C.B., held the affirmative ; Eyre, Perrot, Adams, and De Grey, C.J., held the negative.

III. If such action would have held at Common Law, is it taken away by the Statute 8 Anne, c. 19 ? And is an author by the said statute precluded from every remedy, except on the foundation of the said statute, and the terms and conditions prescribed thereby ?

Upon this question Judges Eyre, Nares, Perrot, Gould, and Adams, and De Grey, C.J., held the affirmative. Judges Ashurst, Blackstone, Willes, Aston, and Smythe, C.B., held the negative.

IV. Whether the author of any literary composition, and his assigns, had the sole right of printing and publishing the same in perpetuity by the common law ?

Upon this question Judges Nares, Ashurst, Blackstone, Willes, Aston, and Gould, and Smythe, C.B., held the affirmative. Judges Eyre, Perrott, Adams, and De Grey, C.J., held the negative.

V. Whether this right is any way impeached, restrained, or taken away, by the statute of 8 Anne ?

Judges Eyre, Nares, Perrott, Gould, and Adams, and De Grey, C.J., held the affirmative. Judges Ashurst, Blackstone, Willes, and Aston, and Smythe, C.B., held the negative.

Upon these answers, the decree of the Court of Chancery was reversed, on the motion of Lord Camden, seconded by the Lord Chancellor, by a majority of 22 to 11.

By this majority of a single judge this momentous question was decided. It will be observed that it was brought about by two judges, Nares and Gould, who voted that an author had perpetual Copyright by Common Law, leaving their side, and voting that this perpetual right was taken away by the statute.

Such an opinion seems to us to be incomprehensible. Modern opinion has confirmed the judgment of the minority, that there is no such thing as Copyright at Common Law. But how judges, who held that Copyright did exist at Common Law, could hold that it was taken away by the statute of Anne, seems past understanding, for there is a clause expressly enacting that the statute should in no way whatever affect pre-existing rights.

Right or wrong, however, this judgment declared that the practice of two centuries, and the deliberate opinion of all the courts of law and equity during that period, were erroneous, and henceforward Copyright had nothing but statute law to support it.

Authors, publishers, and the universities were taken by surprise at this unexpected decision of the House of Lords, destroying what they

imagined was their inviolable property. The universities immediately took the field, and in 1775 an Act was passed (15 Geo. III., c. 53), which granted to both the universities in England, and to each of the Colleges therein, to the Colleges of Eton, Westminster, and Winchester, and to the four Universities of Scotland, perpetual copyright in all works that should be bequeathed to them, so long as they should print them at their own presses, and not assign them over to any one else. They nevertheless might sell them to any one they pleased, in the same manner as any individual author.

And here we may observe that a very curious question might arise. It is a plain maxim of law that a man cannot grant, or assign to another, a greater estate, or interest, than he possesses himself. But here is a manifest exception to this rule. An author has only a very limited interest in his own works, according to the present law, only forty-two years, or his own lifetime, whichever is the longest. Hence he can only assign over that interest to any private person. But if he assign this copyright to any university or college named in the Act, it becomes an estate in perpetuity. Therefore, he has clearly assigned a greater estate than he himself possesses. Again, this question might arise. Suppose an author assigns over his Copyright as above, which immediately becomes perpetual by force of law, and suppose the college, or university, sell this Copyright, which has now become perpetual, to an individual.—Is the copyright perpetual, or limited?

The booksellers also petitioned the House of Commons on the 28th of February, 1774, stating that in the full belief of the perpetuity of Copyrights, they had invested large sums in their purchase, and that the support of many families depended on the same, and prayed for such relief as the House might deem proper. A bill was brought in for this purpose, but rejected. In 1798, a new point was raised in the case of *Beckford v. Hood*. The plaintiff had published a work anonymously, and sued for damages for the piracy of it. The defendant contended that no action lay for damages since the statute of Anne, which gave penalties, and that the author had lost his right by publishing his work anonymously, and not entering it on the Stationers' register, as prescribed by the Act. The court, however, by one of those skilful examples of hair-splitting, where plain sense is against them, gave judgment for the plaintiff. The judgment, however, was so manifestly weak, that an Act was brought in to bolster it up (41 Geo. III., c. 107), and authors and their assigns were allowed to bring actions on the case for damages for pirating their works during the currency of the privilege granted by the statute of Anne. Trinity College, and the King's Inn, Dublin, were also added to the list of those places which were entitled to pillage authors of their works. Trinity College also received the right of holding Copyrights in perpetuity, like the English and Scotch Universities and Colleges.

By an Act passed in 1814 (54 Geo. III. c. 156) the copies of printed books were required only to be delivered on demand, within twelve months of their publication. The author's copyright was extended to twenty-eight years certain, and for

the remainder of his life, if he survived that period. The grievance of every author being mulcted in eleven copies of his work, was complained of in Parliament several times, but nothing was done till 1836, when Mr. Buckingham brought in a bill which was passed, which enacted that the rights of Zion College, the four Universities of Scotland, and the King's Inn, Dublin, should cease, upon receiving compensation, which was to be expended in the purchase of works. By this Act, the number of presented copies was reduced to five.

At last, Serjeant (afterwards Mr. Justice) Talfour appropriately took up the subject of Copyright, and brought the subject before the House of Commons. The discussion extended through several sessions, and his bill having been considerably modified, was passed in 1842, as the 5th and 6th Vic. c. 45. This Act repealed the 8th Anne, c. 19: the 41 Geo. III. c. 107; the 51 Geo. III. c. 156, and is now the one which regulates the subject of literary Copyright. By this Act, the word "Book," is to mean every volume, or part thereof, Pamphlet, Sheet of Letterpress, or Music, Map, Chart, or Plan separately published. The Copyright in every such book published, in the lifetime of the Author, is to last for his lifetime and seven years after; but if such term elapse before the end of forty-two years from the publication of the work, then the Copyright shall exist for forty-two years. If the book is published after the Author's death, the Copyright is to last for forty-two years, and shall belong to the owner of the author's manuscript from which it is first published. If the proprietor of such Copyright refuse to publish it, the Judicial Committee of the Privy Council may authorize it. One copy of every such Book to be delivered at the British Museum. The Libraries at Oxford, Cambridge, the Advocates' at Edinburgh, and Trinity College, Dublin, may have one copy on demand. Articles in Encyclopædias, Magazines, and Reviews, and periodicals, are subject to the same Copyright as Books, except that the Copyright of articles in Reviews, Magazines, and periodicals, reverts to the author after twenty-eight years, for the remainder of the term. Subsequent provisions were made for preventing the importation into British possessions of the works of British Authors, in which Copyright still subsists.

The next subjects which received Copyright from Law, were prints and engravings. The Acts relating to this, are the 8 Geo. II. c. 13; the 7 Geo. III. c. 38; the 17 Geo. III. c. 57, and the 15 & 16 Vic. c. 12. By these Acts, the Copyright in Prints, Engravings, Lithographs, and all such works of Art, is given for twenty-eight years from the day of publication.

By the 27 Geo. III. c. 38, Copyright was given in the designing and printing of manufactures; this Act was modified and extended by subsequent Acts. The present Acts on the subject are the 5 & 6 Vic. c. 100; the 6 & 7 Vic. c. 65; the 13 & 14 Vic. c. 104; and the 20 & 22 Vic. c. 70. By these Acts, designs in manufactures are divided into various classes, and various terms are allowed for the Copyright of Designs in each. For designs for ornamenting articles in metal; wood; glass; earthenware, and other solid substances; paper hangings; carpets, including floor and oil-cloths; shawls, unprinted; linen fabrics with pattern, printed; woven damasks; the term is three years.

For shawls, printed; yarn, thread, or warp; nine months.

For woven fabrics, unprinted; lace, and all other articles, twelve months.

For the shape or configuration of articles of utility, three years.

By the 38 Geo. III. c. 71; and 54 Geo. III. c. 56, Copyright was granted for sculptures, models, and casts, for fourteen years from the time of first publication; and to the author, if living at the end of that term, fourteen years more.

By the 3 & 4 Wm. IV. c. 15, the term of Copyright granted to authors by the 54 Geo. III. c. 156, was extended to the Author of Dramatic compositions of all sorts; publication in this instance being interpreted as representing at a place of dramatic entertainment, and a similar extension was granted by the 5 & 6 Vic. c. 45, and its provisions extended to musical compositions.

By the 5 & 6 Wm. IV. c. 65, the author of any lectures, or the person to whom he might assign the Copyright in them, was to have the sole right of publishing them. No Newspaper editor is to publish them without leave. And no person who is allowed to attend them is to have the right to publish them. If, however, they are published, the Copyright lasts for twenty-eight years. To secure this Copyright, however, notice must be given to two Justices of the peace within five miles of the place where they are to be delivered, two days beforehand. And it does not extend to lectures delivered in unlicensed places, or in public schools and colleges.

International Copyright was first granted by the 1 & 2 Vic. c. 59; but this Act was repealed by the 7 & 8 Vic. c. 12, further amended by the 15 Vic. c. 12. By the first of these Acts, the Queen in Council was permitted to grant to the authors of original foreign works, such term of Copyright in the British dominions as she pleased, not exceeding the term allowed for similar works in this country. By the latter Act, the Queen in Council may grant a Copyright of five years for an authorised translation of foreign works; and also may prohibit for a similar period, the representation of an unauthorised translation of a foreign dramatic piece.

Such is the history and present state of the laws regarding Copyright in this country.

We may mention that the copyright in private letters remains in the writer after transmission; and the receiver of them, and his representatives, have no right to publish them, without the consent of the writer or his representatives.

Copyright in France, as is stated in the *Dictionnaire de l'Economie Politique*, was conferred by the grant of the sovereign, as in England, and sometimes for a limited period. The ancient law was contained in the *Ordonnance de Moulins* of 1566, a declaration of Charles IX. in 1571, and the Letters Patent of Henry III. Usually no limit was fixed to the duration of Copyright, but when a perpetual Copyright was granted, it was always under the condition that it should not be parted with to booksellers. If so, it ceased with the author's life. Several edicts in 1618, 1665, 1682, 1686, and 1723, enacted corporal and pecuniary punishments against pirates.

The revolution of 1789 changed this. Copyright was granted as a right to every one, but its duration was limited. According to existing laws,

the Copyright is vested in an author and his wife during their respective lives, and to their children for twenty years afterwards. If they have none, their heirs have it for ten years. In dramatic pieces, the widow has the same as the children, twenty years.

According to the same authority, the Copyrights in different countries are as follows.

Before the union of Holland and Belgium, Copyright was perpetual in Holland. In 1817, the French law was adopted in the United country, and is now continued in each separately.

In the Zollverein, the Prussian law has been adopted, which gives Copyright to the author during his life, and to his heirs for thirty years after.

This law was adopted in Austria in 1846.

In Russia it belongs to the author for life, and to his heirs for twenty-five years. But if they have published a new edition within five years of the expiry of this term, it is prolonged for ten years.

In Sardinia it lasted only for fifteen years. In 1846, a convention was agreed to with France, by which the benefits of French law were extended to the subjects of both nations. We believe that a new convention has been recently concluded between these two countries regarding literary property.

In Portugal, the law is the same as that of Germany.

In Spain, according to the present law, authors have the Copyright for their lives, and their heirs for fifty years after.

Prussia was the first country which set the example of granting international copyright. In 1837, a law was passed that every country might secure Copyright for its authors in Prussia upon granting reciprocity. This was followed by England in 1838. In consequence of these, several international treaties of Copyright have been negotiated. France, however, has set the example, under the Emperor Napoleon III., by a law of the 28th March, 1852, of forbidding the piracy of books and works of art published abroad, without requiring reciprocity. It is said, too, that steps are about to be taken to make copyright perpetual.

COQ. PAUL, born at Bordeaux, chief editor of *La Semaine*, a weekly review.

Le Sol et la Haute Banque, ou les intérêts de la classe moyenne. Paris, 1850.

COQUELIN, CHARLES, born at Dunkirk, the 27th November, 1805. Became a distinguished writer on Political Economy, both in the *Revue des deux Mondes*, and the *Journal des Economistes*, in which he published a great number of articles on banking, credit, circulation, railways, canals, corn laws, money, &c., &c. He was one of the members of the council of the Free Trade Association, and one of the editors in chief of the excellent French *Dictionnaire de l'Economie Politique*, published by Guillaumin in 1854. M. Coquelin died recently. He has also published as separate works:—

Du Crédit et des Banques. Paris, 1848.

Traité de la filature de lin. Paris, 1845.

COQUEREAU, JEAN BAPTISTE LOUIS. Advocate.

Mémoire concernant l'administration des finances sous le ministère de l'Abbé Terray. London, 1776.

CORBAUX, FRANÇOIS.

Dictionnaire des arbitrages simples, considérés par rapport à la France dans les changes entre les villes commerçantes. Paris, 1802.

The doctrine of compound interest illustrated, and applied to perpetual annuities. London, 1825.

A further inquiry into the present form of our national debt, and into the means and prospect of its redemption. London, 1824.

On the natural and mathematical laws concerning population, vitality and mortality. London, 1833.

CORBET, THOMAS.

An Inquiry into the causes and modes of the Wealth of Individuals, and the principles of Trade and Speculation explained. London, 1841.

CORDIER, A. and FOUCHÉ, VICTOR.

Plus d'impôts! Plus de droits réunis! Organisation du Crédit par l'état. Marseilles, 1848.

CORDIER, JOSEPH, Divisional Inspector of Roads and Bridges, born at Orgelet, in the Jura, in 1784. A voluminous writer. Among his works, those relating to Economic subjects, are—

Mémoire sur l'agriculture de la Flandre française, et sur l'économie rurale. Paris, 1823.

Considérations générales sur la législation des travaux publics. Paris, 1829.

De la nécessité d'encourager les associations et de les appeler à l'exécution des travaux publics. Paris, 1830.

Considérations sur les chemins de fer. Paris, 1830.

Mémoire sur les travaux publics. Paris, 1841.

La France et l'Angleterre, ou recherches sur les causes de prospérité et les chances de décadence des deux nations, et propositions de réforme. Paris, 1843.

CORMENIN, LOUIS MARIE DE LA

HAYE, Viscomte de, born at Paris 6th January, 1788. Joined the Bar in 1808; *Auditeur* to the Council of State in 1810; Master of Requests in 1814; a Deputy in 1828, and Member of the Constituent Assembly in 1848.

Entretiens de Village. Paris, 1846.

Questions des subsistances. Paris, 1849.

CORNIANI, GIOVANNI BATTISTA, born in 1742, at Orzi Nuovi, in the Bresciano, filled an office in the magistracy of that town with credit. He wrote several works, which were much esteemed, among others, *Secoli della letteratura Italiana*. Unfortunately for his reputation, he dabbled in Political Economy, and wrote two small treatises on agriculture and money, in which he adopted the opinions of the Physiocrats, and maintained that it might sometimes be advantageous to tamper with the currency. He died in 1813. Custodi has included his tracts in his collection, though it is difficult to see why, except from regard to the author.

Della legislazione relativamente all'agricoltura. Brescia, 1777.

COST OF PRODUCTION. Any one who was acquainted with the methods of investigation pursued in Physical Science, since the days of Galileo, would know that there could only be one grand general theory at the basis of every science, which must account for all the phenomena. In different physical sciences, there have been severe controversies as to which was the true theory, but no one ever supposed that there could be more than one. The partisans of each theory were perfectly aware that it was conquest or death for it, and they never dreamt of coming to a compromise, and agreeing that one class of phenomena should be explained by means of one theory, another class by means of another theory, a third, fourth, fifth, and sixth class, by a third, fourth, fifth, and sixth theory.

This, however, is the method of investigation followed by a number of eminent Economists. To a certain extent it appears in Adam Smith, but it is Ricardo chiefly who adopts this plan, and he has a number of influential followers, the least we can say of whom is that they ought to know better.

Ricardo divides commodities into several classes, and he endeavours to discover a law of value for each. We shall not enter into all of these here, because that is fully done under RICARDO and PRICES, THEORY OF, but we shall only notice three of these classes. He says that there is one class of commodities, whose quantity cannot be increased by labour, such as rare statues, and pictures, books, and coins, and some other things, whose value is governed by the law of supply and demand. Another class of those which may be multiplied to any extent that may be desired, and on the production of which, competition operates without restraint. He says, that *Cost of Production* regulates the value of this class of commodities. There is a third class of commodities, which are produced by varying costs of production, such as corn, metals, coals, &c. In this class, he says the cost of producing the quantity raised at the greatest expense, regulates the value of the whole.

To this method of investigation, Mr. J. S. Mill adheres. He says (B. III. c. ii. s. 4), "This, then,

is the Law of Value (i. e. *Supply and Demand*) with respect to all commodities not susceptible of being multiplied at pleasure. Such commodities, no doubt, are exceptions. There is *another* law for that much larger class of things, which admit of definite (? indefinite) multiplication." And at p. 550, he says, he will—"examine the case of commodities which can be increased in quantity indefinitely and at pleasure, and determine by what law, *other than that of Demand and Supply*, the permanent or average values of such commodities are regulated." And at p. 575, "the value of an article (meaning its natural, which is the same thing with its average value) is determined by the cost of that portion of the supply which is produced and brought to market at the greatest expense. This is the Law of Value of the third of the three classes into which all commodities are divided."

To this we can only say that such a method of proceeding would horrify any Physicist.

Before, however, shewing the erroneousness of these doctrines, we must first inquire what *Cost of Production* is.

Smith (B. I. c. vi., *Of the Component Parts of the Price of Commodities*) says, that the price of all commodities is composed of three parts, Wages, Profit, and Rent.—"Wages, Profit, and Rent are the three original sources of all revenue, as well as of all exchangeable value." Again,—*"In a civilised country there are but few commodities of which the exchangeable value arises from labour only, rent and profit contributing largely to that of the far greater part of them."*

And in the next chapter, *Of the Natural and Market Price of Commodities*, he says, that in every neighbourhood there is an ordinary or average rate of wages, profit, and rent.—*"When the price of any commodity is neither more nor less than what is sufficient to pay the rent of the land, the wages of the labour, and the profits of the stock employed in raising, preparing, and bringing it to market, according to their natural rates, the commodity is then sold for what may be called its natural rate. The commodity is then sold precisely for what it is worth, or for what it really costs the person who brings it to market."*

He then says that though profit is not in common language included in prime cost, yet if he does not sell it at ordinary profits, he is a loser by his trade, and, therefore, unless he receives it, he will not continue to produce it.

In the passages above cited, Smith makes rent a part, or a cause of price, and a component part of Cost of Production. The practical meaning of which is, that if rents rise prices must rise too, and that if rents fall, or were abolished, prices would fall by the amount.

But in chapter xi. *Of the Rent of Land*, he asserts exactly the contrary:—"Rent, it is to be observed, enters into the composition of the price of commodities in a different way from wages and profit. *High or low wages and profit are the causes of high or low price; high or low rent is the effect of it.* It is because high or low wages and profit must be paid in order to bring a particular commodity to market, that its price is high or low. But it is because its price is high or low, a great deal more, or a very little more, or no more, than what is sufficient to pay those wages

and profit, that it affords a high rent, or a low rent, or no rent at all."

Now, this is a point of no slight practical importance. Many have supposed that, because landlords receive high rents for their lands, that increases the price of bread, and that if rents were abolished, bread would be so much the cheaper. Subsequent writers, however, and especially Ricardo, have shown that this is a complete error; that rent comes out of price, and that no reduction would take place in the price of corn, although landlords should forego the whole of their rent. Such a measure would only enable some farmers to live like gentlemen, but would not make corn one fraction the cheaper. All economists are, therefore, now agreed that the payment of rent in no way whatever influences the price of agricultural produce. This doctrine may do good service in a political point of view, as showing that the odium which some ill-informed people entertain against landlords is unfounded. With respect, however, to commodities in shops, the case is different, as we have fully shown under *RENT*.

Ricardo, who probably invented the expression *Cost of Production*, meant by it the quantity of labour which has been bestowed on the production of a commodity. Now, as Ricardo and Smith themselves admit, quantities of different kinds of labour cannot be compared together. The only way of comparing them is according to their remuneration, or wages. Wages are, therefore, unquestionably, part of Cost of Production. But the question is whether profits ought to be held to be part of it. Smith, we have seen above, says that Profits ought to be included in Natural Price, which is equivalent to Cost of Production, because, if no profits were made, production would cease. Ricardo, in his 3rd edition, admits that Profits are to be included under that term. James Mill, who resolved all value into labour, makes profits to be included under labour.

Colonel Torrens refuses to consider profit as forming one of the elements of Cost of Production. He says—"Those writers who contend for the general equality of market and natural price, include the customary rate of profit under the term natural price, or cost of production. But this classification is highly unphilosophical and incorrect. The profits of stock never make any part of the expense of production; they are, on the contrary, a new creation, brought into existence in consequence of this expense. The farmer, we will suppose, expends 100 quarters of corn in cultivating his fields, and obtains in return 120 quarters. In this case 20 quarters, being the excess of produce above expenditure, constitute the farmer's profit; but it would be absurd to call this excess, or profit, a part of the expenditure. The expenditure, or cost of production, was 100 quarters. It has now been repaid with a surplus of 20 quarters; and unless the surplus which remains after the expenditure is replaced by a part of the expenditure, unless, in fact, 120 quarters be equal to 100, it is impossible that market price should be equivalent to natural. Supposing that corn is £3 per quarter, then in the case we have stated, the natural price of the farmer's produce, or the 100 quarters expended on production, will be equivalent to £300; while the produce of 120 quarters obtained in return will be equivalent to

£360. The excess of market above natural price, or cost of production, is profit; and to contend that this profit is included in the cost of production, is the same thing as contending that the 100 quarters, or £300 laid out on cultivation, are equal to the 120 quarters, or £360 thereby obtained.

"In manufacturing, as well as in agricultural industry, the profit of stock is distinct from the cost of production. The master manufacturer expends a certain quantity of raw material, of tools and implements of trade, and of subsistence for laborers, and obtains in return a given quantity of finished work. This finished work must possess a higher exchangeable value than the materials, tools, and subsistence, by the advance of which it was obtained; otherwise the master could have no inducement to continue his business. Manufacturing industry would cease if the value produced did not exceed the value expended. But it is the excess of value which the finished work possesses above the value of the materials, implements, and subsistence expended, that constitute the master's profit; and therefore we cannot assert that the profit of his stock is included in the cost of production, without affirming the gross absurdity that the excess of value above expenditure constitutes a part of expenditure. Supposing that the materials, tools, and subsistence cost £300, and that the finished work is worth £360, then the difference will be the master's profit; and we cannot maintain that the annual profit is included in the amount of expenditure, or cost of production, without urging the contradiction that £300 are equal to £360.

"The profit of stock, so far from forming any part of the cost of production, is a surplus remaining after this cost has been completely replaced. In carrying on their business, the farmer and manufacturer do not expend their profit, they create it. It forms no part of their first advances; on the contrary, it forms a part of their subsequent returns. It could not have been employed in carrying on the work of production, because, until this work was completed, it had no existence. It is essentially a surplus, a new creation, over and above all that is necessary to replace the cost of production, or, in other words, the capital advanced." Mr. Senior says, that Col. Torrens is just in his criticism on this expression, and allows that profit is not a means but a result. But he says that Col. Torrens has erred by omitting to substitute abstinence, or some equivalent expression, for profit. He then says that *Cost of Production* means the sum of labour, and abstinence necessary for production. But as he defines wages to be the reward of labour, and profit the reward of abstinence, he in fact makes *Cost of Production* to consist of Wages and Profits; though he says that Col. Torrens is right in refusing to make profits an element in the expression.

Mr. J. S. Mill makes quantity of labour and profits to be the natural and necessary elements of *Cost of Production*.

There is an element, too, which he rightly says is a casual one, namely taxes. All taxes laid on the article itself, such as customs and excise, are manifestly part of the expense of Production.

And here we see how Ricardo, and many other economists, are inconsistent with themselves. They

justly say, that Rent has no influence on the price of agricultural produce. But it is quite manifest that Tithes are exactly of the same nature as Rent, and that the influence of Rent and Tithes must be exactly the same. Nevertheless, while these writers see justly enough, that Rent is a mere share of the profits, and cannot influence price, they consider Tithes to be a tax on the produce, and therefore that they raise its price to the consumer. But this is manifestly an error. Rent and Tithes are both a *share* of the produce and not a *tax* upon the produce. They must therefore both be excluded from *Cost of Production*—(RENT; TITHES).

Now with respect to the question whether Profits should be included in the term *Cost of Production*, it appears to us that Col. Torrens has the better shew of reason. Adam Smith himself clearly allows that profits are no part of prime cost. Production is the placing any quantity in a required place, and no doubt, unless there were profits anticipated, production would cease. But profits, as it appears to us, are the inducement to produce, but not part of the cost of producing. It seems better to restrict the expression, *cost of production*, strictly to what mercantile men call prime cost. The profits are the difference between prime cost and market price.

Some Economists, too, are anxious to discriminate between the quantity of labour and the wages of labour. They say that the wages of labour have no influence on price, but only the quantity of labour. We cannot agree in this. Quantities of different kinds of labour cannot be compared together. The only way an employer can appreciate quantities of labour, is by means of the sum he pays for it, or by wages. The only way he can know whether he has made a profit, is by seeing whether he has received more money for the finished article than he expended on producing it.

These considerations, however, in no way affect the questions we are now going to discuss, because whichever way we look at it—and there are, we admit, very plausible reasons for looking at it either way—it is fully admitted that unless profits are made, production must cease. Consequently the profits may be regarded as a constant quantity which do not affect variations of value.

The question now to be discussed is this. Ricardo divided exchangeable quantities into several distinct classes, and for each class he lays down a separate and distinct law of value. And in this he has been followed by many writers since, and particularly by Mr. Mill. Now this is what would never be permitted in any other physical science whatever, and we have now to investigate whether it is a correct mode of reasoning in Political Economy.

Ricardo says, chap. xxx.—"It is the cost of production which must ultimately regulate the price of commodities, and not, as has often been said, the proportion between the supply and demand; the proportion between supply and demand may, indeed, for a time, affect the market value of a commodity, until it is supplied in greater or less abundance, according as the demand may have increased or diminished, but this effect will be only of temporary duration. * * *

"The opinion that the price of commodities depends solely on the proportion of supply to demand, or demand to supply, has become almost

an axiom in political economy, and has been the source of much error in that science."

He then quotes the doctrine of Say that supply and demand regulate prices at all times, but that cost of production is a limit below which they cannot remain for any length of time, because production would then be either entirely stopped or diminished. And Lord Lauderdale's doctrine, (which we have stated under CONTINUITY, LAW OF; PRICES, THEORY OF) and he says—"This is true of monopolized commodities, and, indeed, of the market price of all other commodities for a limited period. If the demand for hats should be doubled, the price would immediately rise, but the rise would only be temporary; unless the cost of production of hats, or their natural price, were raised. If the natural price of bread should fall 50 per cent. from some great discovery in the science of agriculture, the demand would not greatly increase, for no man would desire more than would satisfy his wants, and as the demand would not increase, neither would the supply; for a commodity is not supplied merely because it can be produced, but because there is a demand for it. Here, then, we have a case where the supply and demand have scarcely varied, or if they have increased, they have increased in the same proportion; and yet the price of bread will have fallen 50 per cent., at a time, too, when the value of money had continued invariable.

"Commodities which are monopolized, either by an individual, or by a company, vary according to the law which Lord Lauderdale has laid down; they fall in proportion as sellers augment their quantity, and rise in proportion to the eagerness of the buyers to purchase them, their price has no necessary connection with their natural value; but the prices of commodities which are subject to competition, and whose quantity may be increased in any moderate degree, will ultimately depend, not on the state of demand and supply, but in the increased or diminished cost of their production."

Mr. J. S. Mill agrees in this doctrine. We have shewn above that he says that there is a law different from supply and demand, which regulates the permanent or average values of the class of commodities we are considering. And in agreement with Ricardo he says,—"It is, therefore, strictly correct to say, that the value of things which can be increased in quantity at pleasure, does not depend (except accidentally, and during the time necessary for production to adjust itself) upon demand and supply; on the contrary, demand and supply depend upon it."—"To recapitulate, demand and supply govern the value of all things which cannot be indefinitely increased; except that, even for them, when produced by industry, there is a minimum value determined by cost of production. But in all things which admit of indefinite multiplication, demand and supply only determine the perturbations of value, during a period which cannot exceed the length of time necessary for altering the supply."

Our readers will observe Mr. Mill's reasoning. He says that the value at *any* particular time is the result of supply and demand; the plain meaning of which is, that the value at *all* times is the result of supply and demand. And then he goes to search for a law other than demand

and supply, which regulates their permanent value! That is to say, their permanent value is regulated by a different law from that which regulates it at all times!

Malthus, who was a good mathematician, naturally felt that Ricardo's method of reasoning was inadmissible. He says (*Principles of Political Economy*, p. 71.)—"It has been shown that no change can take place in the market prices of commodities, without some previous change in the relation of the demand to the supply; and the question is, whether the same position is true in reference to natural prices? This question must of course be determined by attending carefully to the nature of the change which an alteration in the cost of production occasions in the state of the demand and the supply, and particularly to the specific and immediate cause by which the change of price which takes place is effected.

"We all allow, that when the cost of production diminishes, a fall of price is almost universally the consequence; but what is it specifically, which forces down the price of the commodity? It has been shown in the preceding section, that it is an actual or contingent excess of supply.

"We all allow that when the Cost of Production increases, the prices of commodities rise. But what is it specifically, which forces up the price? It has been shown that it is an actual or contingent failure of supply. Remove these actual or contingent variations of the supply; that is, let the extent of the supply remain exactly the same, without excess or failure, whether the cost of production rises or falls; and there is *not the slightest ground for supposing that any variation of price would take place.*

"If, for instance, all the commodities which are produced in this country, whether agricultural or manufactured, could be produced during the next ten years without labour, but could only be supplied exactly in the same quantities as they would be in the actual state of things; then, supposing the wills and means of the purchasers to remain the same, there cannot be a doubt that all prices would also remain the same. But if this be allowed, it follows that the relation of the supply to the demand is the dominant principle in determination of prices, whether market or natural, and that the cost of production can do nothing but in subordination to it, that is, merely as it affects the ordinary relation which the supply bears to the demand.

"It is, however, not necessary to resort to imaginary cases, in order to fortify this conclusion. Actual experience shews the principle in the clearest light.

"In the well known instances noticed by Adam Smith, of the insufficient pay of curates, notwithstanding all the efforts of the legislature to raise it, a striking proof is afforded that the permanent price of an article is determined by the demand and supply, and not by the cost of production. The real cost of the education, would, in this case, be more likely to be increased than diminished by the subscription of benefactors; but a large part of it being paid by benefactors, and not by the individuals themselves, it does not regulate and limit the supply; and this supply, on account of such encouragement, becoming and continuing

abundant, the price is naturally low, whatever may be the real cost of the education given.

"The effects of the poor-rates in lowering the wages of independent labor, present another practical instance of the same kind. It is not probable that public money should be more economically managed than the income of individuals; consequently the cost of rearing a family cannot be supposed to be diminished by parish assistance; but a part of the expenses being borne by the public, and applied more largely to laborers with families than to single men, a fair and independent price of labor, adequate to the maintenance of a certain family, is no longer a necessary condition of a sufficient supply. As by means of parish rates so applied, this supply can be obtained without such wages, the real costs of supplying labor no longer regulate the ordinary wages of independent labor.

"In fact, in every kind of bounty upon production, the same effects must necessarily take place; and just in proportion that such bounties tend to lower prices, they show that prices depend upon the supply compared with the demand, and not upon the costs of production."

Having now presented to our readers the opinions of these various writers, we shall endeavour to discover some principles which may decide the controversy, which is at the basis of the whole theory of Economical Dynamics.

The doctrine, then, whose soundness we are going to investigate is this, that there are two classes of cases of value, in the first of which *Cost of Production regulates Value*, in the other the *Cost of Producing the last quantity raised regulates the Value of the whole*.

Now, before we investigate the truth of these laws, we shall lay down certain fundamental principles, drawn from the whole analogy of Physical Science:—

I. *There cannot be more than one grand general Theory of Value.*

II. *That if two, or more, Theories of Value will apparently account for any class of phenomena of value, or changes of value, that Theory only is to be held as the true one, which accounts for ALL the phenomena in the Science, and not that single class of phenomena only.*

Hence it is quite clear that, if in any particular class of phenomena, we have several theories which will apparently account for them, we have, in order to discover which is the true law, only to suppose a change in the relation of the quantities, and then that theory only which holds good for the altered relation of the quantities, and accounts for the change, is the true Law, and all others must be rejected.

This is in exact conformity with the 3rd Aphorism of the *Novum Organum*, Book I.—"Quod in contemplatione instar causæ est, id in operatione instar regulæ est."—"That which in Theory is the Cause, in Practice is the Rule."

The result derived from these principles is this, that the Law according to which changes of value take place, is the Law of Value at all particular times.

Now, as soon as these indubitable principles are laid down, the day is lost for Ricardo and his followers; because Ricardo himself admits that the law of *Supply and Demand* governs the market price of all commodities for a limited

period. And Mr. Mill says that the Law of *Supply and Demand* only governs *perturbations* of value.

Now this concedes the whole question. Because the law which governs the perturbations or changes of Value, can be the only true law of Value in all particular cases.

And here we must notice an ambiguity which will be found to pervade many books on Political Economy. That is the confusion between "*Quantity of Labor*" and "*Value of Labor*," which are very different things, but which are often included under the term "*Cost of Production*."

De Quincey who, in the *Templar's Dialogues*, has undertaken to expound the Ricardian Economics, has justly pointed out the distinction between the "*Quantity of Labor*" and the "*Value of Labor*." He says that Smith has constantly used the two expressions as interchangeable and equivalent. And he claims it as the great law of value first explained by Ricardo, and as the corner stone of all tenable Political Economy, that the ground of the value of all things lies in the *quantity of labor* which produces them. He says—

"Mr. Ricardo's doctrine is, that A and B are to each other in value, as the *quantity* of labor which produces A to the *quantity* which produces B; or to express it in the very shortest formula by substituting the term *base*, as synonymous with producing labour, *all things are to each other in value as their bases are in quantity*. This is the Ricardian law." He then says that this doctrine is quite contradictory to the doctrine that commodities exchange in proportion to the value of their producing labor.—"I mean to affirm that the one law is the direct, formal, and diametrical negation of the other: I assert in the most peremptory manner, that he who says, 'The value of A is to the value of B, as the quantity of labour producing A, is to the quantity of labour producing B,' does of necessity, deny by implication, that the relations of value between A and B are governed by the *value* of the labor which severally produces them." De Quincey then praises Ricardo for his "inexorable consistency."

The distinction is both true and important, but how utterly De Quincey has misunderstood and misrepresented Ricardo, we have fully shewn under DE QUINCEY, where we have exhibited side by side De Quincey's assertion of what Ricardo's doctrine is, and copious extracts from Ricardo himself, shewing what an untrustworthy guide he is.

We have shewn there how utterly untrue it is that Ricardo says that the *value* of labour has no influence on price. But it will be found that Ricardo has constantly confounded the *quantity* of labour, with the *value* of labour, and, sometimes, he makes the value of things to depend upon one, and sometimes upon the other.

The thesis of the first three sections of his first chapter is to prove that the *value* of commodities depends exclusively on the *quantity* of labour necessary for their production, and in no way whatever upon the compensation paid for, or the *value* of labour. But in § iv., he expressly says that the *value* of labour does influence the price of commodities, and at p. 46, (3rd edition,) he says—"It is necessary for me also to remark that I have not said, because one commodity has so much labour bestowed upon it as will cost

£1000, and another so much as will cost £2000, that therefore one would be of the value of £1000, and the other of the value of £2000, but I have said that their value will be to each other as two to one, and that in these proportions they will be exchanged." Now, in this passage, Ricardo clearly asserts that commodities will exchange in proportion to the *value* of their producing labour. What becomes, then, of De Quincey's peremptory assertions, and Ricardo's "inexorable consistency?" Besides this, at p. 461, he expressly calls the natural price of things their money cost of production.

Mr. Mill has seen (*Vol. I, p. 558*), that, in fact, the term Cost of Production cannot be restricted to either labour, or wages, absolutely. It may be labour in some cases, but in others it is money, or the value of labour. "What the production of a thing costs to its producer, or its series of producers, is the labour expended in producing it. If we consider as the producer the capitalist who makes the advances, the word labour may be replaced by the word wages. What the produce costs to him, is the wages which he has had to pay." Thus we see at once that, *quantity of labour* is replaced by the *value of labour*, and the whole of De Quincey's argument falls to the ground.

Now this distinction between *quantity of labour* and money cost of production is of no slight importance, because there are large quantities of valuable property upon which no labour at all has been bestowed, and yet have cost money. Thus flocks, herds, cattle, fowls of all sorts. It is absurd to speak of their growth as labour, as some economists do. So the fermentation of beer or wine in a cellar. Some of our readers may be surprised to learn that some economists are so determined to resolve value into labour, and into labour only, that when they are asked to what the value of a tree, or an animal, or wine improved by fermentation, is due, they maintain it to be labour!

But take it as we may, either quantity of labour or money cost of production, we shall shew that the doctrine that cost of production regulates value is entirely false; because, if this doctrine be true, it must necessarily mean:—

1st. That all things which are produced by an equal quantity of labour, or an equal money cost, must be equal in value, independently of any other consideration.

2ndly. It must also mean, that all changes in value must be due to changes in cost of production, and to nothing else.

3rdly, And if different things produced by equal quantities of labour must be equal in value, still more rigorously, if possible, must it follow that all parts of the same thing when once produced, must be equal in value.

We shall now give examples of each of these cases, to shew that the rule is utterly untrue.

As an example of the first case let us take this. Nothing is more common in coal mines than for two seams of coal to be of totally different qualities, and adapted for different purposes. Now let us suppose that in any coal mine, there is a seam of excellent coal of the finest quality, and next to it, there is a seam of coal of very inferior quality. Any equal quantities of these different seams may be supposed to be raised and conveyed

to market by exactly the same quantity of labour, or at exactly the same money cost. Would they sell at the same price? Common sense says that they would not.

Again, let us suppose an orchard, or garden. The trees are, of course, cultivated with a certain amount of labor, or expense; consequently, each individual piece of fruit must be the result of exactly the same quantity of labour, or cost. Yet everyone knows that out of the very same orchard and off the very same tree, fruit of very different qualities will be gathered. Will these different qualities of fruit, fetch the same price in the market? Common sense says they would not.

Next let us take the third case, for the sake of convenience. If cost of production regulates value, it is quite clear that every part of the same thing ought to bear the same price. The slightest reflection, however, will shew that this is utterly false. Take any animal used for food, for example. Do equal quantities of all parts of the same sheep, or the same ox, bear the same price in the market? Common sense says they do not.

Would equal quantities of the fruit of a tree and of the wood of a tree sell for the same price in the market? Common sense says they would not.

Mr. Mill has also seen that this doctrine is quite inapplicable in such cases. After supporting Ricardo's doctrine in cases of indefinite production, he says—"It is now, however, necessary to take notice of certain cases to which from their peculiar nature this law of exchange value is inapplicable. It sometimes happens that two different commodities have what may be termed a joint cost of production. They are both products of the same operation, or set of operations; and the outlay is incurred for the sake of both together, not part for one, and part for the other. The same outlay would have to be incurred for either of the two, if the other were not wanted or used at all. There are not a few instances of commodities thus associated in their production. For example, coke and coal-gas are both produced from the same material, and by the same operation. In a more partial sense, mutton and wool are an example; beef, hides, and tallow; calves and dairy produce; chickens and eggs. *Cost of production can have nothing to do with deciding the value of the associated commodities relatively to each other.* It only decides their joint value. The gas and the coke together have to repay the expenses of their production, with the ordinary profit. To do this, a given quantity of gas, together with the coke, which is the residuum of its manufacture, must exchange for other things in the ratio of their joint cost of production. But how much of the remuneration of the producer shall be derived from the coke, and how much from the gas, remains to be decided. Cost of production does not determine their prices, but the sum of their prices. A principle is wanting to apportion the expenses of production between the two.

"Since cost of production here fails us, we must revert to a law of value anterior to cost of production, and more fundamental, the law of demand and supply." Mr. Mill then goes on to explain the operation of this law to these cases, and then says—"This theorem is not in itself of any great importance: but the illustration it affords of the

law of demand, and of the mode in which, when cost of production fails to be applicable, that other principle steps in to supply the vacancy, is worthy of particular attention."

Here is well exemplified the utterly unscientific character of which we complain in the school of Political Economy to which Mr. Mill belongs. Mr. Mill himself allows that the investigations in Political Economy are to be conducted in a similar spirit to those of Physical Science. Does he, then, we ask, conduct his investigations in a way that would be permitted in any physical science whatever? As soon as any Physicist saw that any cases whatever could by no possibility be accounted for by a law supposed to be general, he would at once abandon such a law.

We have next to shew that no change in cost of production will influence value, unless accompanied by a change in supply and demand.

Ricardo and Mr. Mill in fact admit this, because they say that perturbations of value are governed by supply and demand, which in fact concedes the question. Ricardo, in the passage from ch. xxx. already quoted, says, "That if the demand for hats should be doubled, the price would immediately rise; but that rise would only be temporary, unless the cost of production of hats, or their natural price, were raised." But if the hats rose from the increased demand, why should they fall again, without the supply being increased? If they are to fall again, why should they have risen? If cost of production, supply, and demand, remain exactly the same after they have risen, how can any change in their value take place? Ricardo has omitted to state, what he meant, no doubt, that upon the rise of prices from the increased demand, a larger supply would be produced, which would again reduce hats to their former value. But the omission of this is the whole essence of the question. Because it was the increased demand which raised them, and it would only be the increased supply which would lower them. Thus shewing that it is entirely through the operation of demand and supply that all changes in value take place.

In order to illustrate this, let us take an example of any manufactured article, such as stockings. Let us suppose that at any given time, they bear a certain price in the market, no matter what, and that there is a certain demand for them at that price.

Let us suppose that at a certain time before the introduction of machinery, a manufacturer employed 1,000 hands. Suppose, then, that he invents a piece of machinery, by which he can produce the same quantity of stockings, but at the expense which only 50 men would be. Now, if he only produces the same quantity as before, as he will of course take the best price he can get for them, the demand remaining the same, it is quite evident that no alteration in price will ensue, and all the profit accruing from this diminution in cost of production will go into the pocket of the producer. Consequently, if he does not manufacture any additional quantity, no alteration in the market price will follow; everything will go on as before. The only difference will be, that that particular manufacturer will make enormous profits, owing to his sagacity and skill in inventing this machinery.

But if the materials for making the stockings

can be supplied in unlimited quantities, the manufacturer will naturally wish to increase the quantity he produces, and realize greater profits. But if he produce a greater quantity than before, that increased quantity will not be sold unless at a diminished price, so as to increase the circle of buyers. But as the cost of production to him has been reduced, he can afford to sell at a diminished price, and the more he wishes to sell, the more must the price be reduced.

Now it is quite evident that the increased quantity thrown on the market by this single manufacturer, and offered at a diminished price, must affect the prices of the whole quantity in the market, because every one else must consent to sell at the same price to effect a sale at all. Thus every single manufacturer must accommodate his prices to the market price, and if he cannot produce at the market price, he will have to cease producing. As we may suppose that there are various degrees of skilfulness and economy among the various manufacturers, it is quite evident that at every successive diminution of the market price, those in succession will have to cease working, who are least able to produce cheaply. Hence it is quite clear that it is the market price which regulates the quantity of expense that can be afforded in producing, and that it is the quantity that can be produced at the least expense compared to the whole quantity that can be sold, that regulates the market price.

These examples are quite sufficient to show that the Law that Cost of Production regulates Value in cases of freely-produced commodities, wholly fails.

We have now to examine the other case where Cost of Production is said to regulate value, namely, where commodities are produced by means of a series of varying Costs of Production. These commodities are corn, coals, metals, &c.

Ricardo asserts that it is the cost of producing the last quantity raised under the most unfavourable circumstances that regulates the value of the whole produce.

We affirm, on the contrary, that supply and demand is the sole regulator of market price, and that the market price indicates the greatest Cost of Production that can be afforded, or the most unfavourable circumstances under which production can take place.

The Ricardian Theory of Rent is fully exhibited under RENT, and granting that production will cease when it ceases to be remunerative, the only question is to decide whether it is Cost of Production that regulates market price, or market price which indicates the limits of Cost of Production. Ricardo says, page 60:—"When land of an inferior quality is taken into cultivation, the exchangeable value of raw produce will rise, because more labour is required to produce it." We think that the subjects connected in this paragraph should have been arranged thus:—"When the exchangeable value of raw produce rises, land of an inferior quality will be taken into cultivation because more labour may be profitably employed in producing it."

During the great revolutionary war a succession of bad harvests, joined to other causes, produced an enormous rise in the price of corn, so that in 1812 wheat reached the price of 130s. a quarter. Owing to this extraordinary rise of price an im-

mense quantity of inferior land was taken into cultivation at an extravagant cost, because the farmers expected that high prices would be permanent. Now, supposing that the old lands in cultivation produced no more than they did during the years of scarcity, what would be the necessary consequence of this additional quantity thrown on the market? As the quantity of land taken into cultivation could only be increased gradually, the first quantity added to the existing supply would not have added much to it. The proportion between the increment and the existing supply would not have been great, consequently it would only lower the prices a little, and would leave a large profit to the producer. But the more land that was brought into cultivation the more would the quantity of corn brought to market be, and the more would the prices be lowered. And this might go on until the constantly increasing quantities of corn lowered the price so much, that it would only just leave a profit, and further production would cease. Any further quantity poured on the market could only depress the market price below the cost of production, and ruin the producers. Assuming, therefore, that market price and cost of production meet, the only question is, which governs the other.

It is perfectly clear that at all times the market price is solely governed by demand and supply. If there is not an adequate supply, the market price would remain permanently above the Cost of Production; if the market continued to be over supplied, the price would remain constantly below the Cost of Production. Let the Cost of Production be what it will, no change in market price will take place except through an alteration of the supply or the demand. Hence it is perfectly clear that it is always the market price which indicates the greatest expense that can be afforded as Cost of Production.

Exactly the same principle holds good with regard to mines. The Cost of Production of all minerals may vary in a series of regular gradations, and at any particular time it is the market price which indicates the most unfavourable circumstances under which production will take place. Mr. Mill says (*Vol. ii., p. 10, 23*) that money is a commodity, and its value is determined like that of other commodities, temporarily by demand and supply, permanently, and on the average, by Cost of Production. But who can tell what the Cost of Production of the money which is in circulation has been? No one can tell where the gold of which the money of the world is made came from. Coinages are melted and remelted through innumerable series of ages. A French Economist says that during the last century, in the remote districts of France, there were actually coins in circulation of the period of the Roman Empire. There is nothing extravagant in the supposition, nay, there is every probability, that a part of the actual gold of which the existing coins are made may have come down to us from the Egyptians. It has certainly come from a vast variety of quarters, and been produced under all sorts of varying degrees of expense. And who can possibly tell what its Cost of Production has been?

It appears, therefore, that the doctrine that there are different classes of commodities, whose values are governed by fundamentally distinct

laws, is not only utterly repugnant to all physical science, but it is shown to be utterly untrue in itself. The *Law of Continuity* abolishes all these false distinctions. And this is no immaterial dispute about words, it is not mere logomachy, but it is a fundamental difference of principle between two distinct systems of Political Economy. We say that those who hold such views not only completely break that Continuity of Science, which Bacon so earnestly and solemnly preached, but they manifestly invert cause and effect.

It is so extremely important to understand the nature of the fallacy which runs through the whole of this system of Political Economy, that we may give an illustration. It is well known that the cultivation of certain agricultural products, and the climate they can flourish in, are intimately connected. At certain points the cultivation of maize, the vines, olives, the palm, ceases, and the average temperature of the lines where each product ceases to be cultivated, can be easily ascertained by observation. Now, reasoning according to the doctrines we have been discussing, we ought to say that the boundaries of the cultivation of these products *regulated* the climate of the place, when it is manifestly the reverse, it is the climate which indicates the possibility of their being raised with a profit.

Or again, there is a certain kind of letter weight, which indicates the weight of the letter by raising a series of weights in succession; now it is quite clear that it is not the last weight raised which regulates the weight of the letter, but the weight of the letter which regulates which weight will be raised last.

It is perfectly true that in a great many cases the natural effects of competition will cause the price to approach very nearly to Cost of Production, and Ricardo's law will apparently be found to answer. But this is just one of the things which must be most sedulously guarded against in science, viz., to give in a careless adherence to a form of expression, or a theory, which is radically erroneous, because it appears to account for phenomena. It is the very purpose of Inductive Logic to discriminate between rival theories. The history of Physical Science furnishes abundant examples to guide us. We may give one. In the olden times, philosophers thought that the motion of projected bodies had a natural tendency to decay. They always saw that the motion of a projected body gradually diminished, and finally ceased. Now it is quite easy to calculate results on this principle. Given, a certain velocity of projection, it would have been quite easy to calculate when the motion would cease, upon the supposition that it naturally decayed. And the results would have agreed with the calculations. What could be more satisfactory? If, then, it is hastily assumed that because results may agree with calculations, the principles of these calculations are therefore *necessarily* true, these opinions might have maintained their ground. But it is well known that modern philosophers have entirely rejected such a notion, as that motion has a natural tendency to decay. They arrive at the result by a totally distinct principle. They say that motion has no natural tendency to decay, but that in all the cases we see, there are counteracting principles,

such as the resistance of the air, friction, &c., which oppose it, and finally destroy it. And they unanimously reject the former mode of accounting for the results, and adopt the latter. Hence we see that though principles are manifestly erroneous, which do not account for results, yet it does not necessarily follow that any principle, or theory, which does account for them, is therefore necessarily true, because in fact it may so happen that several theories may account for the result, and it requires judgment and consideration to decide which is the true one. Now the theories of value we have been discussing, are just like the old theories of motion. They apparently account for results in a great many cases, and therefore they may impose upon an unwary thinker. But they are dangerous and seducing errors, utterly opposed to the fundamental principles of Natural Philosophy, and to be repudiated and rejected by all those who study Political Economy in the true spirit of Science.

COSTAZ, CLAUDE ANTHELME, who did much service in his day to Economic Science, was born at Champagne, in the department of the Ain. After the 9th Thermidor, he obtained an appointment in the office of the Board of Agriculture, and afterwards that of Commerce, in which he rose to be one of the chiefs. In 1802, he was one of the founders of the Society for the Encouragement of National Industry, and five years afterwards he suggested and obtained the establishment of public lectures in the *Conservatoire des Arts et Métiers*, which was just founded. He was appointed by Government to draw up the introduction to the account of the Exposition of National Industry, which was held the same year. He also originated the *Conseils de Prud'hommes*, which have been of so much service in France. In 1812, he was appointed to draw up a large series of statistical tables, relating to commerce and manufactures, to be laid before the *Corps Législatif*. They exhibited the manufacturing condition of France in 1789, 1800, and 1812. He has published the following works:—

Essai sur l'administration de l'agriculture, du commerce, des manufactures, et des subsistances. Paris, 1818.

Histoire de l'administration en France de l'agriculture, des arts utiles, du commerce, des manufactures, des subsistances, des mines, et des usines. Paris, 1843.

Mémoire sur les moyens qui ont amené le grand développement que l'industrie Française a pris depuis vingt ans. Paris, 1816.

COSTER. Ouvrier menuisier.

Organisation du travail, Ebénisterie française. Paris, 1851.

COTTERILL.

An examination of the doctrines of Value, as set forth by A. Smith, Ricardo, M'Culloch, &c. London, 1814.

COTTERILL, CHARLES FOSTER.

Agricultural Distress, its Cause and Remedy. London, 1850.

The Civil Freedom of Trade; or the rights and duties of governments in their relation to the natural freedom of private enterprise. London, 1856.

Public Granaries and the Cycle of the Seasons in connection with Trade and Agriculture. London, 1856.

COTTON, SIR ROBERT BRUCE, a celebrated antiquary, whose collection of manuscripts forms part of the original foundation of the British Museum, was born at Denton, in Huntingdonshire, 22nd January, 1570. He was educated at Trinity College, Cambridge. He devoted himself ardently to antiquarian study, and collected a vast number of manuscripts, charters, &c., and documents relating to the history of the country, which were chiefly gathered from the libraries of the monasteries broken up by Henry VIII. His collection was of great use to Camden, Selden, and other writers of that species, and Cotton himself was held in the highest esteem by the most eminent men in James I.'s time, as an authority on all points of constitutional law. He was knighted by James I., and wrote several tracts by his order. In 1611, the king was much straitened for money, and afraid to call a parliament, was anxious to devise some method of raising money without one. Cotton suggested the creation of the rank of baronet, which was to be sold. The king was delighted with this plan, and Cotton was one of those who bought a baronetcy. He was afterwards employed both by the king and the House of Commons to write several tracts on various subjects. In 1615 his intimacy with the vile favourite of the king—Carr, Earl of Somerset—caused him to be suspected of being privy to Sir Thomas Overbury's murder. He was kept in confinement for five months. A worse misfortune, with a more tragical ending, happened to him in 1629. He was returned to the first Parliament of Charles I., and was in favour of a redress of grievances, but with all due respect for the king. A tract, in manuscript, was disseminated, bearing the title, "A Project how a Prince may make himself an absolute Tyrant." A great uproar being made about it, it was traced to the Cottonian Library. Sir Robert being quite unconscious of the whole transaction, found on inquiry, that it got into his library under another name, without his knowledge, and also without his knowledge had been taken from it, and the title altered. Although Sir Robert proved his entire innocence of the whole transaction, his library was sequestered in the most arbitrary manner, and he was forbidden access to it. He took this so much to heart that he died of chagrin, 6th May, 1631. His library was much augmented by his son and grandson, and passed into the possession of the public in 1700. After various journeyings, it was deposited in a house in Little Dean's Yard, where, in 1731, it was much damaged by fire, 111 manuscripts of great importance being destroyed, and 99 more injured. In 1757 it was transferred to the British Museum.

An Abstract out of the Records of the Tower, touching the King's Revenue. London, 1642.

Cottoni Posthuma.

A Discourse of Foreign War, with an account of all the taxations upon this kingdom, from the Conquest to the end of the reign of Queen Elizabeth. London, 1690.

CREDIT is the name of a certain species of incorporeal property, called also a **DEBT**.

It is the right to demand a certain sum of money from a certain person at a certain time.

It is therefore the lowest form of an annuity : it is an annuity of one term : it is the right to demand a single payment, an annuity in general is the right to demand a series of payments.

An operation on credit in commerce, is a sale, or an exchange, in which one, or both, of the quantities exchanged is a debt.

The system of credit consists in the creation and sale of debts.

It is divided into two branches,—1st. Commercial Credit, which principally consists in the sale or exchange of commodities for debts ; 2ndly, Banking Credit, which consists in the sale or exchange of money and debts for other debts.

The subject of Credit is the greatest and most abstruse in Political Economy ; what the *Differential Calculus* is in mathematics, what *Steam* is in mechanics, that is *Credit* in commerce.

2. Considering the mighty part which Credit plays in modern commerce, and the effects it has had for weal or for woe upon nations, we should naturally have expected that Economists had thoroughly worked out the subject, and were unanimously agreed upon its nature and effects.

So far is this from being the case, that on no subject whatever, if possible, are they more utterly at variance with each other, and what is more surprising still, are they more utterly at variance with themselves.

3. It was out of the discussions on the nature of credit that modern Political Economy took its rise. The terrible catastrophe of the Mississippi scheme in France, which was an attempt to realise "Law's Theory of Money," which was, in fact, the prevailing one of the age, and still has innumerable admirers, set Turgot, then a very young man, speculating upon the nature of money and credit, and gave rise to his subsequent treatises. Turgot did immortal service to Political Economy, and may indeed be said to have laid its corner stone, by explaining the true nature of money, but he entirely failed with that of credit.

In fact, from that day to this, the subject of credit has been an utter perplexity to Economists. To show the absolute necessity for a thorough investigation of the subject, we have only to set before our readers the astounding self-contradictions of Economists of the greatest name on the subject.

4. In the following treatise we shall consider the subject in the following order :—

I. *The Fundamental Conceptions upon which the Theory of Credit rests.*

II. *The Nature of Credit ; and the Elements of the Theory of Credit.*

III. *The Mechanism of the System of Credit.*

IV. *The History of Ideas on the subject, and an examination of the opinions of modern Economists on it.*

SECTION I.

OF THE FUNDAMENTAL CONCEPTIONS ON WHICH THE THEORY OF CREDIT RESTS.

5. The following are the Fundamental Conceptions upon which the Theory of Credit rests :—

1. That an Economic Element—or an article of Wealth—is anything whose value may be measured, as Aristotle said ; or which has the power of purchasing, as Mr. Mill says.

2. That whatever may be exchanged separately, is separate property—is an Economic Element—or Wealth.

3. That Property is not a Thing, but a Right.

4. That Property, or Rights, may be divided into rights to things in actual existence, and rights to things which have no existence at present, but will only come into existence at a future time.

5. That Value is the Exchangeable Relation between any two Economic Quantities, which are each the Value of the other, whatever their nature be, enduring or evanescent, corporeal or incorporeal, present or future, general or particular.

SECTION II.

THE NATURE OF CREDIT, AND THE ELEMENTS OF THE THEORY OF CREDIT.

6. Having laid down these Fundamental Conceptions, we shall now proceed to investigate the Nature of Credit, and show how it arises.

On the distinction between a BAILMENT and a DEBT.

We have now to call our readers' attention to a subject of the greatest importance, and we do so with the greatest solemnity and earnestness, because it is the *Pons asinorum* of Political Economy. It is perhaps, at first sight, of a somewhat subtle nature, and could by no possibility occur to any one not conversant with law and commerce. But it is one of those delicate subtleties which occur in all sciences, upon which the most important consequences turn, and it is, in fact, a confusion on this point which is at the root of most of the false theories of currency and credit, which have produced such terrible catastrophes in the world.

7. There are two species of paper documents which are in general use in commerce, which have some superficial resemblances,—that is, they both convey rights to certain things, and are similarly transferable, and are therefore considered by many to be of the same nature, but which are yet fundamentally distinct in their nature, and in this radical distinction is contained the basis of the Theory of Credit.

These species of paper documents are—

I. Bills of Lading, Dock Warrants, and all other titles to specific things.

II. Bank Notes, Bills of Exchange, and other forms of credit.

8. In order to shew clearly the fundamental distinction between these two classes of paper documents, we will explain how each arises.

When a man ships goods on board a vessel, he receives from the captain a paper document acknowledging the receipt of the goods, and promising to deliver them to whomsoever shall be the owner of the paper. This document is called a BILL OF LADING.

The shipper of the goods sends the Bill of Lading to the consignee, who, directly he receives it, may negotiate it, i.e. transfer it by indorsement to whomsoever he pleases, in all respects like a Bill of Exchange, and it may pass through any number of hands, and whoever is the owner of it at any time may go and demand the goods from the captain.

Similarly, when goods are deposited in a dock warehouse, the dock master gives a paper docu-

ment of a similar nature to the Bill of Lading, which is called a Dock Warrant, which is transferable in all respects like a Bill of Lading, or Bill of Exchange, and whoever is the owner of the Dock Warrant, is the owner of the goods described in it, and is entitled to demand and receive them from the dock master.

9. Now it is especially to be observed in these two cases, that although the goods are delivered into the temporary custody of the captain or dock master, they have no *Property* in them. The *Property* in the goods remains with the shipper, or depositor, and is transferred by him along with the Bill of Lading, or Dock Warrant. The captain, or dock master, is the mere *BAILEE*, or *TRUSTEE* of the goods, and *not* the *OWNER*. He has no right to convert them to his own use, and if he did so, it would be a *robbery*, and he would be liable to be punished as a *thief*. Thus the Bill of Lading and the Dock Warrant form *ONE* *Property* with the goods, and cannot be separated from them. The goods travel *with* the paper document. Thus it may be said in this case, that the paper document *represents* goods. In this case there is no *exchange*, and these documents have no *value*, *i.e.*, they are not exchangeable separately. They are not exchangeable for goods generally, but are titles to certain specific goods, and no others. No one ever spoke of the *value* of a Bill of Lading, or a Dock Warrant. Such documents are *NOT* *CREDIT*, because the owner of them does not simply *believe* that he can obtain goods in exchange for them, but he *knows* that he has become the owner of certain specific goods. Such a transaction is not an *Exchange*, but a *BAILEMENT*.

10. Let us now take the case of a banker. Suppose a customer brings 100 sovereigns tied up in a bag to his banker, and asks him to take care of them for him, and give them back to him, or any one he may choose to name, on demand. This would confer no *Property* in the money on the banker. He would have no right to use it for his own purposes. If he gave a receipt for it, promising to deliver it to whomsoever it might be transferred, that receipt and the money would be *ONE* *property*. The money and the receipt could not be separated, and the very money would always pass along with the receipt, and it would be in its nature exactly similar to a Bill of Lading, or a Dock Warrant. The banker would be merely the *BAILEE* or *TRUSTEE* of the money, and not its *OWNER*, and if he converted it to his own use, he would be liable by law to very severe punishment.

11. But this is not the ordinary case of a banker and his customer. When the customer pays in money to his account at his banker's, the *Property in the money passes absolutely to the banker*. He is not the *TRUSTEE* or the *BAILEE* of it, but he becomes the *OWNER* of it, and is entitled to use it in any way he pleases for his own purposes. In *exchange* for this money, he creates a *CREDIT* in his customer's favor, promising to deliver him an equal amount of money on demand. This transaction is, in fact, an *exchange* or a sale. The banker *buys* the money from his customer by *selling* him the right to demand an equal quantity of money, at any time he pleases. Here, therefore, a *New Property* is created. The customer may transfer this property to whomsoever

he pleases, and it has *value*, because the owner of it can *exchange* it for money, or anything else. It is called *Credit*, because the owner of it only believes he can obtain money in exchange for it, but there is no specific money appropriated to it. The banker is not the trustee of the money, but he becomes the *debtor* of the customer, and if unfortunately he should happen to fail, his customers are only entitled to have his property divided among them, and must take their chance of having their debts paid in full.

Now we must observe this. By this operation a *New Property* is called into existence, by the act of the will, or the mutual consent, of both parties. This debt, or obligation, is a species of property which is called *CREDIT*.

Thus, says Mr. Williams, *Law of Personal Property*, p. 5, speaking of debts—"Choses in action having now become assignable, become an important kind of personal property." Again, p. 58,—"*A legal chose in action constitutes a valuable kind of personal Property.*"

Again, p. 155,—"*In addition to goods and chattles in possession, which have always been personal property, and to DEBTS, which have long been considered so,*" &c.

12. Hence, we see that *CREDIT* or *DEBT* is itself a species of independent property, which may be bought and sold, and is so to the amount of millions of money daily. And there are shops for the express purpose of buying and selling this species of property. As there are shops for dealing in bread, clothes, furniture, &c., so there are shops for the particular purpose of buying and selling *debts*, and these shops are called *BANKS*.

And as there are fish markets, and corn markets, and many other sorts of markets, so also there is a market for buying and selling foreign debts, which is called the *ROYAL EXCHANGE*. Thus banks are nothing but debt shops, and the *Royal Exchange* is the great debt market of Europe.

13. Now a debt being itself independent, exchangeable property, which is bought and sold to the amount of millions of money daily, and also being the largest species of property employed in the purchase of commodities, is by the very force of the definition given by Aristotle and Mr. Mill,—*Wealth!*

14. Hence we at once strike at the root of an enormous amount of confusion on the subject; for, as we have shown hereafter, the common notion of credit is, that it is the *transfer of capital*, whereas we have shown above, that *credit is the name of a certain species of property*.

In the apparently subtle distinction between Bills of Lading being merely titles to certain specific property, and Bank Notes being merely naked rights which may be exchanged for money, lies the basis of the whole Theory of Credit, with all its enormous consequences.

On Commercial Credit.

15. In order to present the subject in as great a variety of ways as possible, we will consider another case.

Let us suppose that two persons trade with each other, say a wine merchant and a tea-dealer. Then if they want from each other, quantities of each other's produce equal in value, they can

effect an exchange, and there is an end of the transaction.

16. But let us suppose that the wine merchant does not want so much tea, to the value of 5 lbs. say, as the tea-dealer wants wine. Then there will be an unequal exchange of present wants. The matter, however, may be arranged in two different ways.

1. Although the wine merchant does not want the tea at present, he will probably want it at some future time. The tea-dealer might, therefore, sever from his stock of tea the quantity due, say 5 lbs., and set it apart as the property of the wine merchant, and agree to keep it for him till he requires it. He might also give him a receipt for it, promising to deliver it to him, or to any one who might be the owner of the paper, on demand. Such a receipt might be transferred from hand to hand any number of times in commerce, and would always carry with it the property in the 5 lbs. of tea. This document would be similar to the Bills of Lading and Dock Warrants described above. It would form but *one* property with the tea, and this document *represents* tea. The tea-dealer has parted with the property in that specific portion of tea, and from being the *owner* of it, has become merely the *bailee* or *trustee* of it, and has lost all power to use it for his own profit.

2. The wine merchant may not wish to have the tea at all, nor anything else at the time. He must have, therefore, a *pledge* that he shall be enabled to make an exchange, or receive what he wants at some future time. And this *pledge* may be of two different forms; 1st, the tea-dealer may give him the amount of the debt in money, which will enable him to get what he wants from any one else. Now, we observe that this money is neither meat nor drink, nor anything else useful to man, it is only the *means* whereby these things can be got. And the wine merchant only takes it because he *believes* he can exchange it for what he wants at any time. It is, therefore, as has often been observed, a general bill of exchange on the whole commercial community—it is general **CREDIT**.

It is also to be observed that though it is exchangeable for commodities in general, it does not *represent* them, as bills of lading represent goods. It is separate and independent exchangeable property over and above commodities. It is of the *value* of commodities, but does not represent them.

2nd. Instead of giving him money, the tea-dealer may merely give the wine merchant his *promise* to pay the tea when demanded. Now, this is manifestly not a general pledge, but only a particular one. The tea-dealer does not part with the property in any portion of the tea. He is still the owner of all his own stock, and may sell and dispose of it all for his own profit if he pleases. But he has created a pledge that he will deliver 5 lbs. of tea whenever he is asked for them. Now the least consideration will shew that this pledge is of the same general nature with the money. The only thing is this, that whereas the money is exchangeable for anything with anybody, and is therefore of *general* value, this promise to pay tea is only exchangeable for tea with him. It is, therefore, *particular* value. Moreover, he may fail, and be unable to pay the tea, and therefore the value of the pledge may be precarious. Money, therefore, is of general and permanent value,

this pledge is of particular and precarious value. Now this pledge or right is a new property created. It may be recorded on paper, and transferred or exchanged any number of times in commerce, among persons who believe in the tea-dealer's capacity to pay the tea when required. This document does not *represent* 5lbs. of tea, but is of the **VALUE** of 5 lbs. of tea.

17. And this is a good opportunity to point out the enormous mischief the expression *Intrinsic Value* has worked in Political Economy, for it is this which has been the chief cause of the confusion which has arisen about the Theory of Credit.

It is very commonly said by writers even of the greatest name, that money has *Intrinsic* value, and paper *representative* value, because labor has been bestowed on the one, and none on the other. The least reflection will show the utter absurdity of this doctrine. Adam Smith himself says that if money would exchange for nothing, it would be of no value, which manifestly proves that value does not depend on labor but upon exchangeability. In fact directly we observe that the value of a thing is the thing for which it will exchange, it manifestly follows that nothing can have intrinsic value, unless it has the thing it will exchange for inside itself.

18. Now as the value of a thing is the thing for which it will exchange, it manifestly follows that anything has as many values, as things it will exchange for. If a thing will exchange for an infinite number of things, it has an infinite number of values. If it will exchange for only one thing it has only one value.

19. Therefore the *value* of a promise is the *thing* promised. If the promise cannot be fulfilled, then the promise has lost its value.

Now the £1, or money, is of the *value* of 5 lbs. of tea—and an infinity of other things besides.

The "promise to pay" the 5 lbs. of tea is of the *value* of 5 lbs. of tea—neither more nor less.

It is **CREDIT** because the person who receives it, or gives anything in exchange for it, believes he can exchange it for tea.

20. Now we see at once that this **CREDIT**, though greatly inferior in security and generality of value, is nevertheless of the same fundamental nature as money, in fact, it is only a lower form of money. Or rather, we may say, that money is only the highest and most general form of Credit.

21. And as money is a separate and independent exchangeable property, wholly distinct from commodities, so Credit is separate and independent exchangeable property, wholly distinct from money and commodities. Credit is manifestly a substitute for money. And it is manifest that the whole aggregate of commercial debts are merely a substitute for an equal amount of money.

22. Credit, however, is not generally expressed in the form of a promise to pay goods, it is invariably, in this country at least, expressed in the form of a promise to pay money, and therefore it is of the value of money. The quantity of commercial credit which is created and exchanged in this country is something enormous, and there is no possibility of forming any estimate of its amount, which can bear any reliable approximation to the truth, because the greater portion of it never gets into a form which appears to the public at all, but is locked up in the books of traders.

23. Hence we see the radical and fundamental distinction between Bills of Lading, Dock Warrants, &c., on the one hand, and instruments of Credit on the other.

The former are always specific titles to certain specific Goods, they always go with them, and cannot be separated from them, and therefore they form only *ONE* property with them. They always arise out of a *BAILMENT*, and never out of an *EXCHANGE*, and they may justly be said to *REPRESENT* goods. Moreover they form no addition to the mass of exchangeable property.

On the other hand, instruments of Credit of all sorts are always claims against the *PERSON*, and are absolutely severed from any connection with any specific goods, which is the very circumstance from which they derive their name. They circulate merely on the *belief* that they can be exchanged for money. They always arise out of an *EXCHANGE*, and *never* out of a *BAILMENT*. Bills of Lading, &c., always go with goods, &c., Bank Notes, &c., are always exchanged for money, or goods. Bills of Lading, &c., *represent* goods, but Bank Notes, &c., are of the *Value* of money. Moreover Credit in all its shapes and forms, is an addition to the mass of other exchangeable property.

24. From this it follows that Bills of Lading can never exceed in quantity, the goods they represent; but instruments of Credit of all sorts immensely exceed in quantity the money in the country—on the lowest calculation, tenfold. The considerations we have arrived at will throw a great light we shall find hereafter, on a question of momentous consequence—the *LIMITS* of Credit.

25. The considerations we have presented respecting the independent nature of Credit as a species of property, will be manifest to any one who thinks of the ordinary language of commerce. Thus, the assets, or the property of a banker, are always stated at so much, and his liabilities, or debts, or the credit which he is liable to exchange, at so much, thereby treating the property and the debts as manifestly independent quantities. So a bankrupt's assets are said to be so much, and his liabilities, or the credit he has created, to be so much, also independent quantities. It is always usual to speak of the value of a bank note or a bill of exchange. No one ever spoke of the *value* of a bill of lading, for the very reason that there can be no value without an exchange, and no exchange without value. Almost all commercial crises arise out of the excessive creation of that species of property called *Credit*; no one ever heard of a commercial crisis being produced by bills of lading or dock warrants.

26. The doctrine that we have stated above, that credit is independent property, will be found in abundance of places, and, in fact, it is so well known to every one who has the simplest knowledge of the first principles of law and commerce, that it may seem scarcely worth dwelling on at so great length. But, unfortunately, while many Economists acknowledge it in some places, in other parts of their works they quite forget it. In fact, it is the incredible confusion between value being what a thing will exchange for, and the labor, or cost, of producing the thing itself, and between Credit being separate exchangeable property transferred by means of Bills, Notes, &c.,

and its being the transfer of capital, that has thrown the Theory of Credit into such confusion.

27. Some writers, however, while they fully admit that a debt is property to be *added* to that of the owner of it, say that it is to be *subtracted* from the property of the obligor, and therefore upon the whole it is nothing.

As this notion is very common; and, as in fact, it contains the real subtlety of the subject, we shall quote an extract from Mr. Thornton's Work on Paper Credit, in which it is fully stated. He says p. 19.—“It may conduce to the prevention of error in subsequent discussions, to define in this place, what is meant by commercial capital. This consists, first, in the goods, (part of them in the course of manufacture) which are in the hands of our manufacturers and dealers, and are in their way to consumption. The amount of these is necessarily larger or smaller in proportion, as the general expenditure is more or less considerable, and in proportion, also, as commodities pass more or less quickly into the hands of the consumer. It further consists in the ships, buildings, machinery and other dead stock maintained for the purpose of carrying on our manufactures and commerce, under which head may be included the gold found necessary for the purposes of commerce, but at all times forming a very small item in this great account. It comprehends also the Debts due to our traders for goods sold and delivered by them on credit; debts finally to be discharged by articles of value given in return.

“Commercial capital, let it then be understood, consists not in paper, and is not augmented by the multiplication of this medium of payment. In one sense, indeed, it may be increased by paper. I mean that the nominal value of the existing goods may be enlarged through a reduction which is caused by paper, in the value of that standard by which all property is estimated. The paper itself forms no part of the estimate.

“This mode of computing the amount of the national capital engaged in commerce is substantially the same with that in which each commercial man estimates the value of his own property. Paper constitutes, it is true, an article on the credit side of the books of some men, but it forms an exactly equal item on the debit side of the books of others. It constitutes, therefore, on the whole, neither a debit nor a credit. The banker who issues £20,000 in notes, and lends in consequence £20,000 to the merchants, on the security of bills accepted by them, states himself in his books to be the debtor to the various holders of his notes, to the extent of the sum in question; and states himself to be the creditor of the acceptors of the bills in his possession to the same amount. His valuation, therefore, of his own property is the same as if neither the bills nor the bank notes had any existence. Again, the merchants in making their estimate of property deduct the bills payable by themselves, which are in the drawer of the banker, and add to their estimate, the notes of the banker, which are in their own drawer; so that the valuation likewise of the capital of the merchants is the same as if the paper had no existence. The use of paper does not, therefore, introduce any principle of delusion into that estimate of property which is made by individuals.”

28. The above extract contains the views to

which we wish to direct attention, as plausibly stated, and in as brief a compass probably, as it is possible to do so. It is also a remarkable example to shew the extreme caution necessary in stating an Economical question, for however apparently sound it is, it is, nevertheless, one tissue of fallacies, and if it were translated into mechanical language, they would be manifest at once to any one conversant in the smallest degree with Natural Philosophy.

Mr. Thornton's argument is simply this:— Suppose A to have £100 in money, and a three months' bill on B of £50 besides. Suppose B also to have £100, having accepted the Bill for £50, at 3 months.

Then A's property would be stated, thus,—

£100 + £50.

B's property would be stated, thus,—

£100 — £50.

Now Mr. Thornton's argument is that the + £50, and the — £50 balance each other, the result is 0, which is, according to him, the same thing as saying that neither of these quantities exists.

29. This view may appear to have some plausibility at first sight, but the slightest reflection will shew that it is totally erroneous.

Suppose a landlord lets a farm to a tenant who agrees to pay him a yearly rent. The tenant is under the obligation to pay his rent a year hence, which is just as if he had accepted a bill payable 12 months after date. Now the right to receive that rent is an actually existing right in the landlord, it is his property, which he may sell or transfer to any one else. It is *plus* to him, and an addition to his other property. The tenant is bound to pay this rent. He is, therefore, exactly in the same position as the merchant who has accepted a bill, and therefore this rent is *minus* to him just as the bill is to the merchant. It is quite clear that if the property of a merchant who has accepted a bill for £50 is stated, thus,—

£100 — £50.

the property of a farmer who is bound to pay rent must be stated thus,—

Property—Rent.

But no one would ever say that because a farmer has agreed to pay rent a year hence, that is any diminution of his balance at his banker's, or to be *subtracted* from the present amount of his property. It is quite clear that the future rents stipulated to be paid are meant to be paid out of *future profits* which are yet to be produced.

30. It is just the same with a merchant who has accepted a bill payable three months hence. He is not in debt at the present time, any more than the farmer. The well-known maxim of law is, that *credit unexpired may be pleaded under the general issue*, which means that if a man sues another for an obligation not yet due, he may reply simply that he is not in debt at all! It is quite clear, therefore, that in this case, the — cannot by any possibility mean *subtraction*.

31. This then is the paradox. The right to receive the future rent is an *addition* to the other existing property of the landlord. In this case + means addition.

But though the tenant is bound to pay the rent, and it is therefore — to him, it is not to be *subtracted* from his present property, and it is no

diminution of it. And in this case the sign — cannot mean *subtraction*.

What then does it mean?

In the first place, we may say that the view we have been considering sins fundamentally against the Philosophy of Science. For it is one of the great fundamental laws of Philosophy that when once the fundamental conception of a science is settled, all questions in the science must be stated so as to be in harmony with the fundamental conception of the science. Now as the fundamental conception of the Science of Political Economy is, that it is the Science of Exchanges, it follows that every question in it must be stated as a question of exchange. Now according to Mr. Thornton's mode of stating the question, he makes it a question of addition and subtraction; now addition and subtraction are not exchange, and therefore it is quite clear that that mode of stating the question must be wrong. It is clear that it must be stated in the form of an Exchange.

Moreover, any one versed in Natural Philosophy will at once see the nature of the fallacy involved in Mr. Thornton's mode of statement. It is just as if we were to say that because equal and opposite quantities neutralize each other's effect for certain purposes, and the result is 0, that that is the same thing as saying the quantities themselves do not exist. We shall fully illustrate this afterwards.

32. It may be as well, however, here to present to our readers the different conceptions which are held respecting Credit, or Debts. Algebraists long ago remarked that debts were negative quantities. They are called so by Maclaurin, and as may be seen in the extracts given below, by Euler and Peacock. So in the article *Algebra*, in the *Encyclopædia Britannica*, it says, § 3,—“A person's property may be considered as a positive quantity, and his debts as a negative quantity.” Adam Smith, as may be seen below, counts paper money as cumulative property, over and above gold and silver money. Mr. Mill, as may be seen below, in some places expressly calls bank notes productive capital, and a substitute for money, and separate exchangeable property. But in others, he makes Credit to be the *transfer* of capital. We have seen above that Mr. Thornton makes it to be a *subtraction* from property, and Dr. Peacock, in the extract given below, makes it to be property affected with the negative sign.

33. This is a specimen of the admired confusion that reigns throughout all Political Economy. Here are no less than *four* distinct conceptions of the nature of Credit! Some of these are used quite indiscriminately by writers, without the slightest apparent notion of their inconsistency. We have now, therefore, to determine what is the true conception of Credit, among these conflicting notions.

34. In order to assist us in the investigation of this point, we may see what the analogy of other sciences suggests. There is scarcely any other science in which the negative sign does not appear. In all of these there are negative quantities. Take Analytical Geometry, Mechanics, Optics, Electricity, or whatever science we please, and we observe that in each of these, negative quantities are not *transfers* of positive ones, or *subtractions* from positive ones, or positive ones affected with a *negative* sign, but separate and inde-

1572
32
33
ent quantities themselves. Hence we may once anticipate by analogy that *negative* quantities in Political Economy, are not *transfers* of positive ones, or *subtractions* from positive ones, property affected with the negative sign. But at they are separate and independent quantities themselves.

But if the sign — does not mean subtraction in Political Economy, what does it mean?

And what is the meaning of a *NEGATIVE* Economic Quantity?

On the Application of the Theory of Algebraical Signs, and of the Separation of the Signs of Position and Operation to Political Economy.

35. The perplexities of the Theory of Credit which have baffled all the Economists in the world to explain, can only be unraveled by the great modern Algebraical doctrine of the *Separation of the Signs of Position and Operation*.

As the introduction of this great doctrine into Political Economy is perfectly novel, we shall have to treat of it very fully.

36. It is a remarkable example of the almost universal truth, that practice has always preceded theory, that even the practice of science long preceded the theory of science. Thus, from the days of Diophantus, it was perfectly well known as an empirical rule that in Algebra — \times — gives +. But though that was the rule universally adopted in practice, because no other would lead to right results, algebraists were wholly unable to explain the reason of it. It was wholly unknown to Newton, and when he tried to explain it, the great Euler babbled like a child.

37. The real explanation has only been given within the present century, and is known by the name of the *Separation of the Signs of Position and Operation*.

Writers who are not versed in Natural Philosophy, have no conception of the signs + and — meaning anything but *addition* and *subtraction*, whereas every one who knows anything of the subject, knows perfectly well that the symbols +, 0, and —, have an immense variety of meanings in Natural Philosophy, according to the particular circumstances under which they occur, and it is wholly impossible to determine their meaning, until we know the particular state of circumstances, out of which they arise.

38. We have shown (CONTINUITY, LAW OF) that every great science is founded upon some single idea, or conception, or quality, which must be of the most general nature, and that every quantity whatever, in which that quality is found, is an element in that science, no matter what other qualities are found in it.

Now, as Political Economy is the science of exchanges, or of values, it necessarily follows that every quantity whatever, which is capable of being exchanged or valued, must be an economical element, no matter what its nature be, enduring or evanescent, corporeal or incorporeal.

39. But these elements in the various sciences may be endowed with *opposite* qualities, and when they are so, it is universally the custom in Natural Philosophy to distinguish them by the signs + and —.

They are then called signs of position, or of affection.

The instances of this that might be quoted from the various branches of Natural Philosophy are innumerable, and we will only quote a few to illustrate our meaning, and to furnish analogies to guide us to the solution of the perplexities of Political Economy.

Thus in Algebraical Geometry, in which it is necessary to fix the position of lines, it is usual to take some fixed point called the origin, and then lines drawn in *opposite* directions from that if the lines drawn to the *right* of this point are distinguished by the sign +, those drawn to the *left* are denoted by the sign —. If those drawn up from it are +, those drawn down from it are —.

So if a line revolving in one direction be +, when it revolves in the other it is —.

So if two mechanical forces act in *opposite* directions, they are distinguished by opposite signs.

So if an accelerating force be denoted by +, a retarding force will be denoted by —. And a retarding force may be called a negative accelerating force, and an accelerating force may be called a negative retarding force.

The engines of a steamer going a-head may be denoted by +, when going astern by —.

A curious instance of this may be cited from steam navigation. Owing to the resistance of the water, the paddles and the screw of a steamer do not, in general, propel the vessel through the water so fast as they would do if there were no resistance. This loss of speed is called the *slip*. But in the case of the screw, by giving the stern of the vessel a particular shape, the paradoxical result may be produced, that she may actually be made to go faster through the water than she ought to do, if the screw were working in a solid. Thus, in this case, the difference between the theoretical and the actual speed is a *gain* instead of a *loss*, and this is called the *negative slip*.

So also in Parliament the supporters of Government may be called + and its opponents —.

40. Now in many of these cases it may happen that the elements endowed with opposite qualities may balance each other, and the result be 0; but it would manifestly be an error of the greatest magnitude to say that because these elements may, under some circumstances, neutralize each others effects, that is exactly the same thing as saying they don't exist at all.

Suppose that on a division, the numbers for Government were 340, and the numbers against, 300. Now it is clear that on this occasion the strength of the Government is practically 40, because the — 300 neutralize the effect of the + 300. But it would clearly be an enormous error to say that is absolutely just the same thing as if these 600 members did not exist at all. It is perfectly clear that there are 640 Parliamentary units. It is quite clear that to find the total number of Parliamentary units we must *add* the opposition to the ministerialists, and not *subtract* them.

41. Now this idea of opposition is applied to a continuous line, or to motion in a continuous line. If any point be taken as 0, then the part of the line on one side may be denoted by +, and the part on the other side by —.

Thus in a thermometer some fixed point is taken as 0, and degrees above that are called +, and those below —.

Now if the mercury passes from a certain number of degrees on either side of 0, to any number of degrees on the other, it is quite clear that in order to find the total number of degrees passed over, the degrees on both sides must be *added* together.

42. The same idea is applied to TIME in Natural Philosophy, which may be considered as motion in a continuous line. If any point be taken, such as the present moment, or any fixed era, then the time on opposite sides of this point will be denoted by opposite signs. Thus if we call time, whether years, weeks, or days, *before* this era +, then time *after* this point will be —, and expressed, thus,—

...7,6,5,4,3,2,1,0,—1,—2,—3,—4,—5,—6,—7,... where we see that the — means simply *futurity*, and nothing else, and is a sign of position.

It is quite clear that if we want to find the number of years between any event which happened some time before this epoch, and another which happened after it, we must add the number of years on both sides of 0.

43. These illustrations, which might be immensely extended by examples taken from every branch of Natural Philosophy, are sufficient to exemplify the doctrine that we have endeavoured to explain, that, universally, in Natural Philosophy the *negative* sign — does not mean *negation*, or non-existence, but *ORRORROR*, and that *negative* quantities have as real and independent an existence as positive ones, and are to be enumerated separately and independently, as elements in that science, to find the totality of elements.

44. But, moreover, inverse or opposite operations may be performed on these quantities which are already affected by opposite signs. And these inverse operations are also denoted by the same signs + and —. And the combination of these opposite signs of inverse operations with the signs of opposite qualities affecting these quantities, that is, the combination of the signs of position and operation, give rise to the well-known Algebraical rules,

$$\begin{array}{rcl} + \times + & \text{gives} & + \\ + \times - & " & - \\ - \times - & " & + \\ - \times + & " & - \end{array}$$

These laws, which are universally applicable in Natural Philosophy, are equally applicable to Political Economy, and among other things, are alone capable of giving the solution of the Theory of Credit, which has hitherto been the opprobrium of the science.

It will be found that there are Economical Elements of inverse, or opposite, properties, and therefore following the strictest analogy with physical science, we shall denote them by *opposite* signs, and also opposite operations may be performed on these opposite quantities bringing into play the well-known Algebraical Rules, which will lead to consequences that may surprise some of our readers.

45. As an example that will furnish us with an important analogy, we will give this one. As any opposite, or inverse operations whatever may be denoted by the signs + and —, to *add to*, and *take away* from, are manifestly inverse, and may be denoted by these signs. Now suppose that in the House of Commons, the Government has 358 supporters, and 300 opponents, then the Government

strength may be denoted by 358—300. Now for practical purposes the strength of the Government may be called 58, and in so far as regards that, the + 300 and the — 300 neutralize each others' effects. But it would be a most grievous error to say that for *all* purposes it is just the same thing as if these 600 numbers did not exist at all. It is clear that to find the total number of members we must *add* the opposition to the ministerialists, and not *subtract* them. Moreover, if we add (+) to the ministerialists (+), we increase (+) the government strength. If we take away from (—) it, we diminish (—) it. On the other hand, if we add (+) to the opposition (—) that diminishes (—) the strength of the Government: but if we take away from (—) the opposition (—) that *increases* (+) the strength of the Government.

Hence the taking away of opponents (— —) gives an increase (+) of strength.

We shall now show the application of these principles to Political Economy.

46. We have defined Property, as every lawyer knows, to be a right residing in the person. Now it is quite evident that a person may have in himself a right to an actually existing thing, the produce of the past, and he may also have the right to receive things which do not actually exist at present, but will only come into existence at some *future* time. But each of these is Property, or Wealth, and consequently the totality of a man's wealth is the *sum* of the two. Now following the ordinary custom of Natural Philosophy, if we denote the accumulated products of the past which already exist by the sign +, we may denote the products which will only come into existence at some future time by the sign —.

47. Let us now examine the Theory of the Value of Land, which may be called the grammar of the Theory of Value.

In what does the value of land consist?

Suppose we purchase an estate in land for £100,000, where is the value of our money? Does it consist in things which have a present existence? The veriest tyro will answer—Certainly not. Where then is the equivalent for the purchase money?

Every one knows that the purchaser of the land buys the right to receive the actually existing produce of the land, *together with* the right to receive its annual profits for ever, say £3,000 a year. Now, as these annual profits only come into existence year by year in future time, we may denote the equivalent of the purchase money in the following way:—

Existing produce of land, — £3,000, — £3,000 — £3,000 — £3,000, &c., ad infinitum, where the sign — of course denotes *futurity*.

Now, each one of these future profits has a Present Value, and the purchase money of the land is simply the sum of the Present Values of this series of profits for ever.

Any, or any number of these future profits, may belong to different persons, giving rise to the whole doctrine of estates in remainder, and in reversion, &c.

Now we may say that when a purchaser has paid for the land, it owes him a series of annual payments, as he bought it merely on the *belief* that he would receive them; and we may call this the *credit* of the land.

Hence the present value of each of these future

payments for ever, is an actually existing article of property, and by our definition — Wealth. And if we buy the land at 33 years' purchase, it is clear that 32 parts of the value of the land have no actual existence at all, but consist merely in the abstract right to receive them when they come into existence.

48. So also if we buy an established business, we have to buy, not only the premises, and the stock-in-trade on them, but also the right to receive the future profits of the business. This property is called the *GOODWILL*, and it is clear that it is purely incorporeal property, lying wholly in the future, and therefore *negative*, according to our notation.

That the goodwill of a business is a valuable species of property, is so well known to every trader, that it seems almost superfluous to mention it. We may quote, however, one instance, which may interest our readers. We are told in Boswell (Vol. IV. p. 86, edit. 1822), that Johnson was appointed by the great brewer, Thrale, one of his executors. In that capacity it became his duty to sell the business. When the sale was going on, "Johnson appeared, bustling about, with an inkhorn and pen in his button-hole, like an exciseman; and on being asked what he really considered to be the value of the property which was to be disposed of, answered, 'We are not here to sell a parcel of boilers and vats, but the *POTENTIALITY* of growing rich beyond the dreams of avarice.'" Now this latter phrase was merely a Johnsonian expression for the goodwill. The price realized on this occasion was, we are told elsewhere, £135,000. Now it is clear that this sum was not given for the boilers and the vats only, the material, and the result of *past* labour, but also, and by far the greater part, for the incorporeal *potentiality* which lay wholly in the future. Now this *potentiality* could be bought and sold, but it was not material; it could not be handled nor seen, but its value might be measured, and therefore it was a valuable thing—it was *Wealth*.

49. So the printed copies of a book are the produce of past labour, but the *COPYRIGHT* is the right to receive the future profits to be made by it. The value of the copyright clearly lies wholly in the future, like that of the goodwill.

50. When a professional man has established a good practice, the right to receive the future profits of it is a valuable property, and is denominated a *PRACTICE*, which is clearly of an analogous nature to those just described.

51. So the capital of a company is the accumulation of past labor, the *SHARES* in it are the right to receive the future profits to be made by trading with the capital.

52. Now it is manifest that the right to receive these future profits is cumulative property, over and above the produce of the past, and moreover it is quite separate and independent exchangeable property, distinct from the actual profits received. Thus manifestly the goodwill of a business is property, quite distinct from the profits actually realized; the copyright of a work is property, quite distinct from the profits realized by the sale of it; the shares in a company are quite separate property from the profits actually made; and generally, any annuity whatever is

separate and independent property from the actual payments.

53. Now Adam Smith, and all Economists since his time, admit that the useful abilities of the people of the country, are part of the wealth of the country. Consequently every merchant in business making an income, is himself an article of wealth, because his talents, industry, &c., may be valued. The money he has earned is the produce of his past industry, and he may trade with it. But he may also trade with the *future* proceeds of his industry. He may sell the right to a future payment out of the future proceeds of his industry. And when he does trade by selling this right, this property is called *CREDIT*.

Now, we observe that a merchant's credit is cumulative property, over and above his money, and quite separate from money and commodities of all kinds. And though, no doubt, his credit is based upon confidence, because no one would sell his goods to him in exchange for his promise to pay, unless they believed he would pay his promise, still we must observe that Credit does not mean the confidence, as many writers suppose, nor yet the transfer of the goods, as many more suppose, but an actual transferable right, which is exchangeable property, and is *Wealth*.

54. Hence we have this great fundamental doctrine of transcendent importance, and involving the most momentous consequences to the world, that over and above existing money and commodities, the *RIGHT* to receive future payments of all sorts, is separate and independent property. In other words, that every future payment, of every sort and description, has a *PARENT VALUE*, quite independent of the payment itself, which is valuable property, or *Wealth*.

55. This stupendous mass of property receives different names, according to the different sources of payment. When arising out of the land, it has no particular name, but yet it constitutes 32 parts out of 33 of the value of the land; when the source is a shop or a warehouse, it is called the *GOODWILL*; when the source is books, prints, or works of art, it is called *COPYRIGHT*; when the source is a mechanical invention, it is called a *PATENT*; when the source is a professional business, it is called a *PRACTICE*; when the source is the capital of a trading company, it is called a *SHARE*; when the source is an ordinary commercial transaction, it is called *CREDIT*; when the source is an annual payment, guaranteed by the Government out of the public revenue, it is called the *FUNDS*.

Besides this there are many other species of annuities of a similar nature, such as tolls, ferries, ground-rents, &c.

56. Hence we see that credit is, in fact, the lowest form of an annuity; it is an annuity of one term; it is the right to receive a single future payment; the other species of property are the right to receive an indefinite number of them.

What the value of this gigantic mass of property in this country may be, it is utterly impossible to form the most distant conception, but there can be no doubt that at least nine-tenths of the property in this country exists in this form.

And yet, except Credit and the Funds, whose nature has been completely misunderstood, there is not a word about it in any English work on Political Economy!!

57. Having now explained the nature of this

species of property, we may exhibit the classification of property in the following form, which may, perhaps, show it in a somewhat clearer form.

If we denote the products accumulated up to the present time by +, those which will come into existence at a future time may be denoted by —, and of course 0 denotes the present time. Thus:—

THE PRODUCE OF THE PAST.	PRESENT TIME.	THE PRODUCE OF THE FUTURE.
+	0	—
Lands, Houses, &c.	Annual Income for ever.
Premises, Stock of Goods in a Shop, &c.	The Goodwill.
The Printed Copies of a Book	The Copyright.
Machines already made	The Patent.
The Money earned by a Professional Man.	The Practice.
The Capital of a Commercial Company	The Shares.
The Money already earned by a Merchant	His Credit.
	..	{ Annuities of all sorts, the Funds, Tolls, Ferries, Ground-rents, &c., &c.

Now, the whole of this mass of incorporeal property is either entirely omitted from works on Political Economy, or its nature misunderstood. But it must manifestly be included in it. And it clearly doubles the extent of the science, or gives it the same extension that Algebra did to the field of Arithmetic, by extending it on both sides of 0 to infinity.

58. The species of Property called Credit being bought and sold to the amount of millions of money daily, it is necessary that there should be some unit of debt, or of credit. And the unit of debt, or of credit, is £100 payable one year hence.

59. Moreover the method of expressing the price of this species of property is peculiar.

When goods are sold for money, the quantity of money given is called the *price*. The less the quantity of money given for any goods, the greater is the value of money respecting those goods. And supposing the quantity of money necessary to purchase any particular amount of those things undergoes a change, the value of money *rises* as the price *falls*, and the value of money with respect to those goods *falls*, as the price *rises*. Thus the value of money varies *inversely* as *Price*.

Now the value of money with respect to debts, which are in fact commodities, must follow exactly the same rules, as with respect to other things. The value of money with respect to debts must *rise* as the price of the debt *falls*, and the value of money must *fall* as the price *rises*. Now as money naturally produces a profit, it is clear that the money, or the price to be given for a debt payable one year hence, must be less than the amount of the debt. The difference between the price of the debt and the amount of the debt is called the *Discount*. In buying commercial debts, the amount of the discount is always mentioned, and never the price of the debt. Thus suppose the buyer gives £97 for a debt of £100 payable one year hence, it is usual to say that he *discounts* it at 3 per cent. When it is said that discount is at 3 per cent. it means nothing more than that debts of £100 payable at

twelve months date are selling for £97. Now if the value of money rises with respect to debts, it is clear that the *price* must *fall*, which is clearly the same thing as saying that the *discount* must *rise*. If the price of the unit of debt falls from £97 to £93, the discount rises from £3 to £6, and also the value of money has risen.

Hence the value of money varies *inversely* as *Price*, and *directly* as *Discount*.

60. These considerations shew that Mr. Mill's censures on the expression value of money, as applied to the rate of discount, are quite unfounded. He says, *Principles of Political Economy*, Book III., ch. VIII.

"It is unfortunate that in the very outset of the subject, we have to clear from our path a formidable ambiguity of language. The value of money is to appearance an expression as precise, as free from possibility of misunderstanding, as any in Science. The value of a thing is what it will exchange for, the value of money is what money will exchange for; the purchasing power of money. If prices are low money will buy much of other things, and is of high value; if prices are high, it will buy little of other things, and is of low value. The value of money is inversely as general prices, falling as they rise, and rising as they fall.

"But unhappily the same phrase is also employed in the current language of commerce in a very different sense. Money, which is so commonly understood as the synonyme of wealth, is more especially the term in use to denote it when borrowing is spoken of. When one person lends to another, as well as when he pays wages or rent to another, what he transfers is not the mere money, but a right to a certain value of the produce of the country, to be selected at pleasure; the lender having first bought this right by giving for it a portion of his capital. What he really lends is so much capital; the money is the mere instrument of transfer. But the capital usually passes from the lender to the receiver through the means of money, or of an order to receive money, and at any rate it is in money that the capital is computed and estimated. Hence, borrowing capital is universally called borrowing money; the loan market is called the money market; those who have their capital disposable for investment on loans, are called the monied class; and the equivalent given for the use of capital, or in other words, interest, is not only called the interest of money, but by a grosser perversion of terms, the value of money. This misapplication of language, assisted by some fallacious appearances, has created a general notion among persons in business, that the value of money, meaning the rate of interest, has an intimate connexion with the value of money in its proper sense, the value or purchasing power of the circulating medium."

From the considerations we have presented, it is quite clear that this censure is unfounded. The language of the commercial classes is quite correct, and no other would be appropriate. When they say that the value of money has risen because discount has risen, it is only another form of saying that the price of debts has fallen.

61. In fact, nearly all the confusion on the subject of credit has arisen, as it so frequently does, especially in Political Economy, from an ambiguity of language. The ordinary charge that Economists, echoing J. B. Say, bring against those who

say that credit is capital, is that by saying so, they maintain that the same thing can be in two places at once. They consider credit to be the loan of some material thing called capital, and then they say, how can two persons have the use of this same capital at the same time? Now this confusion purely arises from their own misconception of the nature of credit, for credit is not the transfer of capital, but the name of a species of property. Moreover the expressions to *lend* and to *borrow* are ambiguous. If I lend my friend a book, or a horse, I do not part with the *property* in the horse, or the book; there is but one property, and of course I cannot have the use of the horse or the book at the same time that my friend has. The horse or the book cannot be in two places at once. But in commerce, the words to lend, and to borrow, have quite a different meaning. A commercial loan is in fact a *sale*. If as above, I lend my friend a horse or a book, he is bound to return me that very horse and that very book. But it is not so in commerce; in a commercial loan, the property in the money passes absolutely to the borrower, and he gives in exchange for it, the right or property to demand an *equal* sum of money at some future time, but not the *identical* sum of money.

The distinction between these two meanings of the word "loan," is well illustrated in Latin. For it has two words corresponding to these two meanings, *commodum* and *mutuum*. A *commodum* is where, like in the case of a horse or a book, the property in the thing lent remains with the lender, and the identical thing is returned. A *mutuum* is where the property in the thing passes from one to the other, and in exchange for it is given the right to demand an equivalent at some future time. Now, from the word used, it is clear that it is an exchange. All commercial loans are *mutua*, and not *commoda*.

And this abstract right is a new property called credit. Hence every commercial loan is a sale, in which a new property, called a debt, is created by the consent of the parties, and these debts form an article of commerce, like any other commodities.

62. And now, at last, we perceive the true mode of reading the connection between A and B, as expressed above, which Mr. Thornton has so misunderstood. When A holds B's bill for £50, and the property of the one is expressed by £100+£50, and that of the other by £100-£50, the +£50 and the -£50 do not *cancel* one another, as Mr. Thornton supposed, nor do the + and the - denote addition and subtraction, as he supposed, but they are in fact symbols of *TIME*. And the sentence is to be read thus:—"A has, besides £100 in money, the present (+) right to demand a future (-) payment of £50 from B."

And this is manifestly the way in which all annuities, or present rights to future payments, may be expressed. When the landlord's property is denoted by property + rent, and the farmer's by property - rent, it means that the landlord has a present right to demand a future rent from the farmer. And if every man's property is expressed by +, his obligations are denoted by -, and his property may be stated thus:—

Property—Obligations.

Now, for certain purposes, it may be said, perhaps, that a man is only substantially worth

his property less his debts, or his obligations. But as far as regards Political Economy generally, that would be a very erroneous mode of statement. Because the fact is, that although his obligations may *neutralize* the effect of an equal amount of his property, so far as he is concerned, yet both his property and his obligations are independent exchangeable property, and may circulate independently in commerce, and are therefore each of them, by virtue of the definition, *Wealth*.

To shew this, we need only refer to the standard case of Credit, that of a Banker. We might say that, practically, a banker was only worth the excess of his assets over his liabilities, and that would be sufficiently correct as far as he is concerned. But for the purposes of Political Economy, it would be extremely wrong, because the banker's assets belong to himself, and he may put them into circulation, and at the same time his obligations may be put into circulation as well. Consequently, here are two classes of economic elements; and as each is capable of being exchanged separately, they must *both* be included under the economic name of *Wealth*.

63. To say, therefore, as Mr. Thornton does, and as is the common way of looking at the matter, that because a man's obligations neutralize an equal amount of his property, and he may be considered substantially worth only the excess of his property over his debts, that therefore it is just the same thing as if his obligations and an equal amount of his property did not exist at all, is an error of as great a magnitude as to say that because the strength of the Government is substantially only the excess of their supporters over their opponents, that it is just the same thing as if their opponents and an equal number of their supporters did not exist at all. It is quite clear that for other purposes, each of them exists as Parliamentary units.

Hence, when a man has a certain amount of property, and has also given forth a certain amount of obligations, they are to be treated as separate and independent articles of property, but of opposite effects, like the supporters and opponents of a Government.

64. We also see how erroneous Mr. Thornton's views are in other respects. He says that when a banker has discounted £20,000 for the merchants, and issued £20,000 in his notes, that if he writes himself down as creditor for the merchants' acceptances, he writes himself down debtor to an equal amount to the holders of his notes, and therefore upon the whole he is exactly as he was before. In the first place, a banker never issues an amount of notes equal in amount to the bills he discounts, because if he did so, that would mean he charged nothing for discount. He always retains the amount of the discount at the time. And supposing the discount to be 5 per cent., and the bills at 12 months, in exchange for the £20,000 in bills, he would only issue £19,000 in notes; consequently, even according to Mr. Thornton, his property would be increased by this sum of £1,000 by the operation.

But the fact is, Mr. Thornton's view is fundamentally erroneous in other ways. He says that because the banker and the merchant each credit themselves with the same sums, and debit themselves with the same sums, it is therefore exactly the same thing as if these obligations did not exist

at all; and that because the merchant and the banker hold each other's obligations, that therefore they cancel and extinguish one another. This is utterly erroneous. The merchant's bills are valuable property, capable of circulating in commerce, and the banker buys this property by creating another property, namely, his own notes, which are also capable of circulating in commerce. Hence it is not a cancelment of debts, but an exchange of valuable properties, both of which may, and do, circulate in commerce. The debts are not cancelled until the bills are given up to the merchant and the notes given back to the banker. Then, no doubt, each of these properties is extinguished and taken out of circulation. But while they are in existence, they each have circulating power.

65. Hence we see the enormous importance of a very careful attention to the mode of stating the facts in Political Economy.

A man's property and his obligations being then analogous to opposite quantities, we have manifestly the following laws:—

If we add (+) to his property (+), his obligations (—) remaining the same, that is an increase (+) of property.

If we take away (—) from his property (+), that is a diminution (—) of his property.

If we add (+) to his obligations (—), that is in effect a diminution (—) of his property.

But if we take away (—) from his obligations (—), that is in effect an increase (+) of his property.

Hence we obtain this doctrine in commerce,—**A RELEASE FROM A DEBT IS AN AUGMENTATION OF CAPITAL.**

We shall see afterwards that this doctrine leads to consequences of the most momentous nature in commerce, which may possibly surprise some of our readers.

66. To shew the extreme attention necessary to state an economic problem, we will quote from the works of two very eminent mathematicians.

Euler says (*Algebra* p. 7.—Edit. 1797.)—"The manner in which we generally calculate a person's property is an apt illustration of what has just been said. We denote what a man really possesses by positive numbers, using or understanding the sign +, whereas his debts are represented by negative numbers, or by using the sign —. Thus, when it is said of any one that he has 100 crowns, but owes 50, this means that his real possessions amount to $100 - 50$, or which is the same thing, $+ 100 - 50$, that is say 50.

"As negative numbers may be considered as debts, because positive numbers represent real possessions, we may say that negative numbers are less than nothing. Thus, when a man has nothing in the world, and even owes 50 crowns, it is certain that he has 50 crowns less than nothing; for if any one were to make him a present of 50 crowns to pay his debts, he would still be only at the point nothing, though really richer than before."

It is quite easy to shew that the first paragraph is not a suitable mode of stating the question in Political Economy. For suppose that a man has 100 crowns and is bound to pay 50 crowns one year hence. It would be manifestly quite inaccurate to say that his property was only ($100 - 50$) or 50 crowns. And yet his property would

be correctly stated $100 - 50$. Here it is quite clear the 50 crowns are not to be subtracted from his present property. Now by the *Law of Continuity*, the same must be true if we diminish the period of payment gradually from one year by small gradations of a day at a time, till we reduce it to 0, or make his debt payable on demand. The fact is that it means he is bound to exchange some of his property for his obligation at a given time.

So in the second paragraph, when he has nothing to pay and owes 50 crowns, he is said to have less than nothing. This clearly means that he has not only spent the accumulation of his *past* industry, but has also spent the anticipated proceeds of the *future*, and the negative sign clearly means futurity. Now let us suppose that having done so, as Euler says, some one makes him a present of 50 crowns to pay his debt, he is clearly 50 crowns richer than before, but yet his property is now only $= 0$. This is an example of $+ \times +$ giving $+$. But there is another combination of Algebraical symbols which gives $+$, namely $- \times -$; and there is another method in commerce of arriving at the same practical result. Suppose his creditor *releases* him from his debt, his property would then be $= 0$, and he would also be 50 crowns better off than before. This clearly shews that the release (—) of a debt (—) is the same thing as an increase (+) of wealth.

The whole subtlety in the case is in distinguishing between one quantity being equal and opposite to another, and therefore neutralising its effects, and taking it way altogether. The opposition in Parliament do not take away, or subtract, an equal number of ministerialists, they only neutralize their effects. To take away from the opposition does not add to the government numbers, it only takes away a quantity which neutralized their effects.

67. Another very eminent writer, Dr. Peacock, Dean of Ely, after saying that property and debts may be symbolized by + and —, says, (*Algebra*, 1st Edit., p. 77.) "if a denoted property possessed, and — a debt, $\sqrt{-1}$ a might denote property neither possessed nor owed, such as a mere deposit would be."

Dr. Peacock has explained his ideas at greater length at p. 366, *Art.* 447, of the same volume. He says—"There are many cases, however, of quantities which cannot be represented, unless symbolically, by lines, which are susceptible of affections denoted by + and —, which are appropriate to their specific nature: thus, if a represented property possessed, — a may represent the same property owed; under such circumstances, what is the meaning which may be attached to a $\sqrt{-1}$ and — a $\sqrt{-1}$?"

If we consider the succession of quantities

$$a, a \sqrt{-1}, a (\sqrt{-1})^2, a (\sqrt{-1})^3,$$

or,

$$a, a \sqrt{-1}, -a, -a \sqrt{-1},$$

and if the first represents property possessed, and the third property owed, the second can neither represent property possessed nor owed, under the same circumstances or by the same person, inasmuch as in such a case, it would be symbolically represented by a or $-a$: it may represent, however, property deposited, which admits of similar relations when considered as property possessed and property owed by another person;

under such circumstances, the *affection* of a denoting property possessed by A by the sign $\sqrt{-1}$, would convert it into property possessed by B : and the *affection* of $a \sqrt{-1}$ by $\sqrt{-1}$, would convert property possessed by B into property owed by A : thirdly, the *affection* of $-a$ by $\sqrt{-1}$ would convert property owed by A into property owed by B : and fourthly, the *affection* of $-a \sqrt{-1}$ by $\sqrt{-1}$ would convert property owed by B into property possessed by A : the repetition of the process of *affection* by the sign $\sqrt{-1}$, would reproduce continually the same succession of transfers of property from A to B , and of conversions of property possessed into debt, and of debt into property possessed, which is required to correspond to the succession of the same symbolical results.

"In this case, the interpretation of the sign $\sqrt{-1}$ which we have given, satisfies the symbolical conditions, and also coincides with the interpretation of the meaning of the signs $+$ and $-$, which is otherwise established: we cannot give it the additional authority of the coincidence of this interpretation with the interpretation of the meanings of the quantities corresponding to a^2 and $-a^2$, for those quantities in the case under consideration admit of no interpretation."

68. With all deference to so great a writer, we think this view is not correct. In fact, there is no such thing as *property owed*. The debt itself is an article of property, which must have arisen out of some previous exchange, and what is really meant by saying that a man is in debt is, that he must exchange some of his property to buy this debt. Now the symbol $\sqrt{-1}$ denotes that operation which being twice repeated, changes $+$ into $-$.

Hence, if this symbol is applicable to Political Economy at all, it must denote the operation which, being twice repeated, changes property into a debt. But depositing a thing twice with a man does not change property into a debt. Nor does it transfer the property. These are single operations of the will, and, therefore, it appears to us that Political Economy is a science to which the symbol $\sqrt{-1}$ is not applicable.

69. After venturing the criticism contained in the preceding paragraph on the views of Dr. Peacock, we have had the great satisfaction of finding that Professor De Morgan has expressed similar sentiments in the article *Algebra* in the English Cyclopædia. He says: "It is impossible that a perfect Algebra can be founded on ideas of time, loss and gain, or any in which only two directions can be imagined. Space, from the infinity of directions which it admits, is as yet the only perfect medium of explanation. Time before and time after a certain epoch may be represented by the positive and negative quantity; but what is there in the idea of time to which the sign $\sqrt{-1}$ can possibly apply? Again, shew us a commercial operation which performed upon a gain, produces a sort of result which can neither be called gain nor loss, but which repeated *two* or more times upon a gain turns it into a loss — and we can immediately see a system of commer-

cial Algebra in which $\sqrt{-1}$ shall be intelligible."

70. As this point is, in fact, the greatest subtlety in Political Economy, and involves consequences of the most momentous nature, which we dare say our readers little dream of at present, but which are fully explained afterwards, we shall extract what Dr. Peacock has said in the 2nd edition of his *Algebra*, p. 15.

"We conclude our observations upon this subject with the discussion of one more example of a problem of very extensive application.

"A merchant possesses a pounds and owes b pounds; his substance is therefore $a-b$, where a is greater than b .

"But since a and b may possess every relation of value, we may replace b by $a-c$, or by $a+c$, according as a is greater or less than b ; in the first case we get

$$a-b = a - (a-c) = c$$

and in the second

$$a-b = a - (a+c) = -c$$

If c therefore express his substance or property, when *solvent*, $-c$ will express the amount of his debts when *insolvent*: and if from the use of $+$ and $-$ as signs of affection, or quality, in this case, we pass to their use as signs of operation, then inasmuch as

$$a + (-c) = a - c \text{ and } a - (-c) = a + c$$

it will follow, that the addition of a debt ($-c$) is equivalent to the *subtraction* of property c of an equal amount, and the *subtraction* of a debt ($-c$) is equivalent to the *addition* of property c of an equal amount, and it consequently appears that the subtraction of a debt, in the language of symbolical algebra, is not its *obliteration* or *removal*, but the change of its affection or character, from money or property owed, to money or property possessed."

71. We hope we shall succeed in shewing that the views expressed in this latter paragraph are not correct.

In the first place we must say that there is no such thing as *property owed*. A debt in commerce is a species of property itself, which was created in exchange for some property. And when a man is in debt it means that he is bound to buy up, or exchange some part of his property for, this debt. But there is no particular part of his property which he may be said to owe more than another. His property is absolutely his own, and indeed he may spend it all and leave his debts unpaid.

Now as a debt always arises out of an exchange, and must necessarily do so, an addition of debt also arises out of an additional exchange. It is a new property created in exchange for more property. Hence to *add* and to *subtract* a debt, is in fact to *create* and to *destroy* property. As we shall shew.

A banker receives £100 in money from his customer, and in exchange for that, he creates £100 of debt, which is the property of his customer. His property is then stated

$$£100 - £100 = 0$$

Now arguing according to the common mode, that means there is no property at all in existence, a conclusion that is manifestly erroneous.

It is perfectly true that, so far as regards the banker himself, he may be said to be no richer

than he was before, but as regards Political Economy—and it is the master subtlety of the subject—the effects are very different. The banker has now £100 in money, which is his own property, which he may trade with and make a profit out of. And his customer has £100 as well, in the banker's notes, with which he can buy anything he wants, as well as with money. Hence there are *two* circulating and exchangeable properties instead of *one*. And though no doubt the banker is always liable to be called on to exchange some of his gold for his liabilities, yet, the very business of banking is based on the probability that he will *not* be called on to do so to any very appreciable amount at any one time.

Now let us suppose that for some reason or another, the customer or creditor chooses to release the banker, his debtor, from his debt, to the amount of £50 say. Then the banker's property would be stated thus,

£100 — £50

and therefore the banker would have gained a practical augmentation of his property. But it would not be, as Dr. Peacock says, by converting property owed into property possessed, but by the *destruction of the debt*.

Just in the same way as a government would gain not a greater numerical amount of supporters but a practical augmentation of strength, by the removal of a number of its opponents.

By cancelling the debt, therefore, the debtor is released from the necessity of a future exchange, which is no doubt to him a practical augmentation of wealth, but yet so far as concerns Political Economy, is a destruction of property.

By this operation his assets remain exactly as they were before, but his liabilities are diminished.

When, as we have shewn below, it entirely depends on these subtle considerations, whether three-fourths of the capital of the Bank of England, and all the Joint Stock Banks in the country, has any real existence at all, our readers will perceive the immense importance of clear ideas on the subject.

72. From the considerations in the preceding paragraphs, we draw these important conclusions:

That in Political Economy the signs + and —, as Signs of Position, symbolize TIME.

As signs of Operation, they mean addition and subtraction, or creation and destruction.

73. We have now, we think, fully explained the nature of credit. It is the present right to a future payment. And of course the value of the instrument entirely depends upon the payment being made. *For the value of the promise is the payment*. If, therefore, the payment cannot be made, the promise has lost its value, and there is a loss of property.

74. The considerations we have presented, furnish us with an answer to a question of the most momentous importance, which has been a great perplexity to many speculators on the subject. It is this: What are the true LIMITS of Credit?

Now as Credit is the right to a future payment, or a future profit, it is manifest that the number of future payments, or profits, are the Limit of Credit; every future payment whatever has its present value, and therefore up to that limit *Credit* may be created. But it is manifest that Credit cannot properly exceed that limit.

Hence, we see at once, another most important distinction in the fundamental nature of a Bill of Lading and Dock Warrant, and Bill of Exchange, and other forms of credit. Because the former documents are absolutely restricted to the *actual quantity* of the goods they represent, and can by no possibility exceed them. But instruments of Credit are founded on the *number of Transfers* of Property, and every transfer of property gives rise to a creation of Credit. Hence, if there be 20 transfers of the same property, 20 Bills of Exchange may be created. But if the same property pass through as many transfers, the same Bill of Lading goes with it always.

75. Hence, we see at once the fundamental error of John Law's ideas of Credit and money, which are very extensively prevalent at the present time. He saw that a merchant's obligations generally exceeded his cash by at least tenfold. He thought that instruments of credit represented money, and then he argued—Why not turn all the property in the country into paper currency, just as money is represented by paper? and such paper he maintained would retain an equality of value with money. But, alas! when these plausible ideas came to be put into practice, they totally failed, and produced the most terrible convulsions. When the French Government issued assignats representing the territory of France, so far from maintaining their value on an equality with silver, they ultimately fell to the 30,000th part of the value of silver (*Assignats*), and all attempts to found a currency upon such principles, have failed (*LAW*).

76. But while the same goods can never give rise to more than one Bill of Lading at the same time, which is extinguished by the delivery of the goods, a quantity of money may discharge and extinguish any number of instruments of Credit, by simply paying them in succession, and there is no absolute relation between the quantity of money and the quantity of Credit in a country. All that is required is that when the payment falls due, the obligor has money to discharge it. The quantity of Credit that may be created purely depends on the *number of transfers*, or the *circulation* of money.

77. It is entirely from a miscalculation of these transfers that commercial catastrophes arise. Sanguine speculators expect that the price of goods will rise, or that there will be a great demand for them. Upon the strength of the expectation of these future payments, they buy the goods with credit. A greater quantity of goods is thrown on the market, or the demand falls short of what they expected. Hence the number and amount of transfers of money which they counted on, do not take place. Consequently the profits out of which they expected to pay their bills never come, their promises lose their value, and then comes ruin and destruction on all concerned.

78. But as a debt is an independent article of commerce, like any other commodity, it may be bought and sold for any other quantity whatever, and of course, among other things, for other debts. One grand division of the great system of debt consists in buying debts by creating other debts, and each of these debts is exchangeable property. And hence we see that there is a gigantic mass of valuable property produced merely by the consent of persons, without any labor at all.

79. Having thus established the great doctrine that Credit is a species of property, and having shown that any species of property whatever, may be capital (CAPITAL), it follows of course, that Credit may be used as capital as well as any other species of property.

But how is Credit *productive* Capital?

We might, perhaps, say that the expression is tautology, because as capital is any economical element used productively, it follows that if it be capital, it must be *productive* capital.

Passing over this, however, we may now enquire how Credit can be used productively. It is manifest that this entirely turns on the meaning of the words *PRODUCTIVE* and *PRODUCTION*.

In the first place, as Credit is a substitute for money, it is clear that it may be used as productive capital, just in the same way as money is, which every one acknowledges may be productive capital.

We have shown (*PRODUCTION*) that the first French school of Economists confined the meaning of the word production, and productive labour, to the obtaining an increase of quantity. But Adam Smith and Condillac extended it to manufactures and commerce, and they very properly say, that money employed in wholesale and retail dealing is *productive capital*.

80. But how is money employed in commerce productive?

To explain this, we have nothing more to do than to look at the genuine meaning in Latin of the word *producere*. We have fully shewn under *PRODUCTION* that the primary meaning of *producere* in Latin, is not to make an increase, but simply to bring out. And it is the technical word used for *exposing to sale*. Thus Terence, *Eunuchus* I, ii, 55, says

"pretium sperans illico

PRODUCIT: vendit."

"Hoping for a good price, offers her there for sale; sells her."

And in the *Heauton timorumenos*, I, i. 90—

"Ancillas, servos,

Omnes PRODUXI ac vendidi."

"All the slaves, male and female, I put up for sale, and sold."

So to produce is to *draw forth*—to *cause to come near*. To produce, in English, is not confined to making or obtaining, or manufacturing, but to *produce* a thing is simply to place it where it is wanted. If a witness is told to *produce* a deed in court, it means that he is to bring it into court and place it there. Now, if a retail dealer can, by means of money, *draw forth* goods from the shop of the wholesale dealer, and place them in his own shop, he is to all intents and purposes the *producer* of those goods as far as the customer is concerned. He sells the goods to his customer, and thus *draws forth* their price from his pocket, and as the price paid by the customer exceeds the price he paid for them, the operation has *produced* him a profit. Hence the money employed in this way has been *productive capital*.

81. Coals are wanted in a London drawing-room. The miner *produces*, or *draws* them *forth*, from the mine; the carrier *draws* them from Newcastle and *produces*, them in London, and deposits them in the cellar. The footman *draws* them *forth* from the cellar, and *produces* them in the drawing room. Hence all the series of laborers

engaged in bringing them from the mine to the drawing room grate are *productive* laborers.

Hence we see that these writers are correct in including the labor of transport, or circulation, as one species of production. Hence money is employed *productively* not only in obtaining, or manufacturing, but also in *CIRCULATING* commodities.

Now though Credit may be employed as productive capital in any operation that money can, it is chiefly in the great function of circulation, that credit is productively employed in England, though in Scotland, as we shall show below, it has been very extensively employed in other ways.

82. As a simple example of how Credit may be productively employed in retail dealing, we may take this. Suppose a retail dealer buys goods from a wholesale dealer for £100, and sells them for £140 to his customers, he has made a profit of £40, and his money has been employed as productive capital.

If he has no money, and no substitute for money, of course he could buy nothing and make no profits.

But if he has no money, still if the wholesale dealer has confidence in his character and judgment, he may agree to sell him his goods for the promise to receive payment three months hence, say, by which time he may expect to have sold the goods to his customers for money at a profit, out of which he can pay the wholesale dealer. Now, we must observe that the transaction between the wholesale dealer and the retail dealer is equally a *sale*, whether the price be paid in money, or by bill. As soon as the transaction is effected the property in the goods has passed away from the wholesale dealer to the retail dealer, as absolutely as if he had received money for them. And while the retail dealer receives the property in the goods, what he gives in exchange for them is the right, or property, to demand payment in money three months after date, a new property called into existence by the mutual consent of the parties. Now the wholesale dealer charges a higher price when paid in credit, than when paid in money, partly because the payment is deferred, and partly because there is a certain risk, that the retail dealer may not be able to pay his bill. The credit price will probably be £110, where the ready money price was £100. Now suppose that the retail dealer sells the goods to his customers for £140 as before, it is clear that the retail dealer's profit will only be £30, when it was £40 in the former case. But we see this, that exactly the same circulation of goods has taken place by means of Credit, as by means of money, and the retail dealer has made a profit where he would not otherwise have been able to make one at all. He is therefore £30 better off at the end of the transaction, when he has paid his bill, than he was before. Hence his Credit has been productively employed for himself and the public in general, just as much as money would have been. Now, says Mr. Senior, "Economists are agreed that *whatever* gives a profit is capital." Therefore is it not clear that Credit has been capital to him? Is it not clear that Credit has been productive capital in every sense that money could have been?

83. We have exhibited in the last section of this article the astounding self-contradictions of J. B. Say, who first invented the absurd notion

that those who maintained that Credit is capital, said that the same thing could be in two places at once, which has been so heedlessly echoed by many writers in this country. A house divided against itself, we are told, cannot stand. What, then, can be the authority of a writer who has put forth such contradictory opinions as we have printed side by side? We are happy to say that the most recent writers in France, on the subject of Credit, have emancipated themselves from this baseless sentence. Thus M. Coquelin says in his work, *Du Crédit et des Banques*, which contains much that is excellent on the subject, (COQUELIN,) at p. 127.—"Il est donc vrai que le crédit, devant de beaucoup en cela l'effet si lent de l'accumulation et de l'épargne multiplie presque instantanément les capitaux. Et comment? par cela seul qu'il augmente pour chacun le pouvoir d'acheter. Au lieu de réserver ce pouvoir à ceux qui ont actuellement la faculté de payer en deniers comptants, il le donne à tous ceux, et le nombre en est grand, qui offrent dans leur position et leur moralité la garantie d'un paiement futur. En d'autres termes, il le donne à quiconque est capable d'utiliser les produits par le travail. Par là il augmente d'abord le nombre des consommateurs, et particulièrement de cette classe de consommateurs qui n'achètent les produits que pour les employer à la reproduction."

Again, p. 129.—"D'un autre côté, peut-on dire que le crédit par lui-même est *productif*? Il l'est peut-être autant que le commerce, qui lui non plus ne crée, ni ne façonne les produits, bien qu'il y ajoute une valeur par le transport. C'est un mot bien vague et bien élastique que le mot *produire*, et bien subtile est la limite où son application s'arrête. Déjà l'on est convenu, et avec raison, que le commerce est *productif*. Et en effet, quelle différence générique y a-t-il entre le fait de l'homme qui extrait la houille de la mine pour la mettre au jour, et celui de l'homme qui la transporte ou qui distribue au loin? Ni l'un ni l'autre n'a créé, ou façonné la houille; l'un et l'autre ont contribué également à la rapprocher du consommateur, quoique par des moyens divers. Si le premier est un producteur, le second doit l'être; si l'on refuse ce titre à celui-ci, on doit aussi le refuser à celui-là, et voilà un produit sans producteur. Le fait est qu'ils ont concouru tous les deux à donner à la houille son utilité propre, en la mettant aux mains des consommateurs, et qu'il y a par conséquent un travail également *productif* des deux côtés. Or je demande, si l'on ne pourrait pas dire également par induction, que le crédit est *productif*, lorsqu'il évidemment c'est par son influence qu'il tant de matières brutes, précédemment perdues, ou stériles, sont sorties de leur inertie, comme la houille de la mine, pour convertir en produits façonnés ou en capitaux actifs?"

"Je n'insiste pourtant pas sur les mots, pourvu qu'on m'accorde les effets. Que le crédit soit ou non *productif*, qu'il multiplie ou non les capitaux, toujours est-il qu'à son défaut la production languit et la multiplication des capitaux s'arrête."

84. And the same writer, criticising the views of J. B. Say, in the *Dictionnaire de l'Economie Politique*, Art. *Crédit*, says:—"Le crédit ne multiplie pas les capitaux, répète-t-on avec une sorte de complaisance doctorale, il ne fait que les déplacer. D'où l'on conclut que le crédit est

peu de chose. Mais n'est-ce donc rien que le déplacement des capitaux? Dans la constitution actuelle de l'industrie, telle que la division du travail nous l'a faite, le déplacement des capitaux ou des produits est une énorme affaire; c'est tantôt le point de départ, tantôt le complément nécessaire de l'œuvre de la production. Aussi est-ce faute de réflexion qu'on se fait un argument contre le crédit de cette vérité banale. Le crédit ne fait que déplacer les capitaux, soit: mais le commerce que fait-il autre chose? N'est pas son principal office de déplacer les capitaux ou les produits pour les distribuer entre les producteurs et les consommateurs? Est-ce à dire qu'il ne soit point utile? Une route, un chemin de fer, un canal ne servent également qu'à déplacer les produits. Autant peut-on dire de la monnaie qui facilite les échanges, et des échanges mêmes, qui ne tendent pas à d'autre fin. C'est qu'en effet, grâce à la division du travail, le déplacement des capitaux ou des produits est un œuvre immense; c'est presque la moitié de la production même."

85. J. B. Say showed very well that a sale is in fact a demi-exchange. Now Credit resolves an exchange into three parts. The goods are first bought with Credit—that is a complete transaction, there is no further question until the Credit expires. Then the Credit is sold to the buyer of the goods for money, and then money is exchanged away for other goods. And each of these transactions is a complete sale. We shall shew hereafter, however, that in the great majority of cases in modern times, the payment in money is dispensed with altogether, and commercial debts are paid by creating other debts.

86. Adam Smith says the labour of wholesale dealers and retail dealers is productive labour, because it adds to the value of the goods as they pass from one hand to the other. Now this labour simply consists in buying with money, or credit, and the value of the goods is increased in one way just the same as in the other. Where, then, is the difference between money and credit, as productive capital? It is clear there is none at all. Smith says (B. i., ch. x.), "In great towns trade can be extended as credit increases, and the credit of a frugal and thriving man increases much faster than his stock. His trade is extended in proportion to the amount of both, and the sum or amount of his profits is in proportion to the extent of his trade, and his annual accumulation in proportion to the amount of his profits." Here we see that Smith places Credit on exactly the same footing as stock, and if the one is capital, how is the other not? Not only is it true, but a trader may begin without any stock at all, if he have only Credit, and by means of the profits realized by Credit, he may accumulate stock.

87. Even in the very narrow extent to which Credit was developed among the Greeks, Demosthenes says, *πρὸς Δελτίην*, p. 464, 20,—Edit. Reiske,—"*δυσὶν ἀγαθοῖν ὄντων πλούτου τε καὶ τοῦ πρὸς ἀπαντας πιστεύεσθαι, μείζον ἔστι τὸ τῆς πίστεως ὑπάρχον ἡμῖν.*"—"There being two good things, Money and Credit, our more important property is Credit." So in the *Υπὲρ Φορμίωνος*, p. 958,—"*εἰ δὲ τοῦτο ἀγνοεῖς, ὅτι πίστις ἀφορμὴ τῶν πασῶν ἔστι μέγιστη πρὸς χρηματισμὸν, πᾶν ἂν ἀγνοήσῃς.*"—"If you were ignorant of this, that Credit is the greatest Capital of all towards

the acquisition of wealth, you would be utterly ignorant."

88. The only real difficulty in the case arises from the confusion that has been caused by considering Credit to be the transfer of the capital, whereas it is the independent property that circulates as a debt. And this confusion has been greatly produced by the unfounded notion that labor and materiality are necessary to value, or wealth. Directly we observe that it is exchangeability alone which confers value, the whole difficulty of the subject vanishes. Nay, Smith himself, to whom it is generally supposed that the doctrine that labor is necessary to value is due, says, (B. II. C. II. *On Metallic and Paper Money*.) "Let us suppose that the whole circulating money of some particular country amounted at a particular time to £1,000,000. * * Let us suppose too, that some time thereafter, different banks and bankers issued promissory notes payable to the bearer to the extent of £1,000,000, reserving in their different coffers £200,000 for answering occasional demands. There would remain, therefore, in circulation £800,000 in gold and silver, and £1,000,000 of bank notes, or £1,800,000 of paper and money together." Now we see that Smith treats the paper bank notes as valuable property, exactly on the same footing as the gold. He classes them together as undistinguishable; and what are these bank notes? Simply Credit; nothing but circulating debts! Placed exactly on the same footing as gold money! Does not this make debts wealth?

In estimating the currency of the country, every one knows that the gold and silver specie is reckoned, and the quantity of paper currency is added to it. And what is that paper currency? Nothing but Credit, or circulating debts; and it is always reckoned as valuable property. So in our old writers, Bills of Exchange were always called merchandize.

89. So Mr. Justice Byles, in the preface to his *Treatise on Bills of Exchange* p. xii, says—"It will not, perhaps, be an unreasonable inference that the bills and notes of all kinds, issued and circulated in the United Kingdom, in the space of a single year, amount to many hundred millions, and that *this species of Property* is now, in aggregate value, inferior only to the land or funded debt of the kingdom." Here we see that the learned Judge treats the bills and notes as separate, exchangeable, and valuable property on the same footing as land. And as these are only Credit, or rather, merely pieces of paper on which the evidence of the credit or the debt is recorded, it clearly follows that all Credit is valuable property.

If the amount of bills and notes, and other forms of Credit, is not separate and independent valuable property, what is it?

Answer us that, Gentlemen Economists, who laugh at the notion that Credit is Capital.

We may be told that Credit is only a promise to pay, and money is actual payment. But what is money? Are not all Economists agreed that money is merely an order for goods and other things? Mr. Webster said most justly, (*BANKING IN AMERICA*, § 448,) "Credit is to money what money is to articles of merchandize." Now, money, which is a mere bill for merchandize, is valuable property separate from merchandize.

Credit, which is a bill for money, must, by a parity of reasoning, be valuable property separate from money. In truth, the payment of a bill of exchange in money is only the exchange of an instrument of general credit for one of particular credit.

90. Now it is by facilitating exchanges that money becomes productive, it multiplies operations out of which profit arises; the function of Credit is exactly the same, it facilitates exchanges to a very much larger amount than money does, it multiplies operations to a far greater degree than money ever can do, and as it is out of these that profit arises, it of course multiplies profits to many times the extent that money ever can do. Hosts of writers, some of them of the greatest name too, have treated the notion that Credit is productive capital with the greatest ridicule, as is fully shown further on, saying that it does not create products, but only gives greater activity, or circulation, to existing capital. But that is all that money does. Credit cannot make two things out of one. But neither can money. Money cannot create anything, it only imparts activity and circulation. Mr. Mill, whose self-contradictions are fully set forth further on, says that Credit is not *productive* power, but only purchasing power. But what is money? It is only purchasing power. Adam Smith shewed long ago that purchase, or circulation, is one *species of production*!

So also Mr. McCulloch, in censuring Adam Smith's assertion, that the gold and silver money of the country *produces* nothing itself, says in a note—"It is a capital error to affirm that the gold and silver used as money, *produce* nothing, on the contrary, it is quite obvious that by facilitating exchanges, and enabling the division of labour to be carried to a much greater extent than it could be under a system of barter, they are in *no ordinary degree productive*." Now, Credit does exactly the same thing as money, and therefore it is in no ordinary degree productive also.

91. Hence, whatever money can do in the way of production, Credit can do, which is not surprising, considering that money is only one form of Credit. The fact is that Credit is the *inverse* of money. To trade with money is to trade with the earnings of *past* industry, to trade with Credit is to trade with the expected proceeds of *future* industry. Hence, if money is positive, by the ordinary laws of Natural Philosophy, Credit is negative.

92. It is somewhat curious to observe the identity of thought between the early Algebraists and the Economists. The early Algebraists were sorely puzzled by the appearance of negative roots in equations. Being unable to divine their meaning, they called them *res*, or *estimaciones fictæ*, or *fictitious* roots, and this name appears so late as Descartes. Cardan was the first to discover their true signification,—that they are simply *inverse* to the positive ones, but equally real and independent quantities. The very same name is very common for paper credit. Economists very frequently call it *fictitious capital*. The least reflection will show that the analogy between money and Credit is exactly that between the positive and the negative roots of equations. The one is simply the inverse of the other. The only writer, that we know of, who has truly ex-

pressed it is Bastiat, and, alas! we have to touch him too for inconsistency on this subject. He says, (*Harmonies Economiques*, Art. *Capital*, Vol. VI. p. 219. edit. 1855), "Ce qui est plus surprenant encore, c'est que nous pouvons faire l'opération INVERSE, quelque impossible qu'elle semble au premier coup d'œil. Nous pouvons convertir en instrument de travail, en chemin de fer, en maisons, un capital qui n'est pas encore né, utilisant ainsi des services, qui ne seront rendus qu'au xx^e siècle. Il y a des banquiers qui en font l'avance sur la foi que les travailleurs et les voyageurs de la troisième ou quatrième génération pourvoient au payment; et ces titres sur l'avenir (i.e. instruments of Credit), se transmettent de main en main sans rester jamais IMPRODUCTIFS."

This is exactly the very doctrine we have been endeavouring to explain. In commerce these *titres sur l'avenir*, or instruments of Credit, are not drawn upon the third and fourth generation, but they are drawn payable three or four months hence, and are exchangeable property, and made productive capital by circulating merchandize.

93. We shall now quote from several well-known writers to show that they all maintain the doctrine, that Credit is productive capital. With respect to Adam Smith, in addition to what we have quoted above, we may refer to an examination of his opinions on Credit, in the last division of this treatise. Mr. McCulloch says in his *Dictionary of Commerce*, Art. *Banking*,—"Those who issue such notes, coin as it were their credit. They derive the same revenue from the loan of their written promises to pay certain sums, that they would derive from the loan of the sums themselves; and while they thus increase their own income, they at the same time contribute to increase the wealth of the society."

Therefore, Mr. McCulloch clearly asserts that Credit is productive capital.

94. Mr. J. S. Mill says, (*Book III. Chap. XXII. § 2.*)—"The value saved to the community by thus dispensing with metallic money, is a clear gain to those who provide the substitute. They have the use of twenty millions of circulating medium, which have cost them only the expense of an engraver's plate. If they employ this accession to their fortunes as *PRODUCTIVE CAPITAL*, the produce of the country is increased, and the community benefited as much as by any other capital of equal amount."

Therefore, Mr. Mill clearly asserts that Credit is productive capital.

95. Mr. Gilbert says, (*Logic of Banking*, p. 46).—"Bankers also employ their own Credit as capital. They issue notes, promising to pay the bearer a certain sum on demand. As long as the public are willing to take these notes as gold, they produce the same effects. The banker who makes advances to the agriculturist, the manufacturer, or the merchant in his notes, stimulates as much the productive powers of the country, and provides employment for as many laborers, as if by means of the philosopher's stone he had created an equal amount of solid gold. It is this feature of our banking system that has been most frequently assailed. It has been called a system of fictitious credit—a raising the wind—a system of bubbles. Call it what you please, we will not quarrel about names, but by whatever name you

please to call it, it is a powerful instrument of production. If it be a fictitious system, its effects are not fictitious, for it leads to the feeding, the clothing, and the employing of a numerous population. * *

"Thus a banker, in three ways, increases the productive power of capital. 1st,—he economises the capital already in a state of employment. 2ndly—by the system of deposits he gives employment to capital that was previously unproductive. 3rdly—by the issue of his own notes he *VIRTUALLY CREATES CAPITAL by the substitution of CREDIT.*"

Thus Mr. Gilbert clearly asserts that Credit is productive capital.

96. In *BANKING IN AMERICA*, § 421, we have shown that Mr. Hamilton, the Secretary to the Treasury, in his report on banking, clearly showed that banking increases the productive capital of a country. And in the same article, § 443, Mr. Webster, the great lawyer and statesman, said in the senate,—"*Credit is the vital air of the system of modern commerce. It has done more, a thousand times, to enrich nations, than all the mines of all the world. * * Credit is to money what money is to articles of merchandize. * ** It is very true that commercial credit, and the system of banking as a part of it, does furnish a substitute for capital."

Therefore, Mr. Hamilton and Mr. Webster clearly assert that Credit is capital.

97. M. Gustave du Puynode says, (*De la Monnaie, du Crédit*, p. 110.)—"Sifécondes qu'aient été les Mines du Mexique et du Pérou, dans lesquelles devait longtemps encore après Colomb sembler enfouie la fortune de l'univers, il y a cependant une découverte plus précieuse pour l'humanité, et qui a déjà procuré plus de richesses que celles des Amériques : c'est la découverte du Crédit. Monde tout imaginaire, mais vaste comme l'espace, inépuisable comme les ressources de l'esprit."

This passage plainly asserts that Credit is productive capital.

Hence we fully conclude that

CREDIT IS PRODUCTIVE CAPITAL.

Such are the Elements of the Theory of Credit.

SECTION III.

ON THE MECHANISM OF THE SYSTEM OF CREDIT.

98. We have obtained, then, as the fundamental conception of the nature of Credit, that it is the *Present Right to a Future Payment*, which is property capable of being valued; and therefore wealth, as Aristotle said; moreover it is exchangeable, and is purchasing power, nay, the greatest purchasing power in modern commerce, and therefore wealth, as Mr. Mill says.

It will be found that this is the great idea upon which the whole system of Credit, in all its varieties, rests. It at once marks out its *nature* and its *limits*. And it will be found that all commercial catastrophes have arisen from transgressing these limits.

99. We shall now endeavour to explain to our readers the mechanism of the great system of Credit.

Credit is embodied in two ways: one in a form not adapted for general circulation, or else in

paper documents, which are more or less adapted for general circulation.

The former consists of the book debts of traders. In these the Credit moves once from the purchaser to the vendor, but being locked up in the books of the traders, never circulates further. The amount of Credit in this form in this country is incalculable, and there is no possible means of forming the most distant conception of its amount.

In the second form Credit is recorded in paper documents, which may circulate more or less generally. These paper documents are of two different forms;

ORDERS to pay, including Bills of Exchange, Cheques, Bankers' Drafts, Exchequer Bills, &c., &c.

PROMISES to pay, including Bank Notes, Promissory Notes, Deposits, &c.

Orders to pay are generally called *Bills*, and Promises to pay are generally called *Notes*. As the peculiarities of these different forms of Credit are fully explained under their respective heads, we shall not detain our readers by explaining them here, but shall assume them as known.

100. The system of Credit forms two great divisions. The first is *Commercial Credit*, in which traders of all sorts buy commodities by creating debts, payable at some time after date. The second is *Banking Credit*, in which bankers buy money and commercial debts, by creating debts, usually payable on demand.

101. Moreover, the system of Credit may, in another way, be conveniently divided into two parts. Credit, being exchangeable property, like money, may be used either to circulate existing products, or to call them into existence. That is, it may be based either on the simultaneous transfer of a commodity, or it may be created to produce one. It is by no means uncommonly supposed that the former is the only legitimate use of Credit, and that the latter is fraudulent. We shall see, however, that this doctrine is quite unfounded. But the fact is, that certain documents of the second form having been very grossly misused for fraudulent purposes, it has brought the whole system into groundless obloquy. We shall endeavour, in explaining the system of this second form, to point out in what the abuse of it, and the danger really consist.

On the System of Credit based upon Simultaneous Transfers of Commodities.

102. Goods or commodities, in the ordinary course of business, pass through the following hands:—1st, the foreign importer; 2ndly, the wholesale dealer; 3rdly, the retail dealer; 4thly, the customer or consumer. To the first three of these persons these goods are *capital*; because they import, manufacture, or buy them, for the sake of selling them with a profit; the fourth buys them for the sake of use or enjoyment. The price the ultimate consumer must pay for them, must evidently be sufficient to reimburse the original expense of production, together with the profits of the three succeeding operations.

103. Now, leaving out of the question at present, how the importer of the goods gains possession of them, which concerns the foreign trade of the country, which we do not touch upon here,—if he sells the goods to the wholesale dealer for ready money, he can, of course, immediately import, or produce, a further supply of goods in

the room of those he has disposed of. In a similar way the wholesale dealer sells to the retail dealer, and if he were paid in ready money, he might immediately effect further purchases from the merchant to supply the place of the goods he had sold. So also if the retail dealer were always paid in ready money by his customer, he might replace the part of his stock that was sold, and so if everybody had always ready money at command, the stream of circulation, or production, might go on uninterruptedly, as fast as consumption or demand might allow.

104. This, however, is not the case. Few, or no persons have always ready money at command for what they require. Very few traders can commence with enough ready money to pay for all their purchases; and if the stream of circulation, or production, were to stop until the customer had paid for the goods in money, it would be vastly diminished.

105. Now let us suppose that the merchant having confidence in the character of the wholesale dealer, agrees to sell the goods to him, but not to demand money for them till a certain period afterwards. He accordingly parts with the property of the goods to the wholesale dealer, exactly as if he had been paid in money, and receives in return the right to demand payment some time after date. Now the very same circulation of goods has taken place as would have been caused by money. The only difference is, that the actual payment is postponed, and for this the merchant charges a certain price. This debt may be recorded in two ways: it may either be simply recorded in the merchant's books, or else in a Bill of Exchange. But it is quite clear that the property is absolutely the same in whichever form it is, though one form may have more conveniences than the other.

In a similar manner, the wholesale dealer may sell for Credit to the retail dealer, and this debt may be recorded in two forms, like the first, either as a book-debt or in a Bill of Exchange. As in the former case the same circulation, or production, has been caused by Credit, as by money. Lastly, the retail dealer may sell to his customer on Credit, and this debt may also be recorded in two forms, either a book-debt or in a Bill of Exchange. In this latter case the debt is very seldom embodied in a Bill of Exchange, it most frequently rests as a book-debt. But in this case, as well as in the former ones, Credit has had precisely the same effect as money in circulating goods. Hence we see that Credit has had precisely the same effect as money in circulating the goods from the merchant to the consumer. Moreover, we see that the passage of the goods through these various hands has generated a debt at each transfer. Supposing the merchant sold the goods for a debt of £100 to the wholesale dealer, the wholesale dealer would probably sell them for a debt of £140 to the retail dealer, and the retail dealer would sell them to different customers for debts, not less probably in the whole than £200. Hence we see that the successive transfers of the same goods have generated debts to the amount of £440. Thereby exemplifying the distinction we have already pointed out between Credit and Bills of Lading, because, if the goods had passed through 20 hands, the same Bill of Lading would always have accompanied them.

106. Now the debt for which the merchant sold the goods to the wholesale dealer is no doubt valuable property to him, because he knows it will be paid in time. It may, moreover, be exchanged for anything else like any other property, if any one will take it. But it is of no immediate use for what the merchant or manufacturer probably wants at the time, namely, money to buy more goods, or to pay wages, &c. Moreover, though he may be quite satisfied as to the safety of the debt, from his knowledge of his customer, it does not follow that others who don't know him will. Consequently such a debt would not be well adapted for general circulation, and therefore it would be of no use towards further production. In a similar way, the debt for which the wholesale dealer sold the goods to the retail dealer, would not be well adapted for general circulation, and therefore could not conduce further to production. The debts due by customers to retail dealers, seldom do conduce to further production, because they are most frequently merely in the form of book-debts.

107. Now, the merchant would probably sell to a great number of wholesale dealers whose debts would fall due at different times, and therefore a certain stream of money would always be coming in, to enable him to continue production. Similarly, the wholesale dealer would sell to a great variety of retail dealers, whose debts would fall due at different periods, and so a certain stream of money would always be coming in to enable him to continue production. Similarly, the retail dealer sells to a great variety of customers, a great many of whom pay him ready money at the time of the purchase, as casual buyers, and his customers too, pay him money, by which he can continue to make purchases and keep up the stream of production. And therefore, this would greatly facilitate circulation or production.

108. And this we believe is the extent to which Credit in ancient times went. It did not go beyond book debts, at least as far as we have been able to discover. But all such statements must be made with the greatest reserve, because it is most unsafe to assert anything on merely negative evidence.

109. Credit, so far even as this, would be of great assistance to production, and the vast amount of it generated in this manner would be valuable property to its owners. But it is manifest that it would be of no further immediate use to them. It might therefore be aptly compared to so much dead stock. The next grand improvement would be to make this dead stock negotiable, or exchangeable. And in this, we believe, consists the great difference between modern and ancient Credit. The great modern discovery is to make the debts themselves saleable commodities. To sell them either for ready money, or for other debts of more convenient amount, and immediately exchangeable for money on demand, and therefore equivalent to money.

110. There are two classes of traders whose especial business is to buy these commercial debts, and so to give activity and circulation to this enormous mass of valuable property, and to convert it from dead stock into further productive power. The first class of these traders are called *BILL DISCOUNTERS*, i. e., *buyers of debts*; as we

have explained above, they buy these debts with money. The second class are called *BANKERS*; and they buy these commercial debts, by creating other debts payable on demand.

111. As according to the prejudices of trade, the business of bill discounting is considered inferior to that of banking, and as it is unquestionably a much less powerful instrument of commerce, our remarks will be confined to banking, and we shall explain how it converts that mighty mass of commercial debts from dead stock into productive capital.

112. We need not describe here how bankers receive money from their customers and give them in exchange for it Credit, or the right of transferring the debt payable on demand, for that is fully described under *BANK*. We have there also described how bankers changed the form of this Credit from a Promissory Note, given at the time of exchange, and capable of circulating in commerce just like money, into a Credit created in their books, called a *Deposit*, and to be drawn against by cheques, which are *Bills of Exchange* payable on demand. We have also shewn there the important consequences which flowed from this apparently unimportant change being the means, in fact, by which the monopoly of the Bank of England was broken in upon, and the London Joint Stock Banks founded.

113. Banks, then, as far as regards our present subject, are shops opened for the purpose of buying these commercial debts. The merchant draws a bill upon the wholesale dealer, who accepts it, and thus becomes the principal debtor on the bill. The merchant then takes the bill for sale, or discount, as it is technically termed, to his banker. It is usual to make bills payable to the drawer, or his order, which is signified by writing his name on the back of the bill. (*BILL OF EXCHANGE*). The merchant, therefore, writes his name on the back of the bill, and sells it to the banker, and this operation is termed *INDORSING* the bill. But the indorsement has another effect besides merely assigning over the debt to the banker, for unless specially guarded against, it makes him a surety for the payment of the bill, in case the acceptor does not pay it. The effect, therefore, of the indorsement, is a sale of the debt, and a warranty of its soundness. But this warranty is not an absolute one, but only a limited one; and the conditions are fully explained under *INDORSEMENT*. The banker, therefore, buys this debt with a limited warranty of soundness, by creating another credit, either as in former times by giving the merchant the amount, less the discount, which some banks are permitted to do now, or else by writing down a similar amount to the credit of his account, which Credit is called a *Deposit*, and giving the merchant power to draw upon him at pleasure and at demand. Thus we see that the banker has bought one debt, which is valuable property, by creating another debt, which is also valuable property, and is equivalent to ready money to the merchant. And we must particularly observe that this is not a cancelment of debts, as many suppose, but an *exchange* of valuable property.

114. The merchant has, however, a great many other similar debts, because he has sold to a great many wholesale dealers, and he will probably want to sell these in a similar way to his banker.

The merchant will, therefore, indorse each of them over to his banker, thereby making each of the acceptors the principal debtor to the banker, but at the same time becoming himself responsible if any of them fail to pay his debt. If, therefore, the banker discounts the bills of 20 acceptors, he will have 20 principal debtors, who are each of them bound, under the penalty of commercial ruin, to pay their debts when they are due. The merchant, however, is surety for each of them, and as it may happen that out of so many, some may make default, the banker usually stipulates that the merchant shall leave a certain amount of deposit on his account by way of additional security. If any acceptor then make default, the banker immediately debits the account of his customer with the amount, and gives him back the bill. Thus, to a certain extent, the banker always keeps the means of paying himself in his own hands, besides having his customer's name on the bill, which makes his whole estate liable, and even should his customer fail, he retains the right to have his debt paid out of the estates of both the principal and surety.

115. The wholesale dealer has given his acceptance for the goods, and he sells them to the retail dealer, and takes his acceptance for them. In a similar manner he wishes to sell this debt to his banker, and so convert it into productive capital. A similar transaction takes place as in the former case. The wholesale dealer sells the debt of the retail dealer, and becomes himself surety for its payment to his banker. The banker also buys this debt by creating another debt payable on demand, which is equivalent to ready money.

116. The retail dealer may also draw upon his customers, though this is comparatively rare, because customers are generally beyond the pale of commercial law.

117. By these means we see that the dead stock of commercial debts are converted into productive capital. The merchant and the wholesale dealer, have now the full command of ready money for any purposes they require, and can continue the stream of production without interruption, and as their bills fall due, all they have to do is to give an order on their banker.

118. These are the fewest number of hands that goods in the ordinary course of business pass through, and it is clear that in their passage from the manufacturer to the customer, they will give rise to at least two bills, and sometimes three. They are all regular business bills, they originate from real transactions, and they are what are called real, or value bills, and they are what arise out of the regular and legitimate course of business and are the great staple of what bankers purchase. It is a very prevalent belief among commercial men that business bills are essentially safe, because they are based upon real transactions, and always represent property. But the foregoing considerations will dispel at once a considerable amount of the security supposed to reside in commercial bills on that account, because we have seen that in the most legitimate course of business, there will generally be two bills afloat, originating out of the transfers of any given amount of property, so that in the ordinary way there will be at least twice as many bills afloat as there is property to which they refer.

119. We must refer to the article *BANK*, for an

exposition of the mechanism of banking, shewing how the creation and exchange of debts is made in modern commerce to perform the part of money. We will only observe here that the manufacturer, the wholesale dealer, and the retail dealer may all be customers of the same bank, and if they all have their bills discounted by it, it will purchase a whole series of debts arising out of the transfers of the same property.

120. The above operations are only what arise in the ordinary course of business; it may sometimes happen that property may change hands much more frequently, and at every transfer, a bill may be created. Hence, when the credits are very long, and the transfers numerous, it is easy to imagine any number of bills being created by repeated transfers of the same property. In times of speculation, this is particularly the case. Now all these bills are technically commercial, or real, bills, but it is evidently a delusion to suppose there is any security in them on that account. The fact is, that the whole misconception arises from an error in the meaning of the word "represent." A bill of lading does, as we have said above, *represent* property, and whoever has the bill of lading, actually has so much property. But a Bill of Exchange does not *represent* goods at all. It represents nothing but *debt*, not even any specific money. It is created as a substitute for money, to transfer property, but it does not represent it any more than money represents it. This was long ago pointed out by Mr. Thornton in his work quoted above, (p. 30) "In order to justify the supposition that a real bill, as it is called, represents actual property, there ought to be some power in the billholder to prevent the property which the bill represents, from being turned to other purposes than that of paying the bill in question. No such power exists; neither the man who holds the bill, nor the man who discounted it, has any property in the specific goods for which it was given." This is perfectly manifest. It is both contrary to the law and the nature of Bills, that they should be tied down to any specific goods. And it shews that the real security of the bill consists in the general ability of the parties to it to meet their engagements, and not in any specific goods it is supposed to represent, the value of which is vague or illusory, and impossible to be ascertained by any one who holds or discounts it.

121. The distinction between Bills of Lading and Bills of Exchange is of so subtle a nature, but is of such momentous consequence, that we may illustrate it still further. The preceding sections shew that any given amount of property may by repeated transfers give rise to any amount of bills, which are all *bonâ fide*, just for the same reason that every transfer would require a quantity of money equal to the property itself to transfer it. Then, even supposing the price remained the same at each transfer, it would require twenty times £20 to circulate property of the value of £20 twenty times. But also £20 by twenty transfers may circulate property to the value of twenty times £20. So also a Bill of Exchange may represent the transfers of many times the amount of property expressed on the face of it. This is the case whenever the bill is indorsed, or passed away for value; and the bill represents as many additional values expressed on the

face of it as there are indorsements. Thus, let us suppose a real transaction between A and B. A draws upon B. That shews the bill has effected *one* transfer of property. A then buys something from C. It is clear that C might draw upon A, in a similar way that A drew upon B. But instead of that, A may transfer the Bill on B, by indorsement. It has now effected *two* transfers of property. In a similar way, C may buy from D, and in payment of the property may indorse over the bill to D. The bill then represents *three* transfers of property. In a similar way it may pass through an unlimited number of hands, and will denote as many transfers of property. When C indorsed over the bill to D, he merely sold to him the debt which A had previously sold to him. Now that might be done, either by drawing a fresh bill on B, cancelling the first, or simply indorsing over the bill he received from A. Hence we see that every indorsement is equivalent to a fresh drawing. But if he draws a fresh bill on B, it will represent nothing but B's debt to him, whereas, if he indorses over the bill he received, it will represent B's debt to A, A's debt to C, and C's debt to D, and, consequently, it will be much more desirable for D to receive a bill which represents the sum of so many previous transactions, and for the payment of which so many parties are bound to the whole extent of their estates. Some thirty years ago, almost the entire circulating medium of Lancashire consisted of Bills of Exchange, and they sometimes had as many as 150 indorsements upon them before they came to maturity. From this also we see that no true estimate can be formed of the effect of the bills of exchange in circulation, by the returns from the Stamp Office, as has sometimes been attempted to be done, as every fresh indorsement is in effect a new bill. So that the useful effect of a bill of exchange is indicated by the number of indorsements upon it, supposing that every transfer is accompanied by an indorsement, which is not always the case. We see here the fundamental difference between Bills of Lading and Bills of Exchange, because the indorsements on the former denote the number of transfers of the same property; the indorsements on the latter denote the number of transfers of *different* property. Ten indorsements on a Bill of Lading shew that the same property has been transferred ten times, but ten indorsements on a Bill of Exchange shew that ten times the amount of property has been transferred once.

122. We have shewn that the prices of all commodities are universally governed by the Law of Supply and Demand at all times (CONTINUITY, LAW OF; PRICES, THEORY OF). If the supply be excessive, nothing can prevent the price from falling to any state of depression, until it becomes absolutely unsaleable. The commodity, therefore, will not pay the cost of its production, and unless those concerned in producing it have independent capital to enable them to hold on until the excessive supply is taken off, and save them from selling when the price is ruinously depressed, or to stand the losses, they will all fail.

123. Almost all men in commerce are under obligations; that is, they accept Bills of Exchange which must be paid at a fixed time, under the penalty of commercial ruin. To meet these obligations due by them, they have property of

two sorts—debts, or obligations due to them; and secondly, commodities. To meet their own obligations, they must sell one or other of these kinds of property. They must either sell their debts to their bankers, or they must sell their commodities in the market. While credit is good—that is, while bankers buy debts freely, they can retain their commodities from the market, and watch their own opportunity of selling at a favourable moment. As their own obligations fall due, they sell to their bankers some of the debts due to them. Thus, if credit were always good, they might go on for ever without the necessity of ever having a single piece of money paid into their account, or having any money at all beyond what is necessary for their petty daily transactions. But if credit receives a check, and the banker refuses to buy their debts, they must still meet their own obligations, under penalty of ruin. They are consequently obliged to throw their commodities on the market, and sell them at all hazards, the supply of them becomes excessive, and inevitably depresses the price. Traders who have capital enough of their own to meet their engagements without discounting, are able to keep their commodities back from the market, until, the extra supply being exhausted, prices rise again, from the natural operation of the demand. Bankers, we have shewn, always buy the debts of traders by creating debts of their own, which are called their “issues,” and when bankers refuse to buy the debts of traders, they are said to “contract their issues.” Consequently, a contraction of issues, or of discounts, is generally followed by a fall in prices. And this fall in prices happening coincidentally with a contraction of issues, is frequently supposed to be caused directly by the diminished amount of currency compared to commodities, which is to a great extent erroneous, because it is in reality caused by the extra quantity of commodities, which a refusal to discount debts, causes to be thrown upon the market.

124. We see, then, how utterly impossible it is to ascertain the precise effect of the contraction of issues of banks upon prices, because the change is principally produced by the quantity of produce which traders are compelled to sell to meet their engagements, when the negotiability of their debts receives a check, and of course similar circumstances not only compel traders to sell, but prevent others from buying. Consequently, the supply is greatly increased, and the demand greatly diminished. If, however, the holders of one commodity are possessed of much independent capital, and are not compelled to realize to meet their engagements, a contraction of issues would not affect them much. On the other hand, if the holders of another commodity were in general men who depended chiefly on credit, and were compelled to sell at a sacrifice to meet their engagements, a sudden refusal to discount for them would cause an extraordinary quantity of their produce to be thrown upon the market, and cause a ruinous depression of price.

125. It is the sudden failure of confidence and extinction of credit, which produces what is called in commercial language a “pressure on the money market,” and which causes money to be “tight.” When money is said to be scarce, it does not mean that there is a smaller quantity of money

actually in existence than before; there may be more, or there may be less in the country, no one can tell what the amount of money in existence is; but a great amount of credit, which serves as a substitute, and was an equivalent for money, is either destroyed altogether, or is suddenly struck with paralysis as it were, and deprived of its negotiable power, and, therefore practically useless. A vast amount of property is expelled from circulation, and money is suddenly called on to fill the void. When a new field of commercial adventure is found by sagacious discoverers, or a new market is suddenly thrown open by a change in the commercial policy of foreign nations, the first adventurers usually reap enormous profits. As soon as this becomes known, a multitude of other speculators rush into the same field, excited by the profits reaped by the first. Numbers of merchants and traders purchase commodities on credit, that is, they incur obligations which they must discharge at a future day, in the hopes that the returns will come in before the day of payment. But the immense quantity of goods poured in usually glut the market in a short time, and from the excess of supply, prices tumble down often to nothing, so that the goods become unsaleable, and either no returns at all come in, or such as are quite inadequate to meet the outlay. When this occurs, it is called *overtrading*, and when this has been extensively practised, it is necessarily and inevitably followed by a great destruction of credit, and a great demand for cash. Thus, credit is destroyed faster than operations can be reduced in proportion. Those traders who have not received the returns they counted upon to meet their engagements, must raise money on any terms, and perhaps sell what property they have, at any sacrifice, to save themselves from ruin. The effect of this will be that money, for which there is an intense demand, will rise greatly in value, that is, discount will rise very high. But as a necessary concomitant of such a state of things, a great quantity of goods will be thrown upon the market, and their price will be enormously depressed. These circumstances will, therefore, produce a very high rate of discount, and ruinously low prices, which must continue until the excessive supply of goods is exhausted, and confidence revived. In such cases as these, traders who have not sufficient capital of their own to meet their engagements, and hold on their goods until prices rise, will infallibly be ruined. Under such circumstances, the rate of discount bears no relation whatever to the rate of profit. The use of ready money to persons who have overtraded, is of infinitely more consequence than the price they have to pay for it. It may be well worth their while to pay 15, or 20, or even 50 per cent. for the use of money for a temporary emergency, which may save them from ruin, and enable them to maintain their position.

126. It is, therefore, not the scarcity of money, but the extinction of confidence, which produces a pressure on the money market: and an examination of all the great commercial crises in this country, will shew that they have always been preceded and produced by a destruction of this credit, which has usually been brought about by extravagant overtrading and wild speculation, as may be seen under *CRISIS*, COMMERCIAL.

127. The principle that the relation between supply and demand is the sole regulator of value, combined with the action of the credit system, will explain all the phenomena witnessed during a pressure on the money market. The failure of credit in any one branch of business will produce its full effect on the general market rate of interest, because that is regulated by the intensity of the demand for money from whatever quarter it comes. But it will not necessarily follow that the market prices of all commodities will be depressed. The market price for each commodity will be governed entirely by its own peculiar circumstances. If the holders of one commodity have independent capital, and have prudently abstained from overtrading, the price of such a commodity will not suffer much, because the ratio of supply and demand will not be altered to any great extent, but it cannot help sympathising to a certain extent with other commodities. But if the holders of another species of commodity have overtraded, and depended too much on credit, without sufficient means, they will necessarily be obliged to throw a great quantity of their produce on the market to realize, and this excessive supply will depress the price. And this effect will be increased, because such are the very times when persons who have ready money are particularly cautious in buying, partly because they always hope the market will fall still lower, and they hope to buy cheaper when prices have fallen to a minimum, and they will certainly not buy more of any commodity than they can help, which is diminishing in value; and partly because they must keep their ready money to maintain their own position. From these causes, not only is the supply increased, but the demand is diminished, so that the fall is doubly aggravated. Thus, we see at once, that a falling market will always be well supplied, because people who must sell, hasten to do so before the price falls still lower, and buyers hold aloof, waiting as long as they can, to see the lowest. On the other hand, when markets are rising, the case is reversed. The sellers hold aloof, hoping the price will be still higher, and buyers crowd in, hastening to purchase before the price rises more. A market that is desponding and inactive will usually continue so until people are persuaded that things are at the lowest, and are at the turn. It is evident that these considerations and observations apply to home produce, or at least to produce which is already in this country, and which can be thrown on the market immediately. In order to attract foreign produce, the market must rise high for a considerable time, with the appearance of continuing so.

128. Considering that any bill whatever which is drawn against *bonâ fide* produce is in commerce technically a real bill, it will be seen at once that their supposed security is greatly exaggerated, because any operation, however foolish and absurd, is a good basis for a real bill. In times of rapid changes in price, multitudes of bills will be generated by speculative purchasers, and when the price falls as rapidly as it rose, as it usually does, it is simply *occupat extremum scabies*. Hence, losses, and very severe ones, too, are sure to happen in such times. But there is always at least this certainty with real bills.

When persons have speculated unluckily and lost their fortunes, they are brought to a standstill. When a man has ruined himself by speculation, no banker out of Bedlam would advance him more money to speculate with. Hence, ill-judged speculation must stop a man's mischievous career in a comparatively short space of time, that is, whenever he has lost the value of the goods he has been speculating with. We shall find in the next section, unfortunately, that traders have devised a method to extract funds from bankers to speculate with, by which they can go on long after they have lost all they ever had, many times over, and adding loss to loss, until, perhaps, they may bring down their bankers, whom they duped and defrauded, as well as themselves. We have shewn in the next section, that there are symptoms which will often indicate a commercial crisis.

On the Theory of Cash Credits, Open Credits, and Accommodation Bills.

129. The operations on Credit, which we have hitherto been considering, were all based on an anterior operation, or one in which an exchange of commodities was affected by the creation and sale of the Credit, which Credit was afterwards sold or exchanged for another Credit. Such Credit is, therefore, manifestly limited by operations which have been made, and by commercial exchanges. The number of Bills created could by no possibility exceed the number of transfers of commodities, although they might be greatly less, because, as we have seen, a single bill might be used to effect many transfers of property. In all these cases, a debt has been created, which was expected to be paid out of the proceeds of the sale of existing property.

130. But since Credit is, as we have shewn, exchangeable property, and a substitute for money, it is clear that it may be applied as well as money to bring new products into existence. The limits of it in this case will be exactly the same as those in the former case, namely, the power of the proceeds of the work to redeem the Credit.

131. As an example of such a creation or formation of a product, we may take such a case as the following. Suppose the corporation of a town wishes to build a market hall, but has not the ready cash to buy the materials, and pay the builder's and workmen's wages. It may be a matter of certainty, that if the market were once built, the stalls in it would be taken up immediately, and the rents received from them would liquidate the debt incurred in erecting it. But, as the workmen cannot wait until that period, but require immediate cash to purchase necessities, it is clear that unless there is some method of providing ready payment, they cannot be employed. In such a case, they might borrow money upon their own bonds, repayable at a future period. Now here we observe that these bonds are the creation of property. They are the right to demand a future payment, and are valuable exchangeable property, which may be bought and sold like anything else. In this case, we observe there is an exchange. But the Corporation need not borrow money. They might make their own obligations payable at a future date. And if these were made small enough, and were readily received by the dealers in the town,

they might be used in the payment of the workmen's wages, and perform all the functions of a currency, and be equivalent to money. Each of them is a new right created, and valuable property, which is exchangeable, and, therefore, wealth, by the definition. They would be quite as efficacious in *producing* or forming the market hall as real capital. And the market hall itself would be capital, because it produces a profit. As the stalls were let and rent received for them, the bonds might be reduced, and the debt cleared off. It is said that many market places have been built by adopting such a plan. This case shews the utter futility of the notion that credit cannot be applied to the formation of products, and here we see it was not based on any anterior operation.

132. But as a more remarkable example of the powers of credit, we will take the Cash Credit system of Scotland.

We have explained under CASH CREDIT, the origin of this species of Credit, which we need not repeat here.

Now let us suppose that a rich proprietor should buy an unimproved part of the country, but one capable of being improved, with a considerable amount of idle persons upon it, who did nothing all the year round beyond the small amount of labour necessary to obtain some miserable food. This proprietor seeing the capabilities of the country, takes with him 1,000 sovereigns, and employs them in bringing the land into cultivation, in paying wages, and setting people to work. By these means the country is, in a few years, converted from a barren moor into fields of corn. Would not every one say that these 1000 sovereigns have been employed as *Productive Capital*? Of course every one would say so.

133. Now let us suppose that the circumstances and capabilities of the country are precisely the same, but the proprietor has no money. Suppose now a great Edinburgh bank seeing this state of matters, and the great undeveloped resources of the district, opens a branch in it, and sends down a boxful of £1 notes.

It is quite evident that as long as these notes remain in the coffers of the bank, they are nothing at all. They are only so many bits of paper, which convey no rights to any one. But as soon as the bank consents to issue them the case is totally changed. For whoever receives them from the bank, receives the right to demand one pound in gold from the bank, and it is very manifest that this is valuable property. Here, therefore, is a new property created of which the notes are the evidence. For it may not be superfluous to observe that it is not the notes, exactly, which are the property, but the engagement of the bank to pay the sum on demand, of which the evidence is recorded on the note, and by means of which it is transferred.

134. Now as we define the value of a thing to be the thing for which it will exchange, it is quite evident that these notes are valuable things, in fact, are of the value of money, because they can be exchanged for money on demand. And this valuable property may be transferred from hand to hand, like any material substance whatever. It is in all respects as transferable as money itself, and, therefore, by the very force of the

definition of wealth, which is anything which has purchasing power, or is exchangeable, it is wealth. And it is notorious that the quantity of paper currency in a country is always reckoned cumulatively to the gold and silver money. And we have shewn below that every Economist does so.

135. Of course we need scarcely observe that as wealth depends upon the single idea of exchangeability, such things are only wealth within the area in which they can be exchanged. Such a bank note, therefore, is only wealth within the limits of Scotland, within which it has purchasing power. Our readers will therefore perceive clearly the manifest truth, that the creation and issue of Bank Notes is the creation and issue of distinct articles of property.

136. The bank, therefore, perceiving the capabilities of the country, and having confidence in the skill, industry, and honesty of the farmers, or proprietors—which in fact may all be summed up in the word character—and upon receiving collateral security against loss if necessary, creates and issues these notes—valuable property—as loans to the farmers. These notes are employed exactly in the same way that money would have been. The people are set to work, the land is reclaimed and stocked, and in a few years what was a bleak and barren moor, is changed into fertile fields of waving corn.

Now, we ask, who in their senses can deny that these notes have been *productive capital*, exactly as much as money would have been?

137. Now when the time for repayment comes, it may be made in three ways. We may suppose that more than one bank has established branches in the district. When the farmer therefore has sold his produce in the market, he may receive for it, either money, or the notes of another bank, or notes of the bank which has made him the loan, or any combination of these. He may therefore pay the bank in money, or in the notes of another bank, or in its own notes. Now we have observed that money is positive property, so the notes, or the debt of a bank, are positive property to the holders of them, though negative to the bank itself. By paying the bank therefore in money or in the notes of another bank, that is transferring to them positive property. But paying the bank in its own notes is the release of a debt, or the taking away of negative property.

We observe, therefore, that in commerce, the *Payment of Money* and the *Release of a Debt*, are in all cases absolutely equivalent. Which is a practical commercial example of the Algebraical doctrine that $+$ \times $+$ is in all cases absolutely equivalent to $- \times -$.

138. The banks, it is to be observed, always limit their advance to a certain moderate amount, varying from £100 to £1,000 in general, and they always take several sureties in each case, never less than two, and frequently many more, to cover any possible losses that might arise. These cautioners, as they are termed in Scotch law, keep a watchful eye on the proceedings of the customer, and have always the right of inspecting his accounts with the bank, and have the right of stopping it at any time, if irregular. Moreover, the banks themselves do not permit these credits to degenerate into dead loans. We must also observe that, though security is taken,

no part of the cautioner's property is taken out of circulation; and therefore his liability is only contingent.

139. The enormous amount of transactions carried on by this kind of accounts may be judged of when it appears from the evidence of the witnesses before the Committee of the House of Commons in 1826, that on a Cash Credit of £1,000, operations to the amount of £50,000 took place in a single week. Its effects therefore were exactly the same as these of £50,000 sovereigns. Others stated, that on a cash credit of £500, operations to the amount of £70,000 took place in a year. One witness stated that during twenty-one years, in a moderately sized country bank, operations had taken place to the amount of nearly £90,000,000, and that there never had been but one loss of £200, on one account, and that the whole loss of the bank during that period did not exceed £1,200.

140. These credits are granted to all classes of society, to the poor as freely as to the rich. Young men in the humblest walks of life begin by making a trifle for themselves. This inspires their friends with confidence in their steadiness and judgment, and they become sureties for them on a Cash Credit.

This is in all respects of equal value to them as money, and thus they have the means placed within their reach of rising to any extent that their abilities and industry permit them. Mr. Monteith, M.P., told the committee that he was a manufacturer, employing at that time 4,000 hands, and that except with the merest trifle of capital, lent to him, and which he very soon paid off, he began the world with nothing but a Cash Credit! And this was only one example out of thousands.

141. This shewed the advantage in a personal way. But even that was but a small part of the system. Almost all the great public works of every description were created by means of Cash Credits. One witness stated that the Forth and Clyde Canal was executed by means of a Cash Credit of £40,000, granted by the Royal Bank. And in a similar way, whenever any other public works, such as roads, bridges, &c., were to be done, the first thing was to obtain a large Cash Credit at one of the banks. And it is by these means that Scotland has been raised to the proud position she now enjoys. It is no exaggeration whatever, but a melancholy truth, that at the period of 1688, and the establishment of the Bank of Scotland, that country, partly owing to such a succession of disasters as cannot be paralleled in the history of any other independent nation, and partly owing to its position in the very outskirts of the civilized world, and far removed from the humanizing influence of commerce, divided in fact into two nations, aliens in blood and language, was the most utterly barbarous, savage, and lawless kingdom in Europe. And it is equally undeniable that the two great causes of her rapid rise in civilization and wealth, were her systems of national education and banking. Her system of banking has been infinitely of greater service to her than mines of gold and silver. Mines of gold and silver would probably have demoralised the people. But her banking system has tended immensely to call forth every manly virtue; and the express business of these banks was to create

out of nothing, but by the mere force of their will, incorporeal entities, which were valuable and exchangeable property, and, therefore, by the very force of the definition, wealth; which having served their purpose, after a time were

"Melted into air, into thin air."

But their solid results have by no means faded like the baseless fabric of a vision, leaving not a rack behind. On the contrary, their solid results have been her far-famed agriculture, the manufactures of Glasgow and Paisley, the unrivalled steamships of the Clyde, great public works of all sorts, canals, roads, bridges, and poor young men developed into into princely merchants.

142. All these marvellous results which have raised Scotland from the lowest state of barbarism up to her present proud position in the space of 150 years, are the children of pure CREDIT. It has been nothing whatever but some incorporeal entities called out of NOTHING, for a transitory existence, and then vanishing again into the NOTHING from which they came. And has not this *credit* been capital? Will any one with these results staring the world in the face, believe that it is maintained by many writers who still are considered as economists, that *Credit conduces nothing to the increase of Wealth!* That Credit conduces nothing to production!! That Credit only transfers existing Capital!! And that those who maintain that Credit is productive Capital are such puzzle-headed dolts as to maintain that the same thing can be in two places at once!!! How we have dealt with these writers, may be seen in the next section.

143. Now, we observe, that these Cash Credits, which have produced such marvellous results, are purely of the nature of what is called *accommodation paper* in England. They are not based upon any previous operations, nor upon the transfer of commodities already in existence. They are created for the express purpose of *creating*, or *forming future* products, which would either have had no existence at all but for them, or at all events it would have been deferred for a very long period, until solid money could have been obtained to produce them. Thus we have an enormous mass of exchangeable property, created by the mere will of the bank and its customers, which produces all the solid effects of gold and silver, and when it has done its work, it vanishes again into nothing, at the will of the same persons, who called it into existence. Hence we see that the mere will of man has *created* vast masses of wealth out of *nothing* and then *DECREATED* them into NOTHING.

144. Here we see one example out of many of the enormous advantages of character. If the applicants were not of good character, the banks would never have granted them these credits. They would never have created this property for them. If the banks themselves were not of great solidity and character, these incorporeal entities would never have obtained the general confidence of the people so as to pass unquestioned throughout the whole country, as equivalent to gold and silver. It is nothing but the breath of confidence which gives them this magic power, which vanishes into nothing at the blight of distrust.

145. The real difficulty which impedes a true comprehension of the subject, is very similar to

that which long obstructed the progress and reception of the Newtonian doctrine of gravity. It had been handed down as a dogma from the days of the Greek philosophers, that a body could not act where it was not. Instead of reflecting on the facts with unbiased minds, the opponents of the Newtonian doctrines contended that his doctrines violated the fundamental dogma that a body could not act where it was not, and treated them with ridicule.

146. A very much more specious dogma is, however, at the root of the common inability among uninstructed writers to grasp the true conception of Credit. From the days of Anaxagoras and Epicurus, it has been handed down from age to age, by succeeding generations of physicists *That Nothing can come out of Nothing, and That Nothing can go back into Nothing.* The fundamental dogma of Lucretius, the hierophant of the Atomic Philosophy is that Nothing can come out of Nothing. i. 151, &c.

NULLAM REM E NIHILO GIGNI DIVINITUS UNQUAM.

NIL igitur fieri de NILO posse fatendum 'st.

Moreover, that Nothing can go back into Nothing. i. 216; &c.

Huc accedit, uti quæque in sua Corpora rursum Dissolvat Natura, neque ad Nihilum interimat res.

Nullius exitum patitur Natura videri.

Immortali sunt naturæ prædita certe;
Haud igitur possunt ad Nilum quæque reverti.

Haud igitur redit ad Nihilum res ulla, sed omnes
Discidio redeunt in corpora materialia.

Haud igitur penitus pereunt quæcumque videntur;
Quando alia ex alio reficit Natura nec ullam
Rem gigni patitur, nisi morte adjutam alienâ.

And this is the constant refrain of the Lucretian philosophy, That nothing can be produced from nothing, and that nothing can go back into nothing, i. 266.

Nunc age, res quoniam docui non posse creari
De Nihilo, neque item genitas ad Nil revocari.

At quoniam supra docui NIL posse creari
De Nihilo, neque quod genitu 'st ad Nil revocari,
Esse immortali Primordia corpore debent."

And this is the identical doctrine which physicists maintain to the present day. Chemists delight to expatiate to their audience on the indestructibility of all things. How seeming destruction is merely the dissolution of atoms under their present combinations, to reappear in new forms and new combinations in perpetual succession.

147. But Political Economy confounds the best settled doctrines of the sages of old. It is true that many Economists have declared that man can call nothing into existence, that all wealth comes from the earth. That wealth is but the particles of matter, and that all that man can do is to re-arrange them, and either place them in a new position, and let nature do the rest. But their own doctrines, their own books, their own definitions, confound all such notions. And lawyers know better than that. Economists, with scarcely an exception, are agreed that whatever can be exchanged, whatever can be bought and sold, is wealth; that everything by which profit can be made is Capital. Twenty-two centuries ago Socrates expressly declared that know-

LEDGE WAS WEALTH. Aristotle laid down as a definition that *everything* whose value could be measured in money was WEALTH. Adam Smith expressly enumerates the "acquired and useful abilities" of the people as part of the Wealth of a country. He also classes paper money—which is credit—as valuable property, and therefore Wealth, making exchangeability the test of Wealth. J. B. Say has done the same. So does Mr. Senior. He says—"Health, strength, and KNOWLEDGE, and the other natural and acquired powers of body and MIND, appear to us to be articles of WEALTH. * * * In the greater

part of the world a man is as purchasable as a horse. In such countries the only difference in value between a slave and a brute consists in the degree in which they respectively possess the saleable qualities that we have been considering. *If the question whether personal qualities are articles of wealth had been proposed in classical times, it would have appeared too clear for discussion.*

[We have shown under *ÆSCHINES* *SOCRATICUS* that this very question was proposed in classical times, and personal qualities were decided to be WEALTH.] In Athens every one would have replied that they in fact constituted the whole value of an *ἐμψυχον ὄργανον*. The only differences in this respect between a freeman and a slave are, first, that the free man sells *himself*, and only for a period, and to a certain extent, the slave may be sold by others and absolutely; and, secondly, that the personal qualities of the slave are a portion of the wealth of his master; those of the freeman, so far as they can be made subjects of exchange, are a part of his own wealth. They perish, indeed, by his death, and may be impaired, or destroyed by disease, or rendered valueless by any changes in the customs of the country, which shall destroy the demand for his services; *but subject to these contingencies, they are wealth, and wealth of the most valuable kind.* The amount of revenue derived from their exercise in England far exceeds the rental of all the lands in Great Britain."

148. Again, at p. 145, Mr. Senior says—"Even in our present state of civilization, which, high as it appears by comparison, is far short of what might easily be conceived, or even of what may confidently be expected, the INTELLECTUAL and MORAL CAPITAL of Great Britain far exceeds all her MATERIAL CAPITAL, not only in importance, but even in productiveness. The families that receive mere wages probably do not form a fourth of the community; and the comparatively large amount of the wages even of these, is principally owing to the capital and skill with which their efforts are assisted and directed by the more educated members of the society. Those who receive mere rent, even using that word in its largest sense, are still fewer; and the amount of rent, like that of wages, principally depends on the knowledge by which the gifts of nature are directed and employed. The bulk of the national revenue is profit, and of that profit, the portion which is mere interest on material capital probably does not amount to one third. The rest is the result of PERSONAL CAPITAL, or in other words of education.

"It is not in the accidents of soil, or climate, or on the existing accumulation of the material

instruments of production, but on the quantity and the diffusion of this IMMATERIAL CAPITAL, that the WEALTH of a country depends. The climate, the soil, and the situation of Ireland have been described as superior, and certainly are not much inferior, to our own. Her poverty has been attributed to the want of *material capital*; but were Ireland now to exchange her native population for seven millions of our English North Countrymen, they would quickly create the Capital that is wanted. And were England, north of Trent, to be peopled exclusively by a million of families from the west of Ireland, Lancashire and Yorkshire would still more rapidly resemble Connaught. Ireland is physically poor, because she is morally and intellectually poor. And while she continues uneducated, while the ignorance and violence of her population render persons and property insecure, and prevent the accumulation and prohibit the introduction of capital, legislative measures, intended solely and directly to relieve her poverty, may not indeed be ineffectual, for they may aggravate the disease, the symptoms of which they were meant to palliate, but undoubtedly will be productive of no permanent benefit. KNOWLEDGE has been called power—it is far more certainly WEALTH. Asia Minor, Syria, Egypt, and the Northern Coast of Africa, were once among the richest, and are now among the most miserable countries in the world, simply because they have fallen into the hands of a people without a sufficiency of the immaterial sources of wealth to keep up the material ones."

149. Knowledge, therefore, by the very generality of the definition, and the consent of nearly every Economist of note—is Wealth. And where does Knowledge come from? And what is it formed out of? Does it come from the earth? and is it formed out of the materials of the globe? We should fancy that few would maintain that. All that we know is that Knowledge originates in the mind. Knowledge is formed in the mind, but is it formed *out of* the materials of the mind? And if so, what is the composition of the mind? Does it come from the earth? Are we to have an Atomic theory of Knowledge, or of the Mind? Will some metaphysical Dalton tell us that knowledge, or the human mind, is composed of indestructible primordial Atoms?

Πολλά τὰ δεινὰ, κούδὲν ἀν-
θρώπου δεινότερον πύλει

But this same knowledge—Whence cometh it? What is it?—Whither goeth it?

We know not—Do our readers?

Nathless it is WEALTH; and therefore it is within the domain of the Economist. It may be bought and sold; it may be valued; it may be accumulated; it may be handed down from age to age, like any material product whatever. The acquisition of knowledge is the acquisition of Wealth; and the loss of knowledge is the destruction of Wealth. And is the loss or destruction of knowledge the dissolution of indestructible primordial atoms? Here, then, are vast masses of Wealth, and the question is where it comes from, and what is it composed of? And there are but two solutions of the question. Either knowledge is composed of indestructible atoms, or it is not.

If it be so, then of course the formation of knowledge is not the Creation of Wealth out of Nothing. But unless we are prepared to admit that—and who is?—the formation of knowledge must be creation of Wealth out of Nothing. And the loss or destruction of Knowledge must be the Decreation, or the return, of Wealth into Nothing!

150. As one example of this out of thousands, we may take a case that was not very long ago before the Scotch Courts. In the beginning of the 17th century, a man named Anderson discovered a way of making pills, which soon became very popular. The secret of making these pills has been handed down from generation to generation, and has been a constant source of Wealth to the owner of it. Very recently, the possessor of it became bankrupt, and his creditors claimed the right of having it given up to them, as part of the bankrupt's property. The pills have been analysed in vain by chemists, and the secret of their composition has never been able to be discovered. Now, here is a manifest case of a trade secret, knowledge, being Wealth,—and where did this Wealth come from? and what is it composed of? Did it come from the earth? and is it composed of the materials of the globe? And yet it has been handed down as an heirloom from age to age. Suppose the present possessor of the secret dies without divulging it, there is a manifest loss of Wealth. And what would become of it in such a case? And this is clearly only a particular example out of countless others.

151. Here, therefore, we have enormous masses of what every Economist, with scarcely an exception, admits to be wealth, which shakes the doctrines of the Physical Philosophers. But also, the doctrines of many Economists are equally overthrown, because they say that all wealth comes from the earth. But here we have great masses of wealth which do not come from the earth. Hence it is manifest that there is another source of wealth besides the Earth, namely, the HUMAN MIND.

152. But even this does not exhaust the list of Economic Quantities, though Economists have scarcely noticed any other. When we adopt the definition of Wealth as everything that can be exchanged, or whose value may be measured; we very soon find that there is yet another species of exchangeable quantities, which do not originate in the earth, nor yet in the mind. And here again we may observe that Lucretius is at fault. For he says that there is nothing, besides the void, which is separated from something corporeal.

*Omnia, ut est, igitur, per se, Natura, duabus
Consistit rebus; nam CORPORA sunt, et INANE.*

*Præterea nihil est, quod possis dicere ab omni
Corpore sejunctum, secretumque esse ab INANI.*

Et facere et fungi sine CORPORE nulla potest res.

*Ergo præter INANE et CORPORA, tertia per se
Nulla potest rerum in numero natura relinqui.*

From these lines it is clear that Lucretius did not live in the days of Public Debts, Bills of Exchange and Bank Notes, Bank Shares, Copyrights and other incorporeal property, or he would have modified this part of his Philosophy.

153. Modern ingenuity has reduced what

Lucretius declared an impossibility into reality. There are enormous masses of exchangeable incorporeal property, for which there are express shops for creating, and there are special markets for trafficking in, namely, the Royal Exchange, and the Stock Exchange.

154. Mr. Mill, we have seen, defines Wealth to be anything which has power of purchasing, and he says that productive labour is labour which is productive of wealth. Hence manifestly labour which produces anything which is exchangeable is producing Wealth. In Book iii., ch. xii., § 5, he gives a table showing that the Bills created in a single year amounted to £528,493,842, and these, after all, were but a fractional part of the total quantity of credit. In B. iii., c. xx., § 2, he expressly calls Bank Notes "Productive Capital," and Smith enumerates paper credit cumulatively to gold and silver money.

155. Now we observe that every one allows Bank Notes, Bills of Exchange, &c., to be separate independent exchangeable property, and therefore *ex vi termini*—Wealth. And what are they? Simply Credit—DEBTS. Now where do these Debts come from? Do they come from the materials of the globe? Are they, too, formed of indestructible primordial atoms? When a debt is extinguished is it a mere dissolution of certain material particles to reappear under another form? Are they even the products of Labour and the human mind?

How is a Debt created? By the mutual consent of two minds. By the mere FIAT of the HUMAN WILL. And how is a debt extinguished? By the mere FIAT of the HUMAN WILL. Now we again ask—we need scarcely repeat that a debt is property—Whence does it come? When two persons have WILLED to create a debt—whence does it come? From the materials of the globe? Does it come even from the mind? No! it is nothing but a valuable product, created out of Absolute NOTHING, by the mere Fiat of the human Will. And when it is extinguished, it is a valuable product DECREATED into NOTHING by the mere Fiat of the Human Will.

156. But besides debts, there is an enormous mass of valuable property of a similar nature created by the mere will of the Legislature, such as Copyrights. It is true that the Legislature cannot make a Copyright a valuable thing; but it can prevent it from being destroyed. Now we ask—Are not the Copyrights held by a publisher part of his fixed Capital? Part of his Wealth? Just as much as so much land? Whence come they? From the materials of the Globe? or even from the Human Mind? It is quite clear that Copyrights are the pure creation of the Will of the Legislature.

Suppose that the Legislature were to abolish Copyrights, would not that be an actual *annihilation* of Wealth, and not merely the Dissolution of material atoms?

157. What again are the Funds? Nothing but valuable Rights created by the Will of the Legislature. Suppose Parliament were to abolish the Funds. Would not that be the *annihilation* of a vast amount of property?

Precisely the same considerations apply to vast amounts of property of a similar nature. Such as policies of insurance, leases, and annuities of

all sorts. They are all property created by the mere Fiat of the Human Will. And who can form the most distant conception of the value of all the Incorporeal property of this nature in Great Britain? In the species of private credit alone, which is the subject of this article, it is probably not far short of the value of the land of the country.

158. We may remark that Plutarch, long ago, saw that the business of Banking overturned the doctrines of the Physical Philosophers; for after describing the method of Discount, which was practised by the Athenian bankers (Δισκουντ) he says,—"εἴτα τῶν φυσικῶν δῆπου καταγελῶσι, λεγόντων μηδὲν ἐκ τοῦ μὴ ὄντος γενέσθαι."

"Then, forsooth, they may laugh to scorn the doctrines of the Physical philosophers who say that nothing can come out of nothing."

159. Moreover, this property, thus created by the wills of two persons, is of so stubborn a nature, that it cannot in general be decreed, except by the same power that called it into existence. We have seen some of its beneficial effects; but, on the other hand, when misused, its power is so terrible, like that of some volcanic agent, that it has blown societies to pieces. Too much of it is very frequently created in commerce, and it is necessary for public policy that some of it should sometimes be destroyed. In order to do this, there are Courts of Law instituted whose express purpose is to decreate this species of property. These are the Courts of Bankruptcy. Their especial purpose is to annihilate this species of property.

Hence we have shops for the express purpose of creating this species of property, which are BANKS. We have a public market for the express purpose of dealing in it, which is the ROYAL EXCHANGE; and we have Courts of Law for the express purpose of destroying it, when it cannot be done by the parties themselves, and these are the COURTS OF BANKRUPTCY.

160. Hence we see that taking the Definition of Wealth in its widest generality, as *everything* whose value may be measured, there are Economic Quantities of three distinct species. 1st, The products of the Earth, comprising all material substances; 2ndly, The products of the Mind, comprising all knowledge of different kinds; and 3rdly, The products of the Will, comprising all incorporeal property, such as credit, the funds, and all annuities of every description. In each of these there may be Property. And all of these various species of Products may be, and are, daily exchanged for one another, or amongst themselves, and therefore manifestly they must all be included in the Science of Exchanges.

We thus see that instead of there being only *one* source of Wealth, as so many Economists have said, that there are, in fact, *three* sources in which Wealth originates, the EARTH—the HUMAN MIND—and the HUMAN WILL.

None of these products, however, are absolutely Wealth in themselves. But men *wanting* and *desiring* to have them, and being willing to give something in exchange for them, give them Value, and constitute them Wealth.

161. Suppose, then, we make £ the general symbol for an Economic Quantity—that is to say

anything whatever whose value may be measured, and representing these various species of Quantities indifferently under the general symbol, we may say that there are in any country, quantities of this sort:—

£528,497,620
£27,956,298
£807,347,281
£24,572,674
&c. &c. &c.
&c. &c. &c.

Then we affirm by virtue of the principle of the Continuity of Science, and by the great Algebraical doctrine of the *Permanence of Equivalent Forms*, that whatever can be proved to be true Economically of any one of this series of Quantities must be true of them all. Moreover, that the fundamental conceptions of Economic Science must be of such a wide and general nature that they must grasp all these Quantities, of whatsoever nature they may be. Moreover, that all the fundamental axioms of the Science must be of that wide and general nature so as to grasp all the phenomena under one general expression.

162. As an example of the doctrine stated in the preceding paragraph, we may give this. No one looking at the series of Economic Quantities placed above, could tell of what species they were. Some may be land, some corn, some minerals, some ships, some money, some debts, some commercial shares, or copyrights, &c. Now what we say is this, that there can be but *ONE* cause of Value for them all. This at once annihilates the false distinctions between the causes of the Value of different species, which have been made by Economists. We see at once that *Demand* is the sole cause of Value of all Economic Quantities (VALUE.)

163. A banker's assets are composed partly of money, and partly of other securities of different kinds, such as debts. His liabilities, or *Deposits*, are exclusively Debts. Now, if we placed before our readers a banker's deposits and assets, thus—

£10,000 | £10,000

who could tell which were the deposits and which were the assets? And of the assets, who could tell what part was money, and what part debts? We see that the debts which are his assets, as well as his deposits, are entered under exactly the same general symbol, £. It follows, therefore, that they are all equally Economic Quantities, and must be subject to the same general laws.

We thus see that there are Economic Quantities of very different species, and a knowledge of Law and Commerce is absolutely indispensable in order to enable us to discern what Economic Quantities are. And then, by the very nature of Natural Philosophy, the fundamental conceptions must grasp all these Quantities of diverse forms and natures.

164. Having thus obtained these independent Economic Quantities, the purpose of the science is to discover the laws which regulate the variations of their Exchangeable Relations. And we say that they must be governed by the grand general Theory of Variable Quantities in general. For if not, the whole of Mathematical Science is shaken to its foundations.

165. It may be as well, perhaps, to explain our argument at somewhat greater length to our readers. Mathematical Science has under its dominion—1st. The Theory of pure number;

2ndly. The Theory of Dependent Quantities; 3rdly. The Theory of Independent Quantities. The Theory of pure number is named ARITHMETIC. Now the very basis of all Mathematical certainty is this, that the combinations of numbers shall be true under all circumstances, and when applied to all cases. Thus we say that in abstract numbers $3 \times 3 = 9$. And this must be true in all cases whatever. If we could imagine some branch of science in which $3 \times 3 = 11$, the science of Arithmetic would be shaken to its foundations.

The very same reasoning is applicable to the general theory of dependent Quantities. Like as in the case of pure number, there is a grand general Theory of Dependent Quantities, which must be applicable to all cases, and to all particular sciences whatever. And this is the reason why the various physical sciences, so widely different in their nature, are all brought within the grasp of the Differential Calculus. What can be more diverse in their natures than Astronomy, Optics, Sound, The Tides, Electricity, &c., &c.? And yet they are all brought within the grasp of Differential Equations, because they are only so many particular cases of Dependent Quantities.

If, then, we find a new order of Variable, or Dependent, Quantities, we are able to affirm that they must be subject to the grand general Theory of Variable Quantities in general. For if they were not, it would shake the whole of mathematical reasoning to its foundations, just in the same way as if we could imagine a science which broke loose from the general laws of number.

Now, in Political Economy we have to deal partly with a new order of Quantities altogether, and partly with a new relation, or quality, of Quantities, with which we are already familiar. The new Quantities are, of course, knowledge, &c., and Incorporeal Property, and the new quality is exchangeability.

Nevertheless, the object of the Science being to discover the Laws which regulate the Variable Exchangeable Relations of these Quantities, we say that they must be only a particular case of Variable Quantities in general. And therefore they must be subject to the same general laws as govern the variable relations of Physical Quantities.

Now the fundamental principle of all Physical Inductive Science is that there is only one general Theory, which accounts for *all* the phenomena. There is no Physical Science whatever, which any one ever thought could by any possibility be based on a multitude of conflicting fundamental theories.

Now it is against this fundamental principle of Natural Philosophy, that the whole of the Ricardian School of Political Economy sins. For that school enumerates a number of distinct classes of cases of Value, and it lays down a distinct fundamental Theory of Value for each. Now this is manifestly to shake all mathematical reasoning to its foundations, for it is as much as to say that here is a Science of Variable Quantities, which is *not* subject to the general Mathematical Theory of Variable Quantities.

This then is the ground of our condemnation of the Ricardian System of Economics. How very differently Condilliac treated the subject we have shown. (CONDILLIAC.)

166. We earnestly hope that our readers do not think we are indulging in mere metaphysical logomachy. Very far from it. The considerations we have presented are indispensably necessary to examine the fundamental nature of the enormously greater proportion of existing property. The ideas we have presented may be new to some readers, but they are simply indisputable principles of Law and Commerce. They are absolutely indispensable to understand the great subjects of Credit and Currency, which have produced such tremendous effects on the well being of nations.

167. We may observe that the whole system of Cash Credits, which we have been describing, shows, among many other things, the utter fallacy of what is called the CURRENCY PRINCIPLE, which asserts that no good can be done by increasing the quantity of money in a country, as well as that the issues of banks should be absolutely restricted to the quantity of money there would be, if they did not exist. We have seen that the whole of the magnificent works which were carried on by means of Credit created an excess of the money actually, and which displaced no money whatever. The very same phenomenon was exhibited in England during the same period. It was soon after 1770 (BANKING IN ENGLAND, § 106) that the prodigious development of her industrial energies began, and to carry out these gigantic works multitudes of country Banks started up on all sides, and filled the country with their rotten notes. Bad as this currency, however, was, it was by means of it that these great works were done, and they could never have been done without it. It was the fatal monopoly of the Bank of England which prevented powerful Banks being formed, and permitted these mushroom shopkeepers to start up and turn Bankers.

On Open Credits.

168. We have seen that Cash Credits are always created to forward a future operation, and are never founded on a past one. There is always, however, collateral security taken, so as to protect the Bank against loss. In the keen spirit of competition, however, a hazardous system has sprung up of granting these credits without collateral security. This system is a good deal practised abroad, we believe, and is called *Crédit à Decouvert*, and in this country *Open Credits*. It is manifestly far more hazardous than Cash Credits, or common discounting, because there are always two names at least in such cases. We believe that the Joint Stock Banks, which failed a few years ago, indulged to a great extent in this dangerous system.

On Accommodation Bills.

169. We now come to a species of Credit, which will demand great attention, because it is the curse and the plague spot of Commerce, and it has been the great cause of those frightful commercial crises, which seem periodically to recur, and yet though there can be no doubt that it is in many cases essentially fraudulent, yet it is of so subtle a nature as to defy all powers of Legislation to cope with it—at least according to the still unreversed doctrines of Westminster Hall.

170. We have shown by the exposition of the system of Cash Credits, that there is nothing

essentially dangerous or fraudulent in a Credit being created for the purpose of promoting future operations. On the contrary, such Credits have been one of the most powerful weapons ever devised by the ingenuity of man to promote the prosperity of the country. A certain species of this Credit, however, having been grossly misused for fraudulent purposes, and having produced great calamities, we must now examine wherein the danger and the fraud of this particular form of Credit lie.

171. When a Bill of Exchange is given in exchange for goods actually purchased at the time, it is called a Real Bill, and it is supposed by many writers, and even by many commercial men, that there is something essentially safe in it, because, as the goods have been received for it, it is supposed they are always there to provide for the payment of it. And that only so much Credit is created, as there are goods to redeem it. Thus, in the article *Credit*, in the *Encyclopædia Britannica*, it is said,—“Every sum of Credit, therefore, must be founded on a transfer of a corresponding sum of Capital, and the whole amount of Credit existing, at any time, can never exceed that of the lent Capital.”

When we see such gross, dense, *crassa ignorantia* in a publication of the character and pretensions of the *Encyclopædia Britannica*, what are we to expect from the general public?

172. Leaving out of consideration at present the cases where Credit is created without the transfer of any Capital at all, it is manifest, from the description of the system of Credit already given, that it is utterly erroneous to say that the quantity of Credit cannot exceed the quantity of Capital lent. A Bill of Exchange, it is true, only arises out of a transfer of goods, but then a fresh bill is created at *each* transfer. In the ordinary course of business, there will always be in general at least *twice* the amount of Bills to what there are goods. But if twenty transfers took place, twenty bills would be created. If goods to the amount of £100 were transferred twenty times, supposing even that the price of the goods did not change, which it most assuredly would, there would be Credit created to the amount of £2,000. And it would only be the last holder of the goods, who would have them, and be enabled to devote the proceeds to the payment of the last Bill only. The remaining nineteen Bills must manifestly depend upon other sources for payment.

173. The security, therefore, which is supposed to reside in Real Bills, on account of their being founded on the transfer of goods, is shewn to be to a great extent imaginary. Let us suppose, however, that A sees that a profitable operation *may* be done. The Bank will not, as traders do, make him an advance on his own name alone. It must have at least *two* names. A therefore goes to B, and gets him to join him as security to the Bank, on engaging to find the funds to meet the bill when due. A then draws a bill on B, who accepts it to *accommodate* A, as it is called, and such a Bill is called an *Accommodation Bill*.

The Bill thus created without any consideration, as is termed in legal language, or in common language, without any transfer of goods, may be taken to a Banker to be discounted, like any other

Bill, an operation may be performed, and, if successful, the bill may be paid with the proceeds.

174. Stated, therefore, in this way, there is nothing more objectionable in such an Accommodation Bill than in any ordinary Real Bill. The security is just the same in one case as in the other. In the one case goods *have been* purchased, which will pay the bill, in the other case goods *are to be* purchased, whose proceeds are to pay the bill. In fact, we may say that all commercial credit is of this nature, because a credit is created to purchase the goods whose proceeds are to pay it.

175. There is therefore clearly nothing in the *nature* of this species of paper worse than in the other, and when carefully used, nothing more dangerous. Cash Credits, which have been one of the safest and most profitable parts of Scotch Banking, and have done so much for the country, are all of this nature. They were created without any anterior operation, for the express purpose of stimulating future operations out of which the Credit was to be redeemed. There is therefore not anything more criminal, atrocious, and vicious in the one system rather than in the other. Or if there be, the criminality and atrocity must lie in the difference between *have been* and *is to be*.

176. Nevertheless, as it is indubitably certain that most of these terrible commercial crises which have so frequently convulsed the nation, have sprung out of this species of paper, it does merit a very considerable portion of the obloquy and vituperation heaped upon it. It is therefore now our duty to investigate the method in which it is applied, and to point out wherein its true danger lies.

177. The security supposed to reside in Real Bills as such, is, as we have seen, exaggerated. But there is at least this in them, that as they only arise out of the real transfers of property, their number must be limited by the nature of things. However bad and worthless they may be individually, they cannot be multiplied beyond a certain extent. There is therefore a limit to the calamities they cause. But we shall show that with *Accommodation Bills* the limits of disaster are immensely and indefinitely extended, frequently involving in utter ruin all who are brought within their vortex.

178. We shall now endeavour to explain to our readers wherein the difference between real and accommodation papers consists, and wherein the true danger lies.

Let us suppose that a manufacturer or wholesale dealer has sold goods to ten customers, and received ten *bonâ fide* trade bills for them. He then discounts these ten bills with his banker. The ten acceptors to the bills having received value for them, they are the principal debtors to the Bank, and are bound to meet them at maturity, under the penalty of commercial ruin. The Bank, however, has not only their names on the bills, but also that of its own customer, as security. It moreover generally keeps a certain balance of its customer in its own hands, proportional to the amount of the limit of discount allowed. Now even under the best circumstances, an acceptor may fail to meet his bill. The Bank then immediately debits its customer's account with the amount of the bill, and gives it him back. If there should not be enough, the customer is

called upon to pay up the difference. If the worst comes to the worst, and its customer fails, the Bank can pursue its legal remedy against the estates of both the parties to the bill, without in any way affecting the position of the remaining nine acceptors, who, of course, are still bound to meet their own bills. Even supposing, however, it is only the acceptor who fails to meet his bill, the Bank would not probably take a second bill upon him, nor would a dealer sell his goods again to him after giving him the annoyance of having to take up his bill.

179. In the case of accommodation paper, there are very material differences. To the eye of the banker there is no visible difference between real and accommodation bills. They are, nevertheless, very different, and it is in these differences that the danger consists.

In accommodation paper, the person for whose accommodation the drawing, indorsing, or accepting is done, is bound to provide the funds to meet the bill, or to indemnify the person who gives his name. In the most usual form of accommodation paper, that of an acceptance, the acceptor is a mere surety, the drawer is the real principal debtor.

Now suppose, as before, that A gets ten of his friends to accommodate him with their names, and discounts these bills at his bankers, it is A's duty to provide funds to meet every one of these bills at maturity. There is in fact only one real principal debtor, and ten sureties. Now, these ten accommodation acceptors are probably ignorant of each other's proceedings. They only give their names on the express understanding that they are not to be called upon to meet the bill. And accordingly they make no provision to do so. If any one of them is called upon to meet his bill, he immediately has a legal remedy against the drawer. In the case of real bills, then, the bank would have ten persons, who, would each take care to be in a position to meet his own engagement; in the case of accommodation paper, there is only one person to meet the engagements of ten. Furthermore, if one of ten real acceptors fails in his engagement, the bank can safely press the drawer; but if the drawer of the accommodation bill fails to meet one of the ten acceptances, and the bank suddenly discovers that it is an accommodation bill, and they are under large advances to the drawer, they dare not for their own safety press the acceptor, because he will of course have immediate recourse against his debtor, and the whole fabric will probably tumble down like a house of cards. Hence the chances of disaster are much greater when there is only one person to meet so many engagements, than when there are so many, each bound to meet his own.

180. We see, then, that the real danger to a bank in being led into discounting accommodation paper is, that the position of principal and surety is reversed. They are deceived as to who the real debtor is, and who the real principal is, being precisely the reverse to what they appear to be, which makes a very great difference in the security to the holder of the bills. To advance money by way of cash credit, or by loan with security, is quite a different affair; because the bank then knows exactly what it is doing, and as soon as anything occurs amiss it knows the

remedy to be adopted. Moreover, it never permits the advance to exceed a certain definite limit, but it never can tell to what length it may be inveigled into discounting accommodation paper, until some commercial reverse happens, when it may discover that its customer has been carrying on some great speculative operation, with capital borrowed from it alone.

181. Such appears to us to be the true explanation of the real danger of accommodation paper, and which was given in our *Theory and Practice of Banking*, Vol. I. 243, and we may say that its correctness has received the sanction of the high authority of Mr. Commissioner Holroyd, who quoted it in his judgment in the case of the great leather frauds, *Laurence, Mortimer, and Schrader*, as appears in the *Standard*, March 7, 1861.

To exhibit to our readers how this nefarious system is carried on, it will be advisable to give an outline of this celebrated case.

In the first place, in order to explain how such things are possible, we may perhaps call attention to a delusion which is very prevalent among uninformed writers, namely, that Bills of Exchange are paid in money. It is true that Bills of Exchange must always be expressed to be payable in money, but, as the reader may see under the article *BANK*, very few bills are really ever paid in money. When a customer has a banking account, the banker discounts his bills by writing down the amount to his credit, and this credit is called a *DEPOSIT*. The customer always pays his bills by drawing upon this credit, and when it gets low, the usual practice is for him to discount a fresh batch of bills. Thus, in ordinary times, the previous debts are always paid by creating new debts. No doubt, if the banker refuses to discount, the customer must meet his bills in money, but then no trader ever expects to do so. If his character be good, he counts upon discounts with his banker almost as a matter of right, and therefore to call upon him to meet his bills in money may oblige him to sell goods, &c., at a great sacrifice, or may cause his ruin.

182. However, it is always supposed that the bills discounted are good ones, that is, they could be paid in money if required. Thus though in common practice very few bills are really paid in money, it is manifest that the whole stability of the Bank depends upon the last bills discounted being good ones.

183. Now let us suppose that for some time a customer brings good bills to the Bank, and acquires a good character, and thus throws the banker off his guard. Meeting some temporary embarrassment, perhaps, he is in difficulty to meet his bills. In order to get over this difficulty, perhaps, he goes to some man of straw, and perhaps for some trifling consideration gets him to accept a bill, without having any property to meet it. He then takes this fraudulent bill to his banker. Thrown off his guard, perhaps, by his previous regularity, the unsuspicious banker buys this bill, and gives him a deposit for it. This deposit goes to pay the former bills. In the mean time the rotten bill is falling due and must be met. The acceptor has manifestly no means to meet it, and the only way to do so is to create some more of these rotten bills. Now the drawer may be speculating in trade and losing money every day. But his bills must be met, and there

is no other way of doing so but by constantly creating fresh rotten bills to meet the former ones. By this means, the customer may extract indefinite sums of money from his banker, and give him in return so many pieces of paper! Now, when times are prosperous and discounts are low this system may go on for many years. But at last a commercial crisis comes. The money market becomes "tight." Bankers not only raise the rate of discount, but they refuse to discount so freely as formerly, they contract their issues. All these rotten bills are in the Bank and must be met. But if the bankers refuse to discount they must be met with money. But all the property which the conspirators ever had may have been lost twenty times over, and consequently when the crisis comes they have nothing to convert into money! Then comes the crash! Directly the banker refuses to pay his customer's bills by means of his own money, he wakes to the pleasant discovery that he has been dancing upon nothing! and finds that he has been paying all his customers' bills for many years with his own money!

184. This is the *rationale* of accommodation paper; and here we see how entirely it differs from real paper. Because with real paper, and *bonâ fide* customers, though losses may come, still directly the loss occurs, there is an end of it. But with accommodation paper the prospect of a loss is the very cause of a greater one being made, and so perpetually in an ever widening circle, till at last the canker may eat into his assets to any amount almost. It is also clear that if a man having got a good character may sometimes do so much mischief to a single banker, the capacity for mischief is vastly increased, if from a high position, and old standing, he is able to discount with several banks. For he is then able to diminish greatly the chances of detection.

185. In the case above mentioned, Laurence, Mortimer, and Co. were of very high position, and of old standing in the commercial world. They were leather and hide factors, and the house was of above fifty years' standing. They bought hides on commission for tanners, and sold leather, and had leather consigned to them for sale. The hides were paid for by the tanners' acceptances of the factor's drafts at four months. In the course of business, they got connected with a considerable number of houses which were in a state of insolvency. To support these houses, and to extend their own operations, they entered into an enormous system of accommodation paper. They were in the habit of advancing money to their customers at five per cent., and then discounting these bills at their bankers at three per cent., thus making two per cent. by the transaction. When their customers often lost the money, their bills were renewed, or new ones created of arbitrary amounts to conceal the loss. The house had an agency in Liverpool, which pursued exactly the same course. They set up people ostensibly in business for the purpose of drawing on them. And these "dummies" drew upon the house, and these cross acceptances were afloat to a large amount. This will be sufficient to give an idea of this complicated network of cross transactions between the house and its satellites. In the mean time, heavy losses were sustained in their trade transactions, which were in fact extracted out of the bankers by the fraudulent concoction of bills

among the losers. The high standing of the house enabled them to entangle no less than twenty-nine banks and discount houses in their meshes. At the time of the stoppage, the London houses had liabilities of £820,000, of which £620,000 consisted of these fraudulent bills. The Liverpool houses had liabilities of £158,750, out of which £130,000 were fraudulent. Such is one example of the mischief worked by this nefarious system.

186. A still more terrible example is the case of the Western Bank of Scotland, which is fully detailed under BANKING IN SCOTLAND, § 310-328, which was in great part caused by the fraudulent proceedings of four houses. The cases there detailed, show to what a gigantic length these proceedings were carried. The Macdonalds had bills discounted to the amount of £408,716, drawn upon 124 acceptors, of whom at least 70 were men of straw, who made it a regular trade to accept bills for a small commission! In fact, they kept an agent in London for the express purpose of procuring accommodation acceptances.

187. From these accommodation bills to forged bills there is but one step. It is but a thin line of division between drawing upon a man who is notoriously utterly unable to pay, and drawing upon a person who does not exist at all, or forging an acceptance. In practical morality and in its practical effects there is none. Traders sometimes do not even take the trouble to get a beggar to write his name on their bills, but they invent one. The case of traders dealing with a number of small country connections affords facilities for such practices. They begin by establishing a good character for their bills. Their business gradually increases. Their connections gradually extend all over the kingdom. The banker, satisfied with the regularity of the account, cannot take the trouble of sending down to inquire as to the acceptor of every bill. The circle gradually enlarges, until some fine morning the whole affair blows up. The ingenuity sometimes exercised by traders in carrying out such a system is absolutely marvellous.

188. It is in times of speculation in great commodities that accommodation paper is particularly rife. In a great failure of the harvest when large importations are required, and it is expected that prices will rise very high, every corn merchant wants to be able to purchase as much as possible. But if no sales have taken place there can be no real trade bills. They therefore proceed to manufacture them in order to extract funds from bankers to speculate with. No banker in his senses would actually advance money for them to speculate with, with his eyes open. Nevertheless, they must have the funds from the bankers, and this they do by means of cross acceptances, which they go and discount with their bankers. They then, perhaps, buy a certain amount of corn or any other goods, and many bankers will discount their bills, with the collateral security of the bill of lading. And this they may repeat many times over, till the quantity of Credit created is something astonishing. In the Crimean war there was a great demand for shipping, and there was an enormous amount of accommodation bills manufactured by the Liverpool shipowners

and discounted all over the kingdom. The results were frightfully disastrous.

189. The insurmountable objection, therefore, to this species of paper, is the dangerous and boundless facility it affords for raising money for speculative purposes. And there is much reason to fear that this pernicious system prevails to a much greater extent than is generally supposed. The legislature has imposed bounds upon the issues of notes by banks, but there is much greater reason that some attempt should be made to curb the extravagant magnitude to which this detestable practice has been developed. The Bank of England is strictly forbidden to issue a single £5 note of accommodation paper, and is it to be tolerated that any set of adventurers may set afloat many hundred thousand pounds worth of their accommodation paper?

190. To deal, however, legislatively, with fictitious paper is the most perplexing commercial problem of the day. The difficulty consists in determining what is really an accommodation bill. An accommodation bill is defined to be a bill to which the acceptor, drawer, or indorser, as the case may be, has put his name, *without consideration*, for the purpose of benefiting, or accommodating some other party, who is to provide for the bill when due. But the whole difficulty turns upon the *consideration*. The consideration may be of many sorts, and does not by any means denote a sale of goods at the time. Moreover, a bill may be an accommodation bill at its creation, but if any consideration be given during the period of its currency, it ceases to be an accommodation bill.

191. Moreover, the consideration may be of many sorts. If A draws a bill upon B who accepts it for A's accommodation for the express purpose of enabling him to go to a Bank and get money for it, that is a pure accommodation bill, and manifestly fraudulent. But if B draws an exactly similar bill at the same time on A, and A accepts it for the accommodation of B, then neither of the bills are accommodation bills.

To an unlearned reader, this may seem monstrous doctrine. It is, nevertheless, firmly established law. In the case of *Rolfe v. Caslon* (2 H. Blackstone, p. 571), A and B being desirous to accommodate each other, each drew a bill upon the other, and accepted one in return, the two bills being precisely alike, in the date, sum of money, and times of payment. Neither party having any effects of the other in his hand. The court were clearly of opinion that the two bills were mutual engagements, constituting on each part a debt, the one being a consideration of the other. This doctrine was repeated and confirmed in the case of *Cowley v. Dunlop* (7 T. R. 565), in which Grose, J., said the instant the bills were exchanged, each was indebted to the other, in the sum which was the amount of their respective acceptances, for the counter acceptances were a good consideration to found a debt upon either side respectively. In the case of a single accommodation acceptance, said the learned judge, there is no debt to the acceptor; the debt accrues only by payment of the money. The acceptor, *quâ acceptor*, can never be a creditor; his acceptance imports the admission of a debt from him to another, and when he has paid an acceptor, if he paid for any other person

in consequence of any request from that other he becomes a creditor, not on the face of the bill, but by a contract collateral to the bill. When two persons exchange acceptances, each becomes the debtor of the other upon his accepted bills. But when a man accepts without consideration he is never a creditor of the person for whom he accepts till he pays; from that payment arises the debt; but when the acceptance was exchanged, the debt arises from these acceptances. This doctrine was repeated and confirmed in the cases of *Rose v. Sims* (1 B. & Ad. 521), and *Buchler v. Bullivant* (3 East. 72), when it was adopted by the whole Court of King's Bench.

192. This doctrine shews how utterly hopeless it is to deal legislatively with accommodation paper. At least they must be very poor rogues indeed who cannot manufacture any amount of real *bonâ fide* bills they please. Two ragamuffins, who neither possess one sixpence in the world, have only to get a quire of paper—if they can pay for it. One engages to pay £1,000 to the order of the other. That would be an accommodation bill. But the second then engages to pay £1,000 at the order of the first. These are no longer accommodation bills! But given for a *consideration*. If two such bills are good, then two thousand, or any larger number, are equally good. We suspect that Bankers would look askance at such paper. But Westminster Hall declares them all to be good *bonâ fide* bills, given for a good *consideration*.

193. That such is the well settled doctrine of Westminster Hall is beyond dispute. And perhaps it may ill become us to offer any suggestions on what has received the sanction of the Courts for so long a time. Nevertheless at the hazard of being thought presumptuous, we may make a few remarks. When we search for the foundation of the doctrine, we find it to be this.—That by giving their cross acceptances the parties become *indebted* to each other. That by these cross acceptances mutual *debts* are created. But is this doctrine quite impeccable? It is admitted that when B accepts a pure accommodation bill for A, no debt is created. It is nothing whatever but a piece of waste paper between the parties. Of course a similar bill upon A would be an absolute nothing as well. Now the question is this.—It being admitted that these two bills *separately* are absolute nothings, how can it be that when created *together* they spring into existence as Debts? A debt being as we know valuable property. It is a doctrine very hard to understand.

194. In a real bill the drawer may of course sue the acceptor. But in an accommodation bill he cannot. Suppose A draws a pure accommodation bill on B, for £100 at three months. Then of course he cannot sue him on it. But suppose one month after the first bill, B draws a bill of £100 at six months on A, without any consideration whatever but his previous acceptance. Then according to the doctrine stated above, the first bill which we may suppose never to have quitted the drawer's possession, immediately becomes a real bill, and A may sue B if his acceptance be unpaid. Did such a case as this ever occur? And could A recover under such circumstances? And yet that is the consequence that must necessarily follow, if it be true that mutual

accommodation acceptances constitute mutual debts between the parties.

195. We venture with the greatest deference to think that a fallacy lurks at the bottom of the doctrine. An accommodation acceptance in the hands of the drawer is simply *nil*. Directly he passes it away, it becomes in effect, the joint promissory note of the two parties. The acceptor cannot incur a liability without the drawer at the same time incurring an equal one. To suppose that one joint promissory note of two parties should be a *consideration*, for a second promissory note of the same parties seems a very strange idea. When a man is already a coöbligant as drawer on a bill, to suppose he can make that bill a good consideration for becoming coöbligant as acceptor on another bill with the same person, seems a most unaccountable doctrine. To suppose that a man can make a liability he has already incurred, a *consideration* for incurring another seems most extraordinary.

196. A consideration in commerce means something *external*. It is a *security* for incurring a debt. If I buy another man's debt, that is a consideration or *security* for creating one of my own. If the Government has created a debt, as the public funds, or Exchequer bills, that may be a good consideration, or security, for the Bank of England to create notes in exchange. So a banker creates a debt, either by notes, or a deposit, in exchange for the bills of his customer. In these cases there is an exchange of independent securities. Neither party are coöbligants, or liable with the other. But how can a liability a man has already incurred be a *consideration* or *security* for incurring a second one? Suppose a bank issues £10,000 in notes. Is the previous issue to be a security for issuing a second amount? If this be a good consideration or security, then indeed the philosopher's stone is at last discovered! There is no need to cross half the globe in search of an El Dorado. All the treasures of California and Australia are dust in the balance compared to this. Only let two men provide themselves with a slip of paper, and shut themselves up in a room, and in the twinkling of an eye they can make themselves richer than ever Solomon was.

197. If it were possible for each party to incur a liability on account of the other, separately, and without himself being also bound, it might alter the case. But in accommodation paper, neither party incurs an obligation without the other being also equally liable. A second bill is, therefore, nothing more than a dilatation of the first bubble; and to suppose that it can be a consideration—a security for the first bubble—to swell it to twice its previous dimensions, is contrary to the usual experience of bubbles.

198. We have felt bound to lay these observations before our readers. As we have already warned them that they are contrary to the established doctrine of Westminster Hall, they must, of course, be held to be fallacious; at least, the probabilities of their being so are very great indeed. But it may, perhaps, exercise the ingenuity of our readers to point out their fallacy. At all events, what we have said, right or wrong, may serve to fix the attention of our readers upon the doctrine under discussion; because, however it may be regarded, it is one of the extreme subtlety. It is one which sanctions a

practice which, without its sanction, would appear to any plain person to be a gross fraud; and it is this practice which has caused incalculable disasters in commerce, and, while it is held to be good, entirely precludes the possibility of dealing legislatively with so great a curse.

On the Transformation of Temporary Credit into Permanent Capital.

199. We have already seen that in commerce the *Release of a Debt* is in all cases whatever absolutely equivalent to the *Payment of Money*; in strict accordance with the Algebraical doctrine that — \times — is in all cases whatever absolutely equivalent to + \times +. Thus, as Diophantus said 1,400 years ago:—*Λείψιν ἐπὶ λείψιν πολλὰ πλεονασσέεισα ποιεῖ ὑπαρξιν*.

Defect multiplied into defect gives existence—which, in Commercial Algebra, means simply this, that the *RELEASE of a DEBT is AUGMENTATION of CAPITAL*.

We shall now give some examples of this, which will probably startle some of our readers.

200. When it is published to the world that the Bank of England has a paid up capital of £14,000,000, and that the various joint stock banks of London have paid-up capitals of this magnitude—

London and Westminster	£1,000,000
Union Bank	720,000
Joint Stock Bank	600,000
London and County Bank	600,000

Does not the whole world, except those very few who are conversant with the mechanism of banking, believe that the Bank of England, and the joint stock banks, have these sums of capital paid up in hard MONEY?

201. What will they say when they learn that this idea is pure *moonshine*! These banks never had anything like that sum paid up in actual money at all. Of course it is utterly impossible to tell how much was ever paid in money, but this we are quite safe in saying, that not the *third* part of these sums was ever paid up in *money*. At least two-thirds, probably more, of these gigantic sums of paid up capital are nothing more than the *Banks' own CREDIT turned into CAPITAL*!

202. In order to see how this was done, the reader has only to turn to *BANKING IN ENGLAND*, § 81, 82, where the mode of increasing the capital of the Bank in 1697 is described. The Bank was founded by means of the payment in *money* of £1,200,000. It afterwards, in the course of business, issued notes to a considerable amount. Now, these notes were *DEBTS*, or *NEGATIVE QUANTITIES*, as we have seen before. The Bank, therefore, by issuing these notes, had put itself into a negative position. After it stopped payment, these notes fell to a heavy discount. In 1697, it was determined to increase the capital of the Bank, and this was done by receiving £800,000 of Exchequer tallies, and £200,000 of *its own Depreciated Notes*. These depreciated notes were received at their full value as cash. And thus we see at once that at the first *Augmentation of Capital* £200,000 consisted of *its own Depreciated Notes*—or *CREDIT*.

203. An exactly similar proceeding is described in *BANKING IN SCOTLAND*, § 288. In 1727, the Bank of Scotland increased its capital. The call

was paid up partly in the Bank's own notes. An outcry was made against this, but the directors justly answered, "But the objectors do not at all consider this point. For the payments are many of them made in specie, and bank notes are justly reckoned the same as specie, when paid in on a call of stock, because when paid in, it LESSENS THE DEMAND on the Bank."

Here we see that the Directors clearly understood that the *Release of a Debt* is in all respects equivalent to the *Payment of Money*. The banks had issued their own notes, on the discount of bills, or on the receipt of money. For whatever reason they were issued, they were debts, or negative quantities, and the bank was in debt, or in a negative position, in regard to the holders of them. When the call was made, the subscribers might either pay in money, which would have been $+ \times +$, or in the bank's own notes; that is, they released it from a debt due by it to them, which was $- \times -$. And we see plainly that the two operations were absolutely equivalent. At every further increase of capital, the very same operation would be repeated, payment in money and in the bank's own notes would always be treated as exactly equivalent; and hence we see that at every fresh increase of capital a certain quantity of the bank's own *Temporary Credit* would be turned into *Permanent Capital*.

204. Thus we see that for 1,400 years Algebraists had adopted the empirical rule that $- \times -$ gives $+$, and the real explanation has only been given within very recent times indeed. For 150 years merchants have been acting on the principle that the *Release of a Debt* is in all respects equivalent to the *Payment of Money*; and, in fact, owing to the immense development of credit, or debts, or negative quantities, in modern commerce, the immense majority of payments are made in this way. And it is left to the year 1862 to show that this latter operation is only one example of the great general Algebraical law!

205. Such are the methods by which the Capital of a Joint Stock Bank, which issues notes, may be increased. It might be thought, perhaps, that it is only Banks which issue notes that can thus turn their Credit into Capital. But that is a complete error. We have seen in the article *BANK*, that the very essence of Banking consists in making advances by creating debts, either in the form of bank-notes, or in credits, named *DEPOSITS*. Thus all the Joint Stock Banks of London, other than the Bank of England, do business exclusively by creating Deposits. Now suppose a customer of one of these Banks has a Balance, or Deposit, on his account. The Bank determines to increase its Capital, and the customer wishes to take part of the Stock. He may either pay in money, or he may give the Bank a Cheque on his account. This is exactly the same thing as paying the Bank in its own notes. It is the *Release of a Debt*. Supposing he has not enough on his account to pay for the stock he wishes to purchase, he may bring the bank bills to discount. The Bank discounts these bills, or buys these debts, by creating another debt, in the shape of a Credit, or Deposit, on the customer's account, which is a Negative Quantity, exactly equivalent to a Bank Note. The customer then gives the Bank a cheque on his account, that is, he releases it from the debt it has just created in

his favor. And that Debt released then becomes AUGMENTATION of CAPITAL. That is, as before, $- \times -$ gives $+$.

206. It is true that this method cannot be adopted to so great an extent by the public when the Bank does not issue notes. Because the general public would not have any claims against the Bank, but only its own customers, and those who might happen to have cheques given to them by them. But this is the way in which the Capital of all Joint Stock Banks is increased, and it may go on to any extent without any payment in money.

207. In a precisely similar way, when great public loans are contracted for, a very large portion of them is always created by means of Credit. The customers of a bank wish to subscribe to a loan. They bring it a batch of bills to discount. They draw cheques against the deposits created on the discount of these bills. These cheques may be paid into the credit of the great contractors at their bankers, and transferred an indefinite number of times without ever being required to be discharged in money, they may, in fact, be discharged by being cancelled against other Credits.

On the Extinction of Credit.

208. In the preceding sections we have examined the various operations out of which credit is generated, and the transcendent functions it performs in production—it being, in fact, the grand productive, or circulating power of modern times. We have now to consider the various modes in which it is extinguished. Because it is by its very nature, and as appears by its very name, transitory, and is created always with the express purpose of being destroyed. It is when it cannot be destroyed that it produces such dire effects. It is UNEXTINGUISHED CREDIT which produces those terrible monetary cataclysms, which shake nations to their foundations, scattering ruin and misery among societies. The inability of credit shops to extinguish the credit they have created, commonly called the failures of banks, are, perhaps, among the most terrible social calamities of modern times.

209. We have seen that in commerce bills are created by the transfers of commodities, a fresh one being created at each transfer. And this debt becomes itself a transferable commodity, and is capable of circulating an indefinite number of times, like money. This debt, or promise to pay, might be made payable in anything the parties pleased—coin, wine, oil, &c., &c.—and in some countries is so. But in this country, instruments of credit are always expressed to be payable in money. But we have already seen that a debt is only a lower form of money, and hence there are four different ways in which credit may be extinguished.

1. *By Payment in Money.*
2. *By Exchanging one Debt for another.*
3. *By the Creation of fresh Debt to discharge the old.*
4. *Where parties are mutually indebted to each other, each being Creditor of, and each Debtor to, the other, they may make a Mutual Release of Debts.*

The different proportions in which these various methods are employed to extinguish credit, have very great effect in determining what quantity

of specie is required to carry on the commerce of a country.

210. Before the establishment of banks, credit could only in general be extinguished by payment in money. But of course the same quantity of money would extinguish an infinite series of bills; in fact, it is always by the *circulation* of money that bills are extinguished. Bills are always generated by the circulation of commodities, and always extinguished by the circulation of money. Each manufacturer, or merchant, would sell to a number of wholesale dealers, who would each buy from a number of manufacturers or merchants. They would then each sell to a number of retail dealers, who would each sell to a number of customers, or consumers. Many of these customers would pay in ready money, or at least they must all do so ultimately, so that the retail dealers would always have a constant stream of ready money coming in to discharge their bills, as they fell due in succession.

Now, as each wholesale dealer sells to a number of retail dealers, who would always have a stream of ready money coming in to pay their bills, each wholesale dealer would always have a stream of ready money coming in from many sources, to enable him to discharge his various bills to the merchants and manufacturers. In a similar manner, the merchants and manufacturers would always have a stream of money coming in from a multitude of sources to discharge their bills to foreigners and producers of raw materials. But of course each of them would spend a certain portion of their profits as revenue, that is, they would be customers of the retail dealers. And consequently, by these means, the identical pieces of money would perform a perpetual circulation among the various classes of society. Each person collecting a multitude of little sums into one reservoir, as it were, and then discharging the aggregate so collected into a multitude of other channels. And so on *ad infinitum*.

211. Now, the least consideration will show that the quantity of money being exactly the same, its circulation may be extremely languid, moderately rapid, or extremely rapid. And as in commerce, assumed to be sound, profits arise out of exchanges, it is clear that within certain limits the greater the profits will be, according as the circulation of money is more rapid. Moreover, we see this, that the quantity of credit generated does not depend simply on the quantity of money, but on its quantity multiplied into the velocity of its circulation.

212. We thus see how the fundamental distinction between bills of lading and bills of exchange is illustrated, which is at the root of the currency question. The bill of lading is not generated by the transfer of the *Property* of the goods, but only by a transfer of *Possession*; and when the possession is given up, the bill of lading is cancelled. Thus the bill of lading is only extinguished by the delivery of the very goods it represents. But bills of exchange are generated by the transfer of the *property* of goods, and are absolutely severed from them, and circulate independently in commerce, and are exchangeable for money at a given time. Bills of Lading can never exceed in quantity the goods they represent; instruments of Credit cannot exceed the Quantity of the Circulation of Money. Be the

circulation of goods fast or slow, the quantity of bills of lading cannot vary, but the quantity of credit varies with the circulation of money, so that if the circulation be increased tenfold, credit may always be, and is almost necessarily increased tenfold.

213. The preceding considerations show that Credit is limited by the Circulation of Money. It is clear, therefore, that if some substitute for money be invented, or if by improved methods a less quantity of Money can do the same duty as a greater quantity, the limits of Credit may be proportionably extended. And new methods of extinguishing credit would come into existence. This is done to an enormous extent by the institution of Banks. We have fully described under the articles *BANK* and *CLEARING HOUSE* how debts are extinguished by the creation of new debts, and partly by the exchange, or cancellation, of debts by the Bankers *inter se*. The extension of business by the means of erecting a vast superstructure of credit upon a basis of bullion is something almost incredible. It is probably quite safe to say that not five per cent. of commercial transactions are ever settled in money. Such is the proportion of *Debts*, or *Negative Quantities*, to Money in Commerce.

On the Limits of Credit.

214. In the preceding sections we have endeavoured to lay before our readers an exposition of the actual mechanism of the system of Credit, and shew its powerful effects as a productive agent. Credit, in fact, is to money what steam is to water. And like that power, while its use within proper limits is one of the most beneficent inventions ever devised by the ingenuity of man, its misuse by unskilful hands leads to the most fearful calamities. It is chiefly the abuse of Credit by which that *over-production* is brought about, which causes those terrible catastrophes called Commercial Crises. It is, therefore, essential to ascertain its limits.

215. The true limits of Credit may be seen from the etymology of the word. Because all Credit is a *Promise to pay something in Future*. And that "something," whatever it be, is the *VALUE* of the promise. That something need not necessarily be money. It is perfectly possible that it should be anything else. The practice of interest, or usury, was in force before the invention of money. It might be a promise to do something. As an example of this we may take a postage stamp, which is a promise by the State to carry a letter. And this service is the value of the stamp. Now it is quite clear, and to shew it we have only to appeal to every one's experience, that a postage stamp is a valuable thing. It passes currently as small change. Now, people take postage stamps as equivalent to pence, because they often wish to send letters by the post. The recent regulations that stamps shall be convertible into money at any post office, makes them in all respects part of the currency of the country. They are, in fact, *id.* notes.

216. Now, the only real difficulty in the case, is to observe that the naked "promise to pay" is independent exchangeable property, quite distinct from the thing itself, and it may circulate in commerce just the same as the thing itself. This may surprise some readers at first, but to shew its

truth they need only appeal to their own daily experience, where they see Bank Notes, Cheques, and Bills of Exchange, circulating to the extent of hundreds of millions, and performing all the functions of money. We shall see below that J. B. Say, whose doctrines of Credit we shall examine in the next section, fully acknowledges that an instrument of Credit has an actual value, and may perform the duties of money.

217. But, of course, it is quite manifest that the VALUE of the promise is the *Thing itself*, and consequently if the thing itself fails the promise has lost its *value*. This consideration, therefore, at once indicates the limit of Credit. Assuming Credit to be, what it is in its best known form in this country, the promise to pay money, it is quite clear that every future payment has a *present value*. Consequently, whenever the possession of money at any time is actually certain, the Right to receive it is an exchangeable Property, which may be bought and sold.

218. Commercial Credit, however, does not rest upon so solid a basis as the *certainty* of being in possession of money, for then it would be as safe as money itself, and losses would be unknown. It is based upon the expectation of receiving money at a certain time. A trader buys goods, and gives his promise to pay money, upon the reasonable expectation that he will be able to sell them for money before the bill becomes due; or, at least, that he shall be in the possession of money before that time. That is, he *produces*, or brings and offers them for sale, in the hope that they will be *consumed*, or bought. If he brings forward for sale more of any species of goods than is suitable to the circumstances of the time, so that they cannot be sold at all, or if they are obliged to be sold at a lower price than they cost, that is *over production*. He must then pay his bills out of any other funds at his disposal, or sell other property to meet them, and if he cannot do so he is ruined.

219. In times of great speculation and great fluctuations of prices, there is an exceeding danger of over production by means of Credit, especially by that abuse of it called Accommodation Paper, which we have described. A new channel of trade is opened, perhaps, and the first to take advantage of it make great profits. Multitudes of others, hearing of these great profits, rush in, all dealing on credit. The market is overstocked, and prices tumble down, and the credit created to carry on these operations cannot be redeemed. Not only are the speculators in many cases ruined, but also frequently the banks which created credit by discounting these bills.

220. The institution of Banks and Bankers, who create currency by means of their Credit, either in the form of notes or deposits, gives a great extension to the limits of Credit. But, nevertheless, the *principle* of the limit remains the same. The increased quantity of currency they can issue by means of their Credit, enables them to lower the rate of discount. These banking debts take the place of money, and serve the purposes of money for all internal transactions. When a banker has created these debts by buying commercial debts, those who are indebted to the banker must obtain a sufficiency of money, or of other bankers' notes, or of the banker's own notes, to discharge their debt. And if this be done the Credit has been sound; payment in all these

forms, as we have seen already, being absolutely equivalent. Hence we see that Credit is never excessive, no matter what its absolute quantity be, so long as it always returns into itself.

221. A banker, of course, can only maintain his credit by being always supposed to be able to cash any reasonable amount of his liabilities on demand. In order to do this he must always maintain a certain proportion between his liabilities and his cash. If, therefore, an excessive number of debts be pressed on him for sale, the same result must follow as when an over-abundant supply of any other article is offered for sale in the market. They must fall in value, that is, the rate of discount must be raised. By this means, if done in due time, over-production may often be arrested, because the difference of 1 per cent. in the rate of discount is sufficient to curb a considerable amount of enterprise. If that is not sufficient still more stringent measures must be adopted until it is effectual. But the method is infallible; by raising the rate of discount sufficiently, nearly all production might be brought to a standstill. It is the neglect of this precautionary measure during an excessive generation of Credit, which drives bullion out of the country, that has led to several Commercial Crises. But this part of the subject is fully treated of under CRISIS, COMMERCIAL, and EXCHANGES, FOREIGN.

SUCH IS THE GRAND THEORY OF CREDIT.

SECTION IV.

On the History of Ideas on the subject of Credit, and an Examination of the Opinions of Modern Economists on it.

222. In the preceding sections we have given an exposition of the Scientific Theory and the Mechanism of the system of Credit, which will be found to overthrow many of the current notions on the subject. It is one of such gigantic importance that we must now examine the opinions of several eminent writers, and see how far they agree with, and in what respects they differ from, the views in the preceding sections, and more particularly how far they differ from themselves.

223. We have shewn in § 87, that in ancient times Demosthenes clearly asserted that Credit is Capital. We are not aware that in modern times the subject excited much attention till the 17th century, when several writers, seeing the immense benefit which the Dutch derived from their bills of debt, wished to introduce them into England, but the inflexible rule of the common law that *choses in action* could not be transferred, presented for a long time an insurmountable obstacle to such a plan. Soon after the restoration, however, the extension of commerce attracted a great deal of attention to the subject of Credit, and multitudes of pamphlets were published advocating the institution of public banks. The notes which were issued by the private bankers of London showed the utility and the convenience of the invention. At last, after several attempts, the Bank of England was founded in 1694, with the express intention, as was very clearly stated by its founders, of *increasing* the quantity of the currency.

224. All these projects, however, were for the purpose of augmenting *Credit*, that is, paper currency convertible into specie, and therefore of the value of specie. But many projectors, not satisfied with the increase of the currency caused by *Credit*, began to devise schemes for creating paper money, that is, paper notes not convertible into specie, a thing of a totally different nature, though often confounded with it. Among these were Chamberlen, Asgill, Briscoe, and others, who wished to found an inconvertible paper money, based upon land. The most famous, however, of the advocates of this plan was John Law, and as it was in fact out of the discussions raised by the terrible catastrophe of the Mississippi scheme, that Modern Political Economy may almost be said to have arisen, we may confine our attention chiefly to him.

225. Most persons have no other conception of John Law than as the deviser of a scheme which produced a great financial catastrophe, somewhat similar to the South Sea bubble. The latter was a pure swindle and fraud; and, as both schemes produced a great catastrophe, about the same period, most persons jumble up the two events, and class the projectors of both enterprises under a common name.

226. This, however, is a very grievous error indeed. Law was neither a swindler nor a rogue. Even his enemies and those persons who were opposed to his system, bear ample testimony to his personal integrity and sincerity, and even after the collapse of the system, the higher ranks of the country treated him with the greatest respect. The fact is that his writings are divided into two distinct classes—those upon Banking and *Paper Credit*, and those upon *Paper Money*. His writings on Banking and Paper Credit, were originally written in French and presented to the Regent Orléans, and were never, that we know of, translated into English. His treatise on *Paper Money* was originally published in English, at Edinburgh, in 1705.

227. Nothing can be better and sounder than his writings on Banking and Paper Credit. They were by far the best exposition of the subject that had then been published, in fact they are some of the best that exist to the present day. But the theory of paper money which he adopted is a totally distinct thing, and has no connection with his doctrines of *Credit*. It would be out of place to examine his theory of money here. That is fully done under CURRENCY and LAW. But we may observe that his career was, like his writings, divided into two distinct operations. We have seen under BANKING IN FRANCE, that so long as he confined his operations to legitimate banking, nothing could be more successful. There was scarcely ever such a marvellous restoration of prosperity in so short a space of time as by the institution of Law's Bank. And well would it have been for him and the country if he had stopped there. It was only when he put into practice his theory of paper money that the mischief was produced. But this does not prove that he was a rogue; it only shews that his theory of money was erroneous. It is, nevertheless, one that has innumerable admirers at the present day, and to shew its fallacy requires a thorough knowledge of the most fundamental subtleties of Political Economy.

228. We have been obliged to say this much here as a preface to quoting anything from Law regarding *Credit*, which must be carefully distinguished, as we have said above, from his doctrines on Money. His writings on Banking and *Credit* are contained in ten *Mémoires sur les Banques*, fifteen *Lettres sur les Banques* addressed to the Regent Orléans, and some letters on the system, all in French, published in the first volume of Guillaumin's Collection of Modern Economists.

We shall now shew that Law maintained that *Credit* was equivalent to an increase of money. In the first *Mémoire*, p. 521 of the volume just mentioned, Law says:—"Les Crédits sont nécessaires et utiles; ils font les mêmes effets et le même bien dans le commerce, comme si la quantité de la monnaie était augmentée." He points out the advantage England derived from the institution of *Credit* during the war with France, and being in great difficulty from want of money—"s'est avisée d'introduire des Crédits, qui ont suppléé aux espèces, et soutenu ses manufactures, et son commerce qui, sans ce secours, auraient été ruinées par de si longues guerres qui ont causé un grand transport d'espèces, et sous lesquelles l'Angleterre aurait succombé sans les Crédits dont elle s'est bien servie. Les Crédits ont non seulement suppléé aux espèces qui étaient transportées, mais ont servi au delà, et ont augmenté ses manufactures et son commerce, même pendant la guerre." He then says:—"La Banque est un espèce de *Credit*," and speaking of the Bank of England—"mais le bien que la banque fait en augmentant la quantité de la monnaie." He shews, too, that its shares being negotiable, in many cases served the purpose of money. At p. 545, he says:—"La Banque d'Angleterre, outre ces commodités qu'elle donne aux négociants pour faciliter les paiements, produit une plus forte circulation, et fait le même effet que si la monnaie d'Angleterre était considérablement augmentée, comme je l'ai déjà remarqué." And at p. 554:—"Donc, l'introduction d'un *Credit*, dans le commerce augmentait la quantité de la monnaie réellement, et faisant le même effet que si elle était augmentée, par une plus forte circulation que ce *Credit* procure, doit diminuer le prix ou intérêt de l'argent." At p. 560:—"La circulation des billets de la banque dans les provinces ferait le même effet qui si la quantité des espèces était considérablement augmentée, et par là, soutiendrait et augmenterait l'agriculture et les manufactures."

Law also saw, of course, that these notes, &c., were of the value of money, because they were exchangeable for money—"ces billets étant supposés au moins aussi bien que l'argent puisqu'on les peut convertir en espèces à volonté."

In the first *Lettre sur les Banques*, he says,—"Si l'Espagne avait cédé les Indes aux Anglais, cette nation n'aurait pas tant profité de ce commerce qu'elle a profité de son crédit."

"Avant le mort de Charles II, roi d'Espagne, le commerce des Indes a fourni aux Anglais environ 25 millions par année en matières d'argent; de cela une partie était consommée, une partie payait une balance due alors à la France, une partie était transportée par la Compagnie des Indes Orientales; il n'en restait qu'environ 8 millions; ainsi, pour augmenter la

monnaie d'Angleterre de 400 millions, il aurait fallu 50 années d'un commerce bien réglé et sans interruption, en donnant le produit et manufactures du pays en échange de ces matières.

"Par l'introduction du crédit, l'Angleterre a augmenté sa monnaie au-delà de cette somme, sans avoir donné en échange aucune valeur en marchandise, car le crédit qui circule dans la ville de Londres seule, monte à plus que les espèces monnayées de la France et de l'Angleterre. Ainsi il ne doit pas paraître extraordinaire que la monnaie soit si abondante à Londres, les espèces ne faisant pas la cinquième partie de ce que le crédit fait.

"Le revenu de cette augmentation de la monnaie produit annuellement plus que double de ce que le commerce des Indes aurait produit, par une augmentation de l'industrie et des manufactures de ce royaume, qui ont été portées si loin qu'elles fournissent la plus grande partie de l'Europe."

229. These extracts are sufficient to show that Law knew and maintained that credit was separate and independent exchangeable property, which was cumulative property over and above specie and commodities. He never falls into that extraordinary confusion of idea of believing that Credit is the transfer of Capital. He sees, as we have said above, that Credit is to be added to the mass of other exchangeable property (§ 23). So also Melon, a contemporary writer, in his *Essai Politique sur le Commerce*, in the same volume, already mentioned, p. 757, commenting on the political arithmetic of Sir W. Petty, says—"Au calcul des hommes il faut ajouter le calcul de ce qu'ils valent par leur travail.

"Au calcul des valeurs numéraires, il faut ajouter le crédit courant du négociant, et son crédit possible."

230. That astounding confusion of ideas which prevails through so many modern writers that Credit is the transfer of something began with Turgot. When he was at College, and only 22 years old, he began to reflect on Law's system, and addressed a letter on the subject to the Abbé de Cicé, *Sur le papier suppléé à la monnaie*. (*Œuvres de Turgot. Vol. I., p. 94. Edit. Guillaumin.*) This letter contains an expression which has been the key note of a fallacy which has been sedulously propagated from that day to this, by a long series of writers both in France and in England. He says:—En un mot tout Crédit est un emprunt, et a son rapport essentiel à son remboursement." Here we see the first statement of that gross confusion of ideas on the subject of Credit, which is so prevalent. Preceding writers had always seen that Credit was a species of exchangeable property, which served the purpose of money. But Turgot makes Credit to be an operation. To say that Credit is a loan is as gross a misconception of the nature of the thing as to say that a guinea is the transfer of a book! Moreover, the word loan is ambiguous. We have fully explained the nature of this ambiguity in § 61, where we have shewn that in English there is but one word for the two Latin ones *mutuum* and *commodum*, in the distinction between which lies one of the greatest subtleties in Political Economy. An operation on Credit is always an exchange, where the property of the thing "lent" always passes to the "borrower,"

and the "lender" receives in return the right, or property, to demand back an equivalent to the thing "lent" at a future time. Turgot rightly enough says that every Credit implies a future repayment. That is true; Credit means the Right to a future Payment. And it is precisely because this Right is exchangeable for something at a future period that it has value. And it may be bought and sold like any other species of property. We shall see afterwards that J. B. Say, whose doctrines we shall have to examine, fully acknowledges this.

The Opinion of Adam Smith on the Nature of Credit.

231. The controversies about Credit, of which the germ is contained in the extract from Turgot, which we have given above, did not commence till after Adam Smith's time. He, therefore, did not discuss them. Though his doctrines on the powers of Credit are self-contradictory, as we have shewn under CURRENCY PRINCIPLE, he is perfectly consistent with himself as to the nature of Credit. He uniformly considers Credit to be independent exchangeable property, and we shall now show that he classes it under CAPITAL.

232. In the first place, we have shewn under CAPITAL, that Smith, in a passage which has been most unaccountably overlooked by nearly every writer, expressly enumerates the useful and acquired abilities of the inhabitants of a country as part of its wealth, or fixed Capital. Now as a man's Credit depends purely upon the belief in his character and abilities, it is manifestly according to the very definition, Capital to him, by means of which he can make a profit. Thus Smith says, Book 1, c. x.—"In great towns trade can be extended as stock increases, and the CREDIT of a frugal and thriving man increases much faster than his stock. His trade is extended in proportion to the amount of BOTH, and the sum or amount of his profits is in proportion to the extent of his trade, and his annual accumulation in proportion to the amount of his profits." Hence we see that Smith places Credit on exactly the same footing as stock, and as he makes a profit by it in the same way as by Stock, it is clearly capital to him as well as his Stock.

233. But we shall now shew that Smith expressly includes Credit under the term Capital, and says that it produces exactly the same effects as money.

Under the term fixed Capital he includes the abilities of the people upon which Credit depends. Under the term floating Capital he includes four sorts. The first of these he says is, "The money by means of which all the other three are circulated and distributed to their proper consumers."

In B. 2, c. ii., he says, "Money, therefore, the great wheel of circulation, the great instrument of commerce, like all other instruments of trade, though it makes a part, and a very valuable part, of the Capital, &c."

Thus we see that Smith expressly includes the wheel of circulation, or according to a name it has received since his day, the "circulating medium," as part of the Capital of the country.

He then says that every saving in the expence of collecting and supporting that part of the circulating capital, which consists of money, is an increase of the neat revenue of the country.

He says then, "The substitution of paper in the room of gold and silver money, replaces a very expensive instrument of commerce with one very much less costly, and sometimes equally convenient. Circulation comes to be carried on by a new wheel, which it costs less both to erect and to maintain than the old one."

"There are several different sorts of paper money, but the circulating notes of banks and bankers are the species which is best known, and which seem best adapted for this purpose."

Thus we see that Smith expressly includes all forms of paper credit under the term money, or circulating power, which he has already said is Capital.

After saying that if people have confidence in a banker, his notes come to have the same currency as gold and silver; because people believe that money can always be had for them, he says, "When a particular banker lends among his customers his own promissory notes to the extent, we shall suppose, of £100,000. As these notes serve all the purposes of money, his debtors pay him the same interest as if he had lent them so much money. This interest is the source of his gain. Though some of these notes are continually coming back on him for payment, part of them continue to circulate for months and years together. Though he has generally in circulation, therefore, notes to the extent of £100,000, twenty thousand in gold and silver may frequently be a sufficient provision for answering occasional demands. By this operation, therefore, £20,000 in gold and silver perform all the functions which £100,000 could otherwise have performed. The same exchanges may be made, the same quantity of consumable goods may be circulated and distributed to their proper consumers, by means of his promissory notes to the value of £100,000, as by an equal value of gold and silver money."

Thus we see that Smith says that a banker may derive exactly the same profit from the use of his Credit that he would from actual money, and therefore it is Capital to him. And he shews that it has exactly the same effects on the country as so much money, and therefore it is equally Capital to the country.

He also supposes a case in which the circulating money of a country should be £1,000,000 at any time. Different banks and bankers issued paper to an equal amount, reserving £200,000 to meet the demand for specie. "There would remain, therefore, in circulation £800,000 in gold and silver and £1,000,000 of bank-notes, or £1,800,000 of paper and money together." Thus we see that Smith classes Paper Credit as independent exchangeable property, just on the same footing as gold and silver. He then says that such an emission of paper will release a quantity of the circulating money, and enable it to be exported to purchase foreign goods, and to be invested in foreign trade, and he says:—"Whatever profit they make will be an addition to the neat revenue of their own country. It is like a new fund created for carrying on a new trade, domestic business being now transacted with paper, and the gold and silver being converted into a fund for this new trade." He says also that it may be applied to purchase an additional stock of materials, tools, and provisions, in order to main-

tain and employ an additional number of industrious people, who reproduce with a profit the value of their annual consumption. *

"When paper is substituted in the room of gold and silver money, the quantity of the materials, tools, and maintenance which the whole circulating capital can supply, may be increased by the whole value of gold and silver, which used to be employed in purchasing them. *

"When, therefore, by the substitution of paper the gold and silver, necessary for circulation, is reduced to, perhaps, a fifth part of the former quantity, if the value only of the greater part of the other four-fifths be added to the funds which are destined for the maintenance of industry, it must make a very considerable addition to the quantity of their industry, and consequently to the value of the annual produce of land and labour."

234. In speaking of bankers he says:—"It is chiefly by discounting Bills of Exchange, that is, by advancing *money* upon them before they are due, that the great part of banks and bankers issue their *promissory notes*. * The banker who advances to the merchants, whose bill he discounts, not gold and silver, but his own promissory notes, has the advantage of being able to discount to a greater amount, by the whole value of his promissory notes, which he finds by experience are commonly in circulation. He is thereby enabled to make his clear gain of interest on so much a larger sum. *

"The banks, when their customers apply to them for *money*, generally advance it to them in their own *promissory notes*. These the merchants pay away to the manufacturers for goods, the manufacturers to the farmers for materials and provisions, the farmers to their landlords for rent, the landlords repay them to the merchants for the conveniences and luxuries with which they supply them, and the merchants again return them to the bank in order to balance their cash accounts, or to replace what they may have borrowed from them; and thus almost the whole money business of the country is transacted by means of them."

235. Thus Smith clearly places Paper Credit on exactly the same footing as Money. He shewed that traders made a profit by their credit, and in the last-mentioned passages he shews how bankers make a profit by their credit, and how in process of time the greater part of the circulation of the country is carried on by Credit. In B. II., c. iv., he says:—"The stock which is lent at interest is always considered as a CAPITAL by the lender." Then a little after—"Almost all loans at interest are made in money, either of paper or of gold and silver." * "The quantity of *stock*, therefore, or, as it is commonly expressed, of *money* which can be lent at interest in any country, is not regulated by the value of the *money*, whether *paper* or coin, &c."

236. Thus Smith expressly classes Paper Credit under the term Capital, and therefore it must be *productive*. It has puzzled many persons, however, to conceive how Credit can be *Productive*. This, of course, manifestly turns on the meaning of *Productive*. We have fully shewn under *Production* the extension of meaning which Smith gave to *productive labour*, beyond that in which it was used by the French Economists. He says that there are four ways in which Capital may

be employed productively (B. II., c. v.)—1st, in procuring rude produce; 2ndly, in manufacturing it; 3rdly, in transporting it from place to place; 4thly, in dividing it into small parcels to suit the convenience of customers. Hence we see that he says Capital may be *productively* employed in buying and selling. Now, of course, it will be at once seen that Credit is employed in buying and selling. Smith says that the labour of wholesale and retail dealers is productive because it adds to the value of the commodities they deal in. But persons can buy and sell with Credit equally well as with money. Hence, their labour is just as much *productive* in the one case as in the other. And here we see at last the root of the difficulty which many persons have in conceiving that Credit is productive capital, because they evidently mean by production an increase of *quantity*. But the fact is that *circulation* is one species of production, and hence the circulating power is Capital. Now the circulating medium, as every one knows, is Money and Credit. As Smith says (B. III., c. 1.)—"The great commerce of every civilized society is that carried on between the inhabitants of the town and those of the country. It consists in the exchange of rude for manufactured produce, either immediately, or by the intervention of money, or of *some sort of paper* which represents money."

The extracts which we have laid before our readers are quite sufficient to shew that Adam Smith never committed the extraordinary error of supposing that Credit is the transfer of Capital, as is so common at present. It is quite evident that he always knew that Credit is independent, exchangeable property, and that it is **PRODUCTIVE CAPITAL**.

On the Opinion of Jean Baptiste Say respecting the Nature of Credit.

237. We now have to examine the opinions of J. B. Say respecting Credit, as it is he who, following up the erroneous notion of Turgot, invented the phrase which so many unthinking writers have echoed from that day to this, that those who consider Credit to be Capital, maintain that the same thing can be in two places at once!

238. Credit, as we have shewn in the preceding sections of this treatise, is a species of incorporeal property, and was always well understood to be so, until Turgot originated the erroneous notion that it was a loan, or the *transfer* of something. The question of Credit, therefore, involves that of the admission of incorporeal property into Political Economy.

239. It is very commonly stated that J. B. Say was the first Economist to introduce immaterial products into Political Economy. We have already shewn that this is erroneous. We have, besides, shewn under CAPITAL, that Say has put forth the most self-contradictory opinions on the subject. We have shewn that in one place he says that immaterial products are not capital, and that the talents and abilities of the people are not part of the wealth of the country; and that in another place he says that they are to be counted as wealth. That in one place he maintains that all transferable capital is composed of *material* products, having an *intrinsic* value, and that it is not possible to amass and transmit to another person any but values incorporated in material objects,

and yet in a note to this very passage he says that there are capitals not incorporated in any material things, such as the *clientelle* of a notary, or of a commercial enterprise. And in the same volume he enumerates other capitals not incorporated in material objects, such as copyright, the goodwill of a business, which he says may be bought and sold.

240. Economists seem to be the chartered libertines of science. Of all the sciences it seems to be the only one in which writers are permitted to utter the most contradictory opinions, and yet to be considered as authorities. We have seen Say's self-contradiction on the subject of Capital; we shall now find that he is equally self-contradictory on the subject of Credit.

In the first place he has fallen into that confusion of ideas about value, which has ruined so much of modern economics. He repeatedly speaks of *INTRINSIC* Value, and of Value being something inherent and innate in a matter, and yet he says, *Traité d'Economie Politique*, p. 57—"La valeur que les hommes attachent aux choses."
* * * Toujours est il vrai que si les hommes attachent de la valeur à une chose, &c.;" and in a note to this passage he says—"Ce n'est pas ici le lieu d'examiner si la valeur que les hommes attachent à une chose est proportionnée ou non à son utilité réelle. La juste appréciation des choses dépend du jugement, des lumières, des habitudes, des préjugés de ceux qui les apprécient. Une saine morale, des notions précises sur leurs véritables intérêts, conduisent les hommes à une juste appréciation des vrais biens." Now what can be more self-contradictory than the notion that value is something inherent in the substances themselves, and then to say that it entirely depends on the judgment, the knowledge, the habits, and the prejudices of men?

241. Having thus shewn his self-contradictions on the conception of Value, we shall now come to his conception of Credit. In B. I., c. 1., of his *Traité*, after speaking of things of value, such as the earth, metals, money, corn, stuffs, &c., he says:—"Si l'on donne aussi le nom de *richesses* à des contrats de rentes, à des *effets de commerce*, il est évident que c'est parce qu'ils renferment un engagement pris de livrer des choses qui ont une valeur par elles mêmes."

And in his *Cours Complet d'Economie Politique*, Part I., ch. 1, Vol. I., p. 67, he says:—"La possession exclusive qui, au milieu d'une nombreuse réunion d'hommes, distingue nettement la propriété d'une autre personne, fait que dans l'usage commun, cette sorte de biens est la seule à laquelle on donne le nom de *Richesse*."
* * * C'est là que viennent se ranger non-seulement les choses capables de satisfaire directement les besoins de l'homme, tel que l'ont fait la nature et la société, mais les choses qui ne peuvent les satisfaire qu'indirectement en fournissant des moyens de se procurer ce qui sert immédiatement, comme l'argent, les **TITRES DE CREANCES**, les contrats de rente, &c."

Thus we see that Say expressly enumerates **DEBTS, or CREDIT, as WEALTH**.

242. Moreover, in B. I., ch. 30, of the *Traité*, he says:—"Une billet à ordre, une lettre de change, sont des obligations contractées de payer, ou de faire payer, une somme soit dans un autre temps, soit dans un autre lieu."

"Le droit attaché à ce mandat (quoique sa valeur ne soit pas exigible à l'instant et au lieu où l'on est), lui donne néanmoins une VALEUR ACTUELLE, plus ou moins forte. Ainsi un effet de commerce de cent francs, payable à Paris dans deux mois, se négociera, ou, si l'on veut, se vendra pour le prix de 99 francs; une lettre de change de pareille somme, payable à Marseille au bout du même espace de temps, vaudra actuellement à Paris peut-être 98 francs.

"Dès-lors qu'une lettre de change ou un billet, en vertu de leur valeur future, ont une VALEUR ACTUELLE, ils peuvent être employés en guise de monnaie dans toute espèce d'achats, aussi la plupart des grandes transactions du commerce, se règlent-elles avec des lettres de change."

Thus we see in this passage that Say maintains exactly the same doctrine as we have set forth in the preceding sections, that an instrument of Credit is a *present right to a future payment*, and that it is separate and independent exchangeable property. That is, that CREDIT, or DEBTS, are WEALTH.

243. We may also quote another passage from his *Cours (Part III., Division III., ch. 27, p. 461, Vol. I.)*:—"Il y a néanmoins une observation importante à faire relativement aux signes représentatifs des monnaies. C'est qu'ils sont capables de rendre un service exactement pareil au service que peuvent rendre les monnaies qu'ils représentent. Si quelqu'un souscrivait un engagement par lequel il s'obligerait à livrer, à une époque désignée, un manteau fait de telle ou telle façon, cette promesse, quoiqu'elle fût en quelque sorte un signe, un gage de la possession du manteau, ne saurait en tenir lieu; car une feuille de papier ne garantit pas du froid, comme fait un manteau; tandis que les signes qui représentent la monnaie, peuvent la remplacer complètement, et rendre tous les services que l'on peut attendre d'elle. En effet, les qualités qui font qu'un sac d'argent nous sert dans nos échanges, peuvent toutes se trouver dans une billet. Ces qualités, vous vous le rappelez, consistent :

"D'abord dans la VALEUR qu'il a. On peut donner à un billet exactement la même valeur qu'à une somme d'argent, en donnant au porteur le droit de toucher la somme, de manière à lui ôter toute inquiétude sur ce remboursement; c'est ainsi qu'un billet de banque peut circuler dix ans en conservant une valeur de mille francs sans qu'il soit remboursé, seulement parce qu'on est convaincu qu'il le sera du moment que le porteur le voudra. * * *

"Vous voyez, Messieurs, que toutes les qualités utiles de la monnaie peuvent se retrouver dans un signe représentatif, qui n'a aucune valeur par lui-même, et tire de la monnaie même, toute celle que l'on veut bien lui accorder."

Hence we see that these passages assert as clearly and explicitly as it is possible that language can do, that Credit may be in all respects equivalent to money, and therefore that it may be CAPITAL, just as money may.

244. Having thus laid before our readers these explicit declarations of Say, that Credit is Wealth, we will now place before them the passage which has been the foundation of such an immense amount of misconception. He says, *Traité*, B II., c. 8:—"On s'imagine quelquefois que le Crédit multiplie

les capitaux. Cette erreur qui se trouve fréquemment reproduite dans une foule d'ouvrages, dont quelques uns sont même écrits *ex professo* sur l'économie politique, suppose une ignorance absolue de la nature et des fonctions des capitaux. *Un capital est toujours une valeur très-réelle, et fixée dans une matière; car les produits immatériels ne sont pas susceptibles d'accumulation. Or un produit matériel ne saurait être en deux endroits à la fois, et servir à deux personnes en même temps.* Les constructions, les machines, les provisions, les marchandises qui composent mon capital, peuvent en totalité être des valeurs que j'ai empruntées; dans ce cas, j'exerce une industrie avec un capital qui ne m'appartient pas, et que je loue; mais, à coup sûr, ce capital que j'emploie n'est pas employé par un autre. Celui qui me le prête s'est interdit le pouvoir de le faire travailler ailleurs. Cent personnes peuvent mériter la même confiance que moi; mais ce Crédit, cette confiance méritée ne multiplie pas la somme des capitaux disponibles; elle fait seulement qu'on garde moins de capitaux sans les faire valoir."

He also says in his *Cours (Part I., c. 9)*:—"Le manufacturier qui achète à Crédit des matières premières, emprunte à son vendeur la valeur de ces marchandises pour tout le temps où ce dernier lui fait Crédit; et cette valeur qu'on lui prête, lui est fournie en marchandises qui sont des valeurs matérielles.

"Or, si l'on ne peut prêter et emprunter une portion de Capital qu'en objets effectifs et matériels, que devient cette maxime que le Crédit multiplie les capitaux? Mon Crédit peut bien faire que je dispose d'une valeur matérielle qu'un capitaliste a mise en réserve; mais s'il me la prête, il faut qu'il demeure privé; il ne peut pas en même temps la prêter à une autre personne; la même valeur ne saurait servir deux fois en même temps; l'entrepreneur qui emploie cette valeur, qui la consomme pour accomplir son opération productive, empêche qu'aucun autre entrepreneur puisse l'employer dans la sienne."

245. We have now to remark upon the extraordinary self-contradictions of Say. He tells us expressly that instruments of Credit have an actual value in respect of their future payment, and that they may be made to have precisely the same value as money itself, and may be employed in purchases in all respects exactly in the same manner that money may. Now this, of course, by implication, admits that they may be Capital, because money is only used as Capital, by being employed in buying and selling.

246. Having laid this down as clearly as can be, we have now to see how Say proceeds to contradict himself. He says, in the passages last quoted, that Capital is always a very real value fixed in a matter! Why he himself has told us that there is incorporeal Capital *not* fixed in any matter whatever, such as Copyright, the goodwill of a business, &c., &c. He then says that immaterial products are not capable of accumulation! What! Cannot a man be possessed of £100,000 of Funded Property? And of the Copyrights of Books, &c., and of a number of Bills of Exchange? He then says that a material product cannot be in two places at once. But who said it could—except Sir Boyle Roche, the famous Hibernian,—and even he limited this power to birds. Neither, however, can an immaterial

product be in two places at once, that we are aware of; so that it makes not much difference as to its capacity of being in two places at once, whether the product is material or immaterial. He says that the material merchandise *lent* cannot serve two persons at once. No one said it could; but that has nothing to do with the question. Because it is not the merchandize which is the Credit, but the *Debt created in exchange for the merchandize*, which is a valuable property in itself, and may either be used to buy other articles, and therefore is productive Capital, or else it may be discounted by a banker, and the proceeds used in the same manner.

247. But Say himself calls these instruments of Credit, Capital. In his *Cours (Partie III., ch. xviii.)* he says:—"Tout particulier peut souscrire un billet ordinaire, et le donner en paiement d'une marchandise, pourvu que le vendeur consente à le recevoir comme si c'était de l'argent. Ce vendeur à son tour, s'il est acheteur d'une autre marchandise, peut donner le même billet en paiement. Le second acquéreur peut le passer à un troisième dans le même but. Voilà un engagement qui circule; il sert à qui veut vendre; il sert à qui veut acheter; il remplit l'office d'une somme de monnaie."

"La valeur d'une signe dépend de la valeur de la chose signifiée; mais pour que cette valeur soit précisément aussi grande que celle de la chose dont elle est la gage, il faut non-seulement que le paiement du billet soit indubitable, mais qu'il puisse être exigé à l'instant."

"Si les billets de confiance peuvent remplacer complètement la monnaie métallique, il est évident qu'une banque de circulation augmente véritablement la somme des richesses nationales; car dans ce cas la richesse métallique devenant superflue comme agent de circulation, et conservant néanmoins une valeur propre, devient une valeur disponible, et peut servir à d'autres usages. Mais comment s'opère cette substitution? Quelles en sont les bornes? Quelles classes de la société font leur profit de l'intérêt des *nouveaux fonds ajoutés aux capitaux* de la nation?"

"A mesure qu'une banque met ses billets dans la circulation et que le public consent à les recevoir sur le même pied que la monnaie métallique, le nombre des unités monétaires augmente."

* Les personnes qui font la spéculation d'envoyer des monnaies métalliques dans l'étranger, après les y avoir vendues, ou les avoir employées à des achats de marchandises, ont soin de se faire adresser l'équivalent de leurs achats. Ce sont là des richesses réelles des valeurs *ajoutées* à nos capitaux, des valeurs sur lesquelles peut s'exercer notre industrie, et que notre industrie rétablit à mesure qu'elle les consomme, pour fournir des avances à une production nouvelle. *Nous avons des capitaux de plus*, et la valeur capitale qui servait auparavant aux besoins de notre circulation, n'est pas moindre, puisqu'elle est remplacée chez nous par un signe représentatif qui en tient lieu parfaitement.

"Il ne faut pas pourtant pas qu'on s' imagine que la valeur retirée de la somme des monnaies et ajoutée à la somme des capitaux-marchandises, égale la somme des billets en émission. Ceux-ci ne représentent la monnaie qu'autant qu'on est toujours en mesure de les payer à bureau ouvert; et pour cela, la banque est obligée de garder dans

ses coffres, et par conséquent de retirer de la circulation une somme quelconque de numéraire. Si, par supposition, elle met dans la circulation pour cent millions de billets, elle retirera peut-être 40 millions d'espèces, qu'elle mettra en réserve pour faire face aux remboursements qui pourraient lui être éventuellement demandés. Or, si elle ajoute à la quantité de monnaie en circulation, 100 millions, et si elle en retire 40 de la circulation, c'est comme si elle en ajoutait seulement 60.

"Nous devons à présent désirer de savoir quelle classe de la société jouit de l'usage de ce NOUVEAU CAPITAL."

Say then goes on to explain how this *new capital* is employed, and who reaps the profit of it.

Thus, J. B. Say, who is supposed to be the Economist *par excellence*, who has proved that those writers who maintain that Credit is Capital, are such poor muddle-headed creatures as to think that the same thing can be in two places at once, himself expressly declares that CREDIT IS CAPITAL!!!

On the Opinion of Mr. J. S. Mill on the subject of Credit.

248. Turgot, we have seen above, was the writer who started the erroneous notion that Credit was the transfer of something, and J. B. Say extended this error by saying that credit could not multiply capital, because the same thing could not be in two places at once. These two sentences have been repeated by a multitude of unthinking writers in France and England, from that day to this. The number of writers who have reiterated these absurdities is so great that we cannot afford room to examine them all. We have only room to examine what Mr. J. S. Mill has said, and to see whether he is more consistent with himself than Say.

We have shown under WEALTH, and MILL, J. S., the unsteady conception which Mr. Mill has of the definition of WEALTH. At p. 8, Vol. I., he says—"Everything forms, therefore, a part of Wealth, which has a power of purchasing." And—"Money being the instrument of an important public and private purpose, is rightly regarded as Wealth; but everything else which serves any human purpose, and which nature does not afford gratuitously, is Wealth also." Here, therefore, are propositions of the widest generality, which assert that whatever can be bought and sold, no matter what its nature be, is Wealth. Consequently if Bank Notes, Bills of Exchange, &c.—or Credit—can be bought and sold, they are Wealth, by the very force of the definition.

249. Let us now turn to Mr. Mill's definition of Capital. He tells us, B. I., c. iv., that money may be productive capital by being exchanged for other things, and that ANYTHING which is susceptible of being exchanged for other things is capable of contributing to production in the same degree. That is to say, without inquiring here what is meant by production, he says that money may be productive capital by being used in a certain way, and that anything which may be used in a similar way may be productive Capital as much as money. Now it is perfectly well known that Bank Notes, Bills of

Exchange, &c.—or Credit—may be, and, are exchanged for other things just as money is. Hence this sentence expressly implies that Credit may be productive Capital just as much as money.

250. Thus we see that Mr. Mill has already by implication admitted that Credit may be Capital. And this doctrine we shall find he still more explicitly states when he speaks of Credit itself. Chap xi., B. III., is headed, "Of Credit, as a substitute for money." Now we observe that if one thing is to be a substitute for another, it must be of the same general nature. Not so high, or excellent in degree, perhaps, but still it must be of the same kind. Things of totally different natures cannot be substituted for each other. Thus, for instance, if a man cannot get xxx ale he may have to put up with swipes as a substitute. But a pair of shoes could never be a *substitute* for a glass of ale. If, therefore, Credit is to be a substitute for money, it must be of the same general nature as money. Now money, as every one knows, is separate and independent exchangeable property, and consequently Credit must be so also. Money, if used in a certain way, is Capital; Credit must also be capable of being used as Capital as well. If money, therefore, is capable of being productive Capital, Credit must be so likewise.

251. Passing over the beginning of this chapter, to which we shall revert, Mr. Mill says in § 3,—"For Credit, though it is not *productive* power, is *purchasing* power." Now here is a striking contradiction already to what he had said before. For in B. I., as we have already shewn, he says that anything which has power of purchase is Wealth. Here he admits that Credit is purchasing power, and therefore, by his own shewing, if it is purchasing power, it is Wealth; and if it is Wealth, it may, by his own admission, be productive Capital.

252. In § 5, he says, that a form "in which credit is employed as a substitute for currency is that of promissory notes." In § 6, he says, another mode "of making credit answer the purposes of money, by which, when carried far enough, money may be very completely superseded, consists in making payments by cheques." Here we see that he expressly calls the Promissory Note and the Cheque, the Credit.

253. In the next chapter, xii., we shall see that he expressly allows that these instruments of Credit are independent exchangeable property, and valuable things. He says, § 1—"An *order*, or *note of hand*, or *bill payable at sight*, for an ounce of gold, while the credit is unimpaired, is worth neither more nor less than the gold itself;" and, "But we have now found that there are other things, such as bank notes, bills of exchange, and cheques, which circulate as money, and perform ALL the functions of it." Now here is an explicit declaration that Credit performs ALL the functions of money, and therefore as one of the functions of money is to be *productive Capital*, it follows that Credit may also be productive Capital.

254. In § 2 of the same chapter, he says, that a man "may make purchases with money which he only expects to have, or even only pretends to expect. He may obtain goods in return for his acceptance payable at a future time, or on his note of hand, or on a simple book credit, that is, on a mere promise to pay. All these purchases have exactly the same effect on price, as if they

were made with ready money. The amount of purchasing power which a person can exercise, is composed of all the money in his possession, and due to him, AND OF ALL HIS CREDIT." "He creates a demand for the article to the full amount of his money AND CREDIT *taken together*, and raises the price proportionably to both." In § 3, he says—"The inclination of the mercantile public to increase their demand for commodities by making use of all or much of their credit as a purchasing power." In § 4—"The banker's credit with the public at large, coined into notes, as bullion is coined into pieces of money to make it portable and divisible, is *so much purchasing power* ~~SUPERADDED~~, in the hands of every successive holder, to that which he may derive from his own credit. * * Credit, in short, has exactly the same purchasing power with money; and as money tells upon prices not simply in proportion to its amount, but to its amount multiplied by the number of times it changes hands, so also does credit; and credit transferable from hand to hand is in that proportion more potent than credit which only performs one purchase."

255. In § 6, he says—"Since, then, credit in the form of bank notes is a more potent instrument for raising prices than book credits—* * If we consider the proportion which the utmost increase of bank notes in a period of speculation bears, I do not say to the whole mass of credit in the country, but to the bills of exchange alone, the average amount of bills in existence at any one time is supposed considerably to exceed a hundred millions sterling. The Bank Note circulation of Great Britain and Ireland is less than thirty-five millions, and the increase in speculative periods at most two or three." And as a note to this passage, Mr. Mill gives a table of the bills supposed to be created in several years, the last of which is 1839, when the bills supposed to be created amounted to £528,493,842. In ch. xiii, he says—"After experience had shewn that pieces of paper of no intrinsic value, by merely bearing upon them the written profession of being equivalent to a certain number of francs, dollars, or pounds, could be made to circulate as such, and to produce all the benefit to the issuers which could have been produced by the coins which they purported to represent—"

256. Now, from these extracts from Mr. Mill's work, our readers will clearly perceive that he expressly asserts, as positively as it is possible that language can do, that Credit is independent, exchangeable property like any other. That it is cumulative property to money and commodities, and that it may be dealt with precisely in the same manner as money, and may produce all the effects of money. Now, as this Credit is nothing but circulating debts, it follows clearly from Mr. Mill's own admission, that DEBTS are WEALTH. All this is in exact accordance with the doctrines laid down in the preceding sections of this treatise.

257. In B. III., chap. xxii, he is equally explicit—"The same effects which would thus arise from the discovery of a treasure accompany the process by which bank notes, or any of the other substitutes for money, take the place of the precious metals."—"The value saved to the community by thus dispensing with metallic money, is a clear gain to those who provide the substitute.

They have the use of 20 millions of circulating medium, which have cost them only the expense of an engraver's plate. If they employ this accession to their fortunes as **PRODUCTIVE CAPITAL**, the produce of the country is increased and the community benefited as much as by any other **CAPITAL** of equal amount. * * When paper currency is supplied, as in our own country, by bankers and banking companies, the amount is almost wholly turned into **PRODUCTIVE CAPITAL**. * * A banker's profession being that of a money lender, his issue of **NOTES** is a simple extension of his ordinary occupation. He lends the amount to farmers, manufacturers, or dealers, who employ it in their several businesses. So employed, it yields, like any other **CAPITAL**, wages of labor, and profits of stock. The profit is shared between the banker, who receives interest, and a succession of borrowers, mostly for short periods, who, after paying the interest, gain a profit in addition, or a convenience equivalent to profit. The **CAPITAL** itself in the long run becomes entirely wages, and when replaced by the sale of the produce becomes wages again; thus affording a perpetual fund of the value of 20 millions for the maintenance of productive labor, and increasing the annual produce of the country by all that can be produced through means of a **CAPITAL** of that value."

258. Thus our readers will perceive from the former extracts that we laid before them, that Mr. Mill expressly stated that Credit was independent exchangeable property, whether embodied in the forms of Notes, Bills, Bank debts, or any other form, which was capable of performing all the functions of money, and therefore by implication capable of being employed as capital. But in the last preceding extracts he expressly calls bank notes—which are Credit—**PRODUCTIVE CAPITAL**.

259. We think we have shewn our readers as clearly as it can be done, that Mr. Mill asserts that Credit is Capital. And yet will they believe that he not only denies that Credit is Capital, but sneers at the imbecility of those who think it is!

In B. III., chap. xix which we have already quoted from, the heading of the chapter is, as we said, "Of Credit, as a substitute for money," which clearly affirms that Credit is exchangeable property like money; he says,—"The functions of Credit have been a subject of as much misunderstanding, and as much confusion of ideas, as any single topic in Political Economy."

"As a specimen of the confused notions entertained respecting the nature of Credit, we may advert to the exaggerated language so often used respecting its national importance. Credit has a great, but not as many people seem to suppose, a magical power; it cannot make something out of nothing [Who said it could?] *How often is an extension of Credit talked of as equivalent to a creation of Capital, or as if Credit actually were capital!!!* [Why! Who has said more distinctly than Mr. Mill himself that Credit is Capital? The very object of the whole of the preceding extracts is to shew that Credit is Capital!] It seems strange that there should be any need to point out that *credit being only the permission to use the capital of another person!!* the means of production cannot be increased by it, but only *transferred*. If the borrower's means

of production, and of employing labor are *increased* by the credit given him, the lender's are as much *diminished*. The same sum cannot be used as capital both by the owner, and also by the person to whom it is lent, it cannot supply its full value as wages, tools, and materials, to two sets of laborers at once. It is true that the Capital which A has borrowed from B, and makes use of in his business, still forms part of the wealth of B for other purposes; he can enter into engagements in reliance on it, and can even borrow, when needful, an equivalent sum on the security of it; so that to a superficial eye it might seem as if both B and A had the use of it at once. But the smallest consideration will shew that when B has parted with his capital to A, the use of it as capital rests with A alone, and that B has no other service from it than in so far as his ultimate claim upon it serves him to obtain another capital from a third person C. All capital (not his own) of which any person has really the use, is and must be, so much subtracted from some one else.

"But though Credit is never anything more than a *TRANSFER of Capital from hand to hand*."

260. Our readers cannot fail to see the astonishing confusion of ideas on the subject of Credit in the above extracts. In the first set Mr. Mill sees clearly that Credit is the *Promise to pay*, which he over and over again says is independent exchangeable property, of the value of money, which may be used in all respects like money and perform all its functions. And therefore it may be Capital as well as money.

Mr. Mill says that the Capital (*i. e.*, the goods) which A has sold on credit to B, are so much subtracted from his property, and cannot be used by him as well as by B. But he wholly forgets that in exchange for those goods, A receives B's "promise to pay," which is a debt, and in fact is the credit. And this debt is exchangeable property, with which he can either purchase new goods to replace those he has sold to B, or he can sell it to his banker, and receive a bank credit, with which he can purchase fresh goods, just the same as he could with money.

In the second extract Mr. Mill has changed his conception of Credit from being a *Promise to pay*, or a Debt, to its being the *Transfer of Capital!!*

Now we ask—Is a Bank Note the *transfer* of a commodity? Is a guinea the sale of a book? Is a piece of independent property the transfer of something else? Is a table the *transfer* of a chair? Is an independent quantity of any sort whatever an *operation*?

Mr. Mill informs us that Credit cannot make something out of nothing. Who said it could? Can a guinea make something out of nothing? It is not Credit that makes something out of nothing; but it is Credit itself which is a valuable property, which is created out of nothing by the consent of the wills of persons, and which by the reiterated acknowledgments of Say and Mill is capable of performing all the functions of money. Now money becomes Capital by their own admission, by being exchanged for other things, or by circulating other things. Credit may be Capital in precisely the same way.

261. Moreover, we see how completely Mr. Mill is in error when he says that Credit is never anything more than the transfer of Capital. It is

wholly untrue that Credit is always created in exchange for commodities. As we have shewn under *BANK*, all profitable banking business consists in buying debts by creating other debts. That is, Credit is created to purchase Credit.

After this exposition our readers will perhaps think that Mr. Mill is not exactly the person to sneer at others for their confused notions about Credit, though his own work is a striking example of the misunderstanding and confusion of ideas which he says prevails upon the subject. And many may wonder, perhaps, at a logician, who is unable to perceive the difference between an independent quantity and a sale of goods.

262. Having thus demonstrated the confusion of ideas of J. B. Say and Mr. Mill on the subject of Credit, it is scarcely worth while to quote from other writers who have fallen into exactly the same confusion. We have seen in § 92, 93, 94, that Bastiat, Mr. McCulloch, and Mr. Gilbart have all declared Credit to be productive capital. But in other places these writers have all denied that Credit is Capital. Bastiat, in his *Ce qu'on voit, et ce qu'on ne voit pas*; § ix., *Credit*; Mr. McCulloch in his *Commercial Dictionary*, *Art. Credit*; and Mr. Gilbart in his *Logic of Banking*, p. 278, all deny that Credit is Capital, the two former going in the same fallacy as that of Say and Mr. Mill conceiving Credit to be an *operation*.

On the Opinion of M. Cieszkowski on the Nature of Credit.

263. We have now to notice a conception of Credit which was, we believe, started by Count Cieszkowski in his treatise, *Du Crédit et de la Circulation* (CIESZKOWSKI), which is founded on a misconception of the distinct nature of Bills of Lading, Dock Warrants and Bank Notes, Bills of Exchange, and, which is fully explained in § 4 of this article. Count Cieszkowski, seeing that Bills of Lading and Bills of Exchange both circulate in commerce by indorsement, has drawn the false conclusion that they are both of the same nature, and defines credit to be the transformation of fixed capital into circulating capital.

264. The fallacy of this doctrine is so instantly apparent to any one having the slightest knowledge of law and commerce, that it would be scarcely worth while to notice it, only that it has obtained acceptance, in a moment of oblivion, from otherwise excellent Economists, and is thus calculated to lead to serious consequences; for it is, in fact, no other than a revival of Lawism. Thus M. Joseph Garnier, in his *Elémens de l'Economie Politique*, c. xix., treating of Credit, says, that there are three definitions of it. *First*, that Credit is the power of borrowing; *secondly*, that it is an anticipation of the future. Both of these definitions he rejects, and then he quotes as a third definition, "*Le Crédit est la transformation des capitaux fixés et engagés en capitaux circulants ou dégages.*"

"C'est la définition que propose M. Cieszkowski dans son remarquable livre sur la circulation et le crédit, que l'on comprendra bien en se reportant à la division qu'Adam Smith a faite des capitaux, et qui nous semble heureusement formulée. Elle traduit bien le rôle des institutions du crédit; elle comprend, complète et rectifie les notions que laissent dans l'esprit les deux

autres définitions qui ont souvent conduit à des conséquences fausses et dangereuses."

265. After quoting some passages from MM. Cieszkowski and Chevalier, regarding the effects of Credit, M. Garnier proceeds—"Mais il s'en faut qu'en constatant les avantages et les effets du crédit on se soit toujours tenu en dehors de l'illusion. De ce que le crédit met en circulation des valeurs fixées, engagées; de ce qu'il fait passer entre les mains des travailleurs, qui les rendent productifs des capitaux restant oisifs et infructueux entre les mains de leurs possesseurs, on a été conduit à cette proposition féconde en abus, si on la prend au pied de la lettre que *le crédit multiplie les capitaux*. Il y a bien une chose que le crédit multiplie, c'est l'action, c'est la force, c'est la fécondité du capital, qui d'abord engagé ou oisif, prend les caractères et les fonctions du capital circulant; devient, dans ce dernier cas, positif de neutre qu'il était, et, dans le premier cas, acquiert une action de plus, l'action du capital roulant qu'il cumule avec celle du capital engagé. Mais cette transformation en améliorant l'instrument, n'en a fait ni deux ou trois instruments; en un mot, elle n'a multiplié le capital. Quand un emprunteur jouit de ce qu'il n'avait pas le prêteur en est privé; quand un escompte est effectué, il n'y a que les rôles qui sont changés; celui qui avait l'effet de commerce l'a donné contre des espèces; celui qui avait des espèces les a données contre des espèces; celui qui avait des espèces les a données contre l'effet. Il peut se faire que celui-ci tire un meilleur parti de l'effet, et celui-là un meilleur parti des espèces; mais en définitive, il n'y a rien là qui ressemble à la multiplication dans le sens littéral du mot.

"En disant que le crédit multiplie les capitaux, on fait d'abord une figure de rhétorique. Cette figure est ensuite prise au pied de la lettre, et on est conduit à penser qu'en créant des signes de valeurs, des engagements, des papiers de commerce, on crée aussi les valeurs réelles correspondantes, au lieu de voir que ces dernières ne sont détenues en échange que par une véritable tromperie, on pense qu'en engageant un avenir incertain on crée un capital futur, au lieu de voir que ce capital n'est encore qu'une espérance ou une illusion."

266. We see in this passage the repetition of a phrase originated by J. B. Say. He exclaims against the fallacy that credit *multiplies* capital. But no one says that credit *multiplies* capital. Credit itself is capital. Every one allows that money may be capital. No one says that money *multiplies* capital. All that is said is, that money being used in a certain way is capital. Money is used to promote circulation in commerce; credit is used precisely in the same way. M. Garnier himself admits that credit *multiplies* movement. That is all that money does. Besides, M. Garnier himself, while protesting against the doctrine that credit *multiplies* capital, goes as near saying so as it is possible to do. For speaking of banks of issue he says "Les banques de dépôt ne pouvaient opérer que sur une masse de certificats ou de billets égale au montant des valeurs déposées, tandis que les banques de circulation peuvent émettre de billets pour une valeur double, triple, et quadruple, &c., du montant espèces qui composent leur encaisse. Ainsi une banque de circulation bénéficie les escomptes sur les billets et les lettres

de change du commerce comme si elle avait un *capital triple et quadruple*." Thus we see that M. Garnier says that the power of issuing notes, which are Credit, is just the same as if the banker's capital were tripled or quadrupled. Surely that is very like saying that Credit multiplies capital, at all events, it is a clear acknowledgment that Credit is Capital.

267. M. Garnier then describes the Docks and Dock Warrants, which are transferable by endorsement, and he says—"Par ce procédé, simple et fécond, les marchandises sont échangées avec la même facilité que les effets de commerce; un capital immense est mobilisé, en même temps que les frais de manutention, d'administration et de commerce sont réduits pour la plus grande commodité des négociants et au grand avantage du consommateur."

"On voit que le warrant est aux marchandises déposées dans les docks ce que les certificats de dépôt furent, dans l'origine, aux monnaies confis aux Banques de dépôt."

Here we have the root of this specious fallacy. The Bank certificates issued by the early Banks of Deposit were similar to Dock Warrants in this respect, that they were not multiplied beyond the amount of the bullion deposited. But they differed in this that they were not specifically appropriated to any particular quantity of bullion. This distinction, which would not be of much practical importance so long as the method of doing business by the early Banks of Deposit was adhered to, becomes of vital importance when Banks began to discount bills by their own notes, or granting credits, and is in fact at the root of the currency question. The fundamental difference between Dock Warehouses and Banks is that in the former, the goods deposited do not belong to the Warehouseman, and he cannot make a profit by using them. The money deposited by a banker belongs to him, and he may trade with it and make a profit of it. Hence the promise to pay, or, his debt, is independent of any particular sum of money, and by the principle we laid down at the commencement of this article, that everything which circulates separately is separate property, and an Economic Quantity, both the money deposited with the banker and his promise to pay it may circulate independently as separate property. The fundamental distinction between the two classes of paper documents is, that Dock Warrants are always bound to, and mere titles to certain goods; instruments of Credit are always severed from money.

The only real difficulty which embarrasses writers, not familiar with Law and Commerce, is in conceiving and holding fast the conception that a debt is an article of property. When M. Garnier says that people are apt to think that when they create engagements or promises to pay they are creating the real corresponding values, we can only say that they must be very loose thinkers indeed who think that. We do not suppose that many would think, when they gave their promise to pay, that they were thereby creating the money to pay it with. The whole doctrine of Credit being Capital is contained in this, that any independent, exchangeable quantity whatever may be used as Capital. Credit or a debt, &c., is exchangeable property, and, in fact, under different forms of Bank Notes, Bills, Book debts, is exchanged for other

things in commerce just like money, and is, in fact, a substitute for money, and hence it may be used as Capital as well as money.

On the Opinion of some Algebraists respecting the nature of Credit, or Debts.

268. Having thus shewn the contradictory notions of some Economists on the subject of Credit, we may as well examine what some very distinguished mathematicians have said about debts, or Credit. We have seen that, among others, MacLaurin, Euler, Peacock, and De Morgan, all admit debts, or Credit, to be *Negative Quantities*. The only real difficulty consists in giving the proper interpretation to the *Negative* sign. Euler and Peacock, in the extracts given above, treat it as a sign of subtraction. But if these distinguished writers had reflected on the general analogy of Physical Science, they would at once have seen that *Negative Quantities* in Natural Philosophy are not subtractions from positive ones, but *Independent Quantities* additional to them.

269. Mr. Justice Byles long ago said that the species of Property consisting of Credit was next in magnitude to the land and the funds. Since he said this, Credit has enormously increased, and may be safely asserted to exceed the funds greatly at present. Suppose that, in order to be within the bounds of the extremest moderation, we place the quantity of Credit existing at the present moment in Great Britain at £1,000,000,000;—what is this to be *subtracted* from, we ask? It is quite clear it is not to be *subtracted* from any thing at all, but is independent property additional other property.

270. But even Dr. Peacock is not consistent with himself in his notion of Debts. Because he says, in the extract given above, that a Debt is Property owed, and that the release of a Debt is the change of the sign of affection of Property owed into property possessed. Now, this is manifestly a different conception of a Debt than its being a *subtraction* from property. But it is equally incorrect. A debt is not an affection of the Property of the Debtor, but a Right residing in the person of the Creditor. The release of a Debt is the destruction of this Right by the consent of the parties. Thus we see that Dr. Peacock is again in error; for he says that the subtraction of a Debt, in the language of symbolical Algebra, is not its obliteration or removal, but the change of its affection or character from money, or property owed to money or property possessed. Now, we see at once the misconception here. The debt is not the money or the goods, but the Right to demand them, and the abolition of the Debt is the abolition or the destruction of the Right, which is the destruction of Property.

271. Thus we see that out of these conflicting notions—

Credit is NOT the TRANSFER of anything; that it is NOT an OPERATION.

Credit is NOT a SUBTRACTION from other property.

Credit is NOT a title to any specific goods.

Credit is NOT Money or Goods owed.

There remains, therefore, only the last conception, that Credit is a mass of property ADDITIONAL to other property, as every writer on the

subject has acknowledged, when treating of the instruments of Credit themselves. Thus, even Mr. Mill says, that a man's purchasing power consists of his money *and* all his Credit, and he speaks of the "mass of Credit" in the country. This mass of Credit, or Debts, however, though additional property to all other, is negative property by the admission of all Algebraists. The only question is, what property can be additional and *negative*, or *inverse*, to money. And there can be but one answer. Money represents the proceeds of a man's past industry, and therefore the only thing that can be additional and inverse, or negative to that, is the proceeds of his *future* industry. A man's power of making *future* profits is, of course, additional to the profits he has already made. And hence we see that the interpretation of the Negative Sign, as symbolizing **FUTURITY**, is the only one that satisfies the conditions of the case. And as soon as this interpretation is adopted, the whole subject falls into harmony and order, all difficulties vanish like the mists before the morning sun, and Political Economy is brought under the well understood laws of Natural Philosophy.

Conclusion.

272. We have now developed the Theory of the Negative Sign, and of Negative Quantities in Political Economy. We see that the interpretation of the Negative Sign, not as **SUBTRACTION**, but as **FUTURITY**, has at once doubled the extent of the science, and shewn how vast masses of property which have never yet been included in any English work are to be classed. And yet the immensely greater proportion of existing property is of this form!

We have seen, too, that what the Algebraists we have mentioned, and hosts of others have merely noticed with a passing remark as Negative Quantities, contain, in fact, one of the most marvellous results of human ingenuity. For that little idea—apparently so simple—of making a Debt transferable, is entitled to rank in its practical effects with the most splendid discoveries of the human mind, and it has produced consequences to the world not one whit inferior to those of the steam engine. The simple doctrine that every future payment has a **PRESENT VALUE**, which is independent exchangeable property, and may be bought and sold like money itself, has increased the effective force of money tenfold, without diminishing its value. In the eloquent and not exaggerated language of Mr. Webster (**BANKING IN AMERICA**, § 448):—"Credit is the vital air of modern commerce. It has done more, a thousand times, to enrich nations than all the mines of all the world." It has excited labour, stimulated manufactures, pushed commerce over every sea, and brought every nation, every kingdom, and every small tribe among the races of men to be known to all the rest; it has raised armies, equipped navies, and triumphing over the gross power of mere numbers, it has established national superiority on the foundations of intelligence, wealth, and well-directed industry." It is to Scotland that is due the unquestionable merit of first having developed the full powers of legitimate credit, and it is this subtle agent which has raised her to her present position. It is Credit which produced those mighty works in

England during the last century. It is, among other things, the want of Credit which kept Ireland so poor and barbarous for so long; it is in the establishment of solid Credit there in comparatively recent times, that she will henceforth find her greatest means of progress and improvement. It is a solid system of Credit which is wanted to develop the resources of rejuvenescent Italy, and it is, above all, solid Credit that is wanted to bring out the boundless resources of India.

The exposition of the Theory of Credit, given in the preceding sections, shews how utterly futile it is for merely literary men to write books on Political Economy, and how absurd it is to suppose that definitions are of no consequence. Who can wonder that the subject has been thrown into such confusion, when such contradictory conceptions are held of the very nature of the thing itself?

To explain the Theory of Credit requires the most careful settlement of every single term and definition in Political Economy, a thorough acquaintance with the history and the law of Credit, (one of the most abstruse branches of law,) and a thorough familiarity with the mechanism of Commerce. Even this is insufficient to unravel its perplexities, which have only finally yielded to one of the most recent and most refined discoveries in Algebra! And thus we see how wonderfully verified is the prescience of Bacon, who so earnestly preached that Natural Philosophy is the only sound basis of exact knowledge.

ANALYSIS OF THE ARTICLE.

- § 1. *Definition of Credit.*
- § 2-3. *Perplexities of Modern Economists about Credit.*
- § 4. *Order of the Treatise.*

SECT. I.

- § 5. *Fundamental Conceptions of the Theory of Credit.*

SECT. II.

THE NATURE OF CREDIT AND THE ELEMENTS OF THE THEORY OF CREDIT.

- § 6-10. *On the distinction between a Bailment and a Debt.*
- § 11-13. *A debt is separate and independent exchangeable Property, for which there are shops and markets.*
- § 14. *Confusion between Credit being Property, and an Operation.*
- § 15, 16. *On commercial Credit.*
- § 17. *Error of Expression, Intrinsic Value.*
- § 18. *Anything has as many values as things it will exchange for.*
- § 19. *The Value of a promise is the THING promised.*
- § 20-22. *Credit is a lower form of money, and is a substitute for it.*
- § 23. *Fundamental difference between Bills of Exchange and Bills of Lading. Bills of Lading REPRESENT goods, but Bills of Exchange are of the VALUE of money.*
- § 24. *The limits of Credit.*

- § 25, 26. The above doctrines apparent from the ordinary language of Commerce.
- § 27-29. Examination of Mr. Thornton's opinion on Credit.
- § 30. Paradox of the Negative Sign.
- § 31. The Negative Sign cannot mean subtraction.
- § 32. Mathematicians acknowledge that debts are Negative Quantities.
- § 33. Confusion about the Conception of Credit.
- § 34. From the analogy of other sciences it may be expected that Negative Economic Quantities are Independent Quantities.

On the application of the Theory of Algebraical Signs, and of the Separation of the Signs of Position and Operation to Political Economy.

- § 35-45. Explanation of the application of the Positive and Negative Signs.
- § 46. Property is a Right residing in the person. There may be property in the past, and in the future.
- § 47. Theory of the Value of Land.
- § 48. The Goodwill of a business.
- § 49. Copyright.
- § 50. A Practice.
- § 51. Shares in a Commercial Company.
- § 52. All these are cumulative property, and separate from the actual payment.
- § 53. Smith and most other Economists admit that abilities are Wealth.
- § 53-55. The Right to receive a future payment is separate and independent Property. And every future payment from whatever source arising has a PRESENT VALUE, receiving different names, according to the source whence it arises, which is independent exchangeable property.
- § 56. Credit is an annuity of one term.
- § 57. Classification of Property.
- § 58. The unit of Credit is £100 payable one year hence.
- § 59. Peculiar method of expressing the price of this species of Property.
The value of Money varies inversely as Price, and directly as Discount.
- § 60. Erroneous censures of Mr. Mill on the expression Value of Money.
- § 61. Origin of the confusion; double meaning of the word Loan.
- § 62-64. Correction of Mr. Thornton's errors.
- § 65. A RELEASE from a DEBT is an AUGMENTATION of CAPITAL.
- § 66. Examination of Euler's views regarding Debts.
- § 67-71. Examination of Dr. Peacock's views regarding Debts, or Negative Quantities.
- § 72. In Political Economy the signs + and - as signs of Position symbolize TIME.
As signs of Operation they mean addition and subtraction, or creation and destruction.
- § 73. Credit is the Right to a future payment.
- § 74. This shews the limits of Credit.
- § 75. This shews the error of Law's Theory of money.
- § 76. The Quantity of Credit depends on the Circulation of Money.
- § 77. Cause of commercial catastrophes.
- § 78. Debts may be bought and sold for other debts.
- § 79. Credit may be Capital as well as any other property.
- § 80-83. How Credit is PRODUCTIVE

- § 83, 84. Recent French writers have come to this opinion.
 - § 85. Credit usually resolves an exchange into three parts.
 - § 86. Smith places Credit on the same footing as Stock.
 - § 87. Demosthenes said that Credit is Capital.
 - § 88. Smith classes Credit on the same footing as Money.
 - § 89. Mr. Justice Byles says that instruments of Credit are Property.
 - § 90. Credit and Money are productive by facilitating exchanges.
 - § 91. Credit can do whatever Money can in Production.
 - § 92. Similarity of expressions used by the early Algebraists and Economists.
 - § 93. Mr. McCulloch declares that Credit is Capital.
 - § 94. Mr. J. S. Mill declares that Credit is productive Capital.
 - § 95. Mr. Gilbart asserts that Credit is productive Capital.
 - § 96. Mr. Hamilton and Mr. Webster assert that Credit is productive Capital.
 - § 97. M. Gustave du Puyode asserts that Credit is productive Capital.
- Conclusion—CREDIT IS PRODUCTIVE CAPITAL.

SECT. III.

ON THE MECHANISM OF THE SYSTEM OF CREDIT.

- § 98. Credit is the Present Right to a future payment.
- § 99. Credit is embodied in two forms, PROMISES to pay, and ORDERS to pay.
- § 100. Credit forms two divisions, Commercial Credit and Banking Credit.
- § 101. Credit may be used like money to circulate an existing product, or to call them into existence.

On the system of Credit based upon Simultaneous Transfers of Commodities.

- § 102-128. Exposition of the ordinary system of Commercial Credit.

On the Theory of Cash Credits, Open Credits, and Accommodation Bills.

 § 213. *Credit extinguished by the institution of Banks.*

On the Limits of Credit.

- § 214, 215. *The true limits of Credit indicated by the etymology of the word.*
 § 216, 217. *The difficulty in the case.*
 § 218-220. *The limits of Commercial Credit.*
 § 221. *How to limit Banking Credit.*

SECT. IV.

ON THE HISTORY OF IDEAS ON THE SUBJECT OF CREDIT, AND AN EXAMINATION OF THE OPINIONS OF MODERN ECONOMISTS ON IT.

- § 222, 223. *Origin of Credit in modern times.*
 § 224. *Modern Political Economy sprung out of the failure of the Mississippi scheme.*
 § 225-227. *Law's Theory of Paper Credit to be distinguished from his Theory of Paper Money.*
 § 228, 229. *Extracts from Law, shewing that he knew that Credit was equivalent to an augmentation of money.*
 § 230. *Turgot originated the erroneous notion that Credit is an operation.*
 § 231-236. *The opinion of Adam Smith on the Nature of Credit, shewing that he always treated it as Productive Capital.*

The opinion of J. B. Say on Credit.

- § 237, 238. *Say followed up the erroneous notions of Turgot.*
 § 239. *Self-contradiction of Say on the subject of Capital.*
 § 240. *Say's self-contradiction on the subject of Value.*
 § 241-243. *Say expressly classes Debts as Wealth.*
 § 244-246. *His contradictory conceptions of Credit.*
 § 247. *Say expressly calls instruments of Credit Capital.*

The opinion of Mr. J. S. Mill on the subject of Credit.

- § 248. *Mr. Mill's definition of Wealth includes instruments of Credit.*
 § 249. *His definition of Capital includes instruments of Credit.*
 § 250-258. *Further extracts from Mr. Mill, shewing that he expressly calls Credit Productive Capital.*
 § 259. *Self-contradiction of Mr. Mill. He ridicules the notion that Credit is Capital.*
 § 260, 261. *Mr. Mill's confusion of ideas on Credit.*
 § 262. *Other writers have fallen into the same confusion.*

On the opinion of M. Cieszkowski on the Nature of Credit.

- § 263-267. *Error of M. Cieszkowski's opinion.*

On the opinion of some Algebraists respecting the Nature of Credit, or Debts.

- § 268-270. *On the opinions of Euler, Peacock, and other Algebraists, on Credit.*
 § 271. *What Credit is not, and what it is.*
 § 272. *Conclusion.*

CREDIT FONCIER.—When after a long period of inactivity the energies of a people are suddenly turned in an industrial direction, they find innumerable enterprises which would be profitable if only they possessed the means of setting them agoing. The quantity of money which was found sufficient for a non-industrial people, is now found to be wholly inadequate to the increased demands for it, and the only consequence can be, that if there be a greatly increased demand for the existing quantity of money, the rate of discount, or interest, will rise proportionably, and rise to such an extent as to preclude all possibility of profit from such enterprises, even if effected.

It has been invariably found, therefore, that whenever this takes place, there are abundant schemes set afloat for increasing the quantity of money. This was particularly the case after the restoration, in England, when men, weary of politics and polemics, began to turn their attention more to commerce.

Among fields of enterprise none appeared at that time more promising than agriculture. But, unfortunately, all the available specie was absorbed in commerce; none was to be had for agriculture, or, at least, except at such rates as to be a practical prohibition.

It was this real want that gave rise to the schemes of Asgill, Chamberlen, and others, for the purpose of turning the land into money, which were so rife at that period. Among all of them, John Law's has attained the greatest name. He perfectly well understood the powers of Credit, and he saw that Credit was an increase of the powers of Money; but he saw that Credit was limited by Money, and his plan was to devise a scheme by which paper money should be created, which should maintain an equality of value with silver.

He supposed that if the land were mortgaged to the Government it might create paper money to the amount of the value in silver of the land, and that this paper money would circulate at par with silver.

This doctrine may seem to have some plausibility in it, and has many modern admirers. But, nevertheless, whenever it has been tried in practice, it has uniformly been found to fail. This, however, is not the place to point out its failure, nor to detail the practical examples of its failure. (**BANKING IN FRANCE; CURRENCY; LAW.**)

Ten years, however, after the failure of Law's system in France, the Scottish Banks, by the admirable invention of Cash Credits, pushed Credit to the utmost extent of its legitimate limits, and realized all that was practicable in Law's scheme.

No one who understands the subject can fail to see the enormous advantages of paper when duly administered. But the great difficulty in all such cases is to determine what are the true limits of the issues of paper. That is, to what extent it may be issued and maintain an equality of value with silver. In fact, it is one of the profoundest problems in Political Economy, and of the most momentous consequence to the prosperity of the nation.

Seeing, then, that paper money directly based upon land was a failure, and that the invention of

Cash Credits could not be carried out by the timid and narrow system of foreign banks, the question was how to divert Capital to the land, without creating paper money.

At the close of the seven years' war, the proprietors in Silesia found themselves in a state of inextricable embarrassment. The ruin and destruction caused by the war, and the low price of corn, caused by the general distress, made them unable to meet their engagements. Interest and commission rose to 13 per cent. They obtained a respite of three years to pay their debts. To alleviate the distress arising out of this state of matters, a Berlin merchant, named Büring, invented a system of Land Credit, which has been very extensively adopted in Germany, Russia, Poland, and lastly in France.

Proprietors of land can no doubt borrow money on mortgage; but in every country such transactions are attended with many inconveniences. They have many expensive formalities to undergo, such as investigation of title, &c. Moreover, the difficulties and expense of transfer are usually very great, as each purchaser has to undergo the same investigation and expense. If the debtor fails to pay, the process of obtaining redress, or possession of the land, is usually very troublesome and expensive. The consequence of all these obstacles is, of course, to raise greatly the terms on which money can be borrowed on mortgage.

The system of Government Funds suggested to Büring the idea of creating a similar species of land stock. The Government could usually borrow much cheaper than the landlords, because the title was sure and indisputable, and there was no impediment to the negotiability.

Büring, therefore, conceived the idea of substituting the joint guarantee of all the proprietors for that of individuals, and establishing a book in which this land stock should be registered and be transferable, and the dividends paid exactly in the same way as the public funds. The Credit, therefore, of the Association, was always interposed between the lenders and the borrowers. Those who bought this stock looked only to the Association for payment of their dividends, and the borrowers paid all interest, &c., to the Association, which took upon itself all questions of title and security. The whole of these obligations were turned into stock transferable in all respects like the public funds. Such is the general design of these Associations. It is plain that they avoid the rock of creating paper money, while they greatly facilitate the application of Capital to the land. They, in fact, do nothing more than turn mortgages into stock.

There are different methods of organizing such Associations, which we shall describe presently, but we may say in a general way that the system was introduced into Silesia in 1770; the March of Brandenburg, in 1777; Pomerania, in 1781; Hamburg, in 1782; West Prussia, in 1787; East Prussia, in 1788; Luneburg, in 1791; Esthonia and Livonia, in 1803; Schleswick-Holstein, in 1811; Mecklenburg, in 1818; Posen, in 1822; Poland, in 1825; Kalenberg, Grubenhagen, and Hildesheim, in 1826; Wurtemberg, in 1827; Hesse-Cassel, in 1832; Westphalia, in 1835; Galicia, in 1841; Hanover, in 1842; and Saxony, in 1844.

These Associations are divided into two classes.

The first are private associations, and these again are divided into companies founded by the borrowers, and financial companies founded by the lenders; the second are associations founded by the State or the provincial authorities.

The fullest information respecting these Companies is to be found in M. Jossean's work, mentioned below, from which we take the following details.

Of Private Associations formed by the borrowers there are—

Pomerania.

The *Société de Pomerania*, called *Landschaft*, or, *Landschaft Casse*, founded in 1781, with an advance of 200,000 thalers from Frederick II., and with revised statutes, in 1846.

The Company creates negotiable obligations at $3\frac{1}{2}$ per cent. for 100 thalers and upwards, and $3\frac{1}{2}$ per cent. below, payable half-yearly.

The proprietor pays 4 per cent. interest, and $\frac{1}{2}$ per cent. for expense of management.

The holder of the obligations has, as security for their payment, the entire capital of the Company, the land specially mortgaged for them, and the liability of all the proprietors of the circle, and, if that should fail, all the proprietors of Pomerania. There is no priority of preference among the obligations. The holder may take away the negotiability of the notes, which can only be restored by a Court. The holder cannot demand repayment, but the Company may pay off their bonds. These bonds can only be issued on property in the power of the Company.

The head office of the Company is at Stettin. A royal commission has the surveillance of its operations, and presides at the general meetings. The Administration consists of a director and two assistants. There are four departments in the country, with a director at their head, and several branches to each. These branches have to make all the necessary inquiries concerning the property upon which loans are to be advanced.

The borrowers receive the Company's bonds at the exchange of the day, in sums of 200 or 1,000 thalers. For one-tenth of the loan they may receive 100, 50, and 25 thaler notes. They may pay either in money, or in the Company's bonds, which they may purchase from the public. Overdue coupons are also received as ready money. Thus, again shewing that the Release of a Debt is equivalent to the payment of money, or — \times — = + \times +. A debtor may at any time pay off his debt, on giving 8 months' notice before the payment of the coupons, and paying a deposit of 5 per cent. The Company may also redeem its bonds on giving 6 months' notice. In 1837, its bonds in circulation amounted to 55,602,844 dollars, and they were above par.

Russia.

The *Banque de Crédit System* was founded in 1818, by Alexander, who advanced funds for its organization. It extends through the Baltic Provinces, Livonia, Esthonia, and Courland.

It issues bonds transferable by indorsement bearing 4 per cent. interest, something for expenses, and something also to form a sinking fund. Its bonds are received by the Government at their nominal value.

Poland.

The *Société de Crédit Foncier de Pologne* was founded in 1825, and reformed in 1838. It issues bonds bearing 4 per cent. interest, transferable by indorsement or delivery. The borrowers pay 4 per cent. interest, 2 per cent. to form a sinking fund, a fee of 1 florin for notes of 200 or 500 florins, and 2 florins for those of a 1,000 florins. By this means the debt is redeemed in 28 years. The sum advanced does not exceed one-half the estimated value of the land. The holders of the Company's bonds have as security, besides the lands specially mortgaged, national domains given by the Crown, and the reserve fund of the Company. The bonds are issued at Warsaw, at the head office, on the recommendation of the branches in the departments. Debtors may free themselves at any time by paying off the debt and 2 per cent. additional. A general meeting is held every two years, at which the Minister of Finance presides. The bondholders also have meetings, at which all the creditors above 10,000 florins have a voice for the purpose of considering any proposals made by the Company.

Gallicia.

The Company of Gallicia is the only Bank of *Crédit Foncier* in Austria. It was founded in 1841 by the Provincial Estates. It issues bonds of from 100 to 1,000 florins, bearing interest at 4 per cent. Besides the 4 per cent., the borrower pays 1 per cent. to form a sinking fund, a single payment of 3 per cent. to form a reserve fund, $\frac{1}{2}$ per cent. for cost of management, and the first six months' interest in advance, on receiving the loan. The bonds cannot be issued for less than 1,000 florins, and only to the extent of one-half of the free value of the land. The holders of the bonds may be compelled to receive payment of them on receiving 6 months' notice. The debtors may always pay off their obligations by adding 6 months' interest. In 1843 the Company's bonds in circulation amounted to 11,414,016 francs.

Wurtemberg.

The *Wurtembergischer Creditverein* was founded in 1827, and its statutes revised in 1831. It differs from the preceding Companies so far that it advances the money itself to the borrowers, and not merely its bonds. Its operations were at first limited to 6 millions of florins, but it has the right of contracting new loans. The Company gives to its creditors negotiable bonds, which may be divided into 100, 200, 500, or 1,000 florins. They bear interest at 3 per cent. The Company only lends on first mortgages, and to the amount of one-half of the value, or two-fifths of the income. The borrowers, besides the 3 per cent. interest, pay $\frac{1}{2}$ per cent. for cost of management; 1 per cent. as a sinking fund, by which the loan is redeemed in 48 years.

The Company makes profits by the debtors paying their interest half-yearly, while it only pays its creditors yearly. The debtors also pay their interest 6 weeks before the end of the half year. At the redemption of the debt at the end of the 48 years, the debtors pay two years' interest to form a reserve fund, and to free themselves from their joint liability. They must also pay $\frac{1}{2}$ per cent. of their actual debt for cost of manage-

ment, and a premium of $4\frac{1}{2}$ per cent. on the advance, and when they wish to pay off any part of their debt before it is due, they must pay 10 per cent. additional. The contribution to the sinking fund varies according to the choice of the borrower, so that he may pay off the debt at the minimum of 10 years, or the maximum of 50. In 1846 the Company had bonds to the amount of 11,936,930 francs in circulation, which stood at a premium of 12 per cent.

Saxony.

There are two Land Credit Banks in Saxony, one private and the other public. The private one is called the *Union de Crédit des pays Heréditaires*, created in May, 1844, with revised statutes in 1849. It advances on both nobles' and peasants' land, which produce not less than 1,256 francs a year. It makes its loans by bonds of 500, 100, and 25 thalers, at an agreed rate of interest, and to not less than 3,756 francs, and not more than half of the value of the land. Debtors must pay half-yearly, and three months before the Company pays its dividends. The public authorities and trustees are authorized to invest funds at their command in these bonds. In 1849 those in circulation amounted to 4,470,656 francs.

Hanover.

Hanover has one public and four private associations of *Crédit Foncier*. The private ones are—

1. *Institut de Crédit Hypothécaire de Luneburg*, founded in 1790, for making advances to the nobles. Its bonds are not less than 200 thalers. It pays dividends of 3 per cent. half-yearly. The borrower pays 5 per cent. for the first five years, and $4\frac{1}{2}$ per cent. afterwards half-yearly. It never can demand more than 5 per cent. from the debtors, but if it is obliged to pay more than 3 per cent. on what it borrows, it may take the difference from the sum paid towards the sinking fund. The debtors may pay by instalments of 50, 100, 200, or more, thalers, on giving six months' notice. If they redeem the debt before the end of five years they must pay 2 per cent., after that $\frac{1}{2}$ per cent. The debtors pay 2 per cent. for the first five years, and $\frac{1}{2}$ per cent. from the sixth to the seventeenth years.

2. *Association de Crédit pour l'ordre équestre des principautés de Kalenberg, Grubenhagen, et Hildesheim*. This Company was founded in 1825, and by new statutes in 1838 was enabled to make advances on peasants' land, if not less than 6,000 thalers in value. Its organization is very much the same as that of Luneburg. In 1844 its bonds in circulation were only 1,500,000 thalers.

3. *Etablissement de Crédit pour l'ordre équestre des principautés de Brême et de Verden*. This Company was founded in 1826. Its statutes are very similar to those of the Bank of Luneburg. It charges $4\frac{1}{2}$ per cent. when it advances to the value of one-half of the land. The debtors may redeem their debts, either in 72 years by paying $\frac{1}{2}$ per cent.; in 56 years by paying $\frac{1}{4}$ per cent.; in 47 years by paying $\frac{1}{8}$ per cent.; or in 41 years by paying 1 per cent. The charge for cost of management is not to exceed $\frac{1}{4}$ per cent.

4. *Association de Crédit pour les propriétaires dans les principauté de la Frise Orientale, et de*

Harlinger-land. This is a small establishment, founded in 1828.

Mecklenburg-Schwerin and Strelitz.

These two Grand Duchies have a Bank of *Crédit Foncier* between them. This was among the earliest founded, and was remodelled in 1818. It issues bonds varying from 1,000 to 25 thalers, bearing $3\frac{1}{2}$ per cent. interest. The debtors pay, besides this interest, $\frac{1}{2}$ per cent. half-yearly, as well as a premium of $\frac{1}{2}$ per cent. on the loan, to cover cost of management, and $\frac{1}{2}$ per cent. to form a sinking fund. The debtors may redeem their debts in advance by buying up the Company's bonds.

Hamburg.

A private *Caisse de Crédit pour les propriétés et les terrains de la ville de Hamburg* was founded in 1832, and its statutes revised in 1844. Its intention is to form a fund by gradual contributions, to make advances to proprietors whose lands are mortgaged and the sums demanded by the mortgagees, and to extinguish the debt by a yearly sinking fund. There are three classes whom this Company is intended to benefit: 1, Proprietors of land situated in Hamburg, who may place their money at interest in it; 2ndly, Proprietors whom the Company guarantees against their creditors to the extent of $\frac{2}{3}$ of their property; and 3rdly, Private persons who wish to buy real property by making annual payments.

Those of the first class pay 2 per cent. on the estimated value of their property on entering, as well as $\frac{1}{2}$ per cent. half-yearly. The Company pays $2\frac{1}{2}$ per cent. on these sums, when they amount to 1,000 marcs-banco. Proprietors who wish repayment must give 6 months' notice; they may receive a bond if they please.

The contributions paid by the second class are similar to those of the first. The property is re-valued every five years. The guarantee of the Company consists in this, that the proprietors can claim its assistance when the payment of the debt is demanded from them, and they cannot get it elsewhere at 4 per cent. Those of whom payment is demanded must give notice to the Company within 4 weeks, and must themselves endeavour to raise the money. If the Company has to pay off the debt, it succeeds to the rights of the creditor. The debtor must then pay 4 per cent. per annum, besides his other contributions; but he is not liable to be called on to pay the capital. But he may pay it off on giving 6 months' notice.

Those of the third class specify the capital they require, for which they receive a note. The payments are the same as those of the first class. But if they place a sum in it they receive $2\frac{1}{2}$ per cent. interest. When the purchase is made they may enter either of the other classes. The Company receives deposits from the public, in return for which they give bonds bearing interest at 3 per cent. above that sum, payable yearly.

Denmark.

In 1786 the Government founded a *Credit-Kasse* for the purpose of making advances for the improvement of agriculture at 2 per cent. It has since then founded several savings' bank for the same purpose. In 1850 a law was passed to form

the establishment of Banks of *Crédit Foncier*. It enacted that each society must have an united fund of 1 million rixdalers, or 3 million francs. Its bonds must not be below 50 rixdalers, nor for a sum exceeding the mortgage, which must not be for more than two-thirds of the value of the land. The members to be jointly and severally liable for the bonds. The debtors must pay something to a sinking fund. The banks must send a quarterly balance to the Minister of the Interior. The bonds of the bank are free from stamp duties, and the property of minors and of the public may be invested in them. The banks may borrow and lend above the legal rate of interest 4 per cent. This law was received with great favour, and immediately on its passing several banks were formed, but we have no information how they have succeeded up to the present time.

The second sort of private associations consists of those formed by companies of lenders.

Bavaria.

No establishment of *Crédit Foncier* was founded in Bavaria before 1835, though many had been talked of. In that year the *Banque Hypothécaire et d'escompte* was founded at Munich, by a company of shareholders, with a capital of 10 millions of florins, divided into 20 thousand shares.

This bank issues notes at 10 florins, which are legal tender, discounts bills, receives deposits, and is also a fire and life insurance company, a savings' bank, and one of *Crédit Foncier*. Its privilege is for 99 years. Its notes must not exceed 4-10ths of its capital, nor the sum of 8 millions of florins. Three-fourths of its issues must be covered by a mortgage of land of double the sum advanced, the remaining fourth by specie.

The bank lends on all sorts of capital producing revenue, in sums not less than 1,070 francs. The borrower pays an interest which cannot exceed 6 per cent., nor be less than 4½, including the sinking fund. At the minimum it requires 61½ years to redeem the debt. The sum paid to lenders is 3 per cent., and 1 per cent. is kept for cost of management, and a reserve fund. Interest is paid half-yearly. But at each payment the sums paid to the sinking fund are marked off against the capital, and the balance treated as a new loan. The obligations signed by the borrowers are not negotiable. Their place is filled by the shares of the bank and its notes. Its shares have been quoted at 30 per cent. premium. The bank pays its shareholders an interest only of 3 per cent. per annum, but they divide the other profits. Its notes enjoy great credit, and are received in public payments. The affairs of the bank are governed by the 60 principal shareholders. They name seven shareholders as directors, who must not engage in commerce. The sixty meet once a year, the directors once a week.

This bank passed easily through the financial crisis of 1848. In 1849 its loans amounted to 13,952,598 florins. It has been found to be of the greatest public utility, and has constantly increased in prosperity.

Hesse-Darmstadt.

There is a company with limited liability, called the *Renten-Anstalt*, at Darmstadt, which, besides granting life assurances and tontines, makes

advances on land, to double the value, in sums of not less than 500 florins. The borrower may pay off the loan in annuities of from 6 per 100 to 30 per cent. at his pleasure. At 6 per cent, the debt is redeemed in 33 years. The company pays its creditors 4½ per cent. per annum. The borrower may always accelerate or retard the final liquidation by increasing or diminishing the annuity.

Belgium.

In Belgium some of these institutions have failed. But there are two in operation.

1. *Caisse des propriétaires*, a limited liability company, founded at Brussels in 1835, and incorporated for 99 years. It lends to the amount of 66 per cent. of the value of the land. The interest is fixed from time to time. The borrower pays besides something to extinguish the capital, and not more than 1 per cent. on the loan for commission. He may regulate the annuity so as to extinguish the debt in terms of from 5 to 60 years. Borrowers may pay the interest either in money or in the company's obligations. They may also discount their debts at the rate agreed upon.

The company issues its obligations on the first of every month for the sum agreed to be advanced during the preceding month. The capital is 3 million francs, divided into shares of 500 francs. The Bank of Brussels receives the company's obligations at par.

2. *Caisse Hypothécaire*. This, like the last, is a company with limited liability, founded in 1835, incorporated for 60 years. This bank borrows at 4 per cent. by issuing shares, which also participate in any surplus profits. It lends at 4 per cent., with 1 per cent. commission, and an annuity to redeem the debt. It issues its obligations once a month, and receives them exclusively in payment of the annuities due to it.

The second class of these establishments are founded by the State and under its control.

Russia.

In Russia there are four classes of institutions of *Crédit Foncier*. The first was founded by the Empress Catherine II., about the middle of the last century. There are more than 100 in the country. They consist—1. Of those managed by the Ministry of Finance for the benefit of the state; 2. Local establishments in each Government under the Ministry of the Interior; 3. Those founded by the Communes; 4. Those directed by the Council of the Foundling Hospital, under the patronage of the Empress. Every one holding the rank of nobility, merchant, or agriculturist, who possesses landed property, has a right to *Crédit Foncier*. Proprietors of lands with serfs are entitled to an advance of 10 silver roubles for every male serf. The borrower pays 5 per cent. interest, ½ per cent. for commission, and ¼ per cent. on the advance. It is said that the proprietors prefer to borrow from private bankers, in consequence of the terms of repayment being easier.

Hanover.

In Hanover a State Bank was founded in 1840, to facilitate the redemption of the feudal burdens and tithes, and it extended its operations as a bank of *Crédit Foncier* into those provinces which had none before. Its statutes were revised in 1849.

It issues bonds repayable in six months, and one month after sight, not exceeding 5,000 thalers. The Government guarantees the bank to the amount of 80,000 thalers, and always keeps 100,000 thalers ready to assist it to repay its bonds if necessary. The borrower pays not more than $\frac{1}{4}$ per cent. per annum— $\frac{3}{4}$ for interest, $\frac{1}{4}$ per cent. for management, and $\frac{1}{4}$ per cent. for sinking fund. This redeems the debt in 60 years. At 1 per cent. the debt is redeemed in 43 years. If the rate of interest falls below $\frac{3}{4}$ per cent., the remainder goes to the benefit of the sinking fund. The bank is said to have done great service by redeeming the feudal burdens.

Saxony.

There is besides the private bank we have already mentioned, a State bank, called *Banque Hypothécaire des États Provinciaux de la Haute-Lusace*, founded in 1844 by the Estates of Haute-Lusace. It issues bonds for not less than 100 thalers, bearing interest fixed from time to time by the Estates. The borrower pays also a premium of $\frac{1}{4}$ to $\frac{1}{2}$ per cent., and also $\frac{1}{4}$ per cent. to the reserve fund. He is not bound to pay an annuity as a sinking fund, but may pay it in any sums he pleases, not less than 20 thalers. In case the debtor does not pay the interest within a month after it is due, the bank may call up the capital. In 1847 the bonds in circulation were 1,668,330 francs. It is said not to be in a very prosperous condition, as the expenses of management are too great.

Hesse-Electorale.

In 1832 the Government founded a bank, called the *Landes-Credit-Kasse*, to assist the peasants to redeem their tithes, and feudal burdens, by loans, at from $\frac{3}{4}$ to 2 per cent. Its operations have been extended by subsequent statutes. The bank borrows from other banks, savings' banks, corporations, and private persons, and from the State, at rates not exceeding $\frac{3}{4}$ per cent., the sums it lends out. The State is liable for all its obligations. Debtors pay $\frac{1}{4}$ per cent. interest. At the end of 1848 the bank had advanced 17,586,536 thalers, and it is said to have been of great service.

Nassau.

In this little State a State bank was founded in 1840, to furnish advances to the communes and landed proprietors to redeem their ancient debts, tithes, and other burdens, to assist agriculture and commerce generally. Its capital was fixed at 3,500,000 florins. The seventh part of this sum was created by means of notes, 100,000 of one florin, 50,000 of five florins, and 6,000 of 25 florins. These notes are received as ready money by the Government, and are payable in specie. It acts as a savings' bank, and one of deposit. Loans must be covered by twice their value in land. The borrower pays 4 per cent. interest, and 1 per cent. as sinking fund. In 1848 the bank was re-organised and transformed into a national bank.

Bremen.

The magistrates of Bremen have instituted a bank which seems more nearly to approach the ideas of Law, or Cieszkowski, than any of the

others we have mentioned. The owner of real property has the right to deliver to commissioners appointed by the magistrates his titles to it, and these are made negotiable like Bills of Exchange. These instruments are of the nature of Dock Warrants.

In Belgium and Switzerland projects for institutions of this nature were brought forward and in course of organization at the date when M. Josseau's book was published.

These institutions have had the most remarkable effects in promoting the agriculture of the countries they have been founded in. Their obligations have maintained through all crises—monetary, war, and revolutionary—a steadiness of value, far beyond any other public securities whatever, either government or commercial. M. Josseau states (*Traité du Crédit Foncier. Introd. p. xxv.*), that in a population of 27,827,990 the negotiable *Lettres de Gage*, or *Pfandbriefe*, amount to about 540,423,158 francs. In 1848, when all public securities fell enormously, owing to the revolution, the *Pfandbriefe* kept their value better than anything else. The Prussian funds fell to 69, the shares of the Bank of Prussia to 63, and the Railroad shares to 30 to 90 per cent., whereas the Land Credit bonds, producing $\frac{3}{4}$ per cent. interest, in Silesia and Pomerania stood at 93, in West Prussia at 83, and in East Prussia at 96. In 1850, those producing 4 per cent. were at 102 in Posen, and at 103 in Mecklenburg.

France.

The marvellous effects of the institutions of *Crédit Foncier* were long unknown in France. At length the increasing weight, and the heavy terms at which the landed debt was contracted in France, began to attract the attention of economists and statesmen. In 1851 the value of the real property in France was estimated at 56 milliards, and its gross income at 1,920 millions. Upon this income the land tax amounted to 240 millions, and the interest on the mortgage debt, estimated at an average of 7 per cent., to 560 millions, leaving 1,120 millions for the support of all the proprietors. On the 1st July, 1820, the mortgage debt in France amounted to 8,863,894,965 francs; on the 1st July, 1832, to 11,233,265,778; and on the 1st July, 1840, to 12,544,098,600; and though later official accounts of the total were not published, it continued to increase up to the revolution of 1848.

The heavy rate of interest on mortgages was due greatly to the imperfect state of the law, which permitted secret mortgages, which could not be discovered by the lender. M. Dupin, the *Procureur Général*, said in 1840:—"In France, the purchaser is never sure of becoming the proprietor; the lender on mortgage is never sure of being paid." We need not be surprised that many estimated the usual interest upon mortgage at 12, or even more, per cent. Owing to these causes landed property was held in bad odour as a security. In 1826, M. Casimir Perier offered a prize of 3,000 francs for the author of the memoir on the best method of improving the law of mortgage. These appeals produced some effect. In 1841, the *Cours d'appel* and the *Faculté de droit* appointed a committee to prepare a scheme of reform, which was just going to be laid before the Chambers when the revolution took place. When

the effervescence produced by this event had calmed down, the Government and the Assembly each appointed a committee to consider the subject. Each of them recommended that all transfers of property, and all burdens on it, should be made public. Both the *Conseil d'état* and the Assembly, however, rejected this proposal. The Government, following the *coup d'état* of the 2nd of December, effected some reform, so that third parties might ascertain the debts affecting land.

M. Wolowski seems to have been the first who brought the banks of *Crédit Foncier* before the notice of the French, in 1835. The idea began to spread slowly. In 1845 the *Conseils Généraux* were consulted, and M. Royer received a commission to go to Germany and study their mechanism. The reports published by him helped to enlighten the public mind. In 1848 multitudes of projects for making paper money, and mobilizing the land, were brought before the Assembly, which were warmly and successfully combatted by MM. Thiers and Léon Faucher on the 10th and 11th of October, 1848. The sufferings of the agriculturists, however, were very severe. M. Wolowski brought forward his plans again, which were warmly taken up by meetings of agriculturists and manufacturers. A meeting of proprietors was held at Paris, to overcome opposition and introduce banks of *Crédit Foncier* into France. The Government then took up the matter. The *Conseil d'état* opened an inquiry, and gave a hearing to every one who had anything to say—Economists, Financiers, Administrators, Lawyers, and projectors of schemes. Further information was sought from Germany. Louis Napoleon had especially studied the *Crédit Foncier* banks in Germany, and had long desired to introduce them into France. Feeling himself less embarrassed after the 2nd of December, he appointed a commission, and himself presided at its meetings, and on the 28th of February, 1852, a decree authorizing the formation of such institutions was published.

Immediately this was done, M. Wolowski, who had so long laboured in the cause, formed a company, whose statutes were approved of on the 3rd of July, 1852, and called the *Banque Foncière de Paris, Société de Crédit Foncier*. It received a privilege for 25 years to carry on operations within the limits of the Cour d'Appel of Paris. Soon afterwards similar institutions were formed at Marseilles, Nevers, Lyons, Toulouse, Orléans, Poitiers, Limoges, Rouen, Bordeaux, Brest, and other places. It was then considered that it would be far more advantageous to have all these consolidated into one great establishment than to remain separate ones. The land bonds would be far more negotiable at the Bourse if they were those of one great company, than if each separate one stood upon its own credit. In December, the establishments of Marseilles and Nevers were united with that of Paris, which was authorized to extend branches into any department where none existed, and to incorporate with it all existing societies, and was then called the *Crédit Foncier de France*. The bank received a subvention of 10 millions from the State, and was bound to raise its reserve fund to 60 millions, and to advance on mortgage 200 millions, redeemable in annuities of 5 per cent., including interest, sinking fund, and cost of management. The debt was extinguished in 50 years by these means. Other

measures were taken to facilitate the abolition of secret mortgages, which was the principal obstacle to their success. M. Josseau's work, published in 1853, contains a full exposition of the mechanism of the proposed institution.

Properly organized, it would be impossible to exaggerate the benefits which such an institution would produce to France, and under the sage direction of M. Wolowski, who was so complete a master of the subject, and who knew well to avoid the dangerous rock of creating a paper money based on land, there would have been no danger of the institution straying from its legitimate objects. But in the 6th volume of Messrs. Tooke and Newmarch's invaluable *History of Prices*, which brings information up to a later date than M. Josseau's work, it appears that in 1854 great and hazardous changes were made in its constitution. By a decree of July, 1854, M. Wolowski, was superseded in its management; a governor, the Comte de Germiny, was appointed, with two sub-governors, MM. Crépy and Daverne. Its objects, as defined by its statutes, are to lend upon mortgage of lands, in any of the departments, sums redeemable by terminable annuities; to adopt any other system of lending upon real security; to create an amount of negotiable interest bearing securities equal to its advances; and to receive deposits, without interest, of sums destined to be turned into these *Obligations Foncières*, or land bonds. The privilege to the company is for 99 years, from 1852. It was intended that the annuities charged should redeem the debts with interest in 50 years. The first charge made by the company was 5 per cent., but, this being found too low, it was raised to 5.44 per cent., then to 5.65 per cent., and then to 5.949 per cent. The bonds are for 1,000, 500, and 100 francs, and bear 3 per cent. interest, but are repayable by lottery drawings, held four times a year, at 1,200, 600, and 120 francs. But a very curious and objectionable species of gambling has been introduced into the lottery, in order to stimulate the public to purchase the bonds. The first bond of 1,000 francs drawn is entitled to a prize of 100,000 francs; the second to 50,000; the third to 40,000; and from the 7th to the 14th to 5,000. The bonds of lower denominations are entitled to rateable prizes. In 1853 and 1854, says Mr. Newmarch, the sum given away as prizes amounted to 1,200,000 francs, and in 1855 to 800,000 francs, and by means of these stimulants at this period it had obtained more than three millions sterling of deposits. As, however, the whole landed debt of France amounts to 320 millions sterling, we see what an enormous field the company has to work upon. In short, should it even succeed in converting a moderate proportion of it, it may become almost a power in the State. If it should succeed in converting the whole it would exceed many times all the banks of *Crédit Foncier* of Germany together. Mr. Newmarch justly censures the gambling element introduced into it as vicious in all points of view, both of economics and morals.

By the annual report of the Directors for the year 1861, published in the *Moniteur* of the 3rd of May, 1862, the position of the company was as follows:—

The loans on mortgage and to the communes, which in 1860 amounted to 69,489,445 francs,

rose in 1861 to 120,065,519, of which there were to private persons 90,272,334, and to communes 29,793,185·12. Of the private loans two-and-a-half millions were for short dates, the remainder for long dates. In 1860 these loans were 709 in number, and 48,054,300 francs in amount; in 1861 they were 1,136 in number, and 87,772,334 in amount, shewing an increase of 63 per cent. in number, and 80 per cent. in amount. Of these 826 amounting to 19,380,700 were advanced to persons in the department of the Seine; 332 to the amount of 18,218,000 in the departments. In 1860 the number of these latter was 199, and their amount 12,617,000; in 1859, their number was 110, and the amount 6 millions.

In 1861 the loans were as follows:—

To 1,000,000 and upwards	8	20,000,000
From 500,000 to 1,000,000	8	5,970,000
" 100,000 " 500,000	162	32,784,000
" 50,000 " 100,000	168	13,827,000
" 10,000 " 50,000	472	13,037,700
" 10,000 and less	845	1,980,300

being an average of 76 thousand on the whole.

Up to the end of 1861, the number of long loans effected by the company was 3,941, to an amount of 275,577,314 francs, of which there had been cleared off by the sinking fund, 6,419,665·60, and by payments in advance 15,347,533·20, leaving in existence 253,810,115·20. Of these 2,404 had been made in the department of the Seine, and 1,537 in the departments. These loans were classed as follows:—

1,000,000 and above	8	41,500,000
500,000 to 1,000,000	41	28,562,000
100,000 to 500,000	595	114,592,000
50,000 to 100,000	599	43,671,234
10,000 to 50,000	1657	41,851,580
Under 10,000	1041	5,400,500

During 1861, the sum the company had to receive for annuities was 11,331,510·02.

The increase in the number and amount of loans was as follows:—

1857	114	8,059,780
1858	227	30,041,200
1859	843	26,886,300
1860	709	43,054,800
1861	1,136	87,807,584

The number of land bonds issued during 1861 was 165,609, and their amount 82,891,800, of which there were 54,461 for 27,317,800, at 3 to 4 per cent.; and 111,148 for 55,574,000 at 5 per cent. At the end of 1853 the company's land bonds in circulation amounted to 22,099,600 francs; at the end of 1861 they had increased to 259,148,200.

The company receives deposits on current accounts like a bank, one-half of which it places in the Treasury, the other half it may invest in securities of not longer than 90 days. During 1861 it received in deposit 252,794,487, and paid out 57,061,275. The number of depositors at the end of the year was 6,743, and the rate of interest they received during the year 2½ per cent.

The dividend per share was 17·50 francs for 1853 and three following years; 20 francs for 1857; 22·50 for 1858; 25 for 1859; 30 for 1860; and 37·50 for 1861, being at the rate of 15 per cent.

Seeing the great development of the company, the directors determined to issue a second series of 60,000 shares, which they were permitted to

do at any time, but ordered to do by a statute of July 6, 1860, whenever their obligations amounted to 600 millions. These shares are to be issued at the price of 250 francs, payable by instalments.

Great Britain and Ireland.

Banks of *Crédit Foncier* have never been formally introduced into Great Britain. In Scotland we have seen that their practical effects had been anticipated by the invention of Cash Credits by the Scotch Banks. By the excellent system of registration of titles to land which has been long in use in that country, all difficulties which have been felt in other countries with regard to secret mortgages were obviated. The rigorous system of entails, however, which prevailed in that country for a long period counteracted the good that might have been done. Successive Acts, however, were passed to mitigate these evils; and the progress of the country has been correspondingly rapid.

In England many obstacles, political and legal, tended to retard and impede the application of Capital to the improvement of the land. When the desire for it, however, existed, the different Insurance Companies supplied the necessary means, and Mr. Newmarch says that in 1858 there were probably advances to the amount of 80 or 90 million sterling by the different Insurance Offices. These, therefore, performed the part which it was the purpose of the Banks of *Crédit Foncier* to supply, only the securities they take are not negotiable.

These facilities, however, not being sufficient for reasons arising out of the tenure of land, an Act was passed, Statute 1840, c. 55, to enable the owners of settled estates to charge their estates with annuities to redeem advances made for draining them. Tenants for life were authorised to petition the Court of Chancery to enable them to borrow money to drain their estates, to be paid off by instalments, in not less than 12, and not more than 18 years, with 5 per cent. interest. But the Court was not to allow such advances to be made unless it was certified to them that the annual value of the lands would be increased by at least 7 per cent. These formalities greatly impeded any improvements that might have been done.

The Repeal of the Corn Laws in 1846 threw the landed interest into a great state of alarm, as is not to be wondered at. It was seen that their principal hope of combatting the effects of low prices was in agricultural improvements. In that year an Act, Statute 1846, c. 101, was passed to authorize the advance of £2,000,000 for Great Britain, and £1,000,000 for Ireland, by way of Exchequer Bills, to promote the improvement of land by draining, to be redeemed by a rent charge of 6½ per cent. for 22 years. These Exchequer Bills we see exactly represented the *Lettres de Gage* of the German Banks of *Crédit Foncier*.

This operation, excusable under the particular circumstances of the case, was, however, contrary to sound principles, as the Government had no business to make advances to one species of industry rather than another. The plan was found successful, and in 1849 an Act was passed to facilitate advances on a similar plan by private persons, Statute 1849, c. 100. The Inclosure Commissioners were appointed to act as the intermediaries between those who wished to lend and those who wished to borrow. Some private

Companies were formed for this purpose, and they obtained private Acts, thus being Banks of *Crédit Foncier*, except that their bonds were not made negotiable. A paper read by Mr. Denton before the Society of Arts in December, 1855, and quoted by Mr. Newmarch, states that the area of cultivated land in Great Britain is about 44 million acres, of which one half requires draining. Of this only about 6 per cent. was drained. That to drain the remainder properly would require a sum of about 107 millions sterling. Since that period considerable advance has been made, but from this statement it is clear what an extensive field is open in this country for the establishment of Institutions of *Crédit Foncier* on sound principles.

CREDIT MOBILIER.—In the preceding article we have given some account of a species of banks which have been found to be of the most beneficial nature, and to have immensely developed the productive powers of the earth. The increasing attention paid to industrial subjects in France since the accession of the Emperor Napoleon III., gave rise to a new species of bank, whose organization we must now endeavour to explain.

On the 18th November, 1852, the Government sanctioned the statutes of the *Société Générale de Crédit Mobilier*, which received a privilege for 99 years. Its objects, as stated in its statutes, Tit. II., are—

1. A souscrire ou acquérir des effets publics, des actions ou des obligations dans les différentes entreprises industrielles, ou de crédit, constituées en Sociétés anonymes, et notamment dans celles de chemin de fer, de canaux et de mines, et d'autres travaux publics, déjà fondées ou à fonder.

2. A émettre pour une somme égale à celle employée à ces souscriptions, et acquisitions, ses propres obligations ;

3. A vendre ou donner en nantissement d'emprunts, tous effets, actions et obligations acquies, et à les échanger contre d'autres valeurs ;

4. A soumissionner tous emprunts, à les céder et réaliser, ainsi que toutes entreprises de travaux publics ;

5. A prêter sur effets publics, sur dépôts d'actions et obligations et à ouvrir des crédits en compte courant sur dépôts de ces diverses valeurs ;

6. A recevoir des sommes en compte courant.

7. A opérer tous recouvrements pour le compte des compagnies susénoncées, à payer leurs coupons d'intérêts ou de dividende, et généralement toutes autres dispositions ;

8. A tenir une caisse de dépôts pour tous les titres de ces entreprises.

Until the whole of the share capital was taken up, the obligations of the Company were not to exceed five times the amount of the paid up capital. When it was all paid up they might be ten times the Capital. But they must always be covered by an equal amount of public securities, shares, and other securities. They were to be payable either at sight, or at not less than 45 days. The united amount of the sums received on current accounts, and of obligations created of less than a year's currency, were not to exceed twice the amount of the paid-up capital. The capital was fixed at 60 millions of francs, divided into 120,000 shares of 500 francs, transferable by delivery.

The *Crédit Mobilier* arose out of the necessity we have described in the preceding article as being felt in any country in which a spirit of commercial enterprise is suddenly developed before the system of Credit is fully understood. We have already said that the Scotch Banks, during the last century, by means of their cash credits, anticipated the system of *Crédit Foncier*, we may also say that they did the same with most of the objects contemplated by the *Crédit Mobilier*. The Banks of *Crédit Foncier* were especially designed to promote agricultural improvements. The Bank of *Crédit Mobilier* is especially designed to promote industrial enterprises of all sorts—Railways, Canals, Docks, Mines, Gas, &c., &c. Now all these things are done by means of the system of Cash Credits, as we have fully shewn under CREDIT, § 129-144.

But the *Crédit Mobilier* had more ambitious aims than these, which are detailed in its reports for 1854 and 1855. In the first year of its existence it subscribed largely to the *Crédit Foncier*, it aided the consolidation of several railways. The Companies of the *Midi* and the *Grand Central* made them their bankers. They advanced to all subscribers to the new shares of the *Compagnie de l'Est* 200 francs per share at 4 per cent., besides various other operations. In the next year, besides subscribing to a large amount to the public loan required to carry on the Russian war, they subscribed to a loan to the *Grand Central Railway*, and the *Compagnie de l'Est*, and various other industrial operations were promoted under their auspices, such as the *Société des immeubles de la Rue de Rivoli* and the *Société Maritime*. They also assisted a mining company in the Loire, which had for several years been in difficulties ; the General Omnibus Company of Paris ; the Salt Company of the East ; a railroad from Dale to Salines, and some Austrian railways.

Besides detailing these operations, the report of of this year contained an exposition of their ulterior projects regarding paper currency. They wished to form analogous institutions in every country in Europe, all in correspondence with each other, so as to issue obligations having an European circulation, to facilitate the flow of capital from one place to another, and ultimately the assimilation of moneys in Europe. This year the Company declared a dividend of very nearly 12 per cent.

In the following year, 1855, the French Government opened a still larger loan than in the preceding one, to which the *Crédit Mobilier* subscribed two sums of 250 and 375 millions of francs. Its commercial operations were also greatly extended, and need not be enumerated, consisting chiefly of advances to numerous railway and other companies. In consequence of this extension of its operations, the dividends declared exceeded 40 per cent. for the year 1855.

Similar institutions were also founded in Austria and Spain.

The extraordinary success of the Company determined the Directors to commence the issue of their obligations, which they were authorized to do by their statutes. These were of two sorts, one at short dates corresponding to their temporary investments, the other at long dates, redeemable by instalments, corresponding to their permanent investments in Stocks, Shares, &c.

These obligations were to be guaranteed by the investments which they represented, as well as by a Capital appropriated to the purpose. They proposed to issue these obligations to the amount of 240 millions.

The extraordinary dividends declared by the Company, and the boldness with which it published its plans of embracing all Europe in its operations, directed the attention of the financiers in every country to it. Their alarm was excited by its scheme of issuing so vast an amount of paper currency, and they dreaded the revival of the days of Law. A note inserted in the *Moniteur* in March, 1856, forbade the creation of the proposed obligations. This blow deprived the Company of much of its public interest, and from that time its dividends greatly declined. They fell to about 22 per cent. for 1856. The great commercial crisis of 1857 still further reduced them, so that in that year they were only 5 per cent. They were the same for 1858. For 1859 it rose to 7½. In 1860 it was 10 per cent., and in 1861 the same.

The prohibition by the Government of the creation of its paper obligations, saves us the necessity of examining them at length. The *Crédit Mobilier* has no doubt been eminently useful in developing industrial associations, but the securities which it receives are much more liable to fluctuation in value than those of the *Crédit Foncier*, and for that reason its operations are more hazardous. This is fully shewn by the remarkable variations in the dividends.

CRISIS, COMMERCIAL.—We have under the article CREDIT, endeavoured to explain to our readers the mechanism of the grand system of

Credit, and shew the marvellous effects it is capable of producing on the prosperity of nations. But there is a reverse to the picture. Like every other great power, like gunpowder, like steam, it is attended with commensurate dangers. Misused Credit is the cause of those terrible mercantile catastrophes which periodically sweep over the world. They increase in magnitude and danger with the gigantic development of Credit. It is, therefore, one of the most transcendental problems in practical Political Economy to know how, if possible, to discern the symptoms which betoken the approach of these terrible convulsions, and to deal with them when they occur.

We have shewn under Credit that its fundamental conception is the *Present Right to a future payment*. Nearly all modern Economists are agreed that transfer is one species of production, and that Credit is productive by being purchasing power,—purchasing power, however, which has always to be redeemed.

If, therefore, persons produce, or bring forward for sale in any way whatever, or buy so much on credit, so that the price of the goods, &c., when sold cannot redeem the credit, it is evident that they have brought forward or produced too much. And this is the true meaning of that often used but ill-defined expression **OVER-PRODUCTION**. Every mercantile operation, therefore, attended with a loss, is over-production, and every person who does it is brought by so much nearer to bankruptcy.

All commercial crises arise from a large portion of the commercial community having brought forward, or produced, more than they can sell. Hence we may say, in general, that all commercial crises spring from over-production.

Credit being the great productive power of modern times, and being divided into Commercial and Banking Credit, of course a Commercial Crisis may originate out of the abuse of either, or both. Many speculators on the subject have supposed that by legal regulations they might be prevented or greatly mitigated. It becomes, therefore, of the greatest consequence to modern society to ascertain the sources whence commercial crises originate, and especially how the conduct of great Banks, which are the pillars of Credit, should be guided during the tempest.

Commercial Crises originating in Credit have, of course, a comparatively modern origin. If there were none but transactions in ready money single individuals might be ruined, who speculate injudiciously; but they would involve no one else in their misfortunes. The increased danger under the modern system of credit is that most persons, even of the highest standing, are so involved with others that it is always impossible to tell how the greatest names may be entangled with others. When, therefore, considerable numbers are affected the discredit is sure to enlarge itself very considerably beyond the actual danger.

A very important branch of the inquiry, therefore, is to consider what means should be adopted to extend temporary aid to those persons who are really solvent, but whose credit may be affected by the general distrust.

Commercial Crises may arise out of one or more of the following causes—

First. A long-continued very low rate of interest. Persons in such times who have nothing

but the interest of small capitals to live on, are so straitened in their means, that they look out for more profitable investments. At such times wild speculators are sure to abound to take advantage of the credulous. One scheme breeds another, and a speculative fever seizes upon the public like a mania. Multitudes of schemes are set afloat for no other purpose than gambling in the shares. Numbers of persons then rush to buy the shares merely for the sake of selling them again, knowing full well that a crash must come, but hoping to make a lucky hit during the fever. Then at last, either when calls come, supposing them ever to get to that stage, or when the circle of dupes is found to be exhausted, prices begin to waver, and every one rushes to sell, and of course things fall as rapidly as they rose, and then comes the crash.

Secondly. When some new large market is opened at home or abroad, in which extraordinary gains are realized by the first adventurers. Numbers then rush in, and over-production takes place, and the herd of adventurers is ruined.

Thirdly. A great and general failure of some great crop necessary for subsistence. The enormously increased price deranges the demand for other things, the sudden rise of price tempts great speculation, sure to be followed by enormous disasters.

Fourthly. A great derangement of the ordinary course of trade from some great general cause, such as the sudden commencement, or the sudden termination, of a war. The sudden cessation of demand for some articles deranges the calculations of the producers of them, and the sudden demand for large quantities of others raises their price suddenly, and gives rise to immense speculations in them, which are sure to be overdone and end in general ruin.

Each of these causes separately, if on a sufficient scale, may produce a Commercial Crisis; but as several of them may happen together, it will, of course, be proportionably intensified. And these effects are immensely increased by that abominable system of accommodation paper we have described under CREDIT, § 169-198. Bad speculation might no doubt cause serious disasters, but after all, these disasters would be limited to the resources of the speculators, and when they came to an end, further progress in ruin would be arrested. But when a herd of speculators can, by means of writing their names on bits of paper, extract funds without limit from bankers to speculate with, the area of ruin is vastly increased.

The object of the present article is to examine the history of these catastrophes, and to explain what has been the action of the Bank of England, to consider the opinions of various persons, who are regarded as authorities on the subject, and to investigate the principles and the policy of the Bank Act of 1844.

The Crisis of 1763.

It is a very favourite doctrine with some persons that Commercial Crises are chiefly caused by the abuse of the power of issuing notes by banks, and that if that power were taken away, such crises would be prevented.

For this purpose they advocate what they call the "Currency Principle" (CURRENCY PRINCIPLE).

But that this is no guarantee against a crisis is shewn among other instances by that of the year 1763. The termination of the war in 1763 was followed by an immense number of failures at Amsterdam, Hamburg, and other great cities abroad. They began on the 29th July, at Amsterdam, by the failure of two brothers, named Neufville, for upwards of 330,000 guineas; in a week they were followed by 30 other houses, and 14 at Hamburg. Discount rose from 3 to 7 per cent., and soon after there was a general failure of private credit, and no business was transacted except for ready money. In the beginning of August the bankers of Hamburg were so alarmed by the report that those of Amsterdam intended to allow the Neufvilles to fail, that they wrote them a most pressing letter to say that such a step would infallibly plunge all Europe into an abyss of distress, and that they had unanimously determined to suspend their own payments if this were not done. "The fate of the general commerce of all Europe is at present absolutely in your hands; determine, gentlemen, whether you should crush it totally, or support it." (*Annual Register; Gentleman's Magazine* for 1763.) This letter came too late, for the Neufvilles had been allowed to fail several days before it was written. And the consequences were very much as the Hamburg bankers had predicted. This crisis extended to England, and Smith says that the Bank of England extended its support to the merchants to upwards of a million.

The Crisis of 1783.

Ten years after the preceding crisis of 1763, another of a very severe nature took place in 1772, and the beginning of 1773. It extended over all the trading nations of Europe. The Bank of England came forward with judicious liberality to assist the merchants, and by this means the general destruction of credit was averted. In 1782, the unfortunate war with America was terminated, and immediately an immense extension of foreign commerce took place. The Bank greatly increased its issues; they rose from about £6,000,000 in 1780, to £9,600,000 in March, 1782. The directors then seem to have become alarmed, for they soon afterwards as violently contracted them; so that in December, 1782, they were reduced to £5,994,000. This course of conduct naturally produced a great demand for specie on the Bank, and a rapid drain set in, which in May, 1783, inspired the Directors with considerable alarm for the safety of the Bank. The Directors considered that if they continued the contraction of their issues, the drain must at length be arrested, and the exchanges turned in their favour by the returns for the exports. They refused to make any advances to Government on the loan for that year, but they did not make any demand for the repayment of the other advances to Government, which amounted to between nine and ten millions. They continued this policy till October, when their specie was reduced to £473,000; but at last the exchanges were turned in their favour, and specie began to flow in from abroad. As soon as the favourable symptoms had decidedly manifested themselves, the Directors advanced freely on the loan, and to the merchants. The doctrine which Mr. Bosanquet, one of the direc-

tors, stated guided them was this; that while a drain of specie is going on, their issues should be contracted as much as possible; but that as soon as the tide had given signs of ceasing, and turning the other way, it was then safe to extend them freely.

The Crisis of 1793.

The great crisis of 1793 may be considered as the first of those great catastrophes in modern times, of which we have a sufficiently distinct account for scientific purposes, and in which the Bank of England acted a decided part, which has been the subject of much criticism from persons who enjoy the highest name in finance.

We have, under **BANKING IN ENGLAND**, § 107, shewn how the seeds of disaster were sown by the monopoly of the Bank of England. Soon after the peace of Paris, in 1763, the industrial energies of the people burst forth in that brilliant career which they have ever since pursued. After they recovered from the interruption of the war with America, commerce, aided by the new means of production and carriage, received an extraordinary stimulus. In 1786, a memorable Treaty of Commerce and Navigation was concluded by Mr. Pitt with France, negotiated by Mr. Eden, afterwards Lord Auckland, providing for the entire abolition of all impediments to the free intercourse between the nations, and the reciprocal and entirely perfect liberty of navigation and commerce between the subjects of each party, in all and every the kingdoms, states, provinces, and territories subject to their majesties in Europe, for all and singular kinds of goods in those places." We may judge how lamentably the French Revolution threw back the progress of economic light, when we see that after a dreary period of mutual mischief, we have not even yet, by the Cobden Treaty of 1861, recovered the ground where we were in 1786!

To shew the astonishing progress of the commerce of the country from 1782 to 1792, we subjoin the following amounts of imports, exports, tonnage inwards and outwards, and the concomitant increase in the issues of the Bank of England. We may premise the valuations of the imports and exports indicate *quantities*, and not *values*, which custom was continued till 1798.

Imports.		Exports.		Tonnage.	
£		£		Inwards.	Outwards.
1782—10,341,628	...	18,009,458	...	777,258	851,512
1783—18,122,235	...	14,681,494	...	1,135,674	1,089,045
1784—15,272,877	...	15,101,491	...	1,215,702	1,050,487
1785—16,279,419	...	16,117,168	...	1,241,761	1,182,479
1786—15,786,072	...	16,300,730	...	1,264,356	1,236,219
1787—17,804,024	...	16,869,789	...	1,316,501	1,349,419
1788—18,027,170	...	17,472,238	...	1,558,172	1,540,686
1789—17,821,102	...	19,340,548	...	1,589,009	1,591,888
1790—19,180,886	...	20,120,121	...	1,705,975	1,548,207
1791—19,669,732	...	22,731,995	...	1,773,862	1,696,023
1792—19,659,358	...	24,906,200	...	1,891,711	1,739,300

Thus shewing that in the space of 10 years, the commerce of the country had more than doubled. Concomitantly with this increase of commerce, the issues of the Bank of England increased from an average of about six millions in 1782, to upwards of eleven millions in 1792. But this gives a very inadequate idea of the increase of paper currency in the country, as during this period the country banks multiplied to an enormous extent, filling all the country districts with paper cur-

rency, a very large portion of which was of a very dangerous and rotten nature, owing to the monopoly of the Bank, which prevented powerful and wealthy banks being founded.

We have no authentic statistics of the increase of banks, and their issues during this period, but Burke says that when he came to London in 1750, there were not more than 12 bankers out of London; in 1792 there were supposed to be little short of 400, and we may fairly assume that the amount of their issues may have multiplied in a somewhat similar proportion. Many of these country bankers were in the habit of issuing notes with various conditions for the purpose of guarding themselves against the consequences of a run for gold, when communication with the metropolis was so slow and difficult. The bankers at Newcastle issued notes which allowed interest to commence at some months after date, and then they were payable on demand. Those at Exeter and in the West of England issued notes payable at 21 days' sight, with interest commencing from the date of the note, and ceasing on the day of acceptance.

Subsequent experience enables us to perceive that an increase of commerce proceeding at such a pace was sure to end in a catastrophe. During the first ten months of 1792, the average of bankruptcies had been about 50, in November they suddenly rose to 105, by far the highest number that had ever been known in a single month. In December they were only 47, but in January 1793, they again increased to 77. The declaration of war in January 1793, gave a shock to credit, which was already staggering from over expansion. On the 15th of February, a house of considerable magnitude deep in corn speculations, failed, and on the 19th the bank refused the paper of Lane, Son, and Fraser, who stopped the next morning to the amount of nearly a million, involving a great number of other respectable houses. The panic now spread to the bankers. It began at Newcastle. The partners in the Newcastle banks were rich, but their funds were locked up, and when a run came upon them they were unable to realize, and stopped. The panic immediately spread throughout the country. It was computed that there were nearly 400 country banks at that time, of which 300 were much shaken, and upwards of 100 stopped payment.

This great pressure extended to the London bankers as well as to the country ones. One of them says that the extraordinary state of credit has obliged every person, connected with trade and money transactions, to gather in and husband every resource to meet all demands. That for six weeks every man of money and resources had been straining every nerve to support himself and immediate friends, and could not give that support to others, which they would have been disposed to do. All these circumstances naturally produced a demand on the Bank of England for support and discounts. But the bank being thoroughly alarmed, resolved to contract its issues. Bankruptcies multiplied with frightful rapidity. In January they were 77; in February 87; in March 105; in April 188; in May 209. The government urged the bank to come forward and assist credit, but they resolutely declined.

Sir Francis Baring (*Observations on the establishment of the Bank of England*) greatly blames

the directors for their conduct on this occasion. He says that they at first accommodated themselves to the crisis, but their nerves could not support the daily demand for guineas, and for the purpose of checking that demand, they curtailed their discounts to a point never before experienced; and that, if they determined to reduce their issues, it should have been gradual. Their determination, and the extent to which it was carried, came like an electric shock.

He says that there are three different causes for a great demand for guineas.

1. For export.

2. For the purpose of hoarding from want of confidence in the government, and in the circulating paper.

3. To enable country banks to discharge their demands, whilst confidence in the government, and in the bank, remained entire.

That every measure ought to be taken to prevent and mitigate the first cause, except prohibition or bankruptcy. We may reserve the second till we come to 1797. That the third ought to be viewed, not with indifference, but with a disposition to spend almost their last guinea. He shews from the state of the exchanges that it was quite impossible the guineas could have left the country, as the loss on exporting them to Amsterdam was £3 6s. 3d., and to Hamburgh £4 2s. 6d. per cent., and it was notorious that large quantities of gold and silver were coming in from France. This of course was owing to the immense issues of assignats that were taking place, and their continued depreciation. Under these circumstances, he says the directors acted quite wrongly, they ought to have seen that the guineas would have very soon come back to them, and that they ought, in fact, to have followed the precedent of 1783, which had been so successful.

When the bank adopted this perverse course, universal failure seemed inevitable. Sir John Sinclair remembered the precedent of 1697, when Montague had sustained public credit by an issue of exchequer bills, and thought that a similar plan might be followed in this crisis. The minister desired him to propose a scheme for the purpose, which he presented on the 16th of April. A committee of the House of Commons was immediately appointed. In the meantime a director of the Royal Bank of Scotland came up with the most alarming news from Scotland. The public banks were wholly unable, with due regard to their own safety, to furnish the accommodation necessary to support commercial houses and the country bankers. That unless they received immediate assistance from government, general failure would ensue. Numerous houses which were perfectly solvent, must fall, unless they could obtain temporary relief. Mr. Macdowall, M. P. for Glasgow, stated that the commercial houses and manufactories there, were in the greatest distress from the total destruction of credit. That this distress arose from the refusal of the Glasgow, Paisley, and Greenock banks to discount, as their notes were poured in upon them for gold.

The committee reported (*Parl. Hist.*, Vol. XXX., p. 740, &c.) that the general embarrassment of commercial credit was so notorious as to call for an immediate remedy without much examination. That the failures which had taken

place had begun with a run on those houses that issued circulating paper without sufficient capital, but had extended so as to effect many houses of great solidity, and possessed of funds ultimately much more than sufficient to answer all demands upon them, but which could not convert these funds into money in time to meet the pressure. That the sudden discredit of so large an amount of bankers' notes had produced a most inconvenient deficiency of the circulating medium. These circumstances had caused bankers to hoard to a great extent. That unless a circulating medium was provided, a general stoppage must take place. That they had requested a number of the most eminent merchants to meet and consider a plan of issuing Exchequer bills to a certain amount under proper regulations, who had unanimously agreed in the propriety of such a course, as the best remedy that could be devised.

The committee recommended that Exchequer bills to the amount of £5,000,000 should be issued under the directions of a board of commissioners appointed for that purpose, in sums of £100, £50, and £20, and under proper regulations. After considerable doubts were expressed by Mr. Fox and Mr. Grey, as to the policy of this extraordinary measure, which was unknown to the constitution, and might subvert our liberties, the bill passed. The committee set to work immediately. A large sum of money, £70,000, was sent down to Manchester and Glasgow on the strength of the Exchequer bills which were not yet issued. This unexpected supply coming so much earlier than was expected, operated like magic, and had, says Sir John Sinclair, a greater effect in restoring credit than ten times the sum would have had at a later period.

When the whole business was concluded, a report was presented to the Treasury. It stated that the knowledge, that the loans might be had, operated in many instances to prevent them being required. The whole number of applications was 338, and the sum applied for £3,855,624, of which 288 were granted, amounting to £2,222,000; 45 for sums to the amount of £1,215,100 were withdrawn, and 49 rejected. The whole sum advanced was repaid; two only of the parties assisted became bankrupt, all the others were ultimately solvent, and in many instances possessed of great property. A considerable part of the sum was repaid before it was due, and all the rest with the utmost punctuality. So much scrupulous care was taken to preserve secrecy as to the names of the applicants, that they were not known to that hour, except to the Commissioners and their own sureties. After all expenses were paid, the transaction left a clear profit to the government of £4,348.

Whatever were the prognostications of its futility and danger before it was done, its success was perfect and complete. The contemporary writers all bear witness to the extraordinary effects produced. Macpherson says, that the very intimation of the intention of the legislature to support the merchants, operated like a charm all over the country, and in a great degree superseded the necessity of relief by an almost instantaneous restoration of confidence. Sir Francis Baring concurs in this view, and adduces the remarkable success of the measure as an argument to shew the mistaken policy of the Bank.

The panic was at length happily staid. The failures up to July had been 932, in the remaining five months they were reduced to 372. This was, however, upwards of double the number that had ever happened in any year before. Gold continued to flow in, and during the last six months of 1793, and two following years, money became as plentiful as in time of peace, and 4 per cent. interest could scarcely be got.

All contemporary writers bear witness to the wonderful success of this expedient. After careful deliberation the Bullion Report warmly approved of it, censured the proceedings of the Bank of England, and especially cite it as an illustration of a principle which they laid down, that an enlarged accommodation is the true remedy for that occasional failure of confidence in the country districts to which our system of paper credit is unavoidably exposed.

Notwithstanding all this weight of testimony in favour of the happy effects of this measure, some rigid doctrinaires afterwards condemned the proceeding as a violation of the true principles of Political Economy. Even some who helped to devise it, changed their opinion afterwards upon the subject. Thus Lord Sidmouth in 1811 (*Parl. Debs.*, Vol. XIX., p. 530) observed, that he was upon consideration inclined to doubt of its wisdom and policy. Lord Grenville also said (*Ibid.*, p. 534) that from experience and reflection he was convinced the measure was founded on wrong policy; as one of those who were concerned in the measure, he was perfectly ready to avow his error, for he was perfectly satisfied in his own mind that it was unwise and impolitic. And such would be the opinion of those who favour the policy of the Bank Act of 1844.

It appears to us that the reply to these objections is short and simple. In the first place, if it were a violation of the true principles of Political Economy, it immediately resolves itself into a question of loss of capital. It is quite easy to shew that all great errors in Political Economy are destructive of capital. They may be estimated in money. Was this measure a pecuniary loss to the country? But what would have been the loss to the country if it had not been adopted? Who can estimate the destruction of capital that would have ensued in the general wreck of public credit? It might have endangered the safety of the State. But there are other arguments which appear to us to be conclusive of its propriety. The general loss of credit was chiefly caused by a thorough want of confidence in the currency of the country. The miserable notes of the majority of bankers were utterly blown upon. The great desideratum was a sound currency. Now what was it caused such an unsafe currency to be in circulation? It was nothing but the unjustifiable monopoly of the Bank of England. It was this monopoly, which was itself the most flagrant violation of the true principles of Political Economy, which caused the bad character of the currency. Consequently the measure of the government in providing a currency in which people would have confidence, was merely a correction of the error which had produced these deplorable results. We fully acknowledge that as a general principle it is highly undesirable that the government should interfere in any way

whatever in commerce, but in this case it was a compensation of opposite errors, and no other course was possible under the circumstances.

On the Crisis of 1797, and the Suspension of Cash Payments by the Bank of England.

We have seen that the Bank in 1793 pursued a policy of restriction in a commercial crisis, which threatened to bring about a general overthrow of commercial credit, and which was only alleviated by the government stepping in in an abnormal manner, and supplying a currency in which people might have confidence. We have under BANKING IN ENGLAND, § 113—137, given a full detail of the circumstances which brought about the stoppage of cash payments in 1797. We have shewn that the Bank pursued exactly a similar course of excessive restriction as they did in 1793.

An event of such portentous magnitude as the suspension of cash payments by the Bank of England, of whose effects there had been no previous experience, could not fail to give rise to the most conflicting opinions as to the necessity of the measure, of the course of conduct of the Directors which led to it, and as to the policy which ought to have been adopted under the drain which occurred in the last week of February, 1797. Many men of eminence and ability changed their opinions in after times, when they came to look back upon the subsequent events. In examining this question, so as to form a just estimate of the conduct of the Directors, we must remember that they were not masters of their own policy. They were distracted by two antagonistic claims, both of which they conceived it impossible to satisfy at the same time—namely, that of the Chancellor of the Exchequer, and the demands of commerce. They considered that if they advanced to the government they must contract their issues to the merchants, and as the Minister was the more powerful and imperious party of the two, they were obliged to yield to his power.

Several of the Directors being examined before the Committees of Parliament, unanimously attributed the necessity of stopping payment to the enormous amount of their advances to government, and they gave it as their decided opinion, that if the government had repaid these advances as they ought to have done, this catastrophe would have been avoided. We may take it therefore as admitted on all hands, that if they had been repaid by government, they would have very greatly extended their advances to merchants. The real question then, is, considering that they were under such advances to government, would it have been prudent to have been more liberal in their accommodation to merchants?

Several of the Directors and eminent merchants were examined before the Committees of Parliament. Mr. Henry Thornton was very strongly of opinion that the excessive contraction of bank notes had produced the most injurious effects in shaking public credit of all descriptions. That the excessive reduction of notes had caused an unusually severe demand for guineas, and that the great public distrust was directed against the country Bank Notes, and that the Bank of England ought to have extended their issues, to supply the place of the country notes.

Mr. Walter Boyd, an eminent merchant, was very clearly of opinion that the restrictions upon the issue of notes by the Bank was the chief cause of the forced sale and depreciation of the public securities, and if the Bank had only maintained its issues at the same height as they were in December, 1795, the drain of specie from the Bank, as well as the embarrassments in the mercantile world, would have been avoided, and a great part of the fall which public securities had experienced would have been prevented.

Mr. George Ellison, who was secretary to an association of a great part of the country banks, considered that the quantity of the coin in the country was greater than it was in 1793, though a very considerable part was hoarded away, owing to the public alarms that were abroad. He attributed the great public distrust to the remembrance of the conduct of the Bank in 1793, when it suddenly contracted its discounts, just at the period when they were most wanted.

The Committee of the Lords called the attention of the House very strongly to these opinions, but they did not venture themselves to pronounce an opinion on their justness. The Committee of the Commons went considerably nearer towards approving of them. In the year 1810, the governor of the Bank being examined before the Bullion Committee, stated that after the experience of their policy of restriction, many of the Directors repented of the measure, and the Bullion Committee explicitly condemned the policy of the Bank both in 1793 and 1797.

The directors of the Bank, acting in the midst of such unprecedented circumstances and so tremendous an emergency, are entitled to have their conduct examined with all forbearance. But taking all these circumstances into consideration, we cannot fail to acquiesce in the opinion expressed by so many eminent bankers and merchants at the time, by the subsequent avowal of many of the Directors that experience had led them to repent of the policy they then pursued, and by the decided opinion of the Bullion Committee, that the policy pursued by the Bank in this momentous crisis was erroneous, and that the severe restrictions they attempted to place upon commerce, very greatly contributed to bring on the calamity by which they were subsequently overwhelmed. Nothing, in short, could be more unhappy than their regulations of the amount of their issues. When the exchanges were violently adverse, so that it was enormously profitable to export gold, they enlarged their issues to an extravagant extent, and when the exchanges were extremely favourable, so that gold was sure to flow in, they restricted them with merciless severity. The issues, which were £14,000,000 when the exchanges were against the country, were reduced to £8,640,250 when they had been for several months eminently favourable. It appears from the entire evidence in the reports, that it was this excessive restriction of notes which drained away their cash during the autumn of 1796, and if they had been more liberal in their issues, their vaults would have been much better replenished with cash.

This disaster was the second notable penalty which the country paid within four years for the unjustifiable monopoly of the Bank. Never was there a more unfortunate example of monopoly-

lizing selfishness; it would neither establish branches of its own in the country, nor would it permit any other private company of power and solidity to do so, whose credit might have interposed and aided in sustaining its own. Moreover, when a failure of confidence was felt in the country notes, it refused to supply notes of its own to supply their place. The power of issuing what plays so important a part in commerce was absolutely forbidden to wealthy companies, and left in an unbounded freedom to private persons, many of whom had no capital or property to support their issues, and whose credit vanished like a puff of smoke in any public danger. The Bank consequently was left to bear the whole brunt of the crisis, solitary and unsupported, and finally succumbed.

From the foregoing considerations, as well as the weight of authority on the subject, we can scarcely have any room to doubt that the suspension of cash payments was brought about, at that particular time, by the erroneous policy of the Directors. Moreover, the weight of evidence and opinion tends to shew that there was no necessity for their stopping when they did. Their treasure, it is true, was reduced to little more than a million, but that was more than twice what they had in 1783, and the exchanges were favourable to the country and gold was pouring in. On the 30th May, Mr. Manning stated in the House, that vast quantities of gold had flowed into the Bank, both from the country and from abroad. In August the Bank had upwards of four millions of treasure, and this continued steadily to increase till August, 1799. But we must in candour state that it appears open to much doubt whether any management, however skilful, could ultimately have saved them from such a disaster during some period of the war. Several of those who concurred in the measure at the time, after their judgment had been corrected by experience, expressed their regret at having done so; Sir Robert Peel, in 1844, said it was a "fatal" measure. Notwithstanding, however, the concurrence of so many weighty authorities—and this is peculiarly a case where great authorities carry much weight—we cannot help thinking that it was fortunate that it occurred at this early period. The alarm and dangers which preceded its stoppage were comparatively slight compared to those which menaced the country after that event. The mutinies in the fleet, the rebellion in Ireland, the enormous accumulation of troops on the heights of Boulogne flushed with victory, led by a more fortunate, though probably not a greater soldier than Hoche, and burning with zeal for the invasion of England, were dangers of such portentous magnitude as to render it to the last degree improbable that any paper currency convertible into gold could have survived them. That Montague was a greater and more successful financier than Pitt, can, we think, scarcely be doubted; and the carrying through the re-coinage of the silver, in the midst of so much public distress, was a financial operation, of which the audacity, skill, and success, must ever be regarded with admiration. But it must be remembered that the crisis in that reign lasted a much shorter time than the revolutionary war, and was never fraught with so much real danger to the independence of the country. At that period there was probably

no paper credit in the form of bank notes out of London, and William was at the head of a great European confederacy against one overgrown power, so that the circumstances of the two periods were in no way parallel, but rather, we may say, reversed. The confederacy against England at the latter period was far more menacing and formidable than the alliance against France. The fortunes of Venice, with the enemy at Chiozza, were scarcely at a lower ebb than those of the British Empire in 1798, and there seemed to be but one thing wanting to complete the destruction of the country—the loss of public credit. However great and invaluable are the blessings of a paper currency in time of peace, there does not appear to be any instance of its having successfully withstood the danger of invasion by a foreign enemy. Even in Scotland, where it had been confessedly conducted on a better system, and obtained the confidence of the country to a much greater degree, it could not have withstood the dread of invasion, if it had not been for the timely assistance of the Bank of England. And if it could not do so in that country, where the danger was remote, it is not probable that it could have done so in England, where not only it was of much inferior stability, but was the very part of the empire aimed at, and first exposed to danger. The constant power of producing public embarrassment by demands for gold would have been a powerful weapon in the hands of the enemy, in which they would have found many in this country to support them from political sympathy. This measure, therefore, removed one perpetual source of terror and alarm from the Ministry. The great depreciation of the currency, which took place some years afterwards, was not by any means a necessary consequence from such a measure, but was produced by the infatuated perversity, both of the Government and of the Bank of England, who with fatal obstinacy persisted in a system combining almost every false principle that could be thought of. Upon the whole, then, we think that the suspension must have taken place sooner or later, and therefore it was probably advantageous for the country that it did occur so early in the struggle.

The Crisis of 1825.

The circumstances which led to the great depreciation of the Bank Note and the appointment of the Bullion Committee in 1810, its report and its rejection by the House of Commons in 1811, the subsequent increased depreciation of the Bank Note, and the fearful monetary disasters in 1815-16-17, and the crisis of 1819, followed by the total suspension of cash payments by the Bank, and the circumstances preceding the great crisis of 1825, are fully detailed under **BANKING IN ENGLAND** and **BULLION REPORT**. We shall therefore not repeat here the details given under these articles, but shall confine ourselves to an examination of the conduct of the Bank of England during the crisis.

The exchange on Paris began to decline at the close of 1823. The last time it was above par was in June, 1824, and it steadily declined till November. On the 18th of that month, Mr. Ward, one of the Directors of the Bank, said that the demand for bar gold shewed that it was being exported. The following table shews that

the treasure in the Bank had been steadily and rapidly declining ever since January, 1824. Now when it was known that immense sums were leaving the country and the exchange falling lower, what did the Bank do? It *increased* its issues. When every consideration of common sense and prudence demanded a rapid *contraction*, when the speculative fever was plainly declared, instead of doing what they could to check it, they added fuel to the flames, in defiance of the principles of the Bullion Report. The following table exhibits the state of their treasure and their issues from the end of 1823 to that of 1825:—

COIN AND BULLION. NOTES ISSUED.			
	1823.	£	£
Dec. 27	14,049,860	17,551,530

Nov. 26	3,012,150	17,464,890	
Dec. 31	1,260,890	25,709,420	

The speculative fever was at its height in the first four months of 1825, when it had spent its force, and came to an end in the natural course of things. Vast numbers of persons who had embarked in these wild schemes, with the hope of selling out of them before the inevitable crash came, were now called upon for their subscriptions. Vast quantities of capital having been absorbed had the inevitable effect of raising the rate of interest. Successive calls compelled the weaker holders to realize, and while the calls for ready money were immediate and pressing, the prospect of returns was distant and uncertain. Accordingly, after May and June, the decline was rapid. The South American loans and the Mexican mining schemes proved almost universally total losses. In the meantime that *slack water*, which Mr. Tooke observes always precedes a great turn in the tide of prices, took place. The increased prices of commodities which speculation had caused, could no longer be kept from being realized, and prices fell as rapidly as they had risen. The obligations of the speculators now became due, and the sale of commodities had to be forced to meet them. Universal discredit now succeeded, goods became unsaleable, so that stocks, which are usually held in anticipation of demand, were wholly unavailable to meet the pecuniary engagements of the holders. Merchants who had accepted bills for only half the value of the goods consigned to them, were unable to realize even that half, or even obtain advances on security of

the bills of lading. The advances already made were peremptorily called in. The usury laws, which limited interest to 5 per cent., greatly aggravated the distress; nobody would lend money at 5 per cent. when its real value was so much greater. Hence numbers, who would have gladly paid 8 or 10 per cent. interest, were obliged to sell goods at a difference of 30 per cent. for cash, compared with the price for time.

The bankers in the country had followed exactly in the steps of the Bank of England. While the fever was raging, they had increased their issues and liabilities by speculative advances on commodities. The persons to whom these advances had been made had no means of repaying them, but the "promises to pay" the bankers had lent them still remained in circulation, and must be met. The bankers foresaw the coming storm, and endeavoured to provide funds to meet it. The Bank of England itself had its eyes opened to the suicidal career it was following in May, and then endeavoured violently to contract its issues. This sudden change of policy only aggravated the general feeling of discredit. During the autumn everything portended the approach of the impending catastrophe.

The inevitable *contre coup* of the undue expansion of credit in the spring began to press heavily on the country banks in the autumn of 1825. It gradually became severer during the month of November. As the crisis was evidently approaching at the end of November, the papers discussed the probable policy of the Bank, and it was generally anticipated that it would continue to contract its issues, and let the evil work its own cure by the fall of the houses which had been imprudent in their speculations. On the 29th November it was announced in the London papers that Sir William Elford's—a large bank at Plymouth—had failed, and that was immediately followed by the fall of Wentworth and Co., a great Yorkshire firm. By the 3rd of December the panic had fairly set in, and the whole city was thrown into the most violent state of alarm and consternation. On that day (Saturday) some of the Directors of the Bank were informed that the house of Pole, Thornton and Co., one of the leading city banking houses, was in difficulties, and at a hurried meeting held on the following day, it was decided to place £300,000 at their disposal on proper security. During that week the utmost attention was paid to the position of that house, which fought it through the following week, though it was privately known to the governor that if the storm did not abate they must fall on the Monday morning. Instead of abating, however, it became more furious than ever on the Monday. Pole and Co. stopped payment, and the ruin of 40 country banks which were connected with them was expected.

The fall of this great banking house was the signal for a run upon all the London bankers. Another great house of equal magnitude, Williams, Burgess and Co. and three or four more, gave way, and spread universal consternation among the country banks, 63 of which succumbed to the crisis, though a considerable number paid 20s. in the pound, and eventually resumed business.

The Bank at first maintained a policy of vigorous restriction, in which they were supported by public opinion. Mr. Huskisson said afterwards

in the House of Commons, that during 48 hours (Monday and Tuesday, December 12 and 13,) it was impossible to convert into money to any extent the best securities of the government. Persons could not sell Exchequer Bills, nor Bank Stock, nor East India Stock, nor the public funds. Mr. Baring said that men would not part with their money on any terms, nor for any security. The extent to which the distress had reached was melancholy to the last degree. Persons of undoubted wealth and real capital were seen walking about the streets of London not knowing whether they should be able to meet their engagements for the next day. The Directors thought that they would certainly have to stop payment, and sounded the government as to a restriction act. But the government would not hear of such a thing, and it was resolved that the Bank should pay away its last guinea and its last shilling.

On the 14th December Mr. Vincent Stuckey, an eminent West country banker, wrote to the Directors recommending them to issue a million of notes a day. That the discredit was directed against the country bank paper, and all they would have to do would be to exchange their powerful credit for the tottering credit of the country banks, and they would not increase the total of the circulation. Whether it was in consequence of this advice or not it does not appear, but they adopted this plan. On Wednesday, the 14th, the Exchange had decidedly turned in favor of the country in consequence of the pressure, and the Bank totally changed its policy. From a policy of the most stringent restriction, they discounted with the most enormous profuseness. They made immense advances on Exchequer Bills and securities of all sorts. Mr. Harman says (*Report Bank Charter, 1832, p. 154*):—"We lent it by every possible means, and in modes we had never adopted before; we took in Stock as security, we purchased Exchequer Bills, we made advances on Exchequer Bills, we not only discounted outright but we made advances on deposit of bills of exchange to an immense amount, in short by every possible means consistent with the safety of the bank; and we were not on some occasions overnice, seeing the dreadful state in which the public were, we rendered every assistance in our power." This audacious policy was crowned with the most complete success—the panic was stayed almost immediately. On Friday evening, the 16th, the *Courier* said:—"We are happy to think that the worst is over, though there are still great demands upon the Bank, particularly from the country. The same paper, on the next day, the 17th, said:—"Although public confidence is on the return in the metropolis, and things are resuming their usual course, yet, as might be expected, this has not yet communicated itself to the country." In fact, the London panic was completely allayed in this week by the profuse issue of bank notes. Between Wednesday, the 14th, and Saturday, the 17th, the bank issued upwards of £5,000,000 of notes!

The waves of discredit, however, were propagated through the country, and throughout the following week the demand still continued great from the London bankers for their country correspondents. During the course of it, it came to the remembrance of some of the Directors that there

was a chest of their £1 notes which had never been used. As soon as this was discovered, it occurred to them that they might be used to stay the panic in the country districts, and the discredit of the country bank notes. Upon communicating this idea to the London bankers it was eagerly approved of, and the sanction of the Government was asked for the experiment. The Government consented, and the notes were sent off to the country bankers without delay, and produced instantaneous relief. "At Norwich, when the Gurneys shewed upon their counter so many feet of bank-notes of such a thickness, it stopped the run in that part of the country."

During the week ending the 17th, the Mint had been kept constantly at work day and night, but notwithstanding all its efforts it could not supply coin with sufficient rapidity, so that it kept continually diminishing. On the Saturday the coin and bullion in the Bank scarcely exceeded one million, but the profuse issue of notes had stayed the panic, and on Saturday evening the Directors were able to assure the ministry that all danger was over. The great pressure had produced the effect which necessarily results from such circumstances. The great increase in the value of money here had turned the exchanges in favour of the country. The Directors expected remittances from Paris, and they fortunately came sooner than was expected. On Monday, the 19th, about £400,000 came from France, and the demand having sensibly abated, the supplies from the Mint fully equalled the sums drawn out of the Bank,—or rather exceeded them. By the 24th the panic was completely allayed all over the country, and the amount of the £1 notes issued was under £500,000, and by the beginning of 1826 the credit of the banking world was completely restored.

The circumstances of this famous crisis are the most complete and triumphant example of the unquestionable truth of the principles of the Bullion Report, and of Sir Francis Baring already quoted. When the drain of treasure from the Bank was severe and unceasing, and notoriously for exportation on account of foreign loans, the Bank with infatuated obstinacy had increased their issues instead of contracting them, in defiance of the clearest warnings of the Bullion Report. After six months' continuance in this fatal course, they at last reversed their course and contracted them. In July 1825, after a steady and notorious drain had been going on for exportation, their issues were upwards of three millions greater, when their treasure scarcely exceeded four millions, than when it had been 14 millions. In the course of the autumn the drain for exportation ceased, but began to be severe for internal purposes. The demand for gold was entirely to support the tottering credit of the country bank notes. Now, as the country bankers were only too glad to withdraw their own notes and substitute gold for them, there was not the slightest danger of an increase of Bank of England notes adding to the general amount of the paper currency in the country, but just the reverse. Consequently it was just the precise case in which Sir Francis Baring and the Bullion Committee said it was the duty of the Bank of England to extend its issues to support general credit. There was not the smallest danger that an extension of

issues would, under such circumstances, turn the foreign exchanges against the country. The character of the demand was declared in the most unmistakable way. On Thursday, the 15th, a meeting of merchants and others took place at the Mansion House, when it was stated that Sir P. Pole and Co. had a surplus of £170,000 after payment of all claims against them, besides large landed property belonging to Sir Peter Pole, and about £100,000, the private property of other members of the firm. Williams and Burgess had enough to pay 40s. in the pound. Now if the course which was adopted on the Wednesday had been adopted on the Monday, the whole of that terrific crisis would have been saved. All contemporary evidence proves that it was this profuse issue of £5,000,000 in a few days that stayed the panic. If they had persevered in the restrictive policy for three days more, the total and entire destruction of commercial credit would infallibly have ensued. In short if they had followed the precedents of 1793 and 1797, so strongly condemned by the Bullion Report, all credit would have been destroyed; they followed the principles laid down in the Bullion Report, and the country was saved.

With respect to the issue of the £1 notes, Mr. Horsley Palmer, the Governor of the Bank, was asked (*Report on Bank Charter, 1832*)—Q. 99: "Was not the difficulty of which you have been speaking in the year 1825, when there was such a run upon the Bank, unconnected with any foreign demand, in fact, met by the re-issuing of the £1 notes?—At Norwich it was, and I believe at one or two other places." Q. 117: "Can there be any doubt that that issue of £1 notes made in 1825 had a most beneficial effect upon the transactions of this metropolis?—I believe that it proved beneficial in stopping the run upon the country bankers." After describing the effect of the fall of Pole and Co. upon commercial credit, in questions 607-616, Mr. Palmer said that the danger to the Bank was in a great degree averted by the issue of its £1 notes, which were a very material aid to it when it was difficult to get coin from the Mint in sufficient quantities. Mr. Stuckey, the eminent banker, said that if the Bank had not done as they did, most of the banks in London as well as the country must have stopped. Mr. Jeremiah Harman was asked—Q. 2,232: "The Bank of England issued £1 notes at that period—was that done to protect its remaining treasure?—Decidedly, and it worked wonders. Do you think that the issuing of the £1 notes did avert a complete drain?—As far as my judgment goes, it saved the credit of the country." Mr. G. W. Norman was asked—Q. 2,479: "Do you not think that with a reduced treasure in the Bank, accompanied with embarrassment in commerce, and workmen thrown out of employment, a prudential regard to the safety of the Bank would cause that to be considered a period of danger to the Bank?—Certainly I should say it would be an anxious period for the Bank; but I think we have generally seen in periods of commercial distress the credit of the Bank rather rose higher above the common credit of other bodies of individuals than at any other time. Why do you think so?—I may refer particularly to the example of 1825; at that time the Bank had the means of increasing its issues prodigiously;

at the moment the crisis took place there was nothing like a want of credit in the public mind with respect to the Bank. Do you suppose that the £1 notes of the Bank at that time stopped the panic?—To a certain degree." Even Mr. Samuel Jones Loyd (now Lord Overstone) whose opinions on Currency we have examined at great length under CURRENCY, testified as to the good effect of the issue of the £1 notes. Q. 3,446: "Do you conceive that any part of what has been called the commercial discredit in the year 1825, consisted in a doubt of the ultimate solvency of the Bank of England?—Not the slightest; and the best proof of that is, that when they had no further sovereigns that they could issue, they luckily found a large quantity of £1 notes, and the public were perfectly satisfied with the £1 notes."

On the Crisis of 1847.

The great crisis of 1825 is the most striking proof of the truth of the fundamental principles of the Bullion Report, one of which was that it was inexpedient to impose a numerical limit on the issues of the Bank, because there were occasional crises to which our system of paper credit was subject, when a liberal issue of Bank notes was indispensable to prevent general commercial ruin. After many long controversies we have seen that the Directors of the Bank were brought to admit the principle that the issues of notes should be regulated by the state of the Foreign Exchanges. We have shewn under BANKING IN ENGLAND, § 218, the rules proposed by the Directors for controlling their issues by the Exchanges, and how utterly futile they were. The mismanagement of the Directors brought the Bank into difficulties in 1837 and 1839, but these crises are not sufficiently important in a scientific point of view to demand a separate notice. The repeated instances of mismanagement, however, turned the attention of writers to devise some plan by which the Bank should be compelled to maintain itself in a position of solvency, and a plan was adopted by Sir Robert Peel, very much in conformity with the ideas of Colonel Torrens, Mr. Samuel Jones Loyd (Lord Overstone), and others, which was carried into effect by the famous Bank Act of 1844. The details of this Act are fully explained in BANKING IN ENGLAND, § 235. We have shewn there that it imposed a definite limit on the issues of the Bank, being allowed to issue notes to the amount of £14,000,000 based on public securities, together with an amount equal to the quantity of coin they possessed in their vaults. This theory was based upon what is called the Currency Principle, which shortly stated is this:—That Bank notes payable to bearer on demand are currency, as distinguished from all other forms of paper credit. That when Bank notes are permitted to be issued, they ought to be exactly equal in quantity to the bullion they displace, and that the quantity of notes in circulation ought always to be exactly equal to what the coin would be if there were no notes. Such was the theory the promoters of the Act intended to carry out. But we have shewn under BANKING IN ENGLAND, § 236-7, and CURRENCY PRINCIPLE what a complete delusion it is to suppose that the Act does really carry it out. However, that is not the most important point which affects us at

present. The chief point we have to consider at present, is the policy of imposing a definite numerical limit on the issues of the Bank, in diametrical opposition to the opinions of the most eminent banking authorities up to 1840.

The intention of the framers of the Act was that, as bullion left the country, the issues of the Bank in the hands of the public should be gradually diminished, so as to make money more valuable, and arrest the drain. After the passing of the Act of 1844, from various circumstances, there was a continual increase in the bullion in the Bank until August, 1846, when it reached a maximum of 16 millions, and the rate of discount was 3 per cent. The following figures shew the notes held by the public, and in reserve, the total amount of bullion, and the rate of discount, from August, 1846, to the crisis of April, 1847.

BANK NOTES.			Total Amount of Bullion.	Rate of Discount.
1846.	Issued.	In Reserve.		
	£	£	£	
Aug. 29	20,426,000	9,450,000	16,866,000	3
Oct. 8 ..	20,551,000	8,809,000	15,817,000	3
Nov. 7 ..	20,971,000	7,265,000	14,760,000	3
Dec. 19 ..	19,549,000	8,864,000	15,168,000	3
1847.				
Jan. 9 ..	20,887,000	6,715,000	14 00	
" 16 ..	20,679,000	6,546,000	12 00	3½
" 30 ..	20,469,000	5,704,000	12 00	4
Feb. 20 ..	19,482,000	5,917,000	12 00	4
Mar. 6 ..	19,279,000	5,715,000	11 00	4
" 20 ..	19,069,000	5,419,000	11 00	4
April 3 ..	18,855,000	3,700,000	10 00	4
" 10 ..	20,243,000	2,558,000	8 30	5

When the public saw the whole banking resources of the Bank reduced to 2½ millions, a complete panic seized the Directors and the public. The Directors adopted measures of the greatest severity to check the drain. Discount out of doors on the best bills rose to 10 and 12 per cent. In consequence of these measures bullion began to flow in, and continued to do so till the end of June, when it was upwards of 10½ millions. At the end of June, however, a new drain began, which continued steadily till after the great crisis in October. At the end of July, the Bank had £9,331,000 of bullion and coin, the notes issued were £18,892,000, and those in reserve were £3,775,000. They had been so severely blamed in April for not taking timely precautions to check the drain, that they now proceeded with greater energy. Discount was raised to 5½, being 1½ per cent. higher than when they had a similar amount of reserve in April.

The crisis of 1847 began in August. There had undoubtedly been a long period during which houses that had been insolvent for years had maintained themselves afloat by the low rate of discount. But besides that, the extraordinary rise in the price of wheat in the spring had led to enormous speculation in corn. The price of wheat had ranged from 70s. to 77s. from January to April. In May the average rose to 105s., a considerable quantity being sold at a much higher figure than that. It did not vary much during June. These high prices, of course, attracted an immense amount of supplies; and during July

the price gradually fell to 76s. The cargoes, however, purchased at the prices of the spring, now arrived. Besides that, the new crops began to come in, and were found to be of excellent quality; and thus the price was still further lowered. The frightful catalogue of failures began in the first week of August. During the first week they were about £1,200,000. In three weeks they amounted to £3,027,000. Week after week followed, each one increasing in severity, until the total exceeded £15,000,000. The increasing severity of the crisis had its usual effect of turning the exchanges in favour of the country, and by the end of September bullion began to flow in.

By the 2nd of October, the reserve was reduced to £3,409,000, with the crisis becoming severer every day. The Bank began to perceive that it was time for them to think of their own safety. On that day they gave notice that the minimum rate would be 5½ on all bills falling due before the 15th October, and they refused to make any advances on stock or exchequer bills. This last announcement created great excitement on the Stock Exchange. The town and country bankers hastened to sell their public securities, to convert them into money. The difference between the price of Consols for ready money and for the account of the 14th October, shewed a rate of interest equivalent to 50 per cent. per annum. Exchequer bills sold at 35 per cent. discount. On the 16th October the rate of discount varied from 5½ to 9 per cent. At this time the bullion was £8,431,000; the notes issued £19,359,000; and in reserve £2,630,000.

The following week, from Monday the 18th to Saturday the 23rd, was the paroxysm of the crisis. On Monday the Royal Bank of Liverpool, with a paid-up capital of £800,000, stopped payment, which caused the funds to fall 2 per cent. This was followed by the stoppage of the North and South Wales Bank, also of Liverpool, the Liverpool Banking Company, the Union Bank of Newcastle, heavy runs on the other banks of the district, and other bank failures at Manchester and in the West of England. As the whole commercial world knew that the resources of the Banking department were being rapidly exhausted, a complete panic seized them. Private discounts ceased. At Liverpool bills of the best houses, bearing the endorsement of the Bank of France, and having only three days to run, were refused discount at the branch of the Bank of England. No one would part with the money or notes they possessed. The most exorbitant sums were offered to merchants, and refused, for their acceptances.

The continued and ever increasing severity of the crisis caused deputation after deputation to be sent to the Government, to obtain a relaxation of the Act. For a long time they were unsuccessful, the Ministry clinging with obstinacy to their pet theory of currency. At last it became evident that matters could go on no longer. Ruin awaited the whole commercial community. On Saturday, the 23rd, the Ministry found that the Act must be abandoned, and communicated this determination to the Directors, who immediately acted upon it, and discounted freely at 9 per cent. The letter itself was not actually sent till Monday, the 25th. It stated that the Government

expected that the pressure which had existed for some weeks would have passed away like the one in April had done, by the operation of natural causes. That, being disappointed in this hope, they had come to the conclusion that the time had come when they ought to attempt, by some extraordinary and temporary measure, to restore confidence to the mercantile community. That for this purpose they recommended the Directors of the Bank of England, in the emergency, to enlarge the amount of their discounts and advances on approved security; but that, in order to restrain this operation within reasonable limits, a high rate of interest should be charged, which, under the circumstances, should not, they thought, be less than 8 per cent. That if such a course should lead to any infringement of the law, they would be prepared to propose to Parliament, on its meeting, a bill of indemnity. This letter was made public about one o'clock on Monday, the 25th; and no sooner was it done so, than the panic vanished like a dream! Mr. Gurney stated that it produced its effect in ten minutes! No sooner was it known that notes *might* be had, than the want of them ceased! Not only did no infringement of the Act take place, but the whole issue of notes in consequence of the letter was only £400,000; so that, while at one moment the whole credit of Great Britain was in imminent danger of being totally destroyed, within one hour it was saved by the knowledge that notes *might* be had, and the actual issue of £400,000!

The extraordinary and disastrous state of public credit at this period may be judged of by the aid afforded by the Bank of England to different establishments from the 15th September to the 15th November, as follows:—

1. It advanced £150,000 to a large firm in London, who were under liabilities to the extent of several millions, on the security of debentures of the Governor and Company of the Copper Miners of England, which prevented them stopping payment.
2. It advanced £50,000 to a country banker, on the security of real property.
3. It advanced £120,000 to the Governor and Company of Copper Miners, which prevented them stopping payment.
4. It advanced £300,000 to the Royal Bank of Liverpool, on the security of bills of exchange, over and above their usual discounts; but this was inadequate, and the bank, having no further security to offer, stopped payment.
5. It advanced £100,000 to another joint stock bank in the country.
6. It advanced £130,000 on real property to a large mercantile house in London.
7. It advanced £50,000 on bills of exchange to another mercantile house, on the security of approved names.
8. It advanced £50,000 on bills of exchange to a joint stock bank of issue, which soon after stopped payment.
9. It advanced £15,000 on real property to another mercantile house in London.
10. It saved a large mercantile house in Liverpool from failing, by forbearing to enforce payment of £100,000 of their acceptances falling due.
11. It assisted another very large joint stock bank in the country by an advance of £800,000 beyond its usual discount limit.

12. It advanced £100,000 to a country banker on real security.

13. It advanced to a Scotch bank £200,000 on the security of local bills, and £60,000 on London bills.

14. It assisted another Scotch bank by discounting £100,000 of local and London bills.

15. It advanced £100,000 to a large mercantile house in London, on approved personal security.

16. It assisted a large house in Manchester to resume payment, by an advance of £40,000 on approved personal security.

17. It advanced £30,000 to a country bank on real property.

18. It assisted many other houses, both in town and country, by advances of smaller sums on securities not usually admitted; and it did not reject, in London, any one bill offered for discount, except on the ground of insufficient security.

The far larger portion of this assistance was given before the 23rd October.

On the meeting of Parliament the Chancellor of the Exchequer moved for a committee to enquire into the causes of the recent commercial distress, and how far it was affected by the Act of 1844. He spoke of the panic in the spring. He said that he had seen no reason to change the opinion he had then expressed, that it was mainly owing to the imprudence of the Bank, which, having full warning of the various demands it would have on it, was too tardy in raising the rate of discount, and had lent out, over the period when the dividends became payable, the money they had provided for that purpose, so that they were not in possession of adequate funds when they were required. The low state of their reserve then excited consternation. The Bank then took the severe step of reducing the amount of discounts. They pulled up as suddenly as they had unwisely let out their reserve before. With respect to the panic of October, he said that the severe pressure in the money market had abated when the bank failures in Liverpool and the North of England took place, which renewed the alarm. After describing the great pressure on the country banks, he said—"The Bank of England were pressed directly for assistance from all parts of the country, and indirectly through the London bankers, who were called upon to support their country correspondents. The country banks required a large amount of notes to render them secure against possible demands; not so much for payment of their notes, as of their deposits. Houses in London were applying constantly to the Bank for aid. Two bill brokers had stopped, and the operations of two others were nearly paralysed. The whole demand for discount was thrown upon the hands of the Bank of England. Notwithstanding this, as I said before, the Bank never refused a bill which it would have discounted at another time; but still the large mass of bills which under ordinary circumstances are discounted by bill brokers could not be negotiated. During this period we were daily, I may say hourly, in possession of the state of the Bank. The Governor and Deputy-Governor at last said they could no longer continue their advances to support the various parties who applied to them; that they could save themselves, that is, they could comply

with the law; but that they could not do so without pressing more stringently on the commercial world. At this crisis a feeling as to the necessity of the interposition of Government appeared to be generally entertained; and those conversant with commercial affairs, and least likely to decide in favour of the course we ultimately adopted, unanimously expressed an opinion, that, if some measures were not taken by the Government to arrest the evil, the most disastrous consequences must inevitably ensue. Evidence was laid before the Government, which proved, not only the existence of severe pressure from the causes I have stated, but also that it was aggravated in a very great degree by the hoarding, on the part of many persons, of gold and Bank notes to a very large extent, in consequence of which an amount of circulation, which under ordinary circumstances would have been adequate, became insufficient for the wants of the community. It was difficult to establish this beforehand, but the best proof of the fact is in what occurred after we interfered. As soon as the letter of the 23rd October appeared, and the panic ceased, thousands and tens of thousands of pounds were taken from the hoards, some from boxes deposited with bankers, although the parties would not leave the notes in their banker's hands. Large parcels of notes were returned to the Bank of England, cut in halves, as they had been sent down into the country; and so small was the real demand for an additional quantity of notes, that the whole amount taken from the Bank when the unlimited power of issue was given was under £400,000. The restoration of confidence released notes from their hoards, and no more were wanted; for this trifling quantity of additional notes is hardly worth notice. * * * Parties of every description made applications for assistance to us, with the observation, 'We do not want notes, but give us confidence.' They said, 'We have notes enough, but we have not confidence to use them; say you will stand by us, and we shall have all that we want; do anything, in short, that will give us confidence. If we think that we can get Bank notes, we shall not want them. Charge any rate of interest you please; ask what you like.' (*Mr. Spooner*, "No! no!") "I beg pardon of the honourable gentleman, but I may be permitted to know what was actually said to me. I say that what I have stated was the tenor of the applications made to me. Parties said to me, 'Let us have notes; charge 10, 12 per cent. for them; we don't care what the rate of interest is. We don't mean indeed to take the notes, because we shall not want them; only tell us that we can get them, and this will at once restore confidence.' We have been asked what was the change of circumstances which induced us to act on Saturday when we declined acting a day or two before. I reply that the accounts we received on Thursday, Friday, and Saturday, were of a totally different description from those that were previously brought us. It was on Saturday, and not before, that this conviction was forced upon us; and it was not till then that we felt it necessary to sanction a violation of the law." The persons applying generally said that it was necessary to place a limit on the amount to be authorized, which they proposed should be two or three

millions; but the Government thought the limit should be placed on the rate of interest, and this was the method adopted. There can be no doubt whatever of the soundness of this opinion. If the Bank had been limited to the paltry sum of two or three millions, it would probably have gone but a little way to stay the panic, or the demand for hoarding. But when everybody knew that they might have notes at a high rate, they did not apply for them, unless they really required them. We have already shown that Sir Robert Peel entirely approved of the conduct of the Government, which was a distinct repudiation of the currency principle. We have given a long extract from Sir Robert Peel's speech under **BANKING IN ENGLAND, § 246.**

On the meeting of Parliament, both houses appointed committees to inquire into the causes of the commercial distress, and the working of the Act of 1844. Before the Committee of the Commons, Mr. Adam Hodgson, a Director of the Bank of Liverpool, gave it as his decided opinion that, if the Act had not been suspended, the Bank of England would have stopped payment. Mr. Samuel Gurney stated that he was quite satisfied there were at least £4,000,000 of notes hoarded from panic, and alarm that notes could not be got at all. He gave the experience of his own firm to illustrate the nature of the crisis. On Saturday, the 23rd, owing to the feeling of alarm that it would not be possible to get circulating medium, they considered it prudent to negotiate a loan for £200,000, which was done at 9 per cent. On the Monday the feeling became still more intense; both from the country and from London there was a general rush to get notes while they were to be had. The firm made an application for a similar amount on Monday, and were told that they should have an answer by two o'clock. Before that time, however, the Government letter came out, and the orders for money were very generally withdrawn. Sums of money were offered them; and before the week was over they had to go to the Bank, to ask them, as a favour, to take back the money they had lent. He was of opinion that the crisis would have been mitigated if the letter had come out sooner. He stated that at first his opinion had been in favour of the Act, but, after seeing its operation in April and October, his opinion had decidedly changed and become adverse to it. He said that, when there was a panic, the only cure was a liberal issue of notes.

Mr. Loyd (Lord Overstone) was of opinion that the Act of 1844 had no effect whatever in causing or aggravating the pressure in April or October; that the course pursued by the Bank from January to April was extremely erroneous and detrimental to the public interest, and was only stopped by the positive provisions of the Act; and that, if that system of procedure had not been stopped, it must have ended in the most disastrous consequences. The bullion in the Bank would have been greatly diminished, and the pressure far more severe, if it had been put off longer. He, however, under the circumstances, approved of the issue of the Government letter to allay the panic, which, he said, was not amenable to the principles of reason. He considered the issue of the letter to have been quite successful.

The Committee of the Commons presented their report on the 8th of June, 1848. It entered into no philosophical examination of the correctness, or the contrary, of the opinions of the witnesses. It aspired to and attained to no higher function than acting as a kind of preface to the mass of evidence, but concluded by stating the opinion of the committee that it was not expedient to make any alteration in the Act of 1844.

The report of the Lords was a much more elaborate production, and is a proof of what has been often remarked of the superior capacity of the Lords as men of business to the Commons. It stated that the committee had come to the conclusion that the recent panic was materially aggravated by the operation of the Bank Act of 1844, and by the proceedings of the Bank itself. The operation of the Act had aggravated the panic by imposing a legislative restriction on the means of accommodation while a large amount of bullion was in the bank, and the exchanges were favourable. They traced the causes of the panic, and entirely approved of the issue of the Government letter. They refused to recognize the doctrine of Mr. Loyd, that "although the letter was a departure from the positive permission of the Act, it was not a departure from the principle of the Act." In section III. they said that the inflexible rule considered to be invariable and self acting, and adopted by the Legislature as connected with, and consequent upon, the separation of the Departments of Issue and Banking, and the regulations provided for both, is founded upon certain principles, which before they can be adopted demand very serious consideration. They then pointed out that some very material considerations enforced by the most eminent authorities of former times, had been entirely overlooked by the framers of the Act, and the supporters of the theory upon which it is founded, and said:—"Many other statements, authorities, and illustrations might be given, exemplifying the same principles, and proving the evil consequences of disregarding them; but enough has been stated to prove, in the judgment of the committee, that the inflexibility of the rule prescribed by the restrictive clauses of the Act of 1844 is indefensible, when equally applied to a state of varying circulation, and that its enforcement in 1847 was an aggravation of the commercial distress, and was therefore wisely set aside by the authority of the Government on the 23rd and 25th October." They then shewed that the same rule was not applicable to periods of an adverse and a favourable exchange, and shewed that the Act of 1844 errs in applying the same rule to these two different cases. They recommended that a discretionary relaxing power should be introduced, which should be exercised only during a favourable exchange.

The Crisis of 1857.

The crisis we have just been considering was the inevitable termination of a multiplicity of derangements of the proper course of commerce. No one conversant with commercial history could fail to foresee that the entanglements of so large a portion of the public with railway speculations, and the losses caused by the failure of the harvest must produce a crisis. We have seen that this crisis gave a fatal blow to the prestige of the

Bank Act of 1844, which was enacted in express contradiction to the opinions of the most experienced authorities of former times, whom it professed to follow. They had always protested against imposing a numerical limit on the issues of the Bank. The experience of the crisis of 1847, amply confirming that of 1793, 1797, and 1825, shewed that such restrictions cannot be maintained in the paroxysm of a great crisis without endangering the existence of the whole mass of commercial credit.

The crisis we are now going to describe was of a very different nature. It burst upon the world in the most unexpected manner. It gave no premonitory symptoms which were apparent to any but very watchful and experienced eyes; and when it did come, it revealed a depth of rottenness in the commercial world which appalled every one, and proved to be of much severer intensity than that of 1847.

The supporters of the Act were much crestfallen by its failure in 1847, but they took courage again after the Crimean war. The Act had been subjected to the test of a great commercial crisis and had failed. It was now subjected to the test of a war, and many of its opponents predicted that it would fail again; but it did not. Its effects during the Crimean war were probably salutary; but the war did not proceed to such a length as to test its powers severely. Peace was restored before the resources of the country were in any manner strained.

A very severe drain happened in the autumn of 1855, but the Bank, warned by previous experience, met it promptly and successfully. In April, 1855, discounts on three-month bills were $4\frac{1}{2}$, in May 4, and in June reduced to $3\frac{1}{2}$. In July the drain began, and continued with rapidity through August. On September 6th the rate was raised to 4, on the 13th to $4\frac{1}{2}$, on the 27th to 5. On October 4th it was raised to $5\frac{1}{2}$. The drain, however, continuing to increase in severity, discount was raised on the 18th October to 6 per cent. for two-month bills, and to 7 per cent. for three months. These rates continued till May 22nd, 1856, when it was reduced to 6 per cent. On the 26th it was reduced to 5 per cent., and on the 26th June to $4\frac{1}{2}$ per cent. This continued till October, when, a great demand again going on, the rate was, on the 1st, raised to 5 per cent. On the 6th it was raised to 6 per cent. for two-month bills and 7 per cent. for three-month bills. On November 13th the minimum for all bills was 7 per cent. On December 4th it was reduced to 6, and on the 18th to 6 per cent., and continued so till the autumn of 1857.

These rates were of course very much higher than the average ones of former times, and they were one ground of accusation brought by many against the Act. But, in truth, they were its very merits. The Directors had now learnt from experience, and it was these very variations which preserved the security of the Bank.

In August nothing seemed amiss to the public eye. "Things were then pretty stationary," said the governor of the bank—"the prospects of harvest were very good, there was no apprehension that commerce at that time was otherwise than sound. There were certain more far-seeing persons who considered that the great stimulus given by the war expenditure, which had created

a very large consumption of goods imported from the East and other places, must now occasion some collapse, and still more those who observed that the merchants, notwithstanding the enhanced prices of produce, were nevertheless importing as they had done successfully in the previous years. But the public certainly viewed trade as sound, and were little aware that a crisis of any sort was impending, far less that it was so near at hand."

The bullion at this time was £10,606,000, the reserve £6,296 000, and the minimum rate of discount $5\frac{1}{2}$, when on the 17th August, the bank entered into a negotiation with the East India Company, to send one million in specie to the East.

Things were in this state, when about the middle of September, news came of a great depreciation of American railroad securities. It was found that for a long time they had been carrying on an extravagant system of management, and paying dividends not earned by the traffic. The system had at last collapsed, and of course an enormous depreciation of their stock followed, to the amount of nearly 20 per cent. It was supposed that as much as eighty millions of this stock was held in England, and that the effects of this fall would be very serious. On the 25th of August, the *Ohio Life and Trust Company*, with deposits to the amount of £1,200,000, stopped payment. The panic spread throughout the Union. Discount rose to 18 and 24 per cent. On the 17th October, news came that 150 banks in Pennsylvania, Maryland, Virginia, and Rhode Island had stopped payment. The drain was then beginning to be severe on the Bank of England. On the 8th, the bullion was £9,751,000, the reserve £4,931,000, and discount was raised to 6 per cent. On the 12th, the rate at Hamburg was $7\frac{1}{2}$, and bullion was flowing towards New York; discount was then raised to 7 per cent. About this time, rumours strongly affecting the Western Bank of Scotland were abroad. On the 19th, discount was raised to 8 per cent. The commercial disasters were increasing in America. In one week the Bank of France lost upwards of a million sterling. The Bullion in the bank had sunk to £8,991,000, and the reserve to £4,115,000. Discount was raised to $7\frac{1}{2}$ in Paris, and to 9 per cent. at Hamburg. On the 26th a deputation from the Western Bank of Scotland applied for assistance, but the Bank was afraid to undertake so enormous a concern. The Borough Bank of Liverpool was also in difficulties, and after some time the Bank agreed to assist them to the amount of £1,500,000 on condition of their winding up. But the arrangements fell through in consequence of the Liverpool bank closing its doors before it was completed.

On the 13th October a general run took place on the New York banks, in consequence of the severe measures of restriction they were obliged to adopt to protect themselves. Eighteen immediately stopped, and soon afterwards, out of 63 banks, only one maintained its payments. This immediately reacted on Liverpool and Glasgow, which were much involved with American firms. By the 19th October the failures began to be numerous in this country. Uneasiness greatly increased in London. On the 28th the principal

discount house applied to the Bank for an assurance that they would give them any assistance they might require. On the 30th an express came for £50,000 sovereigns for a Scotch bank, part of £170,000, and £80,000 for Ireland. On the 5th November discount was raised to 9 per cent. The great house of Dennistoun, with liabilities of nearly two millions, stopped payment on the 7th, and the Western Bank of Scotland closed its doors on the 9th. Failures in London were rapidly on the increase. Purchases and sales of stock were enormous, much beyond what they had ever been before. The bullion in the Bank had sunk to £7,719,000, and the reserve to £2,834,000. On the 9th, discount was raised to 10 per cent. On the 10th November, a large discount house applied to the Bank for £400,000. The Bank of France raised its rate to 8, 9 and 10 per cent. for one, two, and three months. Another English bank was assisted. The City of Glasgow Bank then stopped. On that day the discounts at the Bank were £1,126,000. On the 10th and 11th, upwards of one million sterling in gold was sent to Scotland, and there was a great demand from Ireland. On the 11th, Sanderson and Co., the great bill brokers, stopped payment, with deposits of 3½ millions. On the 12th the discounts at the Bank were £2,373,000. On the 11th, in consequence of these sudden demands for Scotland and Ireland, the bullion was reduced to £6,666,000, and the reserve to £1,462,000.

As the failures in London became more tremendous, discounts became more and more contracted. The stunning news of the stoppage of so many banks created a banking panic. Private banks stopped discounting altogether. The only source of discount was the Bank of England. The public, however, and the directors knew that the precedent of 1847 must be followed, and though they made no direct application to the government for the suspension of the Act, they laid the state of the Bank continually before them, and continued to discount as if they knew the Act must be suspended. At last private persons being unable to obtain discounts, began to make a run for their balances. When universal ruin was at last impending, the government, on the 12th November, sent a letter to the Bank to say, that if they should be unable to meet the demand for discounts and advances upon approved securities, without exceeding the limits of their circulation prescribed by the Act of 1844, they would be prepared to propose to parliament a Bill of Indemnity for any excess so issued. In order, however, to prevent the temporary relaxation of the Act from being extended beyond the necessities of the case, the rate of discount was not to be reduced below their present rate, 10 per cent.

The issue of this letter immediately calmed the public excitement. But on the evening of the 12th the total banking reserve of the Bank and all its branches was reduced to £581,000. Truly said the Governor of the Bank to the question 132, "Supposing that the letter in question had not been issued on that day, would the Bank, on the morning of the 13th, have been in a condition to continue its discounts?—No; certainly not."

"133. Would it not have been compelled to announce it could not discount any more commercial paper?—Yes, or nearly so.

"138. Is it not likely that the announcement of the cessation of discounts at the Bank of England would have increased the alarm of the mercantile public in London?—Materially.

"139. Would not an increased alarm on the part of the mercantile public have naturally led to an increased demand upon the bankers?—It would have led to immediate failures, and would so far have lessened the quantity of bills coming for discount, by the number of bills which were actually rendered unavailable

"140. Without reference to bills, do you not think it likely that there would have been increased demands upon the bankers, which would have compelled them to withdraw a portion of their deposits from the Bank of England?—I think certainly that in part there would have been."

To shew the state the Bank was reduced to, the Governor gave in a paper to the Committee with the following figures, shewing its reserve on the 11th and 12th November:—

On Wednesday, November 11th, the reserve consisted of—

	£	£
Notes in London	875,005	
" at Branches	582,700	
		957,715
Gold coin in London	810,784	
" at Branches	97,665	
		408,449
Silver coin in London	44,046	
" at Branches	51,948	
		95,994
Total Reserve		£1,462,153

On Thursday, November 12, at night, the reserve consisted of—

	£	£
Notes in London	68,085	
" at Branches	62,545	
		130,630
Gold coin in London	274,953	
" at Branches	83,255	
		358,208
Silver coin in London	41,106	
" at Branches	50,807	
		91,913
Total Reserve		£580,751

That is to say that the total reserve in London on the evening of the 12th was £384,144. Such were the resources of the Bank of England to commence business with on the morning of the 13th! Truly, said the Governor, it must have entirely ceased discounting, which would have brought an immediate run upon it; and the banker's balances alone were £5,458,000. It is easy to see that the Bank could not have kept its doors open an hour.

The Governor of the Bank said that the panic of 1857 was not so great as that of 1847, but the real commercial pressure was more intense. This is proved by the fact that while in the former year the issue of the letter immediately allayed the panic, and by that means stopped the demand for notes, and there was only required an issue of £400,000 in notes to surmount all difficulties, which did not exceed the statutory limits; in 1857 the issue of the Government letter produced no cessation of demand for advances. The statutory limit was £14,475,000 of notes issued on

securities, and there were issued in excess of these—

Nov. 13	£ 186,000	Nov. 23	£ 267,000
" 14	622,000	" 24	317,000
" 16	800,000	" 25	81,000
" 17	836,000	" 26	248,000
" 18	852,000	" 27	342,000
" 19	896,000	" 28	184,000
" 20	928,000	" 30	15,000
" 21	617,000		

On the meeting of Parliament an Act was passed permitting a temporary suspension of the Bank Act till February 1st, 1858, provided the directors did not reduce their discount below 10 per cent. On the 24th December they reduced it to 8 per cent., thereby reviving the operation of the Act.

The following table shews the figures of various departments of the Bank before and during the crisis:—

	ISSUE DEPARTMENT.		BANKING DEPARTMENT.						
	Notes Issued.	Gold Bullion and Coin.	Public Deposits.	Other Deposits.	Seven day and other Bills.	Government Securities.	Other Securities.	Notes.	Gold and Silver Coin.

Having thus laid before our readers an historical account of the various commercial crises which have occurred in this country, we may now make a few remarks on the policy which various authorities have recommended should be pursued by the Bank of England during them. And this is an inquiry of the highest national importance. Under the immense development of the system of credit in modern times, these crises are sure to be of periodical recurrence, and a wrong course of action may be attended with the most serious consequences to the public.

Ever since the crisis of 1793, there have been strong differences of opinion as to what ought to be the policy of the Bank in the midst of a crisis. Some contend that its issues ought to be rigorously limited, thinking apparently that if it extends its issues, they will only be thrown back upon it and gold demanded. Others maintain that its true policy, under such circumstances, is to enlarge its issues to support public credit.

In the crisis of 1793, the Bank acted upon the restrictive system, and steadily refused to enlarge its issues, though pressed to do so by Government. When all credit was threatened with ruin in consequence of this policy, the Government at last came forward, and by an issue of Exchequer Bills restored confidence, and the crisis passed away.

In the crisis of 1797, the Bank acted upon the same policy of rigorous restriction, and it had to suspend cash payments.

On both these occasions, 1793 and 1797, the severe policy of the Directors, which was perfectly right to a certain length, had turned the exchanges in favour of the country, and gold was coming in. The precedent of 1793 shewed that under such circumstances their issues might have been enlarged with perfect safety. And this was further proved by the fact that even after the

suspension in 1797, and the increase of their issues, gold continued to flow in in vast quantities, so that in the month of November, they had upwards of five millions of treasure in their vaults. This decisively proves that they might have enlarged their issues with perfect safety, and such a course would have prevented them from being obliged to stop payment.

Mr. Henry Thornton, a banker of great eminence, and one of the authors of the Bullion Report, being examined before the Committee of the Lords in 1797, explained to them how too great a diminution of bank notes produced a demand for guineas. He said, p. 73—"I think that an increased quantity of notes proportioned to the increased occasion for them, must tend to prevent a demand for guineas rather than to promote it; and if the quantity of notes issued should be very considerably less than the occasion of the mercantile world requires, I should think a run upon the Bank for guineas would be the consequence."

At p. 80—"When the Bank of England materially lessens or suppresses its notes, there are no other notes which can supply their place. Their place, indeed, may be supplied partly by guineas, but these guineas must be supplied by the Bank of England itself; the distress which the suppression of Bank of England Notes, to any considerable degree, causes in the metropolis, produces distress throughout the whole kingdom. It is the means of producing the suppression of much of the paper of the country, and of a consequent demand for guineas from the Bank."

Mr. Walter Boyd, also an eminent banker, being asked—"Are you of opinion that an increased issue of Bank of England Notes made to the public by an extension of discounts would or would not have contributed to increase the demand of cash from the Bank?"—said, "I am of opinion

that if the amount of the issues of Bank of England Notes had been only maintained at what I conceive must have been its height in the month of December, 1795, the drain of specie from the Bank, as well as all the embarrassments in the mercantile world, and a very great portion of the fall which the public securities have experienced, would have been prevented."

Mr. Boyd and Mr. Thornton both repeated the same opinions before the Committee of the Commons, saying that a diminution of Bank Notes had the inevitable effect of causing a drain of guineas.

We shall now quote a passage from Mr. Thornton's essay on paper credit. After condemning Adam Smith's notion of restricting the paper to the actual quantity of gold displaced, which we have quoted under CURRENCY PRINCIPLE, he says—"The causes which lead to a variation in the rapidity of the circulation of bank notes may be several. In general it may be observed that a high state of confidence serves to quicken their circulation; and this happens upon a principle which shall be fully explained. It must be premised that by the phrase, a more or less quick circulation of notes, will be meant a more or less quick circulation of the whole of them on an average. Whatever increases that reserve, for instance, of Bank of England Notes which remains in the drawer of the London banker as his provision against contingencies, contributes to what will here be termed the less quick circulation of the whole. Now, a high state of confidence contributes to make men provide less amply against contingencies. At such a time they trust that if the demand upon them for a payment which is now doubtful and contingent, should actually be made, they shall be able to provide for it at the moment, and they are loth to be at the expense of selling an article, or of getting a bill discounted, in order to make the provision much before the period at which it shall be wanted. When, on the contrary, a season of distrust arises, prudence suggests that the loss of interest arising from a detention of notes for a few additional days should not be regarded.

"It is well known that guineas are hoarded in time of alarm on this principle. Notes, it is true, are not hoarded to the same extent, partly because notes are not supposed equally likely, in the event of any general confusion, to find their value, and partly because the class of persons who are the holders of notes is less subject to weak and extravagant alarms. In difficult times, however, the disposition to hoard, or rather, to be largely provided with Bank of England Notes, will, perhaps, prevail to no inconsiderable degree.

"This remark has been applied to Bank of England notes, because these are always in high credit, and it ought, perhaps, to be chiefly confined to these. They constitute the coin in which the great mercantile payments in London, which are payments on account of the whole country, are effected. If, therefore, a difficulty in converting bills of exchange into notes is apprehended, the effect both on bankers, merchants, and tradesmen, is somewhat the same as the effect of an apprehension entertained by the lower class of a difficulty in converting Bank of England notes, or bankers' notes into guineas. The apprehension of the approaching difficulty makes men eager to

do that to-day, which otherwise they would do to-morrow.

"The truth of this observation as applied to Bank of England notes, as well as the importance of attending to it, may be made manifest by adverting to the events of the year 1793, when, through the failure of many country banks, much general distrust took place. The alarm, the first material one of the kind which had for a long time happened, was extremely great. It does not appear that the Bank of England notes, at that time in circulation, were fewer than usual. It is certain, however, that the existing number became, at the period of apprehension, insufficient for giving punctuality to the payments of the metropolis; and it is not to be doubted that the insufficiency must have arisen, in some measure, from that slowness in the circulation of notes, naturally attending an alarm, which has just been described. Every one fearing least he should not have his notes ready when the day of payment should come, would endeavour to provide himself with them somewhat beforehand. A few merchants, from a natural though hurtful timidity, would keep in their own hands some of these notes which, in other times, they would have lodged with their bankers; and the effect would be, to cause the same quantity of bank paper to transact fewer payments, or, in other words, to lessen the rapidity of the circulation of the notes on the whole, and thus to increase the number of the notes wanted. Probably also some Bank of England paper would be used as a substitute for country bank notes suppressed.

"The success of the remedy which the Parliament administered denotes what was the nature of the evil. A loan of Exchequer Bills was directed to be made to as many mercantile persons, giving proper security, as should apply. It is a fact worthy of serious attention, that the failure abated greatly, and mercantile credit began to be restored, not at the period when the Exchequer Bills were actually delivered, but at a time antecedent to that era. It also deserves notice, that though the failure had originated in an extraordinary demand for guineas, it was not any supply of gold which effected the cure. The fear of not being able to obtain guineas, which arose in the country, led in its consequences to an extraordinary demand for bank notes in London; and the want of bank notes in London became after a time the chief evil. The very expectation of a supply of Exchequer Bills—that is, of a supply of an article which almost any trader might obtain, and which it was known that he might then sell, and thus turn into bank notes, and after turning into bank notes, might also convert into guineas—created an idea of general solvency. This expectation cured, in the first instance, the distress of London, and it then lessened the demand for guineas in the country, through that punctuality in effecting the London payments which it produced, and the universal confidence which it thus inspired. The sum permitted by Parliament to be advanced in Exchequer Bills was five millions, of which not one-half was taken. Of the sum taken no part was lost. On the contrary, the small compensation, or extra interest, which was paid to Government for lending its credit (for it was mere credit, and not either money or bank notes, that the Government advanced), amounted

to something more than was necessary to defray the charges, and a small balance of profit accrued to the public. For this seasonable interference, a measure at first not well understood, and opposed at the time chiefly on the ground of constitutional jealousy, the mercantile as well as the manufacturing interests of the country were certainly most indebted to the Parliament and to the Government.

"That a state of distrust causes a slowness in the circulation of guineas, and that at such a time a greater quantity of money will be wanted in order to effect only the same money payments, is a position which needs scarcely be proved. Some observations, however, on this subject may not be useless. When a season of extraordinary alarm arises, and the money of the country in some measure disappears, the guineas, it is commonly said, are hoarded. In a certain degree this assertion may be literally true. But the scarcity of gold probably results chiefly from the circumstance of a considerable variety of persons, country bankers, shopkeepers, and others augmenting, some in a smaller and some in a more ample measure, that supply which it had been customary to keep by them. The stock thus enlarged is not a fund which its possessor purposes in no case to diminish, but a fund which, if he has occasion to lessen it, he endeavours, as he has opportunity, to replace. It is thus that a more slow circulation of guineas is occasioned; and the slower the circulation the greater the quantity wanted in order to effect the same number of money payments.

"Thus, then, it appears that the sentiment which Dr. Smith leads his readers to entertain—namely, that there is in every country a certain fixed quantity of paper supplying the place of gold, which is all that 'can easily circulate' (or circulate without being forced into circulation), and which is all (for such likewise seems to be the intended inference) that should ever be allowed to be sent into circulation—is in a variety of respects incorrect." Mr. Thornton goes on to shew in other ways that Smith's idea is quite fallacious; we have given further extracts under CURRENCY PRINCIPLE, as they bear on that doctrine. At p. 245 he says—"Some political persons have assumed it to be a principle that in proportion as the gold of the Bank lessens, its paper, or, as is sometimes said, its loans (for the amount of the one has been confounded with that of the other) ought to be reduced. It has been already shewn that a maxim of this sort, if strictly followed up, would lead to universal failure." Mr. Thornton then proceeds to controvert the doctrine of the Directors, that a paper currency could not be redundant if based upon mercantile bills arising out of real transactions, which we have discussed under BULLION REPORT, § 51.

In 1810 the Governor and Deputy-Governor of the Bank were examined before the Bullion Committee about their policy in 1797:—

"What do you consider as the result of the experience which the Bank gained in 1796 and 1797?—The experience the Bank gained in those years was, that if they had persisted in diminishing their discounts to a greater degree than they did, they would have brought on ruin to the mercantile part of the community.

"Did not the diminution of discounts at these

periods create great public distress?—Inasmuch as I have already stated; many of the Bank Directors repented of the measure.

"Whether or not there was, in the end of the year 1796 and beginning of the year 1797, a considerable diminution of the outstanding notes of the Bank of England?—There was.

"Was not much of the public and commercial distress which arose at that period attributable to that diminution?"

Mr. Whitmore—"I have no doubt about it.

Mr. Pearce—"Undoubtedly.

"Whether, in your opinion, it was not a much wiser measure, relative to the mercantile interests of the country, that the restriction of cash payments should have taken place in 1797, than that the Bank should have persevered in diminishing the issue of bank notes in discount?"

Mr. Whitmore—"Certainly."

We have quoted in BULLION REPORT, § 39-41, the strong and emphatic opinion of the Committee that the Bank acted wrongly both in 1793 and 1797, and that in certain commercial crises an enlarged accommodation was the true remedy; and they further said—"Your Committee have much satisfaction in thinking that the Directors are perfectly aware that they may err by a too scanty supply in a period of stagnant credit. And your Committee are clearly of opinion that although it ought to be the general policy of the Bank Directors to diminish their paper in the event of the long continuance of a high price of bullion and a very unfavourable exchange, yet it is essential to the commercial interests of the country, and to the general fulfilment of those mercantile engagements which a free issue of paper may have occasioned, that the accustomed degree of accommodation to the merchants should not be suddenly and materially reduced; and that if any general and serious difficulty or apprehension on this subject should arise, it may, in the judgment of your Committee, be counteracted without danger, and with advantage to the public, by a liberality in the issue of Bank of England paper proportioned to the urgency of the particular occasion."

The circumstances which occasioned the appointment of the Committee were produced by improper extension of their issues. "In order to prevent this in future," say they—"your Committee have understood that remedies, or palliatives, of a different nature, have been projected, such as a compulsory limitation of the amount of Bank advances and discounts during the continuance of the suspension; or a compulsory limitation, during the same period, of the rate of Bank profits and dividends, by carrying the surplus of profits above that rate to the public account. But, in the judgment of your Committee, such indirect schemes for palliating the possible evils resulting from the suspension of cash payments would prove wholly inadequate for that purpose, because the necessary proportion could never be adjusted, and, if once fixed, might aggravate very much the inconveniences of a temporary pressure; and even if their efficacy could be made to appear, they would be objectionable as a most hurtful and improper interference with the rights of commercial property."

Thus, we see that the Bullion Committee expressly condemned any arbitrary limitation of

the issues of the Bank, on account of the bad effects it would have in aggravating a commercial crisis.

Nor did the framers of the Act of 1819 hold any different opinion. They expressly disclaimed fixing any numerical limit to the issues of the Bank. Lord Liverpool (*Parl. Deb.*, Vol. XL., p. 620) speaking of the paper circulation, said that, upon a subject of this nature, it was obviously impossible to fix any nice proportion; and if he was asked what was the only criterion of a circulation being sufficient or excessive, he must answer that it could be found only in its value when compared with the precious metals. Lord King said that the numerical amount of Bank notes could be no guidance for the amount of issues. The only rule which could be given for their regulation was to keep gold at the mint price. Mr. Peel, who was chairman of the Committee, and who introduced the bill into the House, said (p. 681) "there was, in fact, no test of excess or deficiency, but a comparison with the price of gold. He said (p. 685) that some proposed to prescribe such a limitation of the issues of Bank notes as would secure the power of the Bank over the foreign exchanges. He, for one, confessed that this always appeared to him to be a very unwise position—and for this reason, that it depended so much on circumstances when to say there was an excess or not of circulation. There were occasions when what was called a run upon the Bank might be arrested in its injurious effects by an increase of the issues. There were other occasions when such a state of things demanded a curtailment. In the year 1797, when a run was made on the Bank, but when the exchanges were favourable, and the price of gold had not risen, it was proved that an extension of issues might perhaps, by restoring confidence, have rendered the original restriction unnecessary, and prevented the evils of the existing panic. On the other hand, if the run was the effect of unfavourable exchanges, and the consequent rise in the price of gold, the alarm must be met by a reduction of issues. It was therefore impossible to prescribe any specific limitation of issues to be brought into operation at any period, how remote soever. The quantity of circulation which was demanded in a time of confidence varied so materially from the amount which a period of despondency required, that the House must feel the absolute incapability of fixing on any circumscribed amount. It was impossible to advert to the evidence taken before the Committees, without being impressed with that conviction." Thus, we see that Sir Robert Peel expressly disclaimed the idea of fixing any limit to the issues of the Bank at any period, however remote. That period came, however, in 1844.

In the crisis of 1825 the Bank again tried the restrictive policy for some days, but found that if it maintained it general ruin would ensue. It then suddenly changed its policy, and issued with great profusion, and the panic passed away in a day or two. Mr. Lloyd himself spoke of the issue of the £1 notes as a fortunate circumstance, before the Bank Charter Committee of 1832. In his speech on the renewal of the Bank Charter in May, 1833 (*Parl. Deb.*, Third Series, Vol. xviii., p. 1336), Sir Robert Peel deprecated the establishment of

another bank of issue in the Metropolis, as he said that the interests of commerce required that there should be but one bank of issue, in order that it might exercise an undivided control over the issue of paper, and give facilities to commerce in times of difficulty and alarm which it could not give with the same effect if it were subject to the rivalry of another establishment. Thus we see that, up to this time, Sir Robert Peel was against the numerical limitation of the issues of the Bank.

The repeated mismanagement of the Bank, however, in 1837 and 1839, convinced that eminent statesman that something required to be done, if possible, to check it. In the Committee of 1840 a very influential body of the witnesses maintained what is called the currency principle, which is this, that bank notes payable to bearer on demand alone are currency, to the exclusion of all other forms of paper credit, and that when these are permitted to be issued, they ought to be exactly equal in number to the quantity of gold that there would be if there were no notes. If this doctrine, then, were to be carried out in practice, it would be necessary to limit the issues of the Bank by some method in accordance with this principle.

In 1844 Sir Robert Peel seized the opportunity which was allowed by the Bank Charter Act to endeavour to carry this principle into effect, which was, as we have seen, quite contrary to his previously recorded opinions. We shall not enter here into an explanation of his method of doing so, because that is done under CURRENCY PRINCIPLE. The leading features of this Act were the *absolute prohibition* of the establishment of any new banks of issue in the country, and the limitation of the issues of the Bank—two things which are by no means necessarily connected with one another. The preceding crises were supposed to have been mainly caused by excessive issues of the Bank; and it was supposed that if these could be prevented, the crises which grew out of them would not occur—a fallacious expectation, as they might have learned from the experience of other nations, because crises just as severe as any in England had occurred at Amsterdam and Hamburg, where the principle they adopted was in full operation.

The experience, however, of 1847 and 1857 has amply vindicated the wisdom of those authorities of former times, who condemned a numerical limitation of the notes on account of the necessity of a liberal enlargement of the issues in times of panic. The restrictive policy was attempted to be maintained in 1847, and it was found necessary to abandon it, and immediately that was done the panic vanished. But this was done in a much more serious manner than in former times. Then the Bank had nothing to do but to change its policy. In 1847 they had to commit a positive breach of the law, at the instigation of the Government. In 1857, when the pressure became very severe, they knew that the Ministry must follow the precedent of 1847, and they acted as if the Government would do so, and the Ministry were obliged a second time to instigate the Directors to break the law, rather than cause universal failure, as well as the stoppage of the Bank itself. We may observe that Sir Robert

Peel and Lord Overstone himself approved of the conduct of the Government in 1847.

There is now no further need of any more experience. Everything that can be said has been said, and the only question is to come to judgment on the conflicting views.

The arbitrary limitation of the word *Currency* to bank notes payable to bearer on demand exclusively, is, we hope we have shewn under *CURRENCY*, quite erroneous, and contrary to all sound philosophy. The *Currency Principle* itself is a pure delusion (*CURRENCY PRINCIPLE*); and, moreover, it is the greatest delusion of all to suppose that the Bank Act of 1844 carries it out.

A great part of these erroneous doctrines are founded on a mistaken view of the nature of credit. Nothing is more common than to say that money has intrinsic value, and that paper is only the representative of value. The utter contradiction of ideas involved in this language is fully shewn under *CREDIT, CURRENCY, VALUE*. It is totally forgotten that money has no value except what it will exchange for, and that whatever will exchange for gold is of the value of gold. Paper that is always exchangeable for gold, as every economist has shewn, is equal in value to gold. The true problem, then, is to discover how paper may best be kept at the value of gold.

The real error of the Bank has always been that, tempted by the desire of making too great profits, they let their stock of gold run down too low, so that it endangered the convertibility of the note. Trusting to their well-known and enormous capital, they thought that no one could ever doubt the solvency of the Bank, and, therefore, that their issues could not be depreciated. They never took proper measures to check a drain at its commencement, in consequence of the unpopularity of such a course with the commercial world with which they were so intimately connected.

It is perfectly well recognised now by every one who has the least knowledge of the subject, that the true method of arresting a foreign drain is by *raising the rate of discount*. This not only checks a foreign drain, but effectually curbs an undue expansion of the credit system at home.

The advocates of the Bank Act have always claimed for it the merit of having compelled the Directors to keep a larger stock of bullion than they did before. They also say that in the spring of 1847, it was the only thing which prevented the Directors committing the same error as they had done so often before, of letting their treasure leak out before they took effectual measures to stop it. They say, therefore, that it arrested the Bank in its mischievous career, and by bringing the pressure on earlier than otherwise would have happened, it made it less severe. They also say that when the panic came in October, 1847, it was only through the restrictions caused by the Act that the Bank had eight millions of treasure in its vaults.

There can be no doubt of the justice of these claims. It is undoubtedly certain that the Directors did commit the same error as they had done before, and it was the Act which arrested them; and it was the Act which compelled them to keep such a reserve as they had in October.

The Act has, therefore, had the undeniable merit of compelling the Directors to pay a strict attention to the rate of discount; and since that

time this principle has been constantly gaining ground, and is now fully understood. The feeling of writers and the public has undergone a wonderful change in this respect within the last few years. It is not so very long ago since the Directors were covered with abuse in many papers whenever they raised the rate of discount. Even writers of eminence, and among others Mr. Tooke, make it an accusation against the Act that variations in the rate of discount have been much more frequent since it was passed, and they exhibit tables of these changes. But, in fact, these tables are just so many testimonies to its merits; and this is happily well understood now. Instead of being abused, the directors are commended; and if they do not take timely measures, they are urged to do so by the papers.

Now, we think that the Act is justly entitled to this merit, and it is of the first magnitude.

The real and fundamental objection to the Act is its operation during a commercial crisis. Ample and undeniable experience has proved this in a way that cannot be gainsayed. Its plan and its theory were known to the most distinguished authorities a very long time ago, and were expressly condemned by them, and its mischievous effects foreseen and predicted long ago. The advocates of rigorous restriction, and the advocates of enlarged issues during a crisis, have both placed their arguments before the world, and repeated experience has shewn that the advocates of enlarged issues are in the right. The restrictive policy has uniformly failed. The only instance in which it was fully carried out it brought on a suspension of cash payments, and in the others it would have done so if it had not been abandoned.

It has often been said that on such occasions houses that have overtraded should be allowed to fall, and that it is not the duty of the Bank to bolster up insolvent concerns, and that it is to the advantage of commerce that they should be swept away. If this course of argument were applied only to insolvent houses, it would, no doubt, be true. All insolvent houses should be swept away; it is quite true that the Bank has no business to bolster them up. Nay, to do so is to do an injustice to their creditors; for, as the Bank will of course do its best to take security for its own advances, that takes away so much from the other creditors.

If the question touched insolvent houses only, the restrictive policy would, no doubt, be correct. But the fact is that the mischief extends much further than to them. By the modern system of credit, houses in commerce are so connected with one another, that the public are wholly unable to tell which are solvent, and which are not. The consequence is that a general distrust of all paper whatever arises. The paper of the greatest houses becomes unmarketable. The Bank only has the means of judging which houses are solvent and ought to be supported, and which are insolvent and ought to fall. All experience proves, and all the most eminent authorities of former times have declared, that there must be some means of extending support to really solvent houses; and of that power of support the Act of 1844 wholly deprives the Bank.

In times of panic every one wishes to obtain some solid credit. Even when the Bank is

allowed unlimited issues, if it is expected that the rate of discount is to be raised, people hasten to get discounts, or to get notes to hoard for the sake of security; and if they cannot get Bank notes, they demand gold.

In ordinary times, raising the rate of discount checks the undue expansion of credit and the demand for notes, and prevents the efflux of gold. But in times of panic, though of course the rate of discount ought to be raised to attract gold from abroad, and to prevent its export, it has no effect whatever in checking the demand for notes. It is then not a question of profit, but of existence. When the power and the resources of the Bank are visibly diminishing before the eyes of the commercial public, every one thinks only of his own security. In such circumstances, raising the rate of discount has only the effect of making the demand for notes stronger. Every one will rush to over-provide himself, and then hoard away the notes. This was decisively proved by the experience of 1847, when many millions of notes were hoarded away, but which came out of their hiding places as soon as the Act was suspended. Hence, it is the very consequence of the Act to make the demand for notes much more intense than it would otherwise have been; and if notes are not to be had, then a run for gold commences. This was the case on all former occasions when the restrictive policy was carried out, and especially in the great crisis of 1857, when a very few hours more would have compelled all the banks in London to stop payment.

The Act of 1844 was avowedly passed because the Directors were shewn to be incapable of managing their own business. It was the severest stigma that could be placed upon them. It was a public declaration, either that they did not know the true principles of banking, or that they had not the firmness to act upon them. If they had conducted the business of the Bank on sound principles, there never would have been any need for the Act; and if it were well ascertained now that for the future the Directors were determined to obey true principles, there would be no further need of it.

And this is what we believe to be the case. For several years past, the management of the Bank has been unimpeachable. It is well understood now, not only in the Bank parlour, but by the general public, that the Bank must be kept in a position to put all danger of the convertibility of the note out of all question; and this is to be done only by carefully adjusting the rate of discount to the state of the foreign exchanges. The general intelligence of the public has amazingly advanced on this point within the last few years; and even if there were any reason to suppose that the Directors were inclined to depart from these sound principles, which there is not, the increased knowledge and intelligence of the public would compel them to keep the Bank in a solvent position.

Fully allowing, then, that this merit is really attributable to the Act, for which it is entitled to the highest commendation, it may be truly said that it has done its work, and that there is no longer any necessity for it, and may now with propriety, and ought to, be repealed, so far, at least, as regards the limitation of the issues of the Bank.

By the confession of its own framer, the expectation of its power of preventing a crisis was over-sanguine. It had been observed that the Bank had greatly contributed on many former occasions to produce commercial crises by over-issues; and the conclusion was too hastily drawn that over-issues of the Bank were the *only* cause of commercial over-trading. Mr. Cobden even said that if the currency were purely metallic, accommodation paper would be prevented. Sir Robert Peel said distinctly that it was better to take measures to prevent paroxysms than to trust to desperate remedies to cure them. He, therefore, took away the power of cure, because he imagined that he had prevented the disease. But ample experience has shown that in this he was too sanguine. Nay, the supporters of such a doctrine need only to look to the experience of those countries where the very principle they admired so much was in full operation, to see the erroneousness of such an expectation. The Banks of Amsterdam and Hamburg were expressly founded on the "currency principle." They gave no credit whatever except in exchange for bullion, and commercial crises were just as severe, nay, probably more so than in England. In the great crisis of 1857 at Hamburg discount rose higher than in London, and the Government were obliged to come forward to interpose their credit to protect the credit of the merchants, because the Bank could not do so. And there can be no reasonable question that if it is absolutely necessary to do such a thing, it ought to be done by a great commercial establishment like the Bank of England, on the recognised principles of business, rather than by the abnormal interference of Government.

The peculiar state of the law with regard to Bank of England notes adds still further force to this view. Contrary to the earnest remonstrance of Sir Robert Peel in 1833, Bank of England notes were made legal tender between all parties, except when the Bank itself is one, so long, and so long *only*, as the Bank pays them in gold on demand. Now, suppose it is generally known that the Bank is about to suspend payments, debtors may go and compel their creditors to receive payment of their debts in bank notes, and perhaps the very next hour the news comes that the Bank has stopped payment, and then these notes are so much waste paper in the hands of the very men who were compelled to receive them an hour before. They were compelled to receive payment in paper, and an hour afterwards they are compelled to pay their own debts in nothing but gold. This is no imaginary case. Every man in London on the 12th November, 1857, knew that the Bank of England could not have been kept open for two hours on the 13th unless the Act was suspended, and directly the Bank stopped payment its notes would have ceased to be legal tender; not a bill could have been paid in them except at the option of the payee.

While, therefore, we admit that one great merit which its admirers claim for it is undoubtedly true, it cannot be denied that a very serious charge brought against it by its opponents is also true. Experience as clear as the sun at noonday has shewn that it is wholly powerless to prevent a commercial crisis, and when a crisis does occur it intensifies its pressure, and converts a crisis into a panic, which is certain to end in universal

failure, including the stoppage of the Bank itself. It then deprives the Bank of what all experience has shewn to be the only remedy for such a state of affairs. On each occasion when this has happened already, the Government have found it necessary to resort to the most desperate course in a constitutional country, namely, to give their solemn sanction to a deliberate violation of the law. Every one knows that commercial crises will recur periodically, and every one knows that on their occurrence every Government will be obliged to pursue exactly the same course. In fact, it would be far more hazardous for the Government to abstain from violating the law than to do so. What example can be more pernicious in a constitutional country? What is the use of a law that every one knows will be set aside and violated, whenever certain occasions recur?

There is every reason to expect that if the Act were repealed so far as regards these points, the Directors would manage the Bank on sound principles. But if they did not, we think that every principle of sound reasoning would point to an improved constitution of the Direction itself. Nothing can be more clear than that the long monopoly of the Bank was utterly opposed to all sound principles of political economy, and inflicted immense injury on the country. The pretensions of the Directors were anomalous. They claimed to exercise a great function of State, and they claimed to be exempt from all interference as a private body. The Directors are exclusively selected out of the commercial class, and of course their sympathies would naturally go with their own class, and in former times it is undoubtedly certain that they allowed such sympathies to have a predominating influence. Their interests as merchants were opposed to their duty as bankers; and formerly, we do not say corruptly, but yet undoubtedly, the latter gave way to the former. There is no reason whatever to suppose that such would be the case now-a-days, if these parts of the Act were repealed. But if such should be the case, the State would have every right to interfere. The Bank of England has become—unfortunately, in our opinion—an engine of the State; and if it should be proved that that class of the community to which hitherto its administration has been exclusively entrusted, should be unable or unwilling to conduct it properly, it would be the undoubted right of the State to devise such an improved organisation of its Direction, as should place it in hands competent to conduct it on sound principles.

CUREL, T. M., Prefect of the Department of the Hautes-Alpes before 1848.

Parti à Prendre sur la Question des Enfants Trouvés. Paris, 1845.

CURRENCY. The most brilliant orator of our times has declared that the Currency has driven more people mad than anything else, except love. Admonished, therefore, by such high authority, that in discussing the Currency Question we have Bedlam under our lee, we must do our best not to strand our readers on such a dreary shore.

In investigating the meaning and extent of the term Currency, we must call to our aid one of the most fundamental rules of philosophical classification. We must entirely disregard etymology, and steadily regard the nature of the thing, and consider the name as a mere mark used to designate a certain class of objects. All science is full of such changes. It is the first duty of the scientific enquirer to emancipate himself from the thralldom of etymology. "Descriptive names, although they might be supposed to be the best, have, in fact rarely been fortunate. The reason of this is obvious. The mark which has been selected for description may easily fail to be essential, and the obvious connection of natural facts may overleap the arbitrary definition. * * * The signification may assist the memory, but must not be allowed to subjugate the faculty of natural classification." (*Whewell. History of Inductive Sciences, Vol. III., p. 433, edit. 1857.*)

The instances of this that might be gathered from every branch of science are innumerable. Names have been given to substances from some quality which first attracted attention, and it has afterwards been discovered that that was not their fundamental idea, and the class has been extended, through the exigences of science, to include other things which have no trace of the quality whence it derives its name. We may only mention a few instances. In geology the term "oolite" was first applied to rocks which resembled the roe of a fish, but the necessities of

science compelled geologists to class certain other formations, which have no resemblance to roe, under the term of oolite, and such classification is universally adopted. So also white chalk may be yellow, green or black. In chemistry the term "combustion" was applied to certain phenomena on account of heat being developed in the process. But a deeper knowledge in chemistry disclosed that it was merely the process of oxygen combining with some other substance, and that the quality of the evolution of heat was accidental, and that there are cases of the combination of oxygen with substances where no heat is developed. And yet these are classed under the term combustion. Thus the rusting of iron is merely the process of oxygen combining with it chemically, and is classed as combustion, though no heat is developed. So the word *acid* is now extended to mean many things which are not sour. A *racecup* is a general name for a prize, which has long drifted away from the form of a cup. In many French establishments *suissé* is still used as a porter. A *quarantine* means any seclusion, though not for 40 days. A *hussar* comes from *haza*, the Hungarian word for 20; and, as was remarked long ago in Roman Law, *Æs etiam aureum nummum dicimus.*

Another important principle, also, in nomenclature, is to include under one term substances which possess the distinguishing quality in diminishing insensible gradations. This is well exemplified in Lyell's *Manual of Elementary Geology*. p. 2:—"The materials of this crust are not thrown together confusedly; but distinct mineral masses, called *rocks*, are found to occupy definite spaces, and to exhibit a certain order of arrangement. The term *rock* is applied indifferently by geologists to all these substances, whether they be soft or stony, for clay and sand are included in the term, and some have even brought peat under this denomination. Our older writers endeavoured to avoid offering such violence to our language, by speaking of the component materials of the earth as consisting of rocks and *soils*. But there is often so insensible a passage from a soft and incoherent state to that of stone, that geologists of all countries have found it indispensable to have one technical term to include both, and in this sense we find *roche* applied in French, *rocca* in Italian, and *felsart* in German."

In investigating the meaning and extent of the word Currency, we must, therefore, exclude all considerations of etymology, and keep our attention steadily fixed on the nature of the thing. In fact, to apply the word Currency to money is one of the most extraordinary instances of the abuse of language that was ever heard of. For a long time it had been usual to speak of money as being current; hence people spoke of the currency of money. So late as the case of *Miller v. Race*, Lord Mansfield (p. 228) says of money, that it cannot be recovered after it has passed in currency; but, before money has passed in currency, an action might be brought for it. He says the same of a Bank note, an action could not be brought for it after it was paid away in currency. Hence we see here that currency was used as a particular action of money. Some time after this, however, though at what period we cannot ascertain, by a most extraordinary con-

fusion of ideas, people began to call the money itself currency.

To shew the utter absurdity of such a notion, we may consider a few other examples. Nothing is more common than to say that an opinion or a report is current, or to speak of the currency of an opinion or a report. But who ever dreamt of calling the opinion or the report itself currency? It is very common to speak of the currency of the session of Parliament; but who ever dreamt of calling the session of Parliament itself currency?

Now, how can it be more rational in a scientific sense to call money currency, than to call a report, or an opinion, or the session of Parliament currency?

It was about the middle of the last century, as far as we can ascertain, that writers began to call money currency. The word is not often used by Adam Smith. He generally uses paper money where modern writers would use paper currency. Still later, between 1790 and 1800 the expression *circulating medium* came into use; as we find Mr. Fox complaining in 1797, that it was a new term whose meaning was not well understood. The expressions *currency* and *circulating medium* are, however, considered by all writers as absolutely synonymous.

Adopting the words *currency* and *circulating medium* as mere names to distinguish a certain species of economic quantities, we have to endeavour to discover to what they should be applied, and what function they fulfil in economics.

Every one knows that in the earliest ages of the world people trafficked by way of barter, or the direct exchange of things they wanted. The inconveniences of this have been so often detailed that there is no need to repeat them.

Among the numerous inconveniences of this would be the perplexities arising from the want of some common measure to refer the things exchanged to. It would take much haggling to decide how much wine should be given for so many slaves, or so much iron for so many hides. The first improvement, therefore, would be to discover some common measure to which the things exchanged might be referred. This appears to have been done in very early times, because though we find that in *Iliad* VII., 468, direct barter was employed, yet in many other passages of the *Iliad* and *Odyssey*, things are spoken of as being worth so many oxen. Some, no doubt, have thought that these oxen were actual coins; but, as we believe that the best authorities have now abandoned such an opinion, and we ourselves are firmly convinced that it is untenable, we may dismiss it from consideration. The fact is simply that people found the advantage of having some common measure when they came to barter, and they used that, without in any way employing that common measure for the purposes of money. Such a state of things in no way implied money, or currency, or circulating medium.

On the Origin of Money.

The necessity of money, however, arose from a somewhat different cause. As long as the things exchanged were equal in value, there would be no need for money, any more than there is at the present day when people exchange commodi-

ties at certain values. If it happened that whenever one man required the services of another, that other at the same time required an equivalent amount of service to be rendered in return, such transactions could take place with great facility, and the amount of service on each side being equal, there would be an end of the business. But it would often happen that when one man required the services of his neighbour, that neighbour would not require an equal amount of service at the same time, or even perhaps none at all. If then a transaction took place between them with such an unequal result, and the one amount of service was balanced against the other, there would remain over a certain amount of difference, or amount of service due from the first to the second, and this would constitute a *debt*.

The second would, however, require at some future time to have the balance of service due to him performed, and the debt discharged. Moreover, for his own security, he would like to have some evidence, or memorial, to prove the debt; and accordingly he might require the debtor to give him some sign or token of the fact. If writing had been known in those times, a statement in writing acknowledging the debt, and promising to render the service due whenever called upon to do so, would be a natural form of such evidence.

We may now suppose that the second person has dealings with a third, and requires his services, but that the third has no immediate use for the services of the second, but requires those of the first. Now, if the parties were so circumstanced, what could be more natural than for the second to transfer to the third the debt due to him from the first? A similar operation might be repeated by several different parties an indefinite number of times; and so, this written obligation, or this evidence of a debt, enabling the possessor of it to demand some service to be rendered by the debtor, would pass from hand to hand, or be current; and, from this use of it, the thing itself has, by a confusion of ideas, come in recent times to be called a *CURRENCY*.

This currency is nothing more than the evidence of services having been rendered, for which an equivalent has not been received, but which can at any time be demanded. It is obvious that as soon as it has been demanded and rendered, the evidence of its being due must be given up to the debtor to be destroyed, and it will be no longer current. Now, if any man can render services to his neighbours, he must in return receive either services, or the evidence of their being due; and, if he renders more than he immediately requires in return, he will accumulate a store of this evidence for his future wants.

It is evident that such a written obligation, as has been described, derives its whole transferable, or current, value from the fact, that the person who acknowledges himself bound to perform such services can render them at any moment that he may be called upon, and is generally believed to be able to do so. Thus, though it receives the *name* of currency from its being passed from hand to hand, it is current only because it has the power of transferring, or circulating, something else.

These simple considerations at once show the nature of a currency. It is the evidence of a

debt due to the possessor of it, proving that he has rendered services for which he has received no equivalent, but which he can demand at any time. And when he does demand it, he must give up or extinguish the evidence of the debt. Hence the use of the currency is to record debts, and to facilitate their transfer from one person to another, and whatever means be adopted for this purpose, whether it be gold, silver, paper, or anything else is a currency.

We may therefore lay down as our fundamental conception that *currency and transferable debt are convertible terms*; whatever represents transferable debt of any description is CURRENCY, and whatever material the currency may consist of, it represents *transferable debt*, and nothing else.

The preceding considerations suggest to us a principle that will be found to be of fundamental importance in Political Economy, and it will be seen that it is essentially requisite to bear it in mind in all questions relating to monetary science. It is this—*Where there is no debt, there can be no currency.* We have seen that where the exchanges were equal, there was no debt and there could be no currency. The debt represented the precise *inequality* of the exchange, and where there is no exchange the debt must equal in value the service rendered. Hence it is perfectly clear that the currency must supply the defect of the exchange, or rather in most cases do away with the necessity for an exchange. Its real use is manifestly to enable commodities to circulate, or move from the possession of one person to another, or to enable one person to render another services without the necessity of an exchange. Hence it may be said that the use of the currency is *rather to abolish exchanges, than to facilitate exchanges.* When some material substance only, like gold or silver was used as money, the quantity of money in a country just represented the quantity of debt that there would have been, if there had been no money. Hence the demand for money, or the work that money had to do was to represent debt, and nothing else, and of course the more money that was required to perform this purpose, the more its value would increase; and if the quantity of money always increased and diminished in exact proportion to the quantity of work it had to do, its value, according to a very common, but very inaccurate, mode of expression among Economists, would not alter. This expression is evidently inaccurate, because its value, or its relation to other things, might alter in consequence of some change taking place in the conditions of the things it was exchanged for. The true meaning of the phrase is, that the cause of the variation would not be in the money, but in the things it was exchanged for.

The true character of money as being a pledge, or security, has been seen by many writers. Thus Aristotle says (*Nicomachean Ethics*, B.V. c. v. 14.)—"Υπὲρ δὲ τῆς μελλούσης ἀλλαγῆς, (εἰ γὺν μηδὲν δεῖται, οὐκ ἔσται, ἐὰν δεηθῇ), τὸ νόμισμα οἷον ἘΠΙΥΗΤΗΣ ἔστιν ἡμῖν· δεῖ γὰρ τοῦτο φέροντι εἶναι λαβεῖν."—"But with regard to a future exchange (if we want nothing at present, that it may take place when we do want something), money is, as it were, our security. For it is necessary that he who brings it should be able to get what he wants."

So also that very excellent and too much neglected writer, Boisguillebert, who was one of the first to expose the fallacy that money was the only wealth, in his *Dissertation sur la Nature des Richesses* (Édit. Guillaumin, p. 374), very well points out the true character of money. He says, c. ii.,—"Le ciel n'est pas si éloigné de la terre qu'il se trouve de distance entre la véritable idée que l'on doit avoir de l'argent, et celle que la corruption en a établie dans le monde, et qui est presque reçue si généralement, qu'à peine l'autre est-elle connue, quoique cet oubli soit une si grande dépravation, qu'elle cause la ruine des états, et fait plus de destruction que les plus grand ennemis étrangers pourraient jamais causer par leurs ravages.

"En effet, l'argent, dont on fait une idole, depuis le matin jusqu' au soir, avec les circonstances que l'on a marquées, et qui sont trop connues pour être révoquées en doute, n'est absolument d'aucun usage par lui-même n'étant propre ni à se nourrir ni à se vêtir; et nul de tous ceux qui le recherchent avec tant d'avidité et à qui, pour y parvenir, le bien et le mal sont également indifférents n'est porté dans cette poursuite qu'afin de s'en dessaisir aussitôt, pour se procurer les besoins de son état ou de sa subsistance.

"Il n'est donc tout au plus, et n'a jamais été, qu'un moyen de recouvrer les denrées, parce que lui-même n'est acquis que par une vente précédente de denrées, cette intention étant généralement tant dans ceux qui le reçoivent que dans ceux qui s'en dessaisissent; en sorte que si tous les besoins de la vie se réduisaient à trois ou quatre espèces, comme au commencement du monde, l'échange se faisant immédiatement et troc pour troc, ce qui se pratique même encore en bien des contrées, les métaux aujourd'hui si précieux ne seraient d'aucune utilité.

"Il n'y a même aucune denrée si abjecte, propre à nourrir l'homme, qui ne lui fût préférée, en quelque quantité qu'elle se rencontrât, s'il était absolument défendu ou impossible au possesseur de l'argent de s'en dessaisir, ce qui le réduirait bientôt au même état que le Midas de la fable.

"Ce n'est donc que comme garant tout au plus des échanges, et de la tradition réciproque, qu'il a été appelé dans le monde, lorsque la corruption, et la politesse ayant multiplié les besoins de la vie, de trois ou quatre espèces qu'ils étaient dans son enfance, jusqu' à plus de deux cents où ils se trouvent aujourd'hui; ce qui fait que n'y ayant pas moyen que le commerce et le troc s'en fassent de main à main, comme dans ces temps d'innocence; et le vendeur d'une denrée ne trafiquant pas le plus souvent avec le marchand de celle dont il a actuellement besoin, et pour le recouvrement de laquelle il se dessaisit de la sienne, l'argent alors vient au secours, et la recette qu'il en fait de son acheteur lui est un procuration, avec garantie, que son intention sera effectuée en quelque lieu que se trouve le marchand, et cela pour autant, et sur un prix courant et proportionné à ce qu'il s'est dessaisi les mains de la denrée dont il était propriétaire: voilà donc l'unique fonction de l'argent. * *

"Comme il n'est tout au plus, ainsi qu'on vient de dire, qu'une garantie de la livraison future d'une denrée, qu'on ne reçoit pas immé-

diatement en vendant celle que l'on possède, du moment qu'elle se peut procurer sans son ministère, il sera obligé de renfermer tout son orgueil à demeurer absolument inutile et immobile."

He then mentions the Maldives Islands, where shells are used as currency; the West Indies, where tobacco was used for the same purpose. He then shows the superiority of the European practice which used neither gold nor silver, nor copper, nor shells, nor tobacco, but made simple pieces of paper perform all the duties of millions of gold and silver, and showed that the bills of a great merchant of undoubted wealth were preferable to ready money, which after passing through a multitude of hands and enriching them all, came back at last to the hands of the original issuer, and were discharged once for all. He then instances the fairs of Lyons, where there was an institution which was the original of the modern clearing house, where 80 millions of transactions were carried on without a single silver coin. We have quoted these views at so great a length that the reader may see how clearly Boisguillebert saw the true nature of money in 1707, and dissipated the fallacy, that money was the only species of wealth, which many suppose was first done by Adam Smith.

An old writer whose pamphlet (*An Essay upon Public Credit*, 1710,) has been accumulating dust for a century and a-half in the library of Eton College, saw the very same truth distinctly. He says,—"Trade found itself unsufferably streightened, and perplexed for want of a general species of a compleat intrinsick worth, as the medium to supply the defect of Exchanging, and to make good the balance where a nation, or a market, or a merchant demanded of another a greater quantity of goods than either the buyer had goods to answer, or the seller had occasion to take back."

Adam Smith had substantially the same idea. He says, B. I., ch. iv.—"When the division of labor has been once thoroughly established, it is but a very small part of a man's wants, which the produce of his own labor can supply. He supplies the far greater part of them by exchanging that surplus part of the produce of his own labor, which is over and above his own consumption, for such parts of the produce of other men's labor as he has occasion for. Every man thus lives by exchanging, or becomes in some measure a merchant; and the society itself grows to be what is properly a commercial society."

"But when the division of labor first began to take place, this power of exchanging must very frequently have been very much clogged and embarrassed in its operations. One man, we shall suppose, has more of a certain commodity than he himself has occasion for, while another has less. The former, consequently, would be glad to dispose of, and the latter to purchase, a part of this superfluity. But if this latter should chance to have nothing that the former stands in need of, no exchange can be made between them. The butcher has more meat in his shop than he himself can consume, and the brewer, and the baker, would each of them be willing to purchase a part of it; but they have nothing to offer in exchange, except the different productions of their respective trades, and the butcher is already provided with all the bread

and beer which he has immediate occasion for. No exchange can in this case be made between them. He cannot be their merchant, nor they his customers; and they are all of them less mutually serviceable to one another. In order to avoid the inconvenience of such situations, every prudent man, in every period of society, after the first establishment of the division of labor, must naturally have endeavoured to manage his affairs in such a manner as to have at all times by him, besides the peculiar produce of his own industry, a certain quantity of some one commodity or other, such as he imagined few people would be likely to refuse in exchange for the produce of their industry."

Smith then mentions several substances which have been used for this purpose. In B. II. c. ii. he expresses the same idea more clearly still:—"If the pension of such a person were paid to him not in gold, but in a weekly bill for a guinea, his revenue surely would not so properly consist in the piece of paper, as in what he could get for it. A guinea may be considered as a bill for a certain quantity of necessaries and conveniences upon all the tradesmen in the neighbourhood. The revenue of the person to whom it is paid does not so properly consist of the piece of gold, as in what he can get for it, or in what he can exchange it for. If it could be exchanged for nothing, it would, like a bill upon a bankrupt, be of no more value than the most useless piece of paper."

Coming down to more recent times, the clear-seeing mind of Bastiat perceived the same truth. In his *Harmonies Economiques; Organisation Naturelle*, p. 25, Edit. 1855, he shows how a young student at Paris receives all sorts of good things from society, and he asks what service has the young student done to society in return for all these things?—"Aucun; il se prépare à lui en rendre. Comment donc ces millions d'hommes qui se sont livrés à un travail positif, effectif et productif, lui en ont ils abandonné les fruits? Voici l'explication: c'est que le père de cet étudiant, qui était avocat, médecin ou négociant, avait rendu autrefois des services,—peut-être à la société chinoise—et en avait retiré, non des services immédiats, mais des droits à des services qu'il pourrait réclamer dans le temps, dans le lieu et sous la forme qu'il lui conviendrait. C'est de ces services lointains et passés que la société s'acquitte aujourd'hui; et, chose étonnante! si l'on suivait par la pensée la marche des transactions infinies qui ont dû avoir lieu pour atteindre le résultat, on verrait que chacun a été payé de sa peine; que ces droits ont passé de main en main, tantôt se fractionnant, tantôt se groupant jusqu'à ce que, par la consommation de cet étudiant tout ait été balancé."

So also, in his admirable little pamphlet, *Maudit Argent*, p. 80, Vol. V., of the same edition, he says:—"C'est bien le moment d'analyser la vraie fonction du numéraire abstraction faite des mines et de l'importation."

"Vous avez un écu. Que signifie-t-il en vos mains? Il y est comme le témoin et le preuve que vous avez, à une époque quelconque, exécuté un travail, dont au lieu de profiter, vous avez fait jouir la société, en la personne de votre client. Cet écu témoigne que vous avez rendu un service à la société, et de plus, il en constate

la valeur. Il témoigne, en outre, que vous n'avez pas encore retiré de la société un service *réel* équivalent, comme c'était votre droit. Pour vous mettre à même de l'exercer, quand et comme il vous plaira, la société, par les mains de votre client, vous a donné une *reconnaissance*, un *titre*, un *bon de la République*, un *jeton*, un *écu* enfin, qui ne diffère des titres fiduciaires qu'en ce qu'il porte sa valeur en lui-même, et si vous savez lire, avec les yeux de l'esprit les inscriptions dont il est chargé, vous déchiffrez distinctement ces mots: '*Rendez au porteur un service équivalent à celui qu'il a rendu à la société valeur reçue constatée, prouvée et mesurée par celle qui est en moi-même.*'

"Maintenant, vous me cédez votre écu. Ou, c'est à titre gratuit, ou c'est à titre onéreux. Si vous me le donnez comme prix d'un service, voici ce qui en résulte: votre compte de satisfactions réelles avec la société se trouve réglé, balancé et fermé. Vous lui avez rendu un service contre un écu, vous lui restituez maintenant l'écu contre un service; partant quitte quant à vous. Pour moi je suis justement dans la position où vous étiez tout à l'heure. C'est moi qui maintenant suis en avance envers la société du service que je viens de lui rendre en votre personne. C'est moi qui deviens son créancier de la valeur du travail que je ne vous ai livré, et que je pouvais me consacrer à moi-même. C'est donc entre mes mains que doit passer le titre de cette créance, le témoin et la preuve de la dette sociale. * * * Vous étiez créancier de la société, vous m'avez substitué à vos droits, et il importe peu à la société, qui est redevable d'un service, de la rendre à vous ou à moi. Elle s'acquitte en le rendant au porteur du titre."

Hence we see that all these writers, and many others might have been cited, perceive that the fundamental conception of money is that it is a pledge, that when any one has rendered some service and receives no equivalent at the time, that he may do so on some future occasion, and of what kind he pleases. Hence it is plain, that as he takes it, not for any direct use it can be to him, but only because he believes he can get what he wants when he pleases, it is general *CREDIT*, or a Bill of Exchange on the commercial community. But though such is its fundamental nature, the quantity of the substance that must be given as the equivalent of the debt, will of course be governed by the universal laws which regulate the exchangeable relations of all substances.

The necessity of having something to perform the duty of representing debts that arise from unequal exchanges, has been felt by all nations from a very early time. The Hebrews we know used silver; although there was clearly no money in the times described by the Homeric poems, soon afterwards a currency made of copper skewers came into use throughout Greece, which was superseded by the silver coinage of Pheidon. In the dialogue named *Eryxias*, which is attributed to *Æschines Socraticus*, it is said that the *Æthiopians* used a currency of carved pebbles. They must have been "blameless" indeed if they could resist so manifest a temptation to forgery. Throughout the islands in the Eastern Ocean shells were used. In Thibet, and in some parts of China to the present day, it is said that little

blocks of compressed tea are used as money. Smith says that salt is used in Abyssinia; that formerly dried cod was used in Newfoundland; sugar in some of the West Indian colonies; and in his own day, there was a village in Scotland where nails served the purpose of money. So late as the middle of the last century, in Virginia, tobacco at a certain price per pound was legal money, in which the salaries of ministers and other public officers were paid. In other of the American colonies powder and shot; in *Carpeachy* logwood; and among the Indians on the American continent, belts of wampum served the purpose of a currency.

But when we consider the purposes for which a currency is intended, it is easily seen that no substance possesses so many advantages as metal. The use of the currency being to preserve the record of services rendered for use at any future time, it is clear that it should be made of some substance which should not be liable to alter by time. A money of dried cod would not be likely to keep very long, nor would it be easily divisible. One of the first requisites of a currency is that it should be divisible into very small fragments, so that its owner should be able to get any small amount of service at any time he pleases. Taking these requisites into consideration, it is manifest there is no substance which combines these qualifications so well as a metal of some description. Metal is uniform in its texture, and it can be divided into any number of fragments, each of which shall be equal in value to another fragment of equal weight, and if required, these fragments can always be reunited, and form a whole again of the aggregate value of all its parts. By this means if we can establish a relation between the quantity of the metal and the amount of the debt; then whatever that relation be, or whatever quantity of metal be taken to represent any amount of debt, any fragment of such metal will always represent a proportionate amount of the debt.

In adopting a metallic currency, that metal which has the greatest value should be selected as the principal money. The exchangeable values of the different metals are settled exactly on the same principles as the exchangeable values of all commodities. All metals are heavy and inconvenient to carry, and if a very abundant one were selected for the purpose, the quantity which would be required to denote even a moderate amount of debt, would be a serious inconvenience. The more rare and valuable the metal, the more portable and convenient it would be, so that a man might carry about with him, as it were, a concentrated essence of power of commanding services. Of all the metals that were first discovered gold and silver combined these advantages in the greatest degree, and from the earliest antiquity the most civilised nations appropriated them for that purpose, and they gradually superseded the inferior metals and other substances used by different nations, and their exchangeable values relatively to each other, as well as to other metals and commodities, was determined.

All these currencies made of material substances we may properly call natural currencies, by which we mean, that though they are all for the purpose of representing debt, yet the quantity

of the substance which is considered as the equivalent of the debt depends purely on the general laws of value, and varies subject to their influence. We shall show a little further on that there are artificial currencies in which the substance has a value attributed to it by some agreement of some sort which it does not bear without that influence.

But although the value of the substance used for money is determined by the general laws of value, we must be carefully on our guard against saying that it has *intrinsic value*. We have fully entered into the confusion in Political Economy which has been caused by this expression under *VALUE*, so that we need not repeat what we have said there, but nevertheless we make a few remarks on it.

It seems almost superfluous to enforce it so often; but when an error is spread throughout the whole science and meets one at every turn, it requires to be constantly exposed. The value of a thing is simply and solely the thing for which it can be exchanged; and, of course, anything has as many values as things it can be exchanged for. When we speak of the value of a thing, we necessarily speak of its value in something—its value in clothes, or its value in bread, or its value in furniture, or any services whatever. How often does it require to be repeated that it is as grossly absurd to speak of anything having absolute value as it is to speak of a thing having absolute distance, and that it is equally irrational to speak of intrinsic value as of intrinsic distance! The value of the money is not the labour bestowed upon obtaining it, but the food, the necessities, and anything else which can be got in exchange for it. While money will purchase tea, and wine, and meat, and clothes, and books, and house-room, and furniture, and other things, it has value, and these things are its values. If it ceased to command them it would have no value; so if placed in a position where it would command nothing, it would have no value. Thus, if we took a bag of sovereigns among the Australian savages, they would have no value. It is clear that if there were anything else that would purchase exactly the same things that money would, it would be of the same value as money.

We must also observe this, that though money is *exchangeable* for other things, it does not *represent* them. Some eminent writers had a curious fancy that money was the representative of other things, and that a state was only well off when it had as much money as was an equivalent for all other things put together. But the slightest reflection shews that this is pure fancy, and quite contrary to the reality. What we wish to observe is that money is a separate and independent exchangeable quantity over and above other quantities of all sorts. It is a substance which has general and permanent value in a country because everyone will give something for it, and it does not depend for its exchangeability upon any particular person.

Now, as we have shewn under *CAPITAL* that any Economic quantity whatever may be used as Capital, money of course may be used as Capital as well as anything else. There are, of course, different ways of using things so as to give a profit, but anything which may be used in any

way whatever so as to give a profit may be capital, so money may be capital though it gives a profit in a different way from corn or cattle. Hence we see that Currency may be Capital.

We shall now lay before our readers a method of viewing the function of money which is slightly different from the preceding, though by no means opposed to it, and we shall then shew why one definition is preferable to the other. We need hardly remind our readers that the old fallacy was that money was the only species of wealth, and that the only true commercial policy was to heap up as much gold and silver as possible. Many persons, however, saw the fallacy of this notion, but they rushed into the opposite extreme, and maintained that money was not wealth at all, but only the representative of wealth, and therefore it was of no consequence of what material it was made of. So long as paper, for instance, they said, was based upon some material article of value, such as land or other things, they maintained that it would preserve the same value as specie. This was the doctrine upon which that theory was founded which we have called Lawism, because he had the opportunity of carrying it out into practice, and it resulted in the Mississippi catastrophe. This doctrine was supported with ingenuity by the Abbé Terrasson, a member of the Academy of Inscriptions and Belles Lettres, who was selected by Law in 1720, to defend his system. It was to reply to this fallacy that Turgot began to write. In sections 40-50 of his treatise *Sur la Formation et la Distribution des Richesses*, he has explained extremely well the true nature of money. He shews that every species of merchandize has a certain value in every other, and may be used to measure it, and in a certain way every merchandize might be used as money. But that some kinds are better than others, and that the precious metals are better for this purpose than any others, for obvious reasons. He then shewed that when a purchase is made with money, the money is not a sign of value, as was commonly said, but an actual equivalent for the thing purchased. He shews also how the use of money has greatly facilitated the division of labor. Thus Turgot shewed that money was simply a species of merchandize which was used for a particular purpose. Since his day this has been the most usual way of regarding it. It has been considered as a species of intermediate merchandize used for the purpose of facilitating indirect exchanges. Thus M. Joseph Garnier (*Eléments d'Economie Politique*, 3rd. edit. 1856, p. 14), observes that direct barter ceases as soon as nations emerge from the infancy of civilization. In civilized countries such cases are very rare, and in most, impossible. Thus a bookseller who has nothing but books, can but rarely pay his baker or his shoemaker with books. A certain peculiar species of merchandize has therefore been devised called money, which the buyers of books give to the bookseller, and which he can give again to those who sell to him. Thus, he says, barter is complicated by an intermediate exchange. This money men have agreed to make of silver, and of gold; and in civilized countries, the shoemaker exchanges his shoes for their equivalent in money, for the purpose of again exchanging this money for a hat,

it may be. The operations of the hatter are similar, and they may be represented thus :—

The shoemaker
first exchanges his *shoes* for *money*,
then exchanges the money for a hat;
which is equivalent to exchanging the shoes for a hat.

The hatter
first exchanges a *hat* for *money*,
then the money for shoes;
which reduces the operation to an exchange of a hat for shoes.

Hence, adopting this view of the operation, we see that the exchange has been resolved into two sales; such being the name of the transaction when one and not both of the quantities exchanged is money. J. B. Say very aptly said that a sale is half an exchange. It is also what is called *circulation*; and money is called the circulating medium, because it enables commodities and other things to circulate without an exchange.

Now, the two views we have presented of the nature of money are by no means contradictory; and as long as the circulating medium, or pledge for future services, consisted of a material substance like specie, it would be not of the least consequence which definition was adopted. But it happens that in modern times a circulating medium, or pledge, of a totally different nature, and which is not formed of any material substance whatever, but is a mere promise to pay, and which is called *credit*, has come into use, and so greatly exceeds the quantity of money, that the most moderate computations reckon it at at least ten times the quantity of metallic currency. Now, as we shall shew that this credit performs exactly the same functions as money, it is of course of the same general nature as money. But it would manifestly be a rather startling stretch of language to say that credit was an intermediate merchandize and an equivalent to commodities.

We shall now, therefore, show why the conception of money being a pledge for a future exchange, is more fundamental and more general than that of its being an intermediate merchandize.

We have already observed that the money which is given to make a balance on an unequal exchange of services, and to be a pledge that the owner of it may obtain what he wants when he pleases, is a separate and independent article of exchangeable property. It is exchangeable for other things, but does not represent them. The quantity of money is manifestly to be counted cumulatively to other things, although it is of no sort of use except as being able to purchase them. Now the debtor need not give a general pledge like money, if the creditor is willing to accept one of a different sort.

Supposing that on an unequal exchange taking place, the debtor owes 10lbs. of tea, then, instead of giving money, he may give his simple promise to pay 10lbs. of tea, when required. Now, it is clear that here we have a pledge to render a future service when required. And this pledge may be passed from hand to hand like money among those who choose to take it. And as it can be exchanged for 10lbs. of tea,

it is manifestly of the *value* of 10lbs. of tea. But it is not an appropriation of any specific 10lbs. of tea. It is, therefore, a pledge of the same nature as money, and a separate and independent article of property, just as money is. Now this species of property is called *CREDIT*, because the owner of this pledge only believes that he can exchange it for the tea.

Now, as we steadily adhere to the meaning of Value that it is the thing for which anything can be exchanged, it manifestly follows that the *value* of a pledge or promise to pay anything, is the thing promised.

The *value* of a pledge or promise to pay £50, is the £50.

The *value* of a pledge or promise to give 10lbs. of tea, is the 10lbs. of tea.

The *value* of a pledge or promise to cut a man's hair, is the cutting of the hair.

The *value* of a pledge, or promise to carry a letter, is the carriage of the letter.

Now, each of these pledges or promises is of course only of the value of the particular thing specified or promised; and, therefore, each of them is only particular. And it may also happen that the person who has engaged to fulfil these several promises may be unable to do so, and then of course the promise loses its value. Therefore, the value of the promise is precarious as well as particular, but that does not affect its independent existence.

Now, money is manifestly nothing whatever but an aggregate of all these particular and precarious values. Because it is a pledge that every one will answer, and consequently if any particular person fails, there are plenty of others who will supply his place.

Hence we see that Credit is the name of a species of property which has a separate and independent existence, and is fundamentally of the same nature as money. It is the representative of Debt. This credit may be exchanged, or bought and sold precisely in the same way as money itself. Hence, manifestly, Money and Credit together constitute the *currency* or *circulating medium*, that is they equally cause commodities to circulate without the necessity of an exchange.

Hence we see that the *currency* or *circulating medium* is the name of a certain species of economic quantities. But as any economic quantity whatever may be used so as to produce a profit, it follows that the economic quantities called the currency may be used to produce a profit, and so they may become capital. How credit may be used as capital is fully developed under *CREDIT*.

The only real difficulties that have caused perplexity in comprehending the nature of credit, have arisen from the apparent subtlety that the *promise to pay* a thing has an independent and separate existence from the thing promised. But the preceding explanations have, we hope, cleared up any doubt on that point, and any one who sees that he can buy things as well with a bank note as with money, can have no doubt about it. The second difficulty is somewhat more specious, and has arisen from the false views of value which have been so prevalent. Every one can see that money has value. Now, the reason given for that by the followers of

Smith and Ricardo, is that labor has been bestowed on producing it. And when they see that a piece of paper has cost, comparatively speaking no labor, they ridicule the notion of its having value. But in the first place the value of the money does not consist in the labor it has cost, but in the things it will buy, and in the second place, it is not the paper itself which has the value, but the right residing in the person of its owner. The paper is merely the evidence of the right. The right is equally valid though it merely exists in a verbal and invisible form, and is equally transferable from hand to hand. But for the sake of convenience, and to avoid disputes, and to preserve its certainty, the *evidence* of it is recorded on paper, which greatly facilitates its negotiability. And the value of this right is the thing promised, just in the same way as the value of money is the thing purchased.

Should there be any difficulty in seeing this, it will be further diminished by considering a species of currency which was formerly issued in enormous quantities by tradesmen, when there was a scarcity of legal currency. These were tokens, which were not promises to pay any specific thing, but a general promise to give out of the tradesman's general stock anything of a certain value. Now it is clear that this token was a separate exchangeable article of property, quite distinct from any particular goods; and yet it manifestly represented a debt of the tradesman's, because he only issued them in exchange for some service rendered. They were only a substitute for the Royal coin. They circulated in the neighbourhood, because the people believed that the original issuers were able to give their value in goods at any time. They were manifestly only an inferior form of money, and they must have had an independent existence as much as money.

Postage stamps are a rude form of currency. They are a right to demand the Postmaster-General to carry a letter. And the carriage of the letter is their value. But as most persons, nowadays, want to write letters, postage stamps are universally received as small change. And, as a late Act declares, that they shall be exchangeable for money at any Post Office, they are now to all intents and purposes penny bank-notes. These postage stamps are evidently a particular form of Government credit, and no one doubts that they are separate and exchangeable property over and above other property.

It is further manifest that it can make no difference in the nature of the pledge, whether it is made payable on demand, or at a certain date after its issue. There may be certain inconveniences attached to it, which may diminish its present value, but it is manifest that it in no way alters its fundamental nature as a pledge, whether it be redeemable six months hence, or three months hence, or on demand. Hence, all species and forms of credit must be included under the category of the Currency, or Circulating Medium, because their essence is, not that they shall be payable on demand, but that they circulate commodities, or other things.

The observations contained in the preceding paragraphs show that the idea of "currency" is quite independent and essentially distinct from that which we usually call "money," regarded as

an intermediate and equivalent merchandize. It is quite possible to have a currency, even though its most useful and general form, money, had never been thought of. If transactions take place between individuals, it is scarcely possible to imagine that there should not be debts, or balances of services, due, arising between them, and this is the basis of a currency. But it does not necessarily follow that there must be money. If the way of conducting commerce by way of money had never been invented, a grocer and a wine merchant might trade with each other. If they had agreed that a bottle of wine and a pound of tea should be considered as equivalents, the grocer might purchase a bottle of wine, and, if the wine merchant wanted more or less than a pound of tea, he might let the grocer have the wine, upon his giving his promise to pay the tea when required. And this note would be made transferable, and pass through a hundred different hands before the owner of it demanded tea. It would perform exactly the same function as money in circulating goods. It would, therefore, be currency, but it would not be money in the sense of being an intermediate and equivalent merchandize. Money has, no doubt, enormous advantages over such a currency, but these advantages are purchased at a very heavy cost; and in modern times, whenever public distress began to be severe, the luxury of a metallic currency is one of the first to be dispensed with. The true nature of a currency is revealed as soon as gold and silver disappear. This is well exemplified in America at the present moment, where private tickets of all sorts have superseded specie. Instead of money, people have now their pockets filled with bread tickets, and milk tickets, and railroad tickets. If a man goes to get his hair cut, and tenders a dollar, he cannot get change, but he receives so many tickets promising to cut his hair so many times.

The metallic currency is termed **MONEY**, and the paper currency of all sorts is termed **SECURITY FOR MONEY**. These securities for money, or the paper currency, are divided into two general species; first, *promises* to pay money, called **PROMISSORY NOTES**; and secondly, *orders* to pay money, called **BILLS OF EXCHANGE**. Each of these general divisions again is subdivided into several varieties, which are fully treated of under **BANK NOTE**; **BILL OF EXCHANGE**; **CHEQUE**; **CREDIT**; **DEPOSIT**; **PROMISSORY NOTE**.

The name of Currency, as we have seen, is given to something which is used as a pledge to denote the power its owner has of commanding services. Every transfer denotes an operation, because it is evident that in commerce every transfer of currency necessarily involves the transfer of something else. The amount of the sum total of all the transferences of the Currency which takes place, is properly called the **CIRCULATION**. Hence a single piece of money may add considerably to the circulation, for every time it is transferred it is an addition to the circulation, though it is no increase of Currency. We may observe that the same confusion of ideas has affected the use of the word circulation as that of currency. It is generally used as synonymous with money and bank notes, and more particularly the latter. Thus the number of notes issued by the Bank of

England, or any other bank, is frequently called its circulation. This of course is manifestly the same confusion of idea that calls money which is current, the currency. It is as great a confusion of idea as to call a wheel a *rotation*. It is clear that money and the circulation do not bear any fixed relation to each other, for there may be a large amount of money in a country, yet if the industrial operations be few, there will be a small circulation; on the other hand, there may be a small amount of money, yet if the people be active and industrious, it will pass frequently from hand to hand, and there will be a large circulation.

When transactions take place between individuals, if the interchange be of things of a like nature, as currency for currency, or commodities for commodities, it is called an *EXCHANGE*, or in the case of commodities, frequently *BARTER*. Thus we speak of the Foreign Exchanges, or the value of the currency of one country in terms of the currency of another; or we ask for the change (i.e., the 'change or exchange) of a £5 note, or a sovereign; so we speak of exchanging a picture for a statue, or one book for another. When the interchange is of things of an unlike nature, such as currency for commodities, it is called a *SALE*, and the one who gives currency is said to buy the commodities, and he who gives the commodity is said to *SELL* it. Thus we buy a horse or a house with money; so an officer *buys* a commission in the army, but he exchanges from one regiment to another. So in Lear, when Albany throws down his glove to the traitor Edmund, the latter, throwing down his own, replies "There's my exchange," meaning, like for like. So, in Hamlet, Laertes says—

"Exchange forgiveness with me, noble Hamlet."

The quantity of the currency given for the commodity is called its *PRICE*, and when the buyer of the goods transfers their stipulated price to the seller, he is said to *PAY* for them.

The subtle question whether if a fair exchange of goods were substituted for the payment of money, it was to be considered as a sale, was warmly debated for 150 years by the two famous sects of Roman Lawyers, the Proculians and the Sabinians, from the time of Augustus to that of Hadrian. Both parties appealed to Homer in support of their views, but the opinion of Proculus finally prevailed, that a *sale* and an *exchange* were operations essentially distinct in their nature. This was confirmed by the Emperors Diocletian and Maximian, and was ratified by Justinian (*Institutes* L. iii. c. 24). The conclusion was just, though the reason assigned for it was scarcely satisfactory, "that in the exchange of two things it can never appear which has been sold, and which has been given as the price of the thing sold, and it is contrary to reason that each should appear to have been sold, and that each should appear to have been given as the price of the other." It would rather appear that when we exchange one commodity for another, we exchange one whose useful qualities are known, for another whose useful qualities are also known; that is, we exchange two things which are acknowledged to be equivalents. But the currency represents an abstract quality, or right. In changing a commodity for currency we commute a known useful quality for an

abstract right; that is, we give a commodity, and receive in return only the power of obtaining an equivalent; or we exchange something that is definite, for another that is indefinite, two operations which are essentially distinct, and it is better to appropriate different expressions to operations of a different nature.

We must carefully observe that the word currency is a complex term involving two simple ideas, and we must resolve it into them. From its first representing a debt, its fundamental idea was, that it was something that denoted power of demanding services, and secondly, it also passed from hand to hand itself. Of these two ideas it must be especially observed that the former is the fundamental idea, but it has received its *name* from the latter. Resolved into its elementary ideas, it is therefore—

1. That which *circulates* commodities, &c., i. e., which causes commodities, &c., to circulate, where *circulates* is an active verb.

2. That which circulates itself, where *circulates* is a neuter verb.

From the first of these ideas it has acquired a name in modern times significant of its quality, viz., *CIRCULATING MEDIUM*.

The amount of the currency or circulating medium in any country, is the aggregate amount of it belonging to every individual. Now, whatever represents the amount of debt due to any individual, over and above his possessions in commodities, in whatever form that debt may be recorded, whether metal or paper, or whether it exist simply as a debt, is the amount of currency belonging to him. Whatever, therefore, confers the power of demanding services or commodities, or professes to confer the power of demanding them, is the currency or circulating medium of any single person, and includes, not only the current coin of the realm, but all its substitutes of every description, and whatever else represents or displaces it. Adopting this definition we may enumerate the different species of it as follows:—

1. Coined money; gold, silver, and copper.

2. The paper currency—including promissory notes and bills of exchange, with all their varieties.

3. Simple debts of all sorts, such as credits in bankers' books, called deposits, book debts of traders, and private debts between individuals.

It is certainly true that some of these descriptions of currency are more eligible and secure than others, and perform the same duties with different degrees of advantage. The metallic currency rests upon the credit of the state, that it is of proper weight and fineness, and the universal readiness of people to receive it in return for services. Paper currency, in this country at least, rests entirely upon private credit, and is of all possible degrees of security, from a Bank of England note down to a private I. O. U. There are several different kinds of paper currency possessing more or less of circulating power; but all these different descriptions of currency, though more or less eligible and secure, represent but one fundamental idea—*DEBT*. From these considerations it follows that the amount of currency, or circulating medium in any country, is the *sum total of all the debts due to every individual in it*.

It is most particularly to be observed that it is the essential quality of currency that it is a general charge of debt on the person of the debtor, or obligant, and is not a title to any specific goods. In all cases whatever, it involves the idea of personal liability. Thus, when we suppose a wine merchant to take a grocer's promise to pay so much tea when required, in return for the wine he lets him have, it must be distinctly remembered that this is only a general power to demand so much tea, and not a particular appropriation of any specific quantity of tea. The whole of the grocer's stock of tea remains his own property until the demand is made upon him for payment; consequently he can sell or dispose of it all if he pleases, which he could not do if any particular part were set aside as the property of another person, and he was merely the keeper of it.

This distinction is of the utmost importance, and it serves to shew that transferability from hand to hand is not the fundamental conception of a currency. There are certain commercial documents which, so far as negotiability is concerned, bear a resemblance to bills of exchange, and are by many supposed to be of the same nature. These are dock warrants and bills of lading. Their nature is so fully explained under **BILL OF EXCHANGE**; **BILL OF LADING**; **CREDIT**; and **DOCK WARRANT**; that we need not repeat it here. We need only observe that, by their very nature, bills of lading and dock warrants can never exceed in quantity the property they represent; but bills of exchange, and other instruments of credit, enormously exceed the quantity of coin in the country, because they are only a promise that the debtor shall pay them in money if demanded at some given time, and so the same coin may discharge an infinite number of bills of exchange in succession.

Every one now can see, we hope, that a simple abstract pledge, or right to command something, is a separate and distinct article of property from the thing itself, and may be transferred separately and independently of anything else, and is, therefore, by virtue of our fundamental axiom, an Economic Quantity. Now these pledges, or rights, or debts, being purchaseable separately, may be bought with other pledges, or rights, or debts. Thus a debt may be bought by creating another debt. Just in the same way as there are money changers for exchanging one species of coin for another, so there are debt changers, whose express business it is to buy debts by creating other debts, or to exchange one species of debt for another. These are bankers. Commercial debts are an enormous species of property, but they are in general not very well adapted for general circulation, except in a few cases; and it is the express business of bankers to buy these commercial debts by creating others of greater convenience, and better adapted for general circulation. The mechanism of this system is fully explained under **BANK** and **CREDIT**. And a point of somewhat subtle nature has arisen from these transactions. It is clear that as it is the business of bankers to buy debts by creating others, there will constantly arise a state of mutual obligation; each party will hold some of the other's pledges.

Now, it is supposed by many that when such a state of things takes place, the mutual debts should be set off against each other, and as each party owes and possesses the same sum, that the two amounts cancel, the result is zero, and the effect is just the same as if neither of these debts existed. But it is quite clear that this is an erroneous method of stating the question. A customer takes a bill to be discounted by his banker, who, we may say, lives in the country, and issues his own notes. The bill arose out of a commercial transaction, and, therefore, has circulated commodities. It is then discounted by the banker, who buys it by creating another debt, either in the form of a deposit, or a bank note. Here, then, is a new property created, with which the customer may go into the market and buy fresh goods. But it is by no means uncommon in the country for bankers to re-issue the bills they discount, with their own indorsements. Here, therefore, are two circulating or exchangeable quantities, each operating independently of the other. Hence it is quite clear that there are two existing economic quantities, and while they continue to exist and circulate separately, they must each be reckoned as an independent quantity. It may be, that after a certain time, when the bill becomes payable, the acceptor of it may pay it in the banker's notes, and then if it be in his hands there will be a mutual release or extinguishment of debts, which will then each cease to exist. But until this is done, they are each of them economic quantities as much as any others.

We may as well take this opportunity of referring to the article on Credit, § 241-247, where we have shewn that J. B. Say, who is the writer to whom most of the modern confusion on the subject of Credit is due, expressly admits the independent existence of debts, or credit, as valuable property, and classes it under the title of Wealth, and says that bills and notes have a present value, and may be made exactly of the same value as a sum of money, and used precisely in the same way, and furthermore calls it Capital. In § 248-257 we have shewn that Mr. Mill over and over again treats Credit as independent exchangeable property, which is of the value, and may perform all the functions of money. And yet these two writers ridicule those who say that Credit is Capital.

It is a matter of considerable interest to discover what are the proportions which credit and money bear to each other in modern commerce. The difficulties, however, which prevent private inquirers arriving at any reliable information are very great, and those opportunities which are presented by Parliamentary inquiries into Commercial Crises are very rarely made use of for any but their immediate purpose. In the Report, however, of the Committee of the House of Commons on the Commercial Crisis of 1857, there occurs a very interesting statement, made by Mr. Robert Slater, the managing partner of the great house of Morrison, Dillon, and Co. Having analysed the operations of the house for the year 1856, he gave in the following statement as shewing the proportions in which each million of payments and receipts were made in money, bank-notes, and other instruments of credit:—

RECEIPTS.		£	£
In Bankers' Drafts, and Mercantile Bills of Exchange, payable after date	583,596		
In Cheques on bankers, &c., payable on demand	357,715		
In Country bankers' notes	9,627		900,938
In Bank of England Notes	68,554		
In Gold	28,089		
In Silver and Copper	1,486		
In Post Office Orders	938		
			99,062
		£1,000,000	
PAYMENTS.		£	£
By Bills of Exchange, payable after date	302,674		
By Cheques on London Bankers ...	663,672		966,346
By Bank of England Notes	22,743		
By Gold	9,427		
By Silver and Copper	1,484		
			33,654
		£1,000,000	

Here we have it shewn that in this great house, which there is no reason to suppose we may not consider a fair representative of commerce in general, it appears that in receipts, gold and silver only entered to the extent of 3 per cent., and Bank of England notes to the amount of less than 7 per cent.; the remaining 90 per cent. being entirely in credit. Of the payments, gold and silver were only 1 per cent., and bank notes 2 per cent., the remaining 97 per cent. being effected by pure credit. In Scotland specie enters even in a far less degree into payments. This will give some idea of the stupendous power of credit in this country.

The Opinions of various Writers on the Nature and Extent of the Currency.

Within the last thirty or forty years strong differences of opinion have manifested themselves among economists as to the nature and extent of the currency. It may be said, we think, that these discordances have arisen from writers not well ascertaining the true philosophical import of the terms they use. We shall now place before our readers the opinions of various persons of eminence on the subject. Whenever we clearly understand that the true function of the currency, or circulating medium, is to circulate commodities, &c., i.e., to obviate the necessity of barter, or exchange, by substituting a pledge of future payment of some sort in place of an actual equivalent, there can be no reasonable doubt but that currency must include money and credit in all its shapes and forms; and such was the opinion of speakers and writers until a comparatively recent period, when an influential sect sprung up, who restricted the term currency to money and bank notes payable to bearer on demand, and excluded all other forms of credit from it.

We shall first place before our readers the opinions of several writers who held the former opinion, and then examine the opinions of those who hold the latter view, and the reasons they allege in support of it.

The discussions on the nature of currency had not arisen in Smith's time. The name itself was new. What we call paper currency he usually calls paper money, which is an error, the two being very different. But it is manifest that he includes all forms of credit under the title of money, or currency.

We have already shown under CREDIT, § 231—236, that Adam Smith includes credit under the title of capital. He specifies money as one form of circulating capital, and under the title of money he includes all forms of paper credit. Thus he says, B. II., c. ii.—“Money, therefore, the great wheel of circulation, the great instrument of commerce, like all other instruments of trade, though it makes a part, and a very valuable part of the capital.” He then speaks of the substitution of paper for specie, and says,—“There are several different sorts of paper money [currency]; but the circulating notes of banks and bankers are the species which is best known, and which seem best adapted for this purpose.” Now, what can the other species of paper currency be, except bills of exchange, &c.? Cheques had only just begun to be used in London a few years before the publication of the *Wealth of Nations*, and the probability is that Adam Smith had never seen a cheque when he wrote his work, but manifestly they are included under his designation. In B. III., c. i., he says,—“The great commerce of every civilised society is that carried on between the inhabitants of the town and those of the country. It consists in the exchange of rude for manufactured produce, either immediately, or by the intervention of money, or of some sort of paper which represents money.” Now what sort of paper, besides bank notes, does this mean, but bills of exchange and cheques?

The controversies about the meaning of currency and circulating medium seem to have begun about the time of the Bank Restriction Act, in 1797. In the debate on that measure (*Parl. Hist.* vol. xxxiii. p. 340), Mr. Fox said that he wished “that gentlemen instead of amusing themselves with new terms of circulating medium and the like.” In his reply Mr. Pitt said, “As so much had been said on the nature of a circulating medium, he thought it necessary to notice that he did not, for his own part, take it to be of that empirical kind which had been generally described. It appeared to him to consist in anything that answered the great purposes of trade and commerce, whether in specie, paper, or any other term that might be used.” Hence we see that Mr. Pitt expressly included all forms of Credit under the term Circulating Medium.

The next writer we may cite is Mr. Henry Thornton, one of the authors of the Bullion Report. In his *Inquiry into the Nature and Effects of the Paper Credit of Great Britain*, he says, p. 40—“A multitude of bills pass between trader and trader in the country in the manner which has been described; and they evidently form, in the strictest sense, a part of the circulating medium of the country.” And in a note on this passage he says—“Mr. Boyd, in his publication addressed to Mr. Pitt on the subject of the Bank of England issues, propagates the same error into which many others have fallen, of considering bills as no part of the circulating

medium of the country." After quoting a passage from Mr. Boyd, which is given below, he says—"It will be seen, in the progress of this work, that it was necessary to clear away much confusion which has arisen from the want of a sufficiently full acquaintance with the several kinds of paper credit, and in particular to remove, by a considerable detail, the prevailing errors respecting the nature of bills, before it could be possible to reason properly upon the effects of paper credit."

We may next quote from a speech of the Marquis of Titchfield, in 1822, on Mr. Western's motion regarding the Act of 1819. He said—"Economy of money was by contrivances to spare the use of it, according to the description of his right honourable friend, by substitutions for the precious metals in the shape of voluntary credit. Every new contrivance of this kind, and every one improved, had that tendency. When it was considered to how great an extent these contrivances had been practised, in the various modes of verbal, book, and circulating credits, it was easy to see that the country had received a great addition to its currency. This addition to the currency would, of course, have the same effect as if gold had been increased from the mines." Here, therefore, we see it explicitly stated that credit in all its shapes and forms was independent exchangeable property, of the value of, and producing the same effects as gold.

We may now consider the opinions of those writers who have taken a different view of the matter.

Mr. Walter Boyd is the first that we are aware of who confined the term currency to money and bank notes. He says (*Letter to Mr. Pitt, p. 2*)—"By the words 'means of circulation,' 'circulating medium,' and 'currency,' which are used almost as synonymous terms in this letter, I understand always ready money, whether consisting of bank notes or specie, in contradistinction to bills of exchange, Navy bills, Exchequer bills, or any other negotiable paper, which form no part of the circulating medium, as I have always understood the term. The latter is the *circulator*; the former are merely *objects of circulation*."

A few traces of this opinion may be discovered in certain writers after this period; but as this view was most prominently brought forward before the Committee of 1840, we may pass at once to that.

Mr. J. B. SMITH, President of the Chamber of Commerce of Manchester, said that he thought circulation and currency were the same (Q. 40); that deposits were currency, which was, in fact, another word for liabilities.

Q. 70. Mr. O'Connell—"There is another description of paper in circulation, namely, bills of exchange; do you include those also in your description of the currency?—I do not consider bills of exchange as currency."

Q. 71. "What is the difference between a bill of exchange which is passing from hand to hand and commanding property in return for it, and a bank note which is performing the same functions, supposing each to be for £100?—I consider a bill of exchange to be a debt."

Q. 72. "Is not a bank note a debt?—The difference between a bill of exchange and currency would be this, that currency would discharge the

debt; the payment of a bill of exchange is not the discharge of a debt till it is due."

Q. 78. Mr. Smith—"Supposing this case to happen, that the same bill of exchange passed through a banker's hands six times in one day on the account of different persons having accounts with this bank, should you not say that that bill of exchange discharged the functions of currency?—It is a mere transfer, after all, from hand to hand, with, every time it is endorsed, an additional security."

Q. 79. "Supposing it not to be endorsed, can you point out the difference between that and a Bank of England note?—The difference between a Bill of Exchange and a Bank of England note in any transaction, is, that a Bill of Exchange is a debt, and it continues a debt till it is discharged by a Bank of England note, or by some other currency, which is a full discharge of the debt."

Q. 80. Sir R. Peel—"What does a Bank of England note profess upon the face of it; is it not 'I promise to pay'?—Precisely so."

Q. 81. "Is not that evidence of a debt?—Certainly, but it is legal tender."

Q. 82. "Supposing a law were passed permitting a gold circulation to continue, and prohibiting the issue of notes by the Bank, do you not think the measure which traders would resort to, would be to supply the deficiency by Bills of Exchange?—It is probable, it might be so."

Q. 83. "Would not they answer the purposes of Currency?—Bills of Exchange do not perform the functions of Currency, but they are instruments by which commodities are exchanged, equally with every other mode of Credit, but requiring money for their discharge."

Q. 84. "Though there is a difference in the nature of the transactions between the issue of a note, payable on demand, and the passing of a bill of exchange, is there any substantial difference in their sensible effect on the currency of the country?—I do not think that Bills of Exchange affect the Currency, though the Currency has a very important influence on Bills of Exchange."

Q. 87. "Do not you recollect, that during the Bank restriction law, there did not remain a circulation of Bank of England notes in parts of Lancashire for the discharge of small payments, but that in point of fact, the great commercial transactions of Lancashire were carried on by the intervention of Bills of Exchange, performing the ordinary functions of currency by means of promissory notes?—Unquestionably, and a very large amount of these payments are still in existence."

Q. 88. "When payments do take place by these means, do not bills of exchange answer, in a great measure, the functions of promissory notes, though there is a difference in the character of the transaction between a bill of exchange and a promissory note?—Yes, they are a medium for the exchange and distribution of commodities, no doubt."

Q. 89. "They are the representatives of commodities?—Yes; they are representatives of transactions in commodities."

Q. 90. "Then are they not currency?—No, I do not think that follows."

Q. 91. Mr. O'Connell—"What is currency but an instrument of Exchange?—It is an instrument

of exchange, but it is an equivalent also for commodities.

Q. 92. "A bill of exchange performs that function, it assists to exchange commodities?—Yes, a bill of exchange assists in the exchange and distribution of commodities.

Q. 93. "Then it has that function of currency?—Yes, it has.

Q. 94. "Then having that function of currency, which, perhaps, is the only function, can you distinguish that from currency? What is there in your mind to induce you to say that that is not currency which performs the functions of currency?—I have already explained that the difference between a bill of exchange and currency is this, that the one discharges a debt and the other does not.

Q. 95. *Mr. Warburton*—"If a party receiving a bill of exchange indorsed, were to give a receipt in full for the payment of the debt, would not that bill of exchange perform precisely the same functions as a bank note does?—Yes, but it would be merely a party consenting to accept a debt due from another person in full discharge of the debt due to himself.

Q. 96. *Mr. Herries*—"Is not that a very common proceeding in trade?—I am not aware of that; if I am asked whether parties accept bills of exchange for debts, that is a fact, but whether they accept them in full discharge of a debt contracted, I am not aware.

Q. 97. *Mr. Gisborne*—"Do you consider a £10 note of a country bank, a joint stock bank, to rank under currency, or to rank under bills of exchange?—Under currency.

Q. 98. *Mr. Grote*—"Suppose there was a seven day post bill issued by a banker, would you consider that a part of the currency?—No.

Q. 99. *Mr. Labouchere*—"Suppose it was a seven day post bill issued by the Bank of England?—No, not until discharged.

Q. 100. *Mr. O'Connell*—"A cheque on the Bank is currency in London, is it not?—It performs the function of currency; it is a transfer of currency from one to another.

Q. 118. *Mr. Wood*—"Will you define what you mean as constituting the entire currency of the country?—I should define currency to be gold and silver, or the promises of bankers to pay on demand, which either constitute a legal tender, or which the public are willing to accept in lieu of coin in discharge of debts; I consider the currency in this country to consist first of coin in circulation; secondly, of Bank of England notes issued against bullion, and of Bank of England notes issued against securities; thirdly, of deposits in the Bank of England, payable on demand, the same as bank notes; fourthly, of notes issued by the Country Banks; and fifthly, of deposits in country banks in their own notes, which are of the same character as deposits in the Bank of England."

As to the meaning of deposits, and the general confusion as to the way in which they arise, see *DEPOSIT*. The witness was further examined at immense length, but the above gives the substance of his opinions.

Mr. Cobden was of opinion that no inflation of the currency would arise from bills of exchange, provided the money of the country were not previously inflated. There is a great distinction

between a bill of exchange and a bank note. A bill of exchange follows the trading transaction, and is merely a voucher for the transaction, in the shape of a transfer of the debt, or an acknowledgment of the debt; but a bank note put into circulation either in the purchase of public securities or in a loan, or in any other way, goes to the artificial creation of commercial transactions, and is not itself necessarily originated by the transaction. Bills of exchange can multiply only in proportion to commercial transactions, provided the currency be kept as a metallic currency.

Mr. Cobden said that with a metallic currency there would be no risk of any great extent of accommodation bills; an opinion which we think is scarcely warranted by the reality.

Q. 572. *Mr. Smith*—"Inasmuch as bills of exchange are used at Manchester as an instrument of exchange, do they not form part of the currency?—No; I have defined currency to be money; I cannot call a bill of exchange money; it is a promise to pay money at a certain time, and it is a security only for a certain time, after which all securities are forfeited."

Mr. W. R. Ward (Q. 674) considered currency to be coined gold, silver, and copper, and notes payable on demand, issued by the Bank of England and country banks.

Mr. Richard Page understood currency to mean the current money of a country, in which debts are discharged and commodities purchased and sold, and consisted of Bank of England notes and gold and silver. Country bank notes he considered only to be money by courtesy. He included deposits in the Bank of England; but as he gave to the word "deposit" an inaccurate meaning, we do not know what he would have done if he had understood the real meaning.

Mr. George Warde Norman, a Director of the Bank of England, was asked:—

Q. 1691. "Are there any grounds for considering the deposits of the Bank of England as currency?—No, I think not.

Q. 1692. "Do you consider that any deposits, merely in their character of deposits, can be considered as currency? No, I do not.

Q. 1693. "Will you state what, in your opinion, forms the distinction between currency and deposits?—I consider that, looking broadly at deposits and currency they are quite distinct; they have little to do with each other; but I conceive that the use of deposits is one of the banking expedients, which is available for economising currency, along with a great many others. I do not consider them as currency or money. I ought to observe, perhaps, to the Committee, that I employ the words 'money' and 'currency' as synonymous. Deposits are used by means of transfers made in the books of bankers; and these afford the means of adjusting and settling transactions, and *pro tanto* dispense with a certain quantity of money; or they may be set off against each other, from one banker to another, to a certain extent, and thus produce the same effect. Still they possess the essential qualities of money in a very low degree.

Q. 1694. "Do you entertain a similar opinion as to bills of exchange?—Yes, exactly; I think they are also used to economise currency; I look upon them as banking expedients for

that purpose; but they do not possess fully the qualities which I consider money to possess.

Q. 1695. "Will you explain the difference between the functions which money will perform, and those which bills of exchange or deposits will perform?—To answer that question fully, one must, I am afraid, take rather a wide view; but I look upon it that the three most essential qualities money should possess are, that it should be in universal demand by everybody in all times and all places; that it should possess fixed value; and that it should be a perfect numerator. There are other qualities; but I think these are the most essential. Now, when I look at all banking expedients, I find they do not possess these qualities fully. They possess them in a very low degree; and therefore, as we see took place in the autumn of 1835, with a very large increase of the deposits of the Bank, the circulation diminished, and there was every appearance of the effects of contraction; there was an increased influx of treasure, and I conceive from that there were lower prices. By a numerator I mean that which measures the value of other commodities with the greatest possible facility. If we look at all these banking expedients, we see that they possess the three qualities which I have mentioned in a very much lower degree.

Q. 1696. "Will you state in what respect?—I can only take them one by one. A bill of exchange is an instrument commonly payable at some future time, at a certain place, and to some particular individual; it is of no use to any other individual except it is indorsed to him; a man cannot go into a shop with a bill of exchange and buy what he wants; he could not pay his labourers with a bill of exchange. The same with a banker's deposit, he can do nothing of that sort with that; he can do with less money than he would otherwise employ, if he has bills of exchange, or bankers' deposits; but he cannot, with bills of exchange and bankers' deposits, do whatever he could with sovereigns and shillings. By a banker's deposit, I mean a credit in a banker's books; nothing more nor less than that."

MR. SAMUEL JONES LOYD, now LORD OVERSTON, was asked:—

Q. 2655. "What is it that you include in the term circulation?—I include, in the term circulation, metallic coin, and paper notes promising to pay the metallic coin to bearer on demand.

Q. 2661. "In your definition then, of the word circulation, you do not include deposits?—No, I do not.

Q. 2662 "Do you include bills of exchange?—No, I do not.

Q. 2663. "Why do you not include deposits in your definition of circulation?—To answer that question, I believe I must be allowed to revert to first principles. The precious metals are distributed to the different countries of the world by the operation of particular laws, which have been investigated and are now well recognised. These laws allot to each country a certain portion of the precious metals, which, while other things remain unchanged, remains itself unchanged. The precious metals converted into coin constitute the money of each country. That coin circulates sometimes in kind; but in highly advanced countries, it is represented to a certain extent by paper notes, promising to pay the coin to bearer

on demand; those notes being of such a nature in principle, that the increase of them supplants coin to an equal amount. Where those notes are in use, the metallic coin together with those notes, constitute the money or currency of that country. Now this money is marked by certain distinguishing characteristics; first of all, that its amount is determined by the laws which apportion the precious metals to the different countries of the world; secondly, that it is in every country the common measure of the value of all other commodities, the standard by reference to which the value of every other commodity is ascertained, and every contract fulfilled; and thirdly, it becomes the common medium of exchange for the adjustment of all transactions equally at all times, between all persons, and in all places. It has further the quality of discharging these functions in endless succession. Now I conceive that neither deposits nor bills of exchange in any way whatever possess these qualities. In the first place, the amount of them is not determined by the laws which determine the amount of the precious metals in each country; in the second place, they will in no respect serve as a common measure of value, or a standard by reference to which we can measure the relative value of all other commodities; and, in the next place, they do not possess that power of universal exchangeability which belongs to the money of the country. If the committee will allow me to refer to it, there is a passage in the report of the French Chambers which has recently been appointed to inquire into a subject very similar to that which this committee is now investigating, which seems to me to put the point of the universal exchangeability of money in a very striking way. 'Si l'on réfléchit en effet aux innombrables transactions commerciales qui s'opèrent chaque jour, depuis celles qui doivent fournir aux plus modestes consommations jusqu'à celles qui multiplient les spéculations, les plus entreprenantes du commerce international, on s'aperçoit aisément qu'elles ne s'accompliraient pas sans le secours d'une valeur intermédiaire qui puisse être mise successivement en rapport avec toutes les autres valeurs, et servir entre elles de moyen d'estimation et d'échange.'

Q. 2664. "Why do you not include bills of exchange in circulation?—I exclude bills of exchange for precisely the same reasons that I have stated in my former answer for excluding deposits. There is another passage in the same report which appears to me to shew very clearly that the French Chamber have fully appreciated the distinction between bills of exchange and money. 'Tout engagement par écrit de payer une somme due a pu devenir ce signe du numéraire; le signe a acquis quelques-uns des avantages de la monnaie circulante, lorsque, comme le billet à ordre et la lettre de change, il a pu être transmis par la voie facile et prompte de l'endorsement. Mais que d'entraves encore! Il ne représente pas à tout moments pour son détenteur la somme pour laquelle il a été souscrit elle peut n'être payable qu'à un terme éloigné, pour le réaliser immédiatement il serait nécessaire de la céder. Trouvera-t-on quelqu'un qui soit assez confiant pour l'accepter? On ne le transmettra qu'en le garantissant de sa signature; c'est une obligation éventuelle que l'on contracte

soi-même, et sous le poids de laquelle jusqu'au jour de l'échéance, on sentira son crédit gêné. On n'est pas toujours disposé à révéler la nature de ses affaires par les signatures que l'on met en circulation ces inconvénients devaient conduire à trouver un signe de numéraire plus actif encore et plus commode, qui participât, comme la lettre de change et billet à ordre, des qualités de numéraire métallique, puisqu'il n'a d'autre mérite que de le représenter mais qui permet de s'en procurer à tout moment; qui, comme la pièce de monnaie se transmet de main en main, sans avoir besoin d'être garanti, sans laisser de traces de son passage. Le billet au porteur et à vue, émis par des associations puissantes, formées sous l'autorisation et agissant sous la surveillance continuelle des gouvernements a paru présenter ces avantages. De là les banques de circulation.

Q. 2665. "Under similar circumstances, will the aggregate amount credited to depositors in bankers' books bear some relation to the quantity of money in the country?—During temporary fluctuations in the amount of circulation, all other things remaining unchanged, I conceive the amount of deposits will be affected by such fluctuations.

Q. 2666. "Is the amount of bills of exchange dependent in some degree on the quantity of money?—I apprehend that it is dependent in a very great degree. I consider the money of the country to be the foundation, and the bills of exchange to be the superstructure raised upon it. I conceive that bills of exchange are an important form of banking operations and the circulation of the country is the money in which these operations are to be adjusted; any contraction of the circulation of the country will of course act upon credit; bills of exchange being an important form of credit will feel the effect of that contraction in a very powerful degree; they will in fact be contracted in a much greater degree than the paper circulation.

Q. 2667. *Sir Robert Peel*—"What are the elements which constitute money, in the sense in which you use the expression 'quantity of money?' What is the exact meaning you attach to the words 'quantity of money—quantity of metallic currency?'—When I use the words quantity of money, I mean the quantity of metallic coin and of paper notes, promising to pay the coin on demand, which are in circulation in this country.

Q. 2668. "Paper notes payable by coin?—Yes.

Q. 2669. "By whomsoever issued?—Yes.

Q. 2670. "By country banks as well as other banks?—Yes.

Q. 2671. *Chairman*—"Would this superstructure, consisting of sums credited to depositors in bankers' books and bills of exchange, equally exist, although no notes payable in coin on demand existed in the country?—Yes, I apprehend that every question with respect to deposits, and with respect to bills of exchange, is totally distinct from the question which has reference to the nature of the process of substituting promissory notes in lieu of coin, and of the laws by which that process ought to be governed. If the promissory notes be properly regulated, so as to be at all times of the amount which the coin would have been, deposits and bills of exchange, whatever changes they may undergo, would sustain

those changes equally, either with a metallic currency, or with a paper currency properly regulated; consequently, every investigation respecting their character or amount is a distinct question from that which has reference only to the substitution of the paper notes for coin.

Q. 2672. "There would be no reason why, if there were no notes payable in coin on demand, the amount of this superstructure should be less than it now is, with a mixed circulation of specie and of notes payable on demand?—None whatever. I apprehend that, upon the supposition that the paper notes are kept of the same amount as the metallic money, the question of the superstructure, whether of deposits or of bills of exchange, remains precisely the same.

Q. 2673. "That answer takes for granted that, in the first case, the metallic currency, and in the second case the metallic currency, plus the notes payable on demand, are the same in quantity?—Yes.

Q. 2674. *Sir Robert Peel*—"You suppose the notes payable on demand to displace an amount of coin precisely equal to those notes?—They ought to do so under a proper regulation of the paper money, otherwise they are not kept at the same value as coin.

Q. 2675. *Mr. Attwood*—"Would you consider that the superstructure of bills of exchange, founded entirely upon a metallic currency, might, at particular times, become unduly expanded?"—The answer to that question depends entirely upon the precise meaning of the word unduly, I apprehend, undoubtedly that it is perfectly possible that credit, and the consequences which sometimes result from credit, viz., overbanking in all its forms, and the over-issue of bills of exchange, which is one important form of overbanking, may arise with a purely metallic currency; and it may also arise with a currency consisting jointly of metallic money and paper notes promising to pay in coin; and I conceive further, that if the notes be properly regulated, that is, if they be kept at the amount which the coin otherwise would be, whatever overbanking would have arisen with a metallic currency, would arise and to the same extent, neither more or less, with money consisting of metallic coin and paper notes jointly.

Q. 2676. "May not overbanking and over-issue of bills of exchange, forming a superstructure based upon money composed of metal and paper notes, derange the certainty of the notes being duly paid in gold?—I apprehend that if the paper notes be properly regulated, according to the sense which I have already attributed to that expression, and if a proper proportion of gold be held in reserve, the solidity of the basis cannot be disturbed; that is, that if there be a proper contraction of the paper notes as gold goes out, the convertibility of the paper system will be effectually preserved by the continually increasing value of the remaining quantity of the currency, as the contraction proceeds.

Mr. Tooke was asked—"In using the term 'circulation' of the Bank of England, what do you include in that term?—I include in that term only the Bank notes in the hands of the public. In order to avoid confusion, perhaps the Committee would allow me to state the meaning which I attach to the different terms 'currency'

and 'circulating medium.' The currency I consider to be, in strictness of language, according to the apparent derivation of the term, that part of the circulating medium, such as the coin of the realm, and Bank of England notes and country bank notes (although not a legal tender) which pass current from hand to hand, without individual signature, such as appears on drafts or endorsements. I am doubtful whether cheques on bankers might not be included, from their perfect similarity to Bank notes, in many of the purposes for which they are employed; at the same time there is the feature of distinction which I have mentioned, viz., that cheques require the signature of the party passing the draft, and that they do not pass from hand to hand. Bills of exchange I consider as a part of the general means of distributing the productions and revenues of the country, and therefore as constituting a part of the circulating medium. I consider, also, that the simple credit by which goods are in many instances bought and sold, come likewise under the general description of the circulating medium, in as far as the prices of commodities are in question; because a simple contract of sale, whether any payment eventually passes or not, is commonly entered in the price currents without distinction from those for which any actual payment is made. I cannot consider that transferable debts constitute circulating medium, but only the actual transfers.

Q. 3279. "What do you mean by transferable debts?—The deposits in the hands of bankers, against which the depositors are entitled to pass their drafts.

Q. 3280. *Mr. Grote*—"You include not simply transfers of deposits in the hands of the Bank of England, but also transfers of deposits in the hands of other bankers?—Yes; transfers of deposits generally.

Q. 3221. *Chairman*—"Do you then consider a deposit to be a transferable debt owing by the banker to the depositor?—Yes.

Q. 3282. "In the use of the term 'currency' in your future examination, do you propose, in addition to coin, Bank of England notes and country bank notes, to include cheques upon bankers?—Yes; I think upon the whole the distinction I have mentioned is not sufficient to exclude them, and therefore I shall propose to consider them as included.

Q. 3283. *Mr. Warburton*—"By cheques, you mean cheques actually drawn, and passing from one person to another?—Yes; that which is current in fact.

Q. 3284. "Will you be good enough to state what you propose to include in the word 'circulation' in the course of your future examination?—I propose to include in the term 'circulation' the notes of the Bank of England, and of country banks, payable on demand.

Q. 3285. "What do you mean by 'circulating medium'?—I mean all instruments of interchange by which the productions and the revenue of the country are distributed; everything which serves and is received as a mode of payment, or which constitutes nominal money-price which appears in price currents.

Q. 3286. "*Mr. Grote*—There is the currency and there are also certain expedients for economizing the use of the currency; you would call

both one and the other of those, portions of the circulating medium?—Precisely.

Q. 3287. "Do you include, in the word 'currency,' bills of exchange?—No.

3288. "If you include, in the term 'currency,' a crossed cheque payable at a banker's, to be presented therefore at the clearing house, and having therefore before presentation not more than seven or eight hours to run, why is it that you do not include in the term 'currency' a bill of exchange payable also at a banker's, falling due to-morrow, and having, probably, not more than about 24 hours to run?—It is only a question of the general acceptance of the term; there is no essential distinction in the particular case. I may perhaps be allowed to say, that the only question as to the employment of different descriptions of circulating medium is referable to the combined considerations of economy, convenience, and security.

Q. 3289. "If the cheque, according to the supposition in the former question, be included in the term 'currency,' will not a bill of exchange due to-day, payable at a banker's, be entitled also to be included in that term?—It is only a question of convenience in the classification; I am not aware that it is of any importance in practical operation.

Q. 3290. "Bills of Exchange having, previous to maturity, one, two, three, four or more days to run, differ in character by insensible degrees from a crossed cheque, a crossed cheque being that bill which has the shortest time to run?—They differ in character by insensible degrees, and likewise in the trifling difference of convenience from their not being used till maturity, unless under a calculation of discount.

Mr. Tooke then started a theory which, like many others, is true in some cases, and which we believe he was the first to notice, but which he pushed to an extreme, which drew out some just strictures from Colonel Torrens.

Q. 3292. *Mr. Hume*—"Will you state what part of the currency or circulating medium affects prices, under the definitions which you have now given?—No one part of them affects the prices of commodities more than any of the other parts.

Q. 3293. *Mr. Grote*—"Do you mean not more in degree, or not in any different way?—Not more in degree.

Q. 3294. "You mean that every portion of that which you have described under the name 'circulating medium' is perfectly equal to every other portion in the effect which it produces upon prices?—Perfectly so.

Q. 3295. *Mr. Hume*—"Do you mean that every transaction of purchase or sale by any of the means which you have mentioned, as included in the circulating medium, equally affects prices?—Yes; and that was my reason for caring so little about making a distinction among them; I doubt whether they operate upon prices at all.

Q. 3296. *Mr. Grote*—"You mean that none of these items which you have enumerated under the general term 'circulating medium' have in your opinion any effect upon prices?—Yes; I mean that they are not operative causes of prices.

Q. 3297. *Mr. Hume*—"What is it, then, which does affect prices?—The cost of production limiting the supply on the one hand, and the pecuniary

means of the consumer limiting the demand on the other.

Q. 3298. "Will not the variations in the quantity of the circulating medium affect prices?—No.

Q. 3299. "Will it not, if abundant, be more at the disposal of individuals for purchases than when it is scarce?—It will be more easily disposable, but it will not be necessarily so disposed of. I believe that the amount of the circulating medium is the effect, and not the cause, of variations in prices."

Such are the various opinions and arguments brought forward to draw a distinction between bills and notes as currency, and we may now examine them seriatim.

I. *That Bills of Exchange are only the Evidence of a Debt.*

This is equally true of Bank Notes, and we have seen that money itself, by the acknowledgment of a long series of writers, is itself nothing more than the evidence of debt. It is a general Bill of Exchange upon all the commercial community; and is only the highest and most general form of credit. The payment of a Bill in money is [only the exchange of a particular and precarious instrument of credit for a general and permanent one.

II. *That Bills of Exchange do not discharge Debts, but they require to be paid in Currency.*

It is a very great error, indeed, to say that Bills of Exchange do not discharge debts. We have said something more below about the effect of taking Bills of Exchange for debts. But Bills of Exchange the day they become payable, are payable on demand like cheques and bank notes, and they are set off against each other among bankers, and at the Clearing House in London, to the amount of several millions daily. They discharge each other by mutual set-off, just in the same way that notes and cheques do. There are, besides, other ways in which Bills are paid, as is fully shewn under *Banks* § 32 and *Credit* § 208. A Trader, when his bills become due, discounts fresh bills with his banker, who creates fresh credit, and bills are paid by giving cheques on this credit.

Mr. NORMAN said that money or currency should possess fixed value, and be a perfect numerator. But how can money or any thing possess *fixed* value, when its value is changing from hour to hour?—An instrument of credit may preserve an equality of value with respect to money, but not with respect to anything else, unless it is expressed to be payable in it. He said that he meant by a numerator that which measured the value of other commodities with the greatest facility. Why does a promise to pay £50 measure the value of things with less facility than £50 itself?

Mr. LOYD's doctrines will be more fully considered under *CURRENCY PRINCIPLE*, where the arbitrary assertions on which that doctrine rests are examined. It is not a little amusing to find the celebrated phrase of the Roman Catholic Church—*Quod semper, quod ubique, quod ab omnibus*, starting up and meeting us in a discussion on currency. In Mr. Loyd's opinion money and currency are identical, and include the coined

metallic money, and the paper notes promising to pay the bearer coin on demand; and, he says, that the characteristic of their being money is, that they are received equally at '*all times, between all persons, and in all places.*' For the sake of shortness, let us designate this phrase by 3A, from the three alls in it. He excludes Bills of Exchange from the designation of currency, because 'they do not possess that power of universal exchangeability which belongs to the money of the country.' This definition is fatal to Mr. Loyd's own view. In fact, if it be true, there is no such thing as money or currency at all. In the first place, it at once excludes the whole of bank notes. The notes of a bank in the remote district of Cumberland would not be current in Cornwall, *therefore* they are not 3A's, *therefore* they are not currency. Again, the notes of a bank in Cornwall would not be current in Cumberland, *therefore* they are not currency. Similarly there are no country bank notes which have a general currency throughout England, *therefore* no country bank notes are 3A, *therefore* no country bank notes are currency. Till within the last thirty years or so, Bank of England notes had scarcely any currency beyond London and Lancashire; in country districts a preference was universally given to local notes, *therefore* Bank of England notes were not 3A, they had not a power of 'universal exchangeability,' *therefore* they were not currency. Bank of England notes would even now not pass throughout the greater part of Scotland. If *therefore* the test of 3A and 'universal exchangeability' be applied, the claims of all bank notes to be considered as currency are annihilated at once. The acceptance of a Baring or a Rothschild would be received in payment of a debt by a far larger circle of persons, than the notes of an obscure and remote country bank.

But the universality of Mr. Loyd's assertion is fatal to his argument in other ways. On the Continent, silver is the legal standard of value; in England, silver, like copper, is merely coined into small tokens, called shillings, &c., which are made to pass current above their natural value, and are only legal tender for a very trifling amount, hence it cannot be used in the adjustment of *all* transactions, *therefore* it is not 3A, *therefore* it is not currency. There are other countries where gold is not a legal tender, *therefore* it fails to satisfy Mr. Loyd's test, *therefore* it is not currency. If then the test proposed by Mr. Loyd be considered as correct, it is easy to see that there is no substance or material whatever that will not fail under it, and *therefore there is no such thing as currency.*

The fact is that the only difference between a Bill of Exchange and a Bank Note is, that the former is a promise of a deferred payment and the latter that of an immediate one, and there is less risk in taking the latter than the former. From these circumstances a Bank Note possesses a greater *degree* of circulating power than a Bill of Exchange. But in the midland counties of England it used to be quite common for the banks to issue the Bills of Exchange they had discounted with their own indorsement upon them. In which respect they were in every way equivalent to Bank Notes; moreover, there is not the same inducement to put a bill into circulation as a

Bank Note, because the former increases in value as the day of payment approaches. But it is unprofitable to keep a note idle. But it is to the last degree unphilosophical to maintain that these two obligations are of different *natures*, because they are adapted to circulate in different *degrees*.

We may quote from Colonel Torrens, as he expresses a view that is by no means uncommon, but which is quite erroneous. He says (*The Principles and Practical Operation of Sir Robert Peel's Act of 1844, explained and defended*, p. 79) "The term money and currency have hitherto been employed to denote those instruments of exchange which possess intrinsic or derivative value, and by which from *law or custom* debts are discharged and transactions finally closed. Bank Notes payable in specie on demand have been included under these terms as well as coin, because by law and custom the acceptance of the notes of a solvent bank, no less than the acceptance of coin, liquidates debts and closes transactions; while Bills of Exchange, bank credits, cheques, and other instruments by which the use of money is economised have not been included under the terms money and currency, because the acceptance of such instruments does not liquidate debts and finally close transactions."

It is upon such views as these that the opinion of those rests who maintain that Bills of Exchange are not currency or circulating medium. They suppose that Bank Notes pass without indorsement, and that Bills of Exchange do not. Even if that were true, it would not be any valid ground for the distinction, because such a thing would in no way affect the nature of the instrument. It is wholly untrue to suppose that Bank Notes and money are the only things which close transactions. By the table given above, it is seen that upwards of 96 per cent. of commercial payments and receipts were made by Messrs. Morrison and Co. in instruments of Credit, other than Bank Notes.

But it is a very great mistake to say that Bank Notes pass without indorsement, and Bills of Exchange do not. At the time the Bank of England was founded, it was quite illegal for any such thing as promissory notes to pass by assignment. The negotiability of Bank Notes had to be provided for by the Act. It was enacted, *BANKING IN ENGLAND*, § 72, x., that all the Bank's bills obligatory and of credit, made or given to any person, might *by indorsement of such person* be freely assigned to any person who should voluntarily accept them, and so by such assignees *toties quoties* by indorsement thereon, and all such assignees might sue thereon in their own names.

The assignment of the goldsmiths' notes, or the private bankers' note, was held to be illegal much later than this. In 1703, *BANK NOTE* § 39, it was decided that no promissory notes were assignable or indorsable over within the custom of merchants. In 1704, the act was passed which allowed promissory notes to be assigned by indorsement like Bills of Exchange. It is true that the *custom* of indorsing Bank of England Notes, and it is probable country bank notes too, soon fell into disuse, but that makes no difference in the *law* of the subject.

The case of *Miller v. Race* has often been

quoted in support of the Doctrine, that Bank Notes are money or currency, to the exclusion of Bills of Exchange, but the true bearings of that case have been completely misunderstood. The case is fully discussed under *BANK NOTE* § 37-45 where it is shewn that the whole point turned on how the property in a stolen note would pass, and it was held that it would pass like that of a stolen Bill of Exchange. It had long been held that, for the convenience of commerce, the innocent holder for value of a stolen Bill should be able to retain it against the former owner, just as if it were money, to which this principle had long been applied. By the case of *Miller v. Race* this principle was *extended* to Bank Notes, and it has been confirmed by numerous cases since. The only effect of this case was that the principle which Bills had in common with money, was now held to extend to notes, so that, if there be any force whatever in it, it proves that Bills were held to be currency long before notes.

It is also an error to suppose that Bills of Exchange require an indorsement at each transfer. A Bill of Exchange may be made payable to bearer, and then it requires no indorsement at all. Bills, however, are generally drawn payable to order, and then they require that the payee should indorse them; but he may do that without making himself liable on them, as is done in many cases. After the first indorsement in blank, the Bill is payable to bearer, and may be passed by mere delivery, in all respects like a Bank Note. "And," says Mr. Justice Byles (*A Treatise on the Law of Bills of Exchange*, &c., 8th Edit., p. 146), "a transfer by mere delivery, without indorsement, of a Bill of Exchange or promissory note made or become payable to bearer, does not render the transferer liable *on the instrument* to the transferee."

"And it is conceived to be the general rule of the English law, and the fair result of the English authorities, that the transferer is not even liable to refund the consideration, if the bill or note so transferred by delivery, without indorsement, turn out to be of no value by reason of the failure of the other parties to it. For the sending to market of a bill or note payable to bearer without indorsing it, is *prima facie* a sale of the bill. And there is no implied guarantee for the solvency of the maker, or of any other party."

"If a bill or note, made or become payable to bearer, be delivered without indorsement, not in payment of a pre-existing debt, but by way of exchange for goods, for other bills or notes, or for money transferred to the party delivering the bill at the same time, such a transaction has been repeatedly held to be a sale of the bill by the party transferring it, and a purchase of the instrument, with all risks by the transferee. 'It is extremely clear,' says Lord Kenyon, 'that if the holder of a bill send it to market without indorsing his name upon it, neither morality, nor the law of this country will compel him to refund the money for which he sold it, if he did not know at the time that it was not a good bill.' So where A gave a bankrupt, before his bankruptcy, cash for a bill, but refused to allow the bankrupt to indorse it, thinking it better without his name, and afterwards, on dishonor of the bill, proved the amount under the commission, the Lord Chancellor ordered the debt to be

expunged, observing, that this was a sale of the bill. So, if a party discounts bills with a banker, and receives, in part of the discount, other bills, but not indorsed by the banker, which bills turn out to be bad, the banker is not liable. 'Having taken them without indorsement,' says Lord Kenyon, 'he has taken the risk on himself. The bankers were the holders of the bills, and, by not indorsing them, have refused to pledge their credit to their validity; and the transferee must be taken to have received them on their own credit only.' So where, in the morning, A sold B a quantity of corn, and, at three o'clock in the afternoon of the same day, B delivered to A, in payment, certain promissory notes of the Bank of C, which had then stopped payment, but which circumstance was not at the time known to either party. Bayley, J., said, 'If the notes had been given to A at the time when the corn was sold, he could have no remedy upon them against B. A might have insisted on payment in money, but, if he consented to receive the notes as money, they would have been taken by him at his peril.' Such seems the general rule governing the transfer by delivery, not only of ordinary Bills of Exchange and Promissory Notes, but also of Bank Notes. Nor is there any hardship in such a rule, for the remedy against the transferer may always be preserved by indorsement, or by special contract."

While it has always been acknowledged that the delivery of a bill without indorsement, in exchange for a valuable consideration, is a sale of it, it has frequently been said that, if the bill be indorsed, it is only a loan. We have pointed out the ambiguity of the word *loan* under CREDIT § 61. It is often said that a banker lends his customer money on the security of bills. But this is an inaccurate mode of statement. What the banker does is to buy a debt due to his customer, and when he indorses the bill, his customer gives him a limited warranty of its soundness. If the banker lent his customer the money it would be his duty to repay it. But that is not so. It is the acceptor's business to pay the bill, and if he do not do so, the banker may, by giving his customer immediate notice and making a demand, make his customer take back the bill, and repay the money. But if the banker fail in giving immediate notice his remedy against his customer is gone.

But the *Law of Continuity* shews the fallacy of the doctrine that Bank Notes payable to bearer on demand alone are currency. Mr. Loyd rigorously restricts the term to such notes. But would not notes payable one minute after demand be currency? or one hour? or two, or three, or four hours? Would not notes payable one day after demand be currency? or two or three days? Mr. Loyd denied that Bank post bills which are issued, payable seven days after sight, are currency. According to this doctrine, if a man deposits money in the Bank and receives in exchange for it a Bank Note payable on demand—that is currency; but, if he ask, for his own convenience, for a note payable seven days after sight—that is not currency! But the note becomes payable on demand on the seventh day after sight, and then, by their own definition, it is currency. What was it before? It used formerly to be

the custom for banks in the country to issue notes payable 20 days after demand. These notes circulated and produced all the effects of money. What were they, if they were not currency? Cheques are payable on demand. How are they not currency as much as notes? How are Bills of Exchange not currency on the day they become payable? And, if they are so then, what were they before? It is quite plain that there can be but one answer. They are all species of currency, though differing in degree, and the distinction between them is untenable.

It would be too long to mention the host of writers who have expressly included all forms of paper credit under the title currency. Mr. Mill truly says there is no generic distinction between bills and notes. We rejoice to say that M. Michel Chevalier is entirely of the same opinion as ourselves. In his treatise *La Monnaie*, sect. 3, ch. v., after shewing the untenable nature of the distinction set up between Bank Notes and Bills of Exchange, he says—"La langue Anglaise a un mot générique qui embrasse la monnaie, le billet de banque, le papier-monnaie on assignat non convertible en espèces, et tout autre espèce de titre qu'on peut mettre dans la circulation et qu'accepte plus ou moins le commun des hommes: c'est le mot de *currency*. Notre langue n'en offre pas l'équivalent parfait. Cependant le terme de *numéraire* pourrait être pris dans le même sens, et je l'emploierai ainsi dans la suite de cet écrit." And in the number of the *Journal des Economistes* for August, 1862, in which the same distinguished writer has published the substance of a Report to the Imperial Institute of France on our *Elements* and this work, he re-affirms the same opinion. After explaining the ideas contained in the former part of this article, he says—"A ce même point de vue, et sous le bénéfice de ce commentaire, la relation intime qu'établit M. Macleod entre la notion de la *currency*, et l'idée d'une dette ou d'une obligation sérieuse et positive a un mérite incontestable."

But, while we contend that Lord Overstone's criterion of a currency is fatal to his own view, we are quite willing to accept it. For what is it that exists in all places, in all times, and among almost all persons? *DEBT, or SERVICES DUE.*—And what is it that is universally required to measure, record, and transfer them? *Some material.* But we see that all currencies are more or less local, none are universal. The idea, or the want alone is universal. The notes of a country banker, only circulating in his own neighbourhood, are like a country *patois*, each district has its own. A national currency rises to the dignity of a language. But even that is only local, on a larger scale. The ideas only expressed in the language are universal. We are therefore strengthened in our conviction, that the only true idea of a currency is, that it is the *Representative of Transferable Debt*, and that *whatever represents Transferable Debt is Currency.*

On Paper Currency, or Paper Credit and Paper Money.

The currencies made of the various substances we have spoken of, were what we may call natural currencies, that is, the substance being selected, it found its exchangeable relations with other things according to the general laws of

value. There is no instance that we are aware of, except one, in ancient times, of what we may call an artificial currency, like that of paper, which has played such an important part in modern times. The only artificial currency that is spoken of, we believe, in ancient times, is that mentioned in the *Eryxias*, a dialogue, which passes under the name of *Æschines Socraticus*. In discussing the nature of wealth, the author, under the name of Socrates, says:—"For the Carthaginians, for instance, use money of this sort; in a small piece of leather something is sewed up of the size of a stater. But what that is which is sewn up no one knows, except those who did so. Then a stamp is put on it, and they use it as money; and whoever has most of this seems to possess most wealth, and to be most opulent. But if any one had ever so much of it amongst us, he would be no richer than if he had so many pebbles from the mountain."

Such is the only meagre notice we have of a fact of considerable interest. We are left entirely in the dark as to who were the issuers of this money, and what were its conditions. The Greeks had some knowledge of credit in its simplest form, that of a direct and simple loan of money, but there is no trace, that we are aware of, of the distinguishing feature of credit, viz., putting the debt itself into general circulation. The Romans invented cheques upon bankers, and therefore, to a certain small extent, we may suppose that they practised the transferability of debts. It is to the Chinese that belongs the unquestionable merit of inventing circulating credit. They also first experienced the miseries caused by the abuses of paper money.

We have already, under **BANKING**, § 570, quoted from Klaproth an account of the first Chinese bank notes. But the subject of Chinese money is treated at great length by M. Edouard Biot in four memoirs in the same periodical, the *Journal Asiatique*, Vol. XXX., p. 422; and Vol. XXXI., pp. 97, 209, and 441. These memoirs detail at considerable length the complete monetary system of the Chinese from the earliest times, both metallic and paper; but we shall confine ourselves here to the paper money. It is sufficient to say that the Chinese Emperors ran through the same course of depreciating their coinage, and with the same results, as took place in European countries many centuries afterwards.

According to the ancient Chinese chronicles, barter prevailed in that country in the earliest ages, as among all nations. The first currency used was shells, as in India and the South Sea Islands. These shells were called *pei*, and the memory of their use is preserved, as the Chinese character for a shell is used as the sign of riches, and is an element in all words relating to wealth and buying and selling. Between the twenty-fourth and the twelfth centuries before the Christian era it is stated that three metals, yellow, white, and red, were used as money. These were gold, silver, and copper, or, as some say, iron.

Some historians say that Iu, the founder of the Hia dynasty, established three classes of money. The first included pearls and jade; the second gold; and the third *pou* and *tao*, though it is not very well understood what these were. Some of it was also called *houey*, or tortoiseshell,

because it is supposed that tortoiseshell was originally used as money.

About the eleventh century B.C. the Emperors made great efforts to insure a uniformity in the medium of exchange. One of the nine great officers of state was called *tsuen-kouan*, or Officer of the Coinage. The word *tsien* or metallic money was afterwards used. The highest species of money was ordered to be gold, in cubes of one *tsun* to the side, and weighing a *kin* or Chinese pound. The *tsun* is calculated to be 20^{mm} French, and the *kin* to be 166 grammes. Copper money was also struck, round and pierced with a square hole, for the convenience of stringing it. The copper unit was called *chu*, and was the 384th part of the pound, but the value of the two metals is not stated. Besides this, cloth and silk were used as money, and called *pou-pe*. The unit of this was called *py*, and was about eight metres long and 0^m.44 wide.

Various changes took place in the coinage which we must pass over. In 230 B.C., Thsin-chi-hoang reduced all China under his power, and ordered a uniform coinage throughout the Empire, gold and copper were the only legal money. The circulation of silver, tin, jade, pearls, and tortoiseshell was suppressed.

The year 807 A.D. is memorable as that in which that wonderful agent paper currency was invented. Great troubles had agitated the Empire, attended with their usual effect of disorganizing the coinage. The Emperor Hian-tsung ordered the merchants to deposit their specie in the Imperial Treasury, and gave them Bills of Exchange, called *fey-t sien* or flying money, payable at the principal towns of the provinces. The convenience of these bills was so great, and so soon appreciated, that all the great officers of the state and rich men hastened to deposit their specie in the Treasury, and receive *fey-t sien* in Exchange. For some reason this system was abolished in three years. In 811, the public officials reported that since the abolition of the *fey-t sien*, private persons had begun to hoard up their money, which had become so scarce that prices were falling. In consequence of this, merchants were permitted to deposit salt and iron at the *hou-pou* or Finance Offices, and receive *fey-t sien* in return. These *fey-t sien* were used as Bills of Exchange between the Capital and the Provinces.

In 970, during the reign of Tai-tson, there was great monetary disorder, and the old expedient of *fey-t sien* was revived. Merchants were invited to deposit their specie in the public treasury, and they received bills payable in the principal towns of the Empire. These were called *pien-t sien* or convenient money. The plan was received with the greatest favor, the specie flowed in, and the issues of paper greatly increased. Similar banks were established in the provinces, and soon became very large. The *pien-t sien* were made legal tender in commerce. In 997, the Government had received in deposit 1,700,000 taels of silver. In 1021, the sum had increased to 2,830,000 taels, equal to about 21,225,000 francs.

These issues were made by the Government, and we see that they were merely in exchange for a similar amount of bullion. This was, therefore, an example of the "Currency Principle."

But, about the same time, the first issues of private circulating paper took place. A certain Tchang-yang seems to have been the inventor of this terrible engine. In the province of Chu, which is the modern Sse-tchuen, the money was made exclusively of iron, and was, of course, very inconvenient. Tchang-yang issued bills called *tsy-ichy*, and also *kuen*, to represent this iron-money. Under the reign of Teking-tsong, from 997-1022, this invention spread greatly. Private bank notes, called *kiao-tseu*, payable every three years, were allowed to be current for sixty-five years. They were for a tael of pure silver. A joint-stock company of sixteen of the richest merchants was formed, with power to issue such notes. The company at first succeeded very well, but new and inexperienced members having replaced the older ones, the company became bankrupt, and caused much misery and litigation. The *kuen* or *tsy-ichy* were payable in a different place to where they were issued. They thus resembled Bills of Exchange in their origin. The *kiao-tseu* were like bank notes, but only payable once in three years.

This bank, the first joint stock bank of issue, failed in 1017, but the invention was found to have so many conveniences, that a commission was appointed to report whether the State might not found a bank of *kiao-tseu*. The Commission reported in favor of the plan, and in 1023, a State Bank was founded at Y-tcheon, the capital of Chu. It issued notes payable every three years, as the former ones, and all private issues were forbidden. In 1032, it was found that its issues were 1,256,340 taels, or about 9,422,550 francs. The edict founding it ordered that it should have a capital of 360,000 taels in specie. The *pien-tien* gradually disappeared before the *kiao-tseu*. In 1060, punishment of death was enacted against forgers of *kiao-tseu*.

In 1069, the Government established a Bank of *kiao-tseu*, at Lou-tcheon, in the province of Ho-tong. In 1070, it founded a similar one in Chen-sy to pay the army contractors in *kiao-tseu* instead of *tchao*, or short dated bills, as they had been used to. The contractors were so discontented that the Government had to give up the plan, but the bank was kept up.

The *kiao-tseu* were redeemable in three years. The holder might have specie or new bills at his option. They seem to have been so popular, that in 1072, when seventeen of the twenty-two terms had expired, only 6,340 taels of paper had been paid off, and it was decided to create a new series of *kiao-tseu* of twenty-five terms, to the amount of 1,250,000 taels, to redeem the old series. In 1076, on pretence that the merchants made too great profits at the expense of the Government, the issue of *kiao-tseu* was suspended in Chen-sy. In 1094, it was observed that trade had drawn a large number of *kiao-tseu* to Chen-sy, and the province where they were issued was in want of them. To remedy this a creation of 150,000 taels for one term of three years was allowed.

In 1102 issues of *kiao-tseu* were resumed in Chen-sy. In 1107 those of Sse-tchuen were replaced by other obligations, called *tsien-yn*. About this time the abuses of paper money, which have been so frequently practised in modern times, began. The Tartars were now invading the country; and the Chinese Emperors

had no resource except to create immense issues of *kiao-tseu*. A new series was created, payable every year, of which one of the new was equal to four of the old. The *kiao-tseu* were replaced by *tsien-yn* of forty-three terms, payable every year. In all commercial payments above 10,000 *tsien* one-half was ordered to be paid in *tsien-yn*, and one-half in copper. These orders created great discontent among the people. Each *tsien-yn* of 1,000 *tsien* had fallen to 100. In 1107-1121 the banks for the issues of *tsien-yn* were relieved from the necessity of cash payments, and the issues were enormously increased. The *min* of 1,000 *tsien* had now fallen to 10 *tsien*. Shortly after this they were suppressed. They never circulated in Fo-kien, Kiang-tche, or Hou-Kouang; but chiefly in King-tong-si, Hoai-nan, and Cai-fong-fu, where the court was, and the northern provinces, where there was always a scarcity of money to carry on the war.

In 1131, after the Tartars had conquered the northern provinces, the money was in the greatest disorder. To pay the troops new bills, called *kouan-tseu*, were created, which were payable in the interior. But when the time for payment came, the government could only pay one third part of their value, and so they fell to a heavy discount. In 1133 new issues were made.

In 1158, under the same Emperor, the copper vessels of private persons and of the religious sects were confiscated. In 1160 the officers of state were not allowed to have more than 20,000 *min* or 150,000 francs in money, and private persons half as much. All gold and silver was ordered to be brought to the treasury; and in exchange bills for tea, salt, and other things were given. In 1159 new state bonds, called *kouan-tseu* and *kong-kue* were created, the former for three years, and the latter for two. The provinces Hoai-sy and Hon-kouang received 800,000 taels, or 6 million francs, of the former; Hoai-tong received 400,000 taels of the latter. They were divided in notes equal to 750 and 7,500 francs.

In 1160 new bills, named *hoei-tseu*, were issued on bullion in the Treasury; and the government declared that they would only use them in the purchase of the annual supplies of salt and other necessaries, and not for state expenses. In 1162, death was denounced against forgers of these bills. Each bill was for 1000 pieces, (or 7.50 francs,) and was called a *tao*. Their circulation was at first limited to Liang-tche, but it was soon extended to Tche-kiang, Hon-kouang, and Pe-king-sy. The government paid half in specie, and half in *hoei-tseu*, and ordered the same in private payments. In 1163, the new Emperor Hiao-tsung created *hoei-tseu* of 500, 300 and 200 pieces (or 3.50, 2.25, and 1.50 francs). No term of payment was mentioned, and so they rapidly fell to a heavy discount. In 1166, the Emperor issued 1,000,000 ounces of silver to buy them up.

In 1137, a report stated that in Chu or Sse-tchuen, which was the parent of paper money, there was a mass of 37,800,000 of taels in circulation, or 284 millions of francs. In 1160, it had increased to 41,470,000 taels or 311 millions of francs. The iron specie amounted to 700,000 taels, or 5,250,000 francs.

In 1167, a minister reported to the Emperor that from 1160, to the second month of 1166, more

than 28 millions of *tao* had been issued. Of *hoei-tseu*, and during that year, 15,600.00 more *tao* had been issued, and it appeared that the Treasury paid out each month from six to seven hundred thousand taels, or from 4.5 to 5.25 million francs, for the expenses of the state. On the other hand the Generals refused every thing but specie, and the Governors of the provinces refused the state paper in payment of taxes. This greatly depreciated their value. The paper on which they were printed was so bad, that five millions wanted to be renewed. The Government said it would issue new notes at the rate of 100 *tsien* for every 1000 *tsien* of the old ones. This new fraud greatly increased the public distrust.

In 1168, the exchange of the old for the new *hoei-tseu* began. They had an échance of three years like the *kiao-tseu*, and each series amounted to ten millions *taels*, or 750 million francs. A commission of 2 per cent. was charged on the exchange. But only the old ones which had the words *kouan* (thousand) and *pe* (hundred) still legible, were exchanged at their nominal value. The verifiers had to distinguish the forged notes, and trace them to their first issuer, for which they received a large recompence. The old ones were only allowed four months to be exchanged, after that they were not to be current.

In 1175, the necessity for funds to carry on the Kin war made the government resort to measures which ruined commerce and public credit. The tax collectors imputed the scarcity of money to the merchants, who were forbidden to export any. Every merchant vessel was searched before leaving by a special officer who gave it a passport. But the merchants embarked their specie in little boats before the visit of the inspector, who probably took care not to see too much. Severe penalties were denounced against all who took away money, but in 1179, these severe decrees could not be carried out; and merchants were allowed to take with them a small quantity of specie.

The government by several decrees in 1176, put off the payment of the several series of *hoei-tseu* till 1197. In 1195, Ning-tsong declared that each series of *hoei-tseu* should consist of thirty millions of *min*, or 225 million francs. In 1200, it was found that the quantity of bills called *tchuen-yn* in circulation was more than fifty-three million of *min*, or three hundred and ninety-five million francs; and besides that there were an almost equal quantity of bills at three terms.

In 1163, the government had created a local paper money, to circulate in the provinces on the river Hoai. The *hoei-tseu* were prohibited in these provinces; and at the tolls on the river, tickets were issued to serve as an intermediary between the two currencies. Copper money was forbidden in these provinces, and iron only was allowed. The people were so discontented that the decrees had to be rescinded. In 1221, more than 300,000 *min* of this local paper money was issued. The Government always tried to emit the greatest quantity of paper money in the districts exposed to the attacks of the enemy.

It appears that since 1160, no paper money had been redeemed, except with fresh paper, which reduced the credit of the Government to a very low ebb. All the state officials, civil and military, were paid in paper. The army was in

want of necessaries. Taxes were only paid in paper. Copper money was regarded as a rarity, and, of course, the more the paper was depreciated, the more the price of food rose. Some feeble efforts were made to improve the public credit by coining copper, but the quantity was very small, and it was much debased. In 1210, the Government sent a quantity of gold and silver to Sse-tchuen, where a new issue of thirteen million *min*, in bills, had greatly depreciated them. The *tchuen-yn* of 1,000 pieces had fallen to 400 and 100 pieces. The specie sent was sufficient to buy up thirteen million *min* of *tchuen-yn*, and their value rose to 500 pieces of iron in Sse-tchuen. Beyond this province the paper was only worth 170 pieces.

For nearly a century, the Niu-tchy, who had conquered the north of China, had followed the example of the Chinese, and created a paper money, in their kingdom of Kin, which was called *kiao-tchao*. They made the tributary provinces pay in nothing but copper, and they paid themselves only in paper. This paper was issued with an échance of seven years, when it was promised to be paid in specie. But, of course, this could not be done, and the paper money fell to a discount.

The Chinese historian says, "Paper should not be made money; it should only be used as a representative sign of metallic values, or necessaries, which should be immediately exchanged for specie, and economise its transport. Such was the original use of paper among merchants. The Government, adopting this invention from private persons, made it into money; and then abused its original intention." The same writer says, in another place, that in a country which had no medium of exchange, except copper and iron, the use of paper as a bill of exchange, or note payable to bearer, was of great use in commerce. But the Chinese Government, whose rapacity had committed so many frauds on the coinage, could not respect this useful invention, when the cost of the war made a continual demand for money. It only maintained its engagements during the period of the first issue of *kiao-tseu*, at Y-tcheon; that is, for about seventy-five or eighty years.

The Kin Government was attacked by the Mongols and the Chinese, and it resorted to the same devices of issuing paper money. The depreciated *kiao-tchao* were replaced by *pao-kuen*, *thong-pao*, *pao-tsen*, *tchin-ho*, which were printed on silk, and by *pao-hoei*. These were all species of inconvertible paper money. The last mentioned were from 1 to 4 *tsien*, that is, from .7 to 3 centimes.

No more metallic currency was made in China till 1276, when the Soung dynasty was overthrown. The only currency was the depreciated *hoei-tseu*. In 1235 a minister speaks of two species of *hoei-tseu*, at sixteen and seventeen terms, and complains of their daily increasing depreciation, and the rise of necessaries. In 1256, in order to diminish their number, it was ordered that the wine duties should be received in them, and then they were to be burnt. In 1265 the *hoei-tseu* were so utterly depreciated, that a new paper money was created, called *hien-trien-kouan-tseu*. There was also a species called *yn-kouan*, or silver notes. The Government issued one of these last to redeem three *hoei-tseu* of

eighteen terms; and received the *hoi-tseu* of seventeen terms in payment of the grain it sold to the people, and then burnt them. This was the last effort of the Soung dynasty; and China then fell under the Mongolians, greatly owing to the demoralization caused by the misery produced by the paper money.

Many of the officers of the Mongolian king, Ogodai (1227—1248), had urged him to issue *kiao-tchao*, in imitation of the Kin kings. His minister, however, Ye-lin-tchou-tsai, had warned him of the danger of paper money; and told him that the paper was refused in payment of taxes, and, in consequence, was so depreciated, that a cake of rice cost 11,000 *min*, or 75,000 francs. He advised that if the king was determined to issue paper money, its value should not exceed 10,000 *ting* of silver, or about 750,000 francs. This sage counsel, however, was not observed. In 1260, Koblai, or Chi-tsow, the first Mongol Emperor, who conquered all China, issued *kiao-tchao*, which were already depreciated one half. In the same year new issues were made, called *tchong-tong-yuen-pao-tchao* of several sorts, besides some printed on silk, called *tchong-tong-yen-ho*. In 1264, banks were erected throughout the empire for the issue of these notes. In 1276, new notes, called *li-tchao*, being little more than a centime or two. In 1279, these issues were stopped, but the old ones continued in circulation, though at a constantly increasing depreciation. In 1288, new issues were made, in which one new note was given for five of the same nominal value of the old. Thus the Government defrauded its creditors of eighty per cent. of their debts.

It was at this period that the celebrated Venetian traveller, Marco Polo, visited China; and discovered the existence of this paper money. In b. ii., c. 18, he gives an account of its manufacture. He says that it was made in Kanbalu. The inner rind of the mulberry tree was steeped and pounded in a mortar, and then made into paper, resembling that made from cotton, but quite black. It was then cut into pieces nearly square, but of different sizes. The smallest were of the value of a Denier tournois; the next for a Venetian groat; others for two, five, and ten groats; others for one to ten gold besants. Several officers had to subscribe their names, and place their seals on each note, which was then stamped with the royal seal dipped in vermilion. Counterfeiting was a capital offence. It had then a forced currency, and no one dare refuse it on pain of death. Caravans of merchants arrived with their goods, which they laid before the king; who selected what he pleased, and paid them in this money. When any one wished to exchange old money for new, it was done at the Mint, at a charge of three per cent. If any one also wanted gold or silver for manufacture, they could obtain bullion at the Mint in exchange for the paper. He also mentions many cities where he observed this money.

In 1309, the Emperor Won-tsung, seeing the paper much depreciated, issued a third species, called *tchi-ta-yen-tchao*; which, in fact, replaced the old at a depreciation of eighty per cent. Although some coinages of metal were issued, this paper was the only money recognised by the Government till the end of the Mongol dynasty. From 1341-1367, new issues were made which

were to replace the old ones, and were called *kiao-tchao* of the period *tchi-teng*, as if the new ones were better than the old. But no one would take them. During this period, insurrections broke out in every quarter, which the author of the work *Tsao-mou*, which is a continuation of *Matan-lin*, attributes to the general discontent caused by the abuses of paper money by the Mongols. But he does justice to the proper use of paper. He recalls the excellent effects which the creation of the *kiao-tseu* by Tchang-yang had previously had in Sse-tchuen. "Then," says he, "it was ordered that at the offices of the rich merchants who managed the enterprise, when the notes were paid in the money came out, when the bills came out the money went in. The money was the mother, the note was the son. The son and the mother were reciprocally exchanged for each other." Thus we see, that even the famous CURRENCY PRINCIPLE was invented in China 500 years ago! This is just the doctrine of some modern writers, that the sole duty of a bank is to exchange specie for paper and paper for specie. It was not so, however, under the Mongols who sought to make the Chinese take their paper by force, and took away all their specie, and then, by wounding the Chinese to the quick, took away their courage. The Mongols spent the money they had extorted from the people on foreign luxuries, and being thus enervated, they were expelled in 1368 from the country which they had held nearly a century.

It was during this period that the famous English traveller, Sir John Maundeville, visited China, and he gives an account of the paper money there. He says (*Travels*, p. 239. Edit 1839) speaking of the Emperor of Cathay or China—"This Emperour may dispenden als moche as he wile with outen estymacioun. For he despendethe not, ne makethe no money, but of lether emprented, or of papyre. And of that money is som of gretter prys, and som of lesse prys, afre the dyversite of his statutes. And whan that money hath the ronne so longe, that it begynneth to waste, than men beren it to the Emperoure's Tresorie, and than thei taken newe money for the old. And that money gothe thorghe out all the contree, and thorghe out all his provynces. For there and beyond hem thei make no money nouthor of gold nor of sylver. And therefore he may despende ynow and outrageously."

The Emperor Hong, the founder of the Ming dynasty, tried to restore a metallic currency, but in 1375 the finances were in such disorder, that the Imperial Council ordered notes, called *ta-ming-pao-chao*, or paper money of the great Ming. Each *tchao* was worth an ounce of silver, or 7.50 francs. It was ordered that four of these should exchange for one ounce of gold. Thus the proportion of gold to silver had varied from 10 to 1 to 4 to 1. Private persons were forbidden to use gold and silver in commerce, but were ordered to bring it to government, and receive *tchao* instead. The *tchao* and the copper money were received in payment of taxes. In 1393 three offices were erected in the Eastern provinces, to each of which 30,000 *ting* (300,000 Chinese ounces, or 2,500,000 francs) were sent to be issued.

In 1403, the *tchao* of the Mings had fallen to a heavy discount. The Emperor Tching-tsou re-

newed the prohibition to use gold and silver in exchanges, whosoever did so was to be punished as forgers of the Imperial ordinances.

In 1426, the *tchao* which were worn out were called in. In 1450, Ya-tsong forbade even copper money to be used in commerce. In 1455, his successor, King-ty, ordered all the current *tchao* to be called in and burnt. In 1467, Chun-tsong ordered all payments, both private and public, to be made, one half in specie and one half in *tchao*.

The last time the *tchao* are mentioned in history is in 1489, when the Emperor Hiao-tsong issued a decree against the government officials and rich men speculating in *tchao*. After this, metallic money seems to have been brought into circulation. In 1576, silver was generally used in commerce. In 1593, in a work called *Souan-fa-tong-tsong*, which is a collection of treatises on arithmetic and geometry, prices are usually estimated in silver ounces, but sometimes in *tchao*. In one place 500 paper ounces are estimated as equal to one silver ounce, though in another place the depreciation stated is not so great. In the introduction *tchao* are mentioned as legal tender as well as silver. Then from 1160 to the end of the 16th century inconvertible paper money had a forced currency in China, and displayed exactly the same phenomena as have been so often seen in modern times in Europe and America.

In 1644, the Mantchous or Tartars conquered all China, and seeing that the paper money was quite discredited, and had been one of the great causes of the overthrow of the Ming dynasty they totally suppressed it. In this they proceeded to the other extreme, and great destruction to commerce was caused by the prohibition to use anything but specie in any transaction. The Tartar Government has never issued anything but specie, but it is certain that there are Banks in China which issue notes, as an account is given of some in the Chinese Repository for 1846. But that only describes those issued in one town, and we have no knowledge how far their use is general.

We have given this account of Chinese paper money because we are not aware that any account of it has ever been published in English, and it may probably be new to our readers to learn that all the phenomena which have been displayed in Europe and America by the issue of paper money, were exhibited in China many centuries ago. We even find that there were strenuous advocates for the "Currency Principle" in China 500 years ago. We have not, however, been able to discover whether they had banks for the purpose of discounting bills of exchange. They had issues of paper in exchange for specie, and also government paper money, but we do not find that they had what we call a solid paper credit, that is instruments of credit created for the purpose of facilitating commerce, and then extinguished; which is the only system of paper which is not followed by depreciation.

The first paper money that we are aware of in Europe, was that issued by the City of Milan, in the 13th century, mentioned by Cibrario, who quotes Giulini *Memorie di Milano*, VII. 540. This issue was paid off, and we do not find that the Italian cities ever again availed themselves of so obvious, but so dangerous an expedient.

We need not load our pages with circumstantial accounts of the paper money of other countries, such as Russia, Austria, &c., as the story is the same in all. The history of the Assignats, Law's Mississippi scheme, and the paper money of the American colonies, furnish ample materials to study the pathology of the subject without repeating the wearisome details.

The nearest approach to paper money which has been in England, were the issues of the Bank of England during the Revolutionary war. But the government strenuously repudiated the name of paper money, and Bank Notes were never actually made legal tender. The issues were never made by the Government but by the Bank, who, as may be seen in the history of Banking in England, resisted the importunities of Mr. Pitt. If Mr. Pitt had had the power in his own hands, it seems probable that he would have run just the same course as so many others have done, before and since. When the Bank stopped in 1797, it was expected that the notes would fall to a heavy discount, as they had done in 1696, but this did not happen. No sensible depreciation took place till 1801, when the great scarcity of coin, and the demand for gold caused by the commercial crisis in Germany, coupled with the absurd usury laws, which prevented gold finding its natural price here, caused immense quantities to be exported. This, of course, raised the paper price of gold. Lord King, and other able writers, then called public attention to the fact, and proclaimed the doctrine, which was perfectly well understood in America 60 years before, that the rise of the market price of specie was, in fact, the proof and the measure of the depreciation of the paper. In a year or two, however, the market, or paper, price fell to about £4, and the depreciation being so slight was comparatively little felt. But Cobbett continued to maintain the doctrine that it was depreciated, in his Register. Gold continued at about £4 in paper per ounce till 1809, when the country banks having multiplied to an inordinate extent, and the Bank of England having immensely extended its issues, and thereby fostering an extravagant commercial speculation, the paper price of gold began rapidly to rise. It was at this period Ricardo, who had attained a distinguished position on the Stock Exchange, came forward and republished the doctrines of Lord King, that the high price of bullion was the proof of the depreciation of the paper. This pamphlet appeared at a fortunate period for the author, as the increased price of gold rapidly became serious, and attracted the attention of Parliament. In 1810, the celebrated Bullion Committee was appointed, which adopted the doctrine that the rise of the market price of gold and the fall of the foreign exchange was the proof and the measure of the depreciation of the paper. The recommendations of the Report were rejected by Parliament, and the price of gold continued to rise till 1815. In that and the following year there was a great destruction of country banks, and a vast amount of their issues being cleared away, the value of the remaining paper rose very nearly to par, and continued so till the end of 1818, when, owing again to the mismanagement of the Bank, it became depreciated for a year or so.

Table shewing the chief variations in the Market Price of Gold Bullion from 1790 to 1819, and the real value of the Bank Note during the restriction.

ON THE REGULATION OF A PAPER CURRENCY.

We have in the article CREDIT, as well as in this one, shewn that it is one of the most important doctrines of Political Economy to understand that instruments of Credit, such as Bills of Exchange, Bank Notes, Bank Credits, &c., are separate and independent articles of property, wholly distinct from money and commodities, and that they do not represent money, as Bills of Lading represent goods. However, they only maintain their value through the belief and confidence that they can be exchanged for money, and if that belief or confidence fail, their whole value vanishes into air. When we consider the colossal amount of this property, which exists in modern times, consisting of many hundreds of millions in value, the destruction of which is in

every respect equivalent to the destruction of any other species of tangible property, we can at once see the amazing importance of the question as to the best method of maintaining the value of this property, and guarding against its liability to destruction. When we consider that the value of this species of property in this country on a moderate estimate cannot be placed at less than £1,000,000,000, and that the cash is not supposed to exceed £70,000,000, we see that the value of the credit is somewhat in what physicists would call a position of unstable equilibrium. This wonderful mass of property may, if mismanaged, come to resemble what is said to have taken place upon opening the tombs of some Etrurian Kings. There appeared to be the form of a man reposing and arrayed in his royal robes, but, upon the slightest vibration disturbing the atmosphere, it immediately sank into a few spoonfulls of dust.

All theories of paper currency, however numerous and perplexed they may appear, may be reduced to three varieties:—

1. To issue paper based upon Bullion.
2. To issue paper based upon Land, the Public Funds, or upon commodities.
3. To issue an inconvertible currency, that is paper money.

We have already given sufficient examples of the last of these, and as the advocates of such a plan in this country are, we believe, almost if not quite extinct, we may pass it over as not worth arguing about. The second theory is John Law's, and as we have given a full account of it under LAW, we refer to that article. We may confine our attention to the first alone, which makes bullion the only proper basis of a paper currency.

But the advocates of this theory are divided into two sects. The one maintains that bank notes, payable to bearer on demand, alone are currency, and excludes all other forms of paper credit from that title; and they maintain this doctrine—

That if bank notes are permitted to be issued they ought to be exactly equal in quantity to the coin they displace.

This is called the CURRENCY PRINCIPLE.

The other party maintains that this limitation is unnecessary, and that it is too severe. They say that if the notes are made payable on demand, and are, practically speaking, convertible at the will of the holder, that the extent of these issues may safely very greatly exceed the amount of specie that would be in circulation under a purely metallic currency. They say that there is no possibility of judging by the absolute numerical quantity of paper whether it is excessive or not, and that the only test whether paper is excessive or not is to be found in the price of gold bullion and the state of the foreign exchanges.

ON THE CURRENCY PRINCIPLE.

We saw in the preceding account of Chinese paper money that when the Government had brought the country to a state of the deepest distress by their extravagant issues of paper money, a writer sighed for the days when no paper was issued except in exchange for specie, and specie was exchanged for paper. This is the first instance, that we are aware of, of the

doctrine which is called the CURRENCY PRINCIPLE. The next enunciation of it that we are aware of is in John Law's *Money and Trade Considered*, p. 73, edit 1755, where he says:—"Some are against all banks where the money does not lie pledged equal to the credit."

It was upon this principle that the Banks of Venice, Amsterdam, and Hamburg were constructed. These places were the centres of a great foreign commerce, and, as a natural consequence, an immense quantity of coin of all sorts, of different countries and denominations, was brought by the foreigners who resorted to them. These coins were, moreover, greatly clipped, worn, and diminished. This degraded state of the current coin produced intolerable inconvenience, disorder, and confusion among merchants, who, when they had to make or receive payment of their bills, had to offer or receive a bagful of all sorts of different coins. The settlement of these bills, therefore, involved perpetual disputes,—which coins were to be received, and which were not, and how much each was to count for. In order to remedy this, it became absolutely necessary that some fixed uniform standard of payment should be devised, to ensure regularity and a just discharge of debts. In order to do this, the magistrates of these cities instituted a Bank of Deposit, in which every merchant placed all their coins of different weights and nations. These were all weighed, and the bank gave him credit, either in the form of notes, or an entry in their books, exactly corresponding to the real amount of the bullion deposited. The owner of this credit was entitled to have a certain quantity of coin of full weight on demand. These credits, therefore, always insured a uniform standard of payment, and it was enacted that all bills upon the respective cities, above a certain amount should be paid in these credits, which were called bank money. The consequence was evident: as this bank money was always exchangeable for money of full weight on demand, it was always at a premium, or *agio*, as compared with the current money. The difference was usually from 5 to 9 per cent. in the different cities. The expression, *agio* or premium, is likely to mislead, because it is evident that it was the bank money that was the true standard, and the current money that was at a discount.

These banks professed to keep all these coins and bullion in their vaults. They made no use of them in the way of business, as by way of discounting bills. Thus the credit created was exactly equal to the specie deposited, and their sole business was to exchange specie for paper, and paper for specie.

They were examples of the CURRENCY PRINCIPLE, and they are the models to which many persons would wish to see all banks reduced, and we shall see that they maintain that paper should fluctuate in quantity exactly as a metallic currency would do if there were no paper; and that if paper is substituted for specie, it can only maintain an equality of value with specie by being exactly equal in quantity to what the specie would have been if there were no paper.

Those who support this doctrine, however, in modern times, rely probably upon some passages in Adam Smith, which we shall now lay before our readers and examine. In B. II. c. 11 (p. 126,

McCulloch's edition) Smith speaks of the substitution of a paper currency for money, and says that the way in which this tends to increase the revenue of the Society is not very obvious, and which he then endeavours to explain. After saying that a banker, who has obtained the confidence of the public, may substitute his own notes for specie, and support their credit by keeping perhaps only one-fifth in specie, he shews what becomes of the remaining specie. He says:—

"Let us suppose, for example, that the whole circulating money of some particular country amounted, at a particular time, to one million sterling, that sum being then sufficient for circulating the whole annual produce of their land and labour. Let us suppose, too, that some time thereafter different banks and bankers issued promissory notes payable to bearer to the extent of one million, reserving in their different coffers £200,000 for answering occasional demands. There would remain, therefore, in circulation £800,000 in gold and silver, and a million of bank notes, or eighteen hundred thousand pounds of paper and money together. But the annual produce of the land and labour of the country had before required only one million to circulate and distribute it to its proper consumers, and that annual produce cannot be immediately augmented by these operations of banking. One million therefore will be sufficient to circulate it after them. The goods to be bought and sold being precisely the same as before, the same quantity of money will be sufficient for buying and selling them. The channel of circulation, if I may be allowed such an expression, will remain precisely the same as before. One million we have supposed sufficient to fill that channel. Whatever, therefore, is poured into it beyond this sum cannot run in it, but must overflow. One million eight hundred thousand pounds are poured into it. Eight hundred thousand pounds therefore must overflow, that sum being over and above what can be employed in the circulation of the country. But though this sum cannot be employed at home, it is too valuable to be allowed to lie idle. It will therefore be sent abroad, in order to seek that profitable employment which it cannot find at home. But the paper cannot go abroad, because at a distance from the banks which issue it, and from the country in which payment of it can be enacted by law, it will not be received in common payments. Gold and silver, therefore, to the amount of eight hundred thousand pounds, will be sent abroad, and the channel of home circulation will remain filled with a million of paper, instead of the million of those metals which filled it before.

"But though so great a quantity of gold and silver is thus sent abroad, we must not imagine that it is sent abroad for nothing, or that its proprietors make a present of it to foreign nations. They will exchange it for foreign goods of some kind or another, in order to supply the consumption either of some other foreign country, or of their own.

"If they employ it in purchasing goods in one foreign country, in order to supply the consumption of another, or in what is called the carrying trade, whatever profit they make will be an addition to the neat revenue of their own

country. It is like a new fund created for carrying on a new trade."

Smith then proceeds to detail the various methods in which he considers such a course will augment the revenue of the country. And we observe this, that though he makes the arbitrary assertion that the annual produce cannot be immediately augmented by the operations of banking, a dogma which we shall consider hereafter, he expressly says that the revenue and wealth of the country are increased by the full amount of the gold and silver exported. Thus we see that he expressly says that the wealth of the country is *increased* by the amount of the credit created.

In the next page he says:—

"When paper is substituted in the room of gold and silver money, the quantity of the materials, tools, and maintenance which the whole circulating capital can supply, may be increased by the whole value of gold and silver which used to be employed in purchasing them. The whole value of the great wheel of circulation and distribution is added to the goods which are circulated and distributed by means of it. * * * When, therefore, by the substitution of paper, the gold and silver necessary for circulation is reduced to, perhaps, a fifth part of the former quantity, if the value of only the greater part of the four-fifths be added to the funds which are destined for the maintenance of industry, it must make a very considerable addition to the quantity of that industry, and consequently to the value of the annual produce of land and labour."

Thus we see that Smith first of all says that the operations of banking can make no increase of the annual produce of the country, and then he says that it must make a very considerable addition to it!

At p. 130, he says:—"The whole paper money of every kind, which can *easily* circulate in any country, never can exceed the value of the gold and silver of which it supplies the place, or which (the commerce being supposed the same) would circulate if there was no paper money. * * Should the circulating paper at any time exceed that sum, as the excess could neither be sent abroad nor be employed in the circulation of the country, it must immediately return upon the banks to be exchanged for gold and silver."

The reader will at once perceive the loose character of the dogmatic assertions contained in this extract. What is the "whole paper money of every kind?" What does he mean by "easily circulate?"

The comments of Mr. Thornton on this passage are so good that we will lay them before our readers. He says (*Essay on Paper Credit*, p. 44) "Does Dr. Smith mean to include, in his idea of the *whole* paper money of *every kind* which can "*easily circulate*," all the bills of exchange of a country, or does he not? And does he also include interest notes, Exchequer bills, and India bonds, and those other articles which very much resemble bills of exchange? In an earlier part of his chapter he has this observation: "There are different sorts of paper money; but the circulating notes of banks and bankers are the species which is best known, and which seems best adapted for this purpose." We are led to judge by this passage, and also by the

term "paper money of every kind," in the passage before quoted that it was his purpose to include bills of exchange; on the other hand, if *all* the bills of exchange of a country are to be added to the bank notes which circulate, it becomes, then, so manifest, that the whole of the paper must be more than equal to the amount of the money which would circulate if there were no paper; that we feel surprised that the erroneous position did not strike Dr. Smith himself. He introduces, indeed, the qualifying word "*easily*;" he speaks of "*the whole paper money of every kind which can easily circulate*." But the term, as I apprehend, is meant only to refer to an easy, in contradistinction to a forced paper circulation; for it is on the subject of a forced circulation that a great part of his observations turn. He seems, on the other hand, to have paid no regard to the distinction on which I have dwelt, of a more slow and a more rapid circulation; a thing which is quite different from an easy and a difficult circulation. He appears, in short, not at all to have reflected how false his maxim is rendered (if laid down in the terms which he has used) both by the different degrees of rapidity of circulation which generally belong to the two different classes of paper of which I have spoken, and also by the different degrees of rapidity which may likewise belong to the circulation of the same kinds of paper, and even of the same guineas, at different times.

"The error of Dr. Smith, then, is this—he represents the whole paper, which can *easily* circulate when there are no guineas, to be the same in quantity with the guineas which would circulate if there were no paper; whereas, it is the quantity not of "*the thing which circulates*," that is of the thing which is *capable* of circulation, but of the actual circulation which should rather be spoken of as the same in both cases. The quantity of circulating paper, that is of paper capable of circulation may be great, and yet the quantity of actual circulation may be small, or *vice versa*. The same note may either effect ten payments in one day, or one payment in ten days; and one note, therefore, will effect the same payments in the one case which it would require a hundred notes to effect in the other."

To shew how utterly futile the notion of Adam Smith is, we have only to recollect that a bill of exchange for £100, with 20 indorsements on it, is equivalent to 20 bills of exchange of £100 each, so that it purely depends upon the convenience of the parties whether there is a single bill of £100, or 20 bills for £100 in circulation.

Such is the doctrine of the Currency Principle as it appears in Smith, and we can clearly see that it is a mere dogmatic assertion, destitute of the smallest shadow of proof, and the history of Banking in Scotland proves its utter falsehood. We have fully explained under *CASH CREDIT* the mechanism of that part of Scotch banking. Now, when to promote a public work or anything else, a Scotch bank creates a credit, and issues a quantity of notes, what pretence is there for saying that they only replace a quantity of specie that was already in existence? Is it not clear that they are in *excess* of the metallic specie? But they produce exactly the same effects as if they were specie, and therefore they are capital

as much as money would be. Adam Smith only asserts the truth of the proposition on the supposition that the commerce remains the same. But what need is there that the commerce should remain the same? On the contrary, the commerce may be immensely extended by this means.

The doctrine of Smith, that the paper money of every kind that can easily circulate in any country is only equal to what the specie would have been if there were no paper, is manifestly false, if bills of exchange be included under the term as Smith clearly includes them.

The sect, however, who support this principle in the present day, rigorously exclude all forms of paper credit from the designation of currency, except Bank Notes payable to bearer on demand, and they maintain that the doctrine is true regarding them. This sect comprehends Lord Overstone, Colonel Torrens, Mr. Norman, and some others. Their opinions have been so fully quoted already in the preceding parts of this article, that we need not repeat them here.

We shall now examine Mr. Mill's opinions. In the Preliminary Remarks to vol. I., he says:—"Further consideration shewed that the uses of money are in no respect promoted by increasing the quantity which exists and circulates in a country; the service which it performs being as well rendered by a small as by a large aggregate amount." The slightest experience of reality shews that this dogma is utterly unfounded. Is it really to be believed that the introduction of fresh money can produce no benefit to a country? Such a statement only requires to be made to be refuted by general experience.

In B. III. cap. 13. § 5, he says—"Another of the fallacies from which the advocates of an inconvertible currency derive support is the notion, that an increase of the currency quickens industry. This idea was set afloat by Hume, in his Essay on Money, and has had many devoted adherents since." Not only has it had many devoted adherents since, but it had many devoted adherents long before Hume was born, as every one the least acquainted with economical literature knows well enough, and as every one knows to be true who has studied economical history.

He then says, § 6—"The substitution of paper for metallic currency is a national gain, *any further increase of paper beyond this is but a form of robbery.*

"An issue of notes is a manifest gain to the issuers, who, until the notes are returned for payment, obtain the use of them as if they were a real capital; and so long as the notes are no permanent addition to the currency, but merely supersede gold or silver to the same amount, the gain of the issuer is a loss to no one; it is obtained by saving to the community the expense of the more costly material. But if there is no gold or silver to be superseded—if the notes are added to the currency, instead of being substituted for the metallic part of it—all holders of currency lose by the depreciation of its value, the exact equivalent of what the issuer gains."

Again in B. III. ch. 22. § 3, he says—"When metallic money had been entirely superseded and expelled from circulation, by the substitution of an equal amount of bank notes, any attempt to keep a still further quantity of paper in circula-

tion must, if the notes are convertible, be a complete failure. The new issue would again set in motion the same train of consequences by which the gold coin had already been expelled. The metals would, as before, be required for exportation, and would be for that purpose demanded from the banks to the full extent of the superfluous notes, which thus could not possibly be retained in circulation."

In B. III. ch. 8. § 2, he says—"It is to be remarked that this ratio would be precisely that in which the quantity of money had been increased. [He is speaking of a sudden increase in the quantity of money.] If the whole money in circulation was doubled, prices would be doubled. If it was only increased one fourth, prices would rise one fourth."

We have only now to consider the mechanism of Banking to see that it at once gives the death-blow to all these brain-spun theories about the Currency Principle, and to shew how futile it is to suppose that it can be carried out in this country.

The early bankers, as we have shewn, received money on deposit, for which they gave their notes. By doing so therefore they only gave paper for specie, and if they had stopped there, that would have been the Currency Principle. But by doing so they would have made no profit for their trouble, unless they had received a commission on the money they kept. But on the contrary, they paid interest for its use. They made profits by discounting commercial bills. And this they did, not by lending out the money they received, as is commonly but erroneously supposed, but by giving their notes payable to bearer on demand. Hence it is quite clear that the whole amount of notes so advanced was in addition to the metallic currency, and therefore a robbery according to Mr. Mill, and so far a violation of the Currency Principle. By this means they multiplied their issues many times greater than the amount of specie they held, and though of course a certain amount would be demanded in specie, yet experience would show that they could safely maintain in circulation about eight or ten times the amount they held in specie.

We will now recall to our readers the first organization of the Bank of England. It was founded by the subscription of £1,200,000 in money to forward the war with France. This money was advanced to Government, and put into circulation. But the Bank was authorised to create, and issue notes to an equal amount in the discount of bills and loans, and the annual sum paid by the Government was supposed to be sufficient to maintain their credit, or convertibility. Now it is quite clear that the sum of £1,200,000 in notes was so much *added* to the previously-existing metallic currency—and therefore robbery according to Mr. Mill—and, by so much, a violation of the Currency Principle.

We have not been able to gather distinctly what were the limits imposed upon the obligations of the Bank at its foundation. It appears to be clear that they did not use cheques, as John Law, writing upwards of twenty years afterwards, says that they were not used in London then. But the increased powers of issue the Bank acquired, enabled them in a very short time to reduce the rate of discount from 8 per cent. to 3 per

cent. This shows how utterly unfounded is Mr. Mill's assertion, B. III., c. xliii, § 4—"An increase of the currency has in itself no effect, and is incapable of having any effect on the rate of interest."

But as the favourers of the Bank Act of 1844 allege that the Currency Principle is carried into effect by that Act, we will show how utterly futile such a notion is. That Act permits a certain amount of issues to be made on public securities, and all above that must be covered by bullion actually deposited, so that the amount of issues permitted always varies with the specie in its vaults. This is supposed to be the Currency Principle. But the least consideration will show that such a notion is a delusion. The Bank purchased the fourteen millions of securities with money advanced to Government, and on the security of the public debt, it is allowed to issue fourteen millions of notes. Is it not quite clear that these fourteen millions of notes are an addition to the mass of the Currency, just as the first £1,200,000 of notes were an addition to the then existing specie? But more than that. The Bank makes advances by means of credits created in its books called deposits, and in a vast quantity of cases these are not turned into notes at all, but are operated upon by means of cheques. Now it is clear that they are an augmentation of the Currency just as much as if they were notes, and yet they are taken no account of by the supporters of the Currency Principle! These "other Deposits," as they are called in the Bank Accounts, may be largely increased without any increase of the notes in circulation, and they are counted as nothing by the believers in the Act! Now what possible difference can it be, whether a man has Bank Notes in his pocket, or a credit in the Bank's books, which he can draw a cheque upon? What the amount of operations effected by means of cheques as compared with those effected by means of notes is, it is of course wholly impossible even to surmise; but, whatever it is, and it must amount to many millions daily, it goes absolutely for nothing in the estimation of those who maintain that nothing but Bank Notes payable on demand are currency!

The simplest consideration will show that those who maintain that the Bank Act carries out the Currency Principle must maintain this proposition—that twice fourteen millions, and besides that, a large and indefinite number of millions are equal to fourteen millions.

We thus see how erroneous it is to suppose that the Bank Act carries into effect the Currency Principle, or that it is possible to do so while the Bank is permitted to do any banking business at all. Every bill discounted by a bank is a violation of the Currency Principle, and is an increase of the Currency, and therefore robbery, according to Mr. Mill.

We shall now examine another supposed attempt to carry the Currency Principle into effect.

When the administration of India was placed by Parliament directly in the hands of the Crown, it became necessary to re-organise its finances, which had been left in a deplorable condition by the Company. Mr. James Wilson, who had taken a conspicuous part in the Anti-Corn Law League, and had founded the *Economist* news-

paper, and had been Secretary to the Treasury, and was supposed to be a great financial authority, was appointed Financial Secretary to the Government of India. If there is any country in the world in which a sound scheme of paper currency would produce greater benefits, or one in which a bad one would produce a more tremendous catastrophe, that country is India. We shall now lay before our readers Mr. Wilson's scheme as contained in his despatch laid before Parliament.

He says that in the advanced stage of Political Economy at which we are arrived, there is so much of general principle universally admitted, that many of the preliminary considerations may be stated as admitted axioms requiring neither argument nor proof.

One of these admitted axioms he states to be: "But in no direct way, as is too often supposed, especially by those who advocate an inconvertible paper currency, can the available capital of a country be added to by an increase of a mere circulating medium, whether it be metallic or paper."

So far is this from being true and universally admitted, that it is notoriously untrue, and is not admitted by any one who ever had a real knowledge of business.

He then says that in order to render paper, which has of itself no *intrinsic* (!) value, a safe and useful substitute for coin, there are certain conditions which must attach to it. These may be thus stated:—

First.—The paper must be identical in exchangeable value with the coin it represents.

Second.—To be identical in value, it should be identical in quantity with the coin which is displaced by its use, so that, in point of fact, the mixed currency of notes and coin would be of the same amount as if it were wholly of coin.

Third.—All the laws which would determine variations in the quantity of the coin in circulation, from time to time, should apply equally to a mixed circulation of coin and paper; *the latter not being an addition to the currency, but only a substitution of a portion of the coin which would otherwise be required.*"

That these doctrines are theoretically true as parts of economic science is, as has been abundantly demonstrated, wholly untenable. Nevertheless, though not theoretically true, it would be quite possible to carry them out into practice; and we shall now see how Mr. Wilson proposed to give practical effect to his theory.

The Bank of England, as our readers know, issues notes partly based, it is said, upon public securities and partly upon bullion, and is supposed, erroneously as we have shewn, to carry into effect the Currency Principle. Mr. Wilson's plan was to found a paper currency somewhat on the model of that of the Bank of England—partly upon specie and partly upon public securities.

Let us now examine what the securities for the issues of the Bank of England really are.

In the first place the Bank bought the Government securities with money. It has, therefore, these securities as its own property. Moreover, the Bank is not an agent of the Government, it is an independent body, and the obligation of one to the other is a *bonâ fide* property. Having, then, this amount of property, the Bank is

allowed to issue an equal amount of notes. But it does not issue them for nothing. They are only issued in discounting bills,—that is in purchasing other property. Supposing then the whole amount issued in purchasing bills, the Bank in exchange for its notes would have acquired an equal amount of property (neglecting the discount for the sake of brevity). Besides that, it has 3 millions of accumulated rest. Consequently, as a total security for the redemption of its 14 millions of notes, it has 14 millions of Government securities, and 14 millions of private securities, and 3 millions of rest, making 31 millions altogether. And thus it has an excess of 17 millions of assets over and above all its liabilities, every farthing of which must be lost before its creditors can lose a penny. No doubt these public securities may become depreciated in their value; but it is clear that all such loss would fall on the bank itself. It is not possible to conceive that the creditors of the bank could ever lose. The insolvency of the bank is therefore a simple impossibility.

Now let us see how Mr. Wilson proposed to organize an analogous paper currency for India.

He proposed to establish a currency commission in connection with the Mint, which was therefore not a body independent of the Government, but the mere agent or servant of the Government, and therefore a part of the Government, and consequently no obligations of the one to the other was valid as an independent security.

The duties of these Commissioners were, amongst other things:—

To exchange with the Treasury and with private persons on demand, notes for coin, and coin for notes.

To purchase at a fixed price silver, bullion and foreign coin.

Now this was carrying out the Currency Principle, and if the duties and powers of the Commissioners had stopped there, that would have been merely substituting paper for an equal amount of coin, and of course there would have been no addition to the currency.

But their next duty was to purchase and hold public securities to an amount not intended to exceed two thirds of the specie deposited with them.

Now as the whole paper issued in exchange for the specie would be in circulation, and two thirds of the specie also would be put into circulation, it is quite clear that this was an augmentation of the currency to that amount.

To exhibit the practical working of this scheme more clearly to our readers, let us take figures.

Let us suppose that the number 252 represents the specie deposited with the Commissioners. Then in exchange for that they issue 252 in notes payable to bearer on demand. Thus the specie and the paper being exactly equal—that is the Currency Principle.

But they may purchase securities to the amount of two-thirds of their specie, or to the amount of 168.

Now there is in circulation 252 in paper payable on demand, and 168 in specie is added to it—making 420 of currency.

But the holders of the 168 in specie may come and deposit it with the Commissioners, and demand notes in exchange for it. When they have done this, the Commissioners will have issued 420

in notes payable on demand, and against that they hold 252 in specie, and 168 in public securities.

But as they have issued 420 in notes and have a reserve of 252 in specie, whereas they are only to maintain a reserve of one third of 420, or 140 in specie, they may purchase 252—140, or 112 of further securities with specie. Consequently by this means they throw 112 of specie into circulation as currency, which is an increase of the 420 in notes already in circulation, making a total of 532.

There is now therefore a sum of 532 of notes in circulation, for which the Commissioners hold 252 in specie and 280 in securities, but as they need only hold the third of 532, or 174 in specie, they have 74 to purchase fresh securities. They thus have a reserve of 174 in specie and 354 in securities.

But the holders of the 74 in specie may come and demand notes in exchange for it, and the same process may be repeated, as is clear, until the notes are issued to the amount of three times 252, or 756, and for this, if the arithmetical process be exhausted, it will be found that the Commissioners will hold 252 in specie and 504 in securities.

But let us mark the consequences. Suppose the securities are purchased at par, and times are peaceful, and affairs flourishing, it may be, there might not be much danger. But suppose political troubles to arise, and the securities to be depreciated 10 or 20 per cent., where is the security for the notes then? It is clear that the Government is insolvent. And as these notes are payable on demand, there would of course be a run for gold. How is that to be met? By the sale of securities—that would at once send them down to such a discount as would be fatal to the Government. But even then the Government would be bankrupt, as the sum that might be raised by selling securities would leave a very large uncovered deficit.

Our readers will at once see how utterly preposterous it is to suppose that such a scheme was in any way analogous to the issues of the Bank of England which are covered by such an immense excess of assets above liabilities. In fact, the more one considers it, the more incredible does it appear that such a visionary delusion should have emanated from any man of sense. It is quite clear that the Government securities in the hands of their own agent were no securities at all. Directly the Government bought up its own obligations, it is quite clear they were extinguished.

To suppose that the Government holding its own securities could make them a basis for paper issues, is as absurd as to suppose that if the Directors of the Bank of England were to sign obligations, and deposit them with the issue department, they could make them a basis for paper issues! Or to suppose that if a man were to sign a promissory note of £1000 to himself, and put it into his own pocket, he could make that a basis for issuing to the public a thousand £1 notes payable to bearer on demand!

What then was the real practical result of this wonderful financial scheme? It was simply this: By means of obtaining 252 in specie from the public, by a series of exchanges, it created 252 of notes payable on demand, and also turned 504 of funded debt, of which only the interest was

demandable from the Government, into 504 of notes payable to bearer on demand!

It is quite easy to see that if this scheme had ever been carried out, it would have infallibly brought on a tremendous financial catastrophe, which would have done more to overthrow the Government than half a dozen mutinies. Fortunately it was immediately quashed by the home authorities. But that such a scheme should emanate from any one holding such a position, is a deep disgrace to British finance in the nineteenth century.

To shew that the quantity of money in a country at any time bears no necessary relation whatever to the quantity of other goods &c., in it, or to their price.

Many writers have supposed that the quantity of money in a country bears some necessary relation to the quantity of other things in it. Thus Smith says, Book II. c. 2.—“What is the proportion which the circulating money of any country bears to the whole value of the annual produce circulated by means of it, it is perhaps impossible to determine. It has been computed by different authors at a fifth, at a tenth, at a twentieth, and at a thirtieth part of that value.” Many more have supposed that variations in prices are caused by variations in the quantity of specie; or, that the prices of commodities are determined by the proportion which the quantity of money bears to the quantity of commodities. That this is a very grievous error can easily be shown. Thus, let us suppose that two persons, A and B, are reciprocally indebted to each other for the sale of goods. Let us deal with small figures, as that will exhibit the principle of the thing as well as large ones. Let us suppose that A has bought goods of B to the amount of £10, and B has bought goods of A to the amount of £13; then it is quite clear that there are three different ways of settling their dealings.

1. Each may send a clerk to the other with the amount of his debt to the other. To settle the matter in this way, would require £23.

2. A may carry £10 to B in discharge of his debt; and B may pay it back to A, together with £3, in discharge of his own. This method would require £13.

3. They may meet and set off their mutual debts against each other, and pay only the difference in coin. This method would require only £3.

Now it is quite clear that a very different amount of money would be required to carry on any given amount of business, according as either of these three methods was adopted. Between the first and the third there is a difference of £20; but there would be no difference in the prices of commodities. So that by a simple change in the method of doing business, £20 might be withdrawn from circulation altogether, if only the same quantity of business can be carried on.

From these considerations it manifestly appears that there may be great quantities of money in a country which may exercise no influence whatever on prices, and that the proportion between money and commodities may vary greatly, according to the method in which business is carried on. Few countries, after adopting the third method, would go back to the first. But many might change from the first to the third. As an example of

the change from the first to the third, we may mention the case of the London banks. Every bank in London has, probably, claims against every other, every morning. The old method used to be, that every morning each bank used to send out clerks to collect the sums due to it from its neighbours. But at the same time it was obliged to keep in reserve a large stock of specie and notes to meet its neighbours' claims on it. The consequence of this system was very manifest. There was an enormous mass of specie and notes kept for no other purpose but to be carried backwards and forwards from one bank to another to settle claims, which might be much more easily settled by being simply set off one against the other. To facilitate this change, a considerable number of the London Banks agreed to have a room where their clerks should meet and set off their mutual claims against each other, and only pay the differences in specie. By a further improvement in the organisation of this institution, no specie or bank notes at all are now used. This method saves the use of many millions of specie or bank notes, which would be required if it did not exist, and it is clear that this vast sum of money, which would be required to fulfil the purpose of the Clearing House, would exercise no influence on prices.

On the Theory of Regulating the Paper Currency by the Discount of Mercantile Bills.

Adam Smith, who is supposed to countenance the doctrine discussed in the preceding section, called the Currency Principle, has, a few pages further on, started another theory, which was strenuously supported by the Directors of the Bank of Ireland in 1804, and those of the Bank of England in 1810; namely, that, as long as Notes are issued in the discount of *bonâ fide* mercantile bills, they cannot be excessive. This very specious theory was controverted by the Bullion Committee, but not in our opinion conclusively. We have endeavoured to demonstrate its fallacy under BULLION REPORT, § 51.

On the Regulation of the Paper Currency by means of the Rate of Discount.

Having shown that the two theories of Paper Currency which have obtained the greatest notoriety in recent times are inconsistent with each other, and both erroneous, we have now to consider what other means there may be of regulating the Paper Currency.

Although it is an error to suppose that the Paper Currency must always be exactly equal to what the specie would have been if there were no paper, and in fact can by no possibility do so whilst the business of banking is allowed to continue, yet it is unquestionably true that the paper should vary proportionably to the specie. The framers of the Bullion Report and of the Act of 1819, as well as all the best authorities of the period, maintained that the mere numerical amount of notes was no criterion as to whether they were over-abundant or not. They maintained that the true criterion was to be found in the price of gold bullion and the state of the Foreign Exchanges. Having regard to these, they said that the more paper there was the better, as it only showed the activity of enterprise.

So long as the paper is convertible at the will of the holder, the price of gold bullion may be omitted, because though the Bank may endanger its stability by excessive issues, yet the market price of gold cannot be affected by them until cash payments have been suspended, and the notes become inconvertible. So long, therefore, as the Paper Currency is convertible, the state of the Foreign Exchanges is the principal thing that need be looked to.

Directly we observe that a debt is an article of merchandise, and may be bought and sold like any other commodity—which was perfectly well understood until the erroneous doctrine was adopted by Economists that labour and materiality are necessary to value—and that the laws governing the price of debts are perfectly analogous to those which govern the prices of all other commodities, we shall find that the subject becomes quite clear and simple.

For many centuries, it was the custom, in this and other countries, to fix the prices of labour and corn. It was considered a heinous crime to lay up corn for the purpose of selling it again. Those who did so were called by various uncouth names, such as Foresters, Reagraters, &c., the meaning of which, we hope, will shortly be known only to antiquaries. At last, writers began to see the fallacy of this. It is one of Smith's merits, we believe, to have been among the first to show the useful part played by corn speculators, who bought up corn when it was cheap, and kept it in reserve until there was a scarcity. After laborious efforts, it came to be generally understood that corn factors, instead of being the cause of the scarcity and dearness of corn, were, in fact, the very persons who prevented it being a great deal more scarce and dear than it was; and, so far from aggravating variation in prices, were in fact the great mitigators of them. That, so far from being the noxious vermin they were supposed by the ignorant vulgar to be, they were great public benefactors.

But long after the evil effects of meddling with the value of labour and commodities were fully understood, people clung to the chimera of fixing a maximum price for debts, or discount, and while it was lawful to take any amount by way of commission, or extraneous charges, it was held to be a legal and moral crime to take anything above a certain amount by way of interest. Such is the weakness of human nature, that Adam Smith himself, who had done so much to enlighten the world as to the mischief of meddling with prices, gives most fantastical reasons for maintaining a maximum rate of interest. This called forth Bentham's admirable *Defence of Usury*. The usury laws produced the most serious inconveniences in every commercial crisis, and yet no effort was made to repeal them till 1834, when bills and notes of not more than three months' date, were exempted from their operation; and it was not till 1854, that the last remnants of them were abolished, and contracts for money left free.

Directly we observe that a debt is simply an article of merchandise, and that banking is simply buying and selling debts, we have only to observe the analogy between that and every other species of merchandise, and the proper method of controlling the paper currency becomes obvious and simple.

As discounting bills is simply buying debts, the price of such debts must follow exactly the same laws as the price of corn, or any other article. If money is very scarce, and wheat very abundant, the price of wheat must rise. The price of debts obeys the same rules. If money becomes very scarce, the price of debts must fall, i.e., the discount must rise. If money becomes abundant, the price of debts will rise, i.e. the discount will fall. The price of debts, then, must follow the same great laws of nature that the price of wheat does. Every one knows now that it is a great error to control the price of corn. As we have shown (*PRICES; THEORY OF*) it is not the fluctuation of the price of wheat that is the evil. The real evil is the change in the proportion of the demand and supply, and the fluctuation of the price is the grand natural corrector of the evil. A high price of corn is the way to *attract* corn to where it is deficient, and a low price repels it from where it is already too abundant. Nothing can be more erroneous policy than to force down the price of wheat when there is a real scarcity, and to sell it below the price it would naturally attain to.

Now apply all the arguments which irresistibly govern the case of wheat to the case of credit, or debts, and the same results follow. The same great law of nature operates to preserve the due proportion between money and credit, and any interference with this great law must necessarily be attended with the same evil consequences as an interference with the natural price of wheat. And yet almost all legislation up to a very recent period, and the great majority of writers on political economy, and too many of the commercial world were in a perverse combination to thwart this great law of nature, and to attempt to keep the rate of discount, or the price of debts, fixed at a uniform rate!

While, therefore, the greater part of commercial complaints were levelled against variations in the rate of discount as the great evil—the truth is, they are only the sign of the evil. The real evil is the altered proportion between money and credit, and a variation in the rate of discount is the grand natural corrector of the evil. To attempt to keep the rate of discount uniform, is to thwart and contravene the laws of nature just the same as an attempt to fix the price of wheat. Like all true laws of nature, the simplicity, beauty and perfection of its action is marvellous, and it produces a multitude of results which are not perhaps very obvious at first. If money is leaving the country and becoming scarce compared to credit, every principle of nature shows that the value of money must rise, i.e., the rate of discount must rise; and this prevents the outflow of bullion, and attracts it from abroad. On the other hand, if money be flowing into the country, and likely to become too abundant compared to credit, a fall in its value, or a fall in the rate of discount *repels* it from the country. If a nation be visited with a great failure of the crops, it can only buy such food from foreign countries with its commodities, or its money—it cannot send its credit as permanent payment abroad. Now, if commodities are too dear, it must pay with money, and credit in this country is the great producing power; and credit, *for a time*, is a great sustainer of prices by enabling people to withhold their commodities from the

market. Now, raising the rate of discount curtails credit, forces sales, and thereby lowers the price of commodities, and makes it less profitable to export specie, and more profitable to export goods. Moreover, this rise in the value of money here, i.e., the low price of debts and commodities, tempts buyers from neighbouring countries to bring their money here. It thus causes an influx of money, and brings the value of the currency here to a nearer level with that of other countries. Again, if this nation has to spend a great part of its money in buying foreign corn, it is quite clear it has not got so much to spend in purchasing goods; an over-production of goods therefore can only end in a disastrous fall in prices. And here, too, the beautiful action of this great law of nature is manifest. So enormous a proportion of the commodities of this country are produced by the credit system, that a rise in the rate of discount just hits profits between wind and water, as we may say. Consequently, a rise in the rate of discount retards and curtails production in proportion to the diminished consuming powers of the nation, and so prevents such a ruinous fall in price, as would necessarily follow an undiminished production, accompanied by a diminished power of consumption.

In fact, when a commercial crisis occurs in a country, it invariably means that more persons are wishing to sell than there are persons wishing to buy, or at least at remunerative prices. A commercial crisis invariably arises from a lack of purchasers, which is, in fact, over-production. True prudence, therefore, shows, that in all commercial crises, *production should be curbed*. It is better not to produce at all, than to produce and be obliged to sell at a loss. To produce and be obliged to sell below cost of production is loss of capital. It is better, therefore, not to employ the capital at all than to lose it. Raising the rate of discount, therefore, acts as a timely warning to producers to hold hard. It is necessary to dispose of the stock already produced before producing more, and if the stream of sale is stopped while production continues, it can only tend to a more aggravated fall at last.

Now, what is the necessary consequence of an attempt to thwart this great law of nature? In time of scarcity of food, and a necessary export of money to buy it, if the rate of discount be kept unnaturally low, nothing but money will go, commodities are too dear, they will not go. Again, money being kept at an unnaturally low rate here, no one will bring it here from neighbouring countries; consequently, great quantities of money will go out and none will come in, till at last the circulating medium will be nothing but "promises to pay," and no money to pay them with. Then, at last, violent convulsions, total destruction of credit, every one wishing to sell, and no one wishing or able to buy.

On the other hand, if, when money is flowing in with too great abundance, it be not repelled by a due diminution in the value of money, i.e., a fall in the state of discount, it will continue to do so until it is so superabundant, that a violent fall takes place. Persons who are accustomed to depend on the income they receive from the interest of money, suddenly find their means are seriously diminished. Then wild speculations find favour in the public mind, promising higher

profits, and thus the community goes through the cycle of bubble speculation, extravagant credit, ending in commercial catastrophe. In 1824, money was so abundant, that the Scotch Banks gave no interest on deposits. Then came 1825. It is perfectly certain that during the various crises this country has passed through, if more attention had been paid to observe the natural rate of discount, instead of thwarting the course of nature, though the variations would have been more frequent, they would have been less violent and extreme. If money is coming in with too great speed, it is good to lower the rate of discount quickly, to prevent it getting lower; if money is going out too rapidly, it is good to raise the rate quickly, to prevent it being higher.

Hitherto, however, a great number of persons have thought that a uniform and invariable rate of discount is the great thing to be preserved, no matter what nature may say to the contrary; and much ingenuity has been given to devise a plan for always keeping it so, just as if the governor of a steam engine ought always to revolve with uniform velocity. The inevitable consequence of taking these means to thwart nature will be, that when money is scarce, it will be repelled by a lower rate than the natural one; when it is already too abundant, it will be still further attracted by a rate higher than the natural one.

Many have supposed that the object ought to be to maintain the currency at a uniform amount, and have proposed that as gold goes out, paper should be issued to supply its place. Thus, Sir Archibald Alison, who condemns the theory that gold and paper should vary together, says (*History of Europe, Vol. II. p. 391.*):—"The true system would be just the reverse. Proceeding on the principle that the great object is to equalise the currency, and with it prices and speculation, it would *enlarge* the paper currency when the precious metals are withdrawn, and credit is threatened with a stoppage, and proportionally contract it when the precious metal returns, and the currency is becoming adequate without any considerable addition to the paper." This plan has been tried over and over again, and has been uniformly attended with a catastrophe. When gold was leaving the country in vast quantities, in 1796, the Bank of England still maintained its issues, against its own will, it is true, but yet the *fact* illustrates the *principle*—and the consequence was the suspension of cash payments, in 1797. When the Bank had got right again, in 1817, a drain for foreign loans began, and the Bank extended its issues in 1818, and the consequence was the second suspension of cash payments, in 1819. In 1824, when bullion was departing from the country like a flood, the Bank extended its issues. Then, when it saw itself right in the vortex of bankruptcy, it suddenly altered its policy, and the result of this was the catastrophe of 1825. In 1838-9, a similar drain occurred; the Bank, with marvellous perversity, maintained its rate of discount considerably below the market rate, and the result was the monetary crisis of 1839. In 1847, there was the same error, and the same result. Surely these instances are enough to destroy this fatal delusion.

In fact, those writers who maintain this doctrine—or rather, we may say, who did so, because they are almost if not quite extinct—wholly mistake the object to be sought for in so delicate

and artificial a machine as a Paper Currency. The object to be aimed at is not to preserve a uniform rate of discount, or a uniform quantity of currency in this country, but to maintain a uniformity in the VALUE of the British Currency with that of other countries. If money be made artificially cheap in this country, that is, cheaper than it is in neighbouring countries, persons in this country will *export* it to where it is of greater value; they will buy foreign securities, they will buy foreign commodities. On the other hand, foreign nations will flood this country with their securities, just as the Americans did in 1839—when the Bank kept down the rate of discount below its proper level—because they can sell them at a better price here than in their own country. If a man wishes to sell a horse, and my neighbour will only give £90 for it, and I will give £96, he of course will sell the horse to me and take away my cash. So, when the Americans wished to sell their debts, and found that in their own country they could only get £90 per cent. for them, whereas they could get £97 per cent. for them in England, as a natural consequence they sent them to England for sale, and took away the cash. The only way for England to have stopped this would have been to give no more for these securities than the Americans would themselves; in other words, to maintain a uniformity in value between the currencies of the two countries.

There are, also, other considerations which shew that the rate of discount is the true method of acting upon the Paper Currency. It has almost universally been supposed that Bills of Exchange arise only out of previous commercial transactions between countries; and, therefore, that if there have been no transactions there can be no Bills. Under the article EXCHANGES, FOREIGN, we have shown the fallacy of this notion, and explained that when *The Rate of Discount in two countries exceeds the Cost of the Transmission of Bullion between them, Bills of Exchange are fabricated for the express purpose of exporting bullion.* If the rate of discount at Paris is 6 per cent., and the rate in London 4 per cent., not only will debts fly from Paris to buy bullion, and bullion fly from London to Paris to buy debts, but debts will be created in London for the express purpose of buying bullion in London at 4 per cent., and selling it in Paris for 6 per cent. And this, of course, will manifestly go on as long as this difference is maintained. There is no other method of preventing such operations, but by equalising the rates of discount at London and Paris—this of course effectually prevents all such operations. If only the numerical amount of notes be looked to, and the rate of discount be kept down, these speculators may get their bills passed, while legitimate trade bills may be refused. A moderate rise in the rate of discount will never inflict any real injury on trade, at all equal to the refusal to discount trade bills altogether, and that is the result which has always ensued from a perseverance in keeping down the value of money below its natural level.

We are happy to say that this great truth is now generally admitted and acted upon. Within the last few years, the Bank of England have fully understood it, and the Usury Laws in France have recently been modified, so as to permit the Bank of France to counteract drains of bullion

by their natural controller—the rate of discount. In order to carry this into effect, the Directors of the Bank have only to fix upon some sum which they consider is absolutely necessary to secure the convertibility of the note—say eight millions for example. They should then determine that as their treasure gradually diminishes to this point, the rate of discount should gradually rise to such a rate as would, under all ordinary circumstances, prevent bullion from leaving the country, say 10 per cent. or thereabouts. As the bullion gradually rose, the rate of discount should gradually fall. Of course it is impossible to state absolutely what the exact rate should be, as it would always depend upon the state of the Foreign Exchanges, but in our *Theory and Practice of Banking*, 1856, we gave such a scale; and, on comparing the scale given there with that actually adopted by the Bank, (Discount) it will be seen that the Bank has very nearly followed the scheme there given.

If such a scale had been adopted in former times by the Bank it would have prevented most of those terrible catastrophes which have so often happened. It would have rendered any legal regulation of the number of Bank Notes unnecessary, and it would enable the Bank to surmount monetary crises without aggravating them into panics. The experience of the two great crises of 1847 and 1857 has fully confirmed the accuracy of the arguments upon which this plan rests; and when the Bank Act broke down, it was the plan recommended by the Government, and adopted with perfect success. The Bank was permitted to make unlimited issues to stay the panic, but at a very high rate of discount. Every one knows that this is the plan which must be adopted on the recurrence of all future crises. Hence we “conclude that reason, evidence and experience combine to demonstrate that,” it is a false and dangerous principle to fix the numerical amount of paper issues; and that the only true method of REGULATING THE PAPER CURRENCY IS BY CAREFULLY ADJUSTING THE RATE OF DISCOUNT TO THE STATE OF THE FOREIGN EXCHANGES. (CRISIS, COMMERCIAL; DISCOUNT; EXCHANGES, FOREIGN.)
